Primary Author: Usha Krishnamurthy

Contributors: Adrian Daniel Popescu, Alan Williams, Alfonso Colunga Sosa , Andy Witkowski, Atif Chaudhry, Aymaan Ashhab Ahmed, Beda Hammerschmidt, Bill Lee, Chris Saxon, Drew Adams, Gerald Venzl, Giridhar Ravipati, Gopal Mulagund, Gregg Christman, Hermann Baer, Huagang Li , Ian Neall, James Stamos, Jan Michels, Josh Spiegel, Laurent Daynes, Loic Lefevre, Mahesh Girkar, Mark Dilman, Martin Bach, Mary Beth Roeser, Nigel Bayliss, Neelam Goyal, Nishant Chaudhary, Oskar Van Rest, Sankar Subramanian, Shashaanka Agrawal, Sergiusz Wolicki, Shashank Gugnani, Sundeep Abraham, Thomas Baby, Vlad Ioan Haprian, Wayne Smith, Ya Li, Yanfei Fan, Yi Ouyang, Yinliang Wang, Yuan Zhou , Yunrui Li

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Oracle customer access to and use of Oracle support services will be pursuant to the terms and conditions specified in their Oracle order for the applicable services.

Changes in This Release for Oracle AI Database SQL Language Reference

Changes in Oracle AI Database Release 26ai i

1 Introduction to Oracle SQL

History of SQL 1
SQL Standards 1
- How SQL Works 1
- Common Language for All Relational Databases 2

Using Enterprise Manager 2
Lexical Conventions 2
Tools Support 3

2 Basic Elements of Oracle SQL

Data Types 1
- Oracle Built-in Data Types 5
  - Character Data Types 8
  - Numeric Data Types 12
  - LONG Data Type 17
  - Datetime and Interval Data Types 18
  - RAW and LONG RAW Data Types 27
  - Large Object (LOB) Data Types 27
  - JSON Data Type 30
  - Extended Data Types 33
  - Boolean Data Type 34

Copyright © 1996, 2026, Oracle and/or its affiliates.

Vector Data Type 40
Rowid Data Types 42
ROWID Data Type 43
UROWID Data Type 43
ANSI, DB2, and SQL/DS Data Types 43
User-Defined Types 45
Object Types 45
REF Data Types 46
Varrays 46
Nested Tables 46
Oracle-Supplied Types 47
Any Types 47
ANYTYPE 47
ANYDATA 47
ANYDATASET 47
XML Types 48
XMLType 48
URI Data Types 48
URIFactory Package 49
Spatial Types 50
SDO_GEOMETRY 50
SDO_TOPO_GEOMETRY 50
SDO_GEORASTER 50
Data Type Comparison Rules 51
Numeric Values 51
Datetime Values 51
Binary Values 51
Character Values 52
Object Values 55
Varrays and Nested Tables 55
Data Type Precedence 55
Data Conversion 55
Implicit and Explicit Data Conversion 56
Implicit Data Conversion 56
Implicit Data Conversion Examples 59
Explicit Data Conversion 59
Security Considerations for Data Conversion 61
Literals 62
Text Literals 63
Numeric Literals 64
Integer Literals 64
NUMBER and Floating-Point Literals 65

Copyright © 1996, 2026, Oracle and/or its affiliates.

Datetime Literals 67
Interval Literals 71
INTERVAL YEAR TO MONTH 71
INTERVAL DAY TO SECOND 72
Format Models 74
Number Format Models 74
Number Format Elements 75
Datetime Format Models 77
Datetime Format Elements 78
Datetime Format Elements and Globalization Support 83
ISO Standard Date Format Elements 84
The RR Datetime Format Element 84
Datetime Format Element Suffixes 85
Format Model Modifiers 85
Format Model Examples 86
String-to-Date Conversion Rules 88
XML Format Model 89
Nulls 90
Nulls in SQL Functions 91
Nulls with Comparison Conditions 91
Nulls in Conditions 91
Comments 92
Comments Within SQL Statements 92
Comments on Schema and Nonschema Objects 93
Hints 93
Alphabetical Listing of Hints 99
ALL_ROWS Hint 99
APPEND Hint 100
APPEND_VALUES Hint 100
CACHE Hint 101
CHANGE_DUPKEY_ERROR_INDEX Hint 101
CLUSTER Hint 102
CLUSTERING Hint 102
COMPRESS_IMMEDIATE Hint 103
CONTAINERS Hint 103
CURSOR_SHARING_EXACT Hint 104
DISABLE_PARALLEL_DML Hint 104
DRIVING_SITE Hint 104
DYNAMIC_SAMPLING Hint 104
ENABLE_PARALLEL_DML Hint 105
FACT Hint 106
FIRST_ROWS Hint 106

4 Operators

About SQL Operators 1
Unary and Binary Operators 1

Copyright © 1996, 2026, Oracle and/or its affiliates.

Operator Precedence 2
Arithmetic Operators 2
COLLATE Operator 4
Concatenation Operator 5
Hierarchical Query Operators 6
PRIOR 6
CONNECT_BY_ROOT 7
Set Operators 7
Multiset Operators 7
MULTISET EXCEPT 8
MULTISET INTERSECT 9
MULTISET UNION 10
SHARD_CHUNK_ID Operator 10
User-Defined Operators 12
Data Quality Operators 12
FUZZY_MATCH 12
PHONIC_ENCODE 15
GRAPH_TABLE Operator 16
Graph Reference 20
Graph Pattern 23
Path Pattern 25
Element Pattern 28
Quantified Path Pattern 39
Parenthesized Path Pattern 42
Graph Pattern WHERE Clause 44
Graph Table Shape 45
COLUMNS Clause 45
Rows Clause 48
Value Expressions for GRAPH_TABLE 53
Property Reference 53
Vertex and Edge ID Functions 55
Vertex and Edge Equal Predicates 57
SOURCE and DESTINATION Predicates 58
Aggregation in GRAPH_TABLE 60
JSON Object Access Expressions for Property Graphs 63
MATCHNUM 64
ELEMENT_NUMBER 66
PATH_NAME 67
IS LABELED 69
PROPERTY_EXISTS 70
JSON_ID Operator 71

5 Expressions

About SQL Expressions 1
Simple Expressions 2
Analytic View Expressions 3
Examples of Analytic View Expressions 23
Compound Expressions 25
CASE Expressions 26
Column Expressions 28
CURSOR Expressions 29
Datetime Expressions 30
Function Expressions 32
Interval Expressions 32
JSON Object Access Expressions 33
Model Expressions 36
Object Access Expressions 38
Placeholder Expressions 38
Scalar Subquery Expressions 39
Type Constructor Expressions 39
Expression Lists 41
BOOLEAN Expressions 42

6 Conditions

About SQL Conditions 1
Condition Precedence 3
Comparison Conditions 3
Simple Comparison Conditions 5
Group Comparison Conditions 6
Floating-Point Conditions 8
Logical Conditions 9
Model Conditions 10
IS ANY Condition 10
IS PRESENT Condition 11
Multiset Conditions 12
IS A SET Condition 12
IS EMPTY Condition 13
MEMBER Condition 13
SUBMULTISET Condition 14
Pattern-matching Conditions 15
LIKE Condition 15
REGEXP_LIKE Condition 19

Copyright © 1996, 2026, Oracle and/or its affiliates.

Null Conditions 21
XML Conditions 21
EQUALS_PATH Condition 21
UNDER_PATH Condition 22
SQL For JSON Conditions 23
IS JSON Condition 23
JSON_EQUAL Condition 30
JSON_EXISTS Condition 30
JSON_TEXTCONTAINS Condition 34
Compound Conditions 36
BETWEEN Condition 37
EXISTS Condition 38
IN Condition 38
IS OF type Condition 41
BOOLEAN Test Condition 42

7 Functions

About SQL Functions 2
Aggregate Functions 4
Analytic Functions 7
Data Cartridge Functions 15
Model Functions 15
Object Reference Functions 15
OLAP Functions 15

Preface

This reference contains a complete description of the Structured Query Language (SQL) used to manage information in an Oracle AI Database. Oracle SQL is a superset of the American National Standards Institute (ANSI) and the International Organization for Standardization (ISO) SQL standard.

This Preface contains these topics:

- Audience
- Documentation Accessibility
- Related Documents
- Conventions

Audience

The *Oracle AI Database SQL Language Reference* is intended for all users of Oracle SQL.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customer access to and use of Oracle support services will be pursuant to the terms and conditions specified in their Oracle order for the applicable services.

Related Documents

For more information, see these Oracle resources:

- *Oracle AI Database PL/SQL Language Reference* for information on PL/SQL, the procedural language extension to Oracle SQL
- *Pro*C/C++ Developer's Guide* and *Pro*COBOL Developer's Guide* for detailed descriptions of Oracle embedded SQL

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with a Database installation. Refer to *Oracle AI Database Sample Schemas* for information on how these schemas were created and how you can use them yourself.

Conventions

The following text conventions are used in this document:

Copyright © 1996, 2026, Oracle and/or its affiliates.

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
italic	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
`monospace`	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Changes in This Release for Oracle AI Database SQL Language Reference

Changes in Oracle AI Database Release 26ai

The following sections contain links to new features, desupported, and deprecated features for Oracle AI Database 26ai.

New Features

Oracle AI Database New Features

Deprecated Features

For the full list of deprecated features for Oracle AI Database Release 26ai, see Oracle Database Changes, Desupports, and Deprecations *Oracle AI Database Upgrade Guide*

Desupported Features

1

Introduction to Oracle SQL

Structured Query Language (SQL) is the set of statements with which all programs and users access data in an Oracle AI Database. Application programs and Oracle tools often allow users access to the database without using SQL directly, but these applications in turn must use SQL when executing the user's request. This chapter provides background information on SQL as used by most database systems.

This chapter contains these topics:

- History of SQL
- SQL Standards
- Lexical Conventions
- Tools Support

History of SQL

Dr. E. F. Codd published the paper, "A Relational Model of Data for Large Shared Data Banks", in June 1970 in the Association of Computer Machinery (ACM) journal, *Communications of the ACM*. Codd's model is now accepted as the definitive model for relational database management systems (RDBMS). The language, Structured English Query Language (SEQUEL) was developed by IBM Corporation, Inc., to use Codd's model. SEQUEL later became SQL (still pronounced "sequel"). In 1979, Relational Software, Inc. (now Oracle) introduced the first commercially available implementation of SQL. Today, SQL is accepted as the standard RDBMS language.

SQL Standards

Oracle strives to comply with industry-accepted standards and participates actively in SQL standards committees. Industry-accepted committees are the American National Standards Institute (ANSI) and the International Organization for Standardization (ISO), which is affiliated with the International Electrotechnical Commission (IEC). Both ANSI and the ISO/IEC have accepted SQL as the standard language for relational databases. When a new SQL standard is simultaneously published by these organizations, the names of the standards conform to conventions used by the organization, but the standards are technically identical.

> **See Also**
>
> Oracle and Standard SQL for a detailed description of Oracle AI Database conformance to the SQL standard

How SQL Works

SQL provides benefits for application programmers, database administrators, managers, and end users. Technically speaking, SQL is a data sublanguage. The purpose of SQL is to provide

Copyright © 1996, 2026, Oracle and/or its affiliates.

an interface to a relational database such as Oracle AI Database, and all SQL statements are instructions to the database. In this SQL differs from general-purpose programming languages like C and BASIC. Among the features of SQL are the following:

- It processes sets of data as groups rather than as individual units.
- It provides automatic navigation to the data.
- It uses statements that are complex and powerful individually, and that therefore stand alone. Flow-control statements, such as begin-end, if-then-else, loops, and exception condition handling, were initially not part of SQL and the SQL standard, but they can now be found in ISO/IEC 9075-4 - Persistent Stored Modules (SQL/PSM). The PL/SQL extension to Oracle SQL is similar to PSM.

SQL lets you work with data at the logical level. You need to be concerned with the implementation details only when you want to manipulate the data. For example, to retrieve a set of rows from a table, you define a condition used to filter the rows. All rows satisfying the condition are retrieved in a single step and can be passed as a unit to the user, to another SQL statement, or to an application. You need not deal with the rows one by one, nor do you have to worry about how they are physically stored or retrieved. All SQL statements use the **optimizer**, a part of Oracle AI Database that determines the most efficient means of accessing the specified data. Oracle also provides techniques that you can use to make the optimizer perform its job better.

SQL provides statements for a variety of tasks, including:

- Querying data
- Inserting, updating, and deleting rows in a table
- Creating, replacing, altering, and dropping objects
- Controlling access to the database and its objects
- Guaranteeing database consistency and integrity

SQL unifies all of the preceding tasks in one consistent language.

Common Language for All Relational Databases

All major relational database management systems support SQL, so you can transfer all skills you have gained with SQL from one database to another. In addition, all programs written in SQL are portable. They can often be moved from one database to another with very little modification.

Using Enterprise Manager

Many of the operations you can accomplish using SQL syntax can be done much more easily using Enterprise Manager.

Lexical Conventions

The following lexical conventions for issuing SQL statements apply specifically to the Oracle AI Database implementation of SQL, but are generally acceptable in other SQL implementations.

Copyright © 1996, 2026, Oracle and/or its affiliates.

When you issue a SQL statement, you can include one or more tabs, carriage returns, spaces, or comments anywhere a space occurs within the definition of the statement. Thus, the database evaluates the following two statements in the same manner:

```
SELECT last_name,salary*12,MONTHS_BETWEEN(SYSDATE,hire_date)
  FROM employees
  WHERE department_id = 30
  ORDER BY last_name;
```

```
SELECT last_name,
  salary * 12,
        MONTHS_BETWEEN( SYSDATE, hire_date )
FROM employees
WHERE department_id=30
ORDER BY last_name;
```

Case is insignificant in reserved words, keywords, identifiers, and parameters. However, case is significant in text literals and quoted names. Refer to Text Literals for a syntax description of text literals.

> **Note**
>
> SQL statements are terminated differently in different programming environments. This documentation set uses the default SQL*Plus character, the semicolon (;).

Tools Support

Oracle provides a number of utilities to facilitate your SQL development process:

- Oracle SQL Developer is a graphical tool that lets you browse, create, edit, and delete (drop) database objects, edit and debug PL/SQL code, run SQL statements and scripts, manipulate and export data, and create and view reports.

  Use SQL Developer to connect to a database schema using standard database authentication. DBAs can also use SQL Developer to administer and monitor their database, with interfaces for Data Pump, RMAN, and Auditing also included.

  Once connected, you can perform operations on objects in the database. You can also connect to schemas for selected databases, such as MySQL, Microsoft SQL Server, and Amazon Redshift, view metadata and data in these databases, and migrate these databases to an Oracle database.
- Oracle SQL Developer Command Line (SQLcl) is a free command line interface for the database. It allows you to interactively or batch execute SQL and PL/SQL.

  SQLcl offers integrated Oracle Cloud (OCI) support, client side scripting with JavaScript, custom commands, and updated SQL*Plus commands (INFO vs DESC). Additionally, SQLcl provides native vi or Emacs editing, statement completion, and persistent command recall for a feature-rich experience, all while supporting your previously written SQL*Plus scripts.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- Database Actions delivers the database desktop tool's features and experience to your web browser. Delivered as a single-page web application, Database Actions is powered by Oracle REST Data Services (ORDS).

  Database Actions offers a worksheet for running queries and scripts, the ability to manage and browse your data dictionary, a REST development environment for your REST APIs and AUTOREST enabled objects, an interface for Oracle's JSON Document Store (SODA), a DBA console for managing the database, a data model reporting solution, and access to PerfHub. Database Actions is also available automatically for any Oracle Autonomous Database OCI Service.
- SQL*Plus is an interactive and batch query tool that is installed with every database server or client installation. It has a command-line user interface.

> **See Also**
>
> *SQL*Plus User's Guide and Reference* and *Oracle APEX App Builder User's Guide* for more information on these products

The Oracle Call Interface and Oracle precompilers let you embed standard SQL statements within a procedure programming language.

- The Oracle Call Interface (OCI) lets you embed SQL statements in C programs.
- The Oracle precompilers, Pro*C/C++ and Pro*COBOL, interpret embedded SQL statements and translate them into statements that can be understood by C/C++ and COBOL compilers, respectively.

> **See Also**
>
> *Oracle C++ Call Interface Developer's Guide*, *Pro*COBOL Developer's Guide*, and *Oracle Call Interface Developer's Guide* for additional information on the embedded SQL statements allowed in each product

Most (but not all) Oracle tools also support all features of Oracle SQL. This reference describes the complete functionality of SQL. If the Oracle tool that you are using does not support this complete functionality, then you can find a discussion of the restrictions in the manual describing the tool, such as *SQL*Plus User's Guide and Reference*.

2

Basic Elements of Oracle SQL

This chapter contains reference information on the basic elements of Oracle SQL. These elements are the simplest building blocks of SQL statements. Therefore, before using the SQL statements described in this book, you should familiarize yourself with the concepts covered in this chapter.

This chapter contains these sections:

- Data Types
- Data Type Comparison Rules
- Literals
- Format Models
- Nulls
- Comments
- Database Objects
- Database Object Names and Qualifiers
- Syntax for Schema Objects and Parts in SQL Statements

Data Types

Each value manipulated by the database has a **data type**. The data type of a value associates a fixed set of properties with the value. These properties cause Oracle to treat values of one data type differently from values of another. For example, you can add values of `NUMBER` data type, but not values of `RAW` data type.

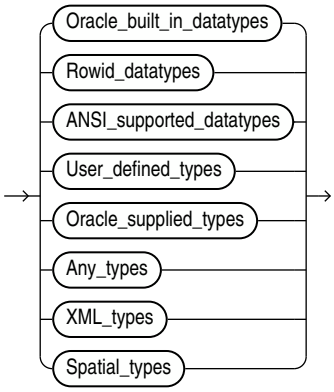
When you create a table or cluster, you must specify a data type for each of its columns. When you create a procedure or stored function, you must specify a data type for each of its arguments. These data types define the domain of values that each column can contain or each argument can have. For example, `DATE` columns cannot accept the value February 29 (except for a leap year) or the values 2 or `'SHOE'`. Each value subsequently placed in a column assumes the data type of the column. For example, if you insert `'01-JAN-98'` into a `DATE` column, then the database treats the `'01-JAN-98'` character string as a `DATE` value after verifying that it translates to a valid date.

The database provides a number of built-in data types as well as several categories for user-defined types that can be used as data types. The syntax of Oracle data types appears in the diagrams that follow. The text of this section is divided into the following sections:

- Oracle Built-in Data Types
- Rowid Data Types
- ANSI, DB2, and SQL/DS Data Types
- User-Defined Types
- Oracle-Supplied Types
- Any Types

Copyright © 1996, 2026, Oracle and/or its affiliates.

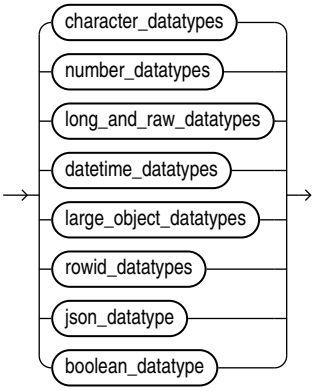
- XML Types
- Spatial Types



A data type is either scalar or nonscalar. A scalar type contains an atomic value, whereas a nonscalar (sometimes called a "collection") contains a set of values. A large object (LOB) is a special form of scalar data type representing a large scalar value of binary or character data. LOBs are subject to some restrictions that do not affect other scalar types because of their size. Those restrictions are documented in the context of the relevant SQL syntax.

See Also

Restrictions on LOB Columns



The Oracle precompilers recognize other data types in embedded SQL programs. These data types are called **external data types** and are associated with host variables. Do not confuse built-in data types and user-defined types with external data types. For information on external data types, including how the database converts between them and built-in data types or user-defined types, see *Pro*COBOL Developer's Guide*, and *Pro*C/C++ Developer's Guide*.

Oracle Built-in Data Types

The **Built-In Data Type Summary** table lists the built-in data types available. The database uses a code to identify the data type internally. This is the number in the **Code** column of the **Built-In Data Type Summary** table. You can verify the codes in the table using the DUMP function.

In addition to the built-in data types listed in the **Built-In Data Type Summary** table, the databaseuses many data types internally that are visible via the DUMP function.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 2-1 Built-In Data Type Summary

Code	Data Type	Description
1	VARCHAR2(*size* [BYTE | CHAR])	Variable-length character string having maximum length *size* bytes or characters. You must specify *size* for VARCHAR2. Minimum *size* is 1 byte or 1 character. Maximum size is: • 32767 bytes or characters if MAX_STRING_SIZE = EXTENDED • 4000 bytes or characters if MAX_STRING_SIZE = STANDARD Refer to Extended Data Types for more information on the MAX_STRING_SIZE initialization parameter. BYTE indicates that the column will have byte length semantics. CHAR indicates that the column will have character semantics.
1	NVARCHAR2(*size*)	Variable-length Unicode character string having maximum length *size* characters. You must specify *size* for NVARCHAR2. The number of bytes can be up to two times *size* for AL16UTF16 encoding and three times *size* for UTF8 encoding. Maximum *size* is determined by the national character set definition, with an upper limit of: • 32767 bytes if MAX_STRING_SIZE = EXTENDED • 4000 bytes if MAX_STRING_SIZE = STANDARD Refer to Extended Data Types for more information on the MAX_STRING_SIZE initialization parameter.
2	NUMBER [(*p* [, *s*])]	Number having precision *p* and scale *s*. The precision *p* can range from 1 to 38. The scale *s* can range from -84 to 127. Both precision and scale are in decimal digits. A NUMBER value requires from 1 to 22 bytes.
2	FLOAT [(*p*)]	A subtype of the NUMBER data type having precision *p*. A FLOAT value is represented internally as NUMBER. The precision *p* can range from 1 to 126 binary digits. A FLOAT value requires from 1 to 22 bytes.
8	LONG	Character data of variable length up to 2 gigabytes, or 2^{31} -1 bytes. Provided for backward compatibility.
12	DATE	Valid date range from January 1, 4712 BC, to December 31, 9999 AD. The default format is determined explicitly by the NLS_DATE_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. The size is fixed at 7 bytes. This data type contains the datetime fields YEAR, MONTH, DAY, HOUR, MINUTE, and SECOND. It does not have fractional seconds or a time zone.
100	BINARY_FLOAT	32-bit floating point number. This data type requires 4 bytes.
101	BINARY_DOUBLE	64-bit floating point number. This data type requires 8 bytes.
180	TIMESTAMP [(*fractional_seconds_precision*)]	Year, month, and day values of date, as well as hour, minute, and second values of time, where *fractional_seconds_precision* is the number of digits in the fractional part of the SECOND datetime field. Accepted values of *fractional_seconds_precision* are 0 to 9. The default is 6. The default format is determined explicitly by the NLS_TIMESTAMP_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. The size is 7 or 11 bytes, depending on the precision. This data type contains the datetime fields YEAR, MONTH, DAY, HOUR, MINUTE, and SECOND. It contains fractional seconds but does not have a time zone.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 2-1 (Cont.) Built-In Data Type Summary

Code	Data Type	Description
181	`TIMESTAMP [(fractional_seconds_precision)] WITH TIME ZONE`	All values of `TIMESTAMP` as well as time zone displacement value, where *`fractional_seconds_precision`* is the number of digits in the fractional part of the `SECOND` datetime field. Accepted values are 0 to 9. The default is 6. The default date format for the `TIMESTAMP WITH TIME ZONE` data type is determined by the `NLS_TIMESTAMP_TZ_FORMAT` initialization parameter. The size is fixed at 13 bytes. This data type contains the datetime fields `YEAR`, `MONTH`, `DAY`, `HOUR`, `MINUTE`, `SECOND`, `TIMEZONE_HOUR`, and `TIMEZONE_MINUTE`. It has fractional seconds and an explicit time zone.
231	`TIMESTAMP [(fractional_seconds_precision)] WITH LOCAL TIME ZONE`	All values of `TIMESTAMP WITH TIME ZONE`, with the following exceptions: • Data is normalized to the database time zone when it is stored in the database. • When the data is retrieved, users see the data in the session time zone. The default format is determined explicitly by the `NLS_TIMESTAMP_FORMAT` parameter or implicitly by the `NLS_TERRITORY` parameter. The size is 7 or 11 bytes, depending on the precision.
182	`INTERVAL YEAR [(year_precision)] TO MONTH`	Stores a period of time in years and months, where *`year_precision`* is the number of digits in the `YEAR` datetime field. Accepted values are 0 to 9. The default is 2. The size is fixed at 5 bytes.
183	`INTERVAL DAY [(day_precision)] TO SECOND [(fractional_seconds_precision)]`	Stores a period of time in days, hours, minutes, and seconds, where • *`day_precision`* is the maximum number of digits in the `DAY` datetime field. Accepted values are 0 to 9. The default is 2. • *`fractional_seconds_precision`* is the number of digits in the fractional part of the `SECOND` field. Accepted values are 0 to 9. The default is 6. The size is fixed at 11 bytes.
23	`RAW(size)`	Raw binary data of length *`size`* bytes. You must specify *`size`* for a `RAW` value. Maximum *`size`* is: • 32767 bytes if `MAX_STRING_SIZE = EXTENDED` • 2000 bytes if `MAX_STRING_SIZE = STANDARD` Refer to Extended Data Types for more information on the `MAX_STRING_SIZE` initialization parameter.
24	`LONG RAW`	Raw binary data of variable length up to 2 gigabytes.
69	`ROWID`	Base 64 string representing the unique address of a row in its table. This data type is primarily for values returned by the `ROWID` pseudocolumn.
208	`UROWID [(size)]`	Base 64 string representing the logical address of a row of an index-organized table. The optional *`size`* is the size of a column of type `UROWID`. The maximum size and default is 4000 bytes.
96	`CHAR [(size [BYTE | CHAR])]`	Fixed-length character data of length *`size`* bytes or characters. Maximum *`size`* is 2000 bytes or characters. Default and minimum *`size`* is 1 byte. `BYTE` and `CHAR` have the same semantics as for `VARCHAR2`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 2-1 (Cont.) Built-In Data Type Summary

Code	Data Type	Description
96	NCHAR[(*size*)]	Fixed-length character data of length *size* characters. The number of bytes can be up to two times *size* for AL16UTF16 encoding and three times *size* for UTF8 encoding. Maximum *size* is determined by the national character set definition, with an upper limit of 2000 bytes. Default and minimum *size* is 1 character.
112	CLOB	A character large object containing single-byte or multibyte characters. Both fixed-width and variable-width character sets are supported, both using the database character set. Maximum size is (4 gigabytes - 1) * (database block size).
112	NCLOB	A character large object containing Unicode characters. Both fixed-width and variable-width character sets are supported, both using the database national character set. Maximum size is (4 gigabytes - 1) * (database block size). Stores national character set data.
113	BLOB	A binary large object. Maximum size is (4 gigabytes - 1) * (database block size).
114	BFILE	Contains a locator to a large binary file stored outside the database. Enables byte stream I/O access to external LOBs residing on the database server. Maximum size is 4 gigabytes.
119	JSON	Maximum size is 32 megabytes.
252	BOOLEAN	The BOOLEAN data type comprises the distinct truth values *True* and *False*. Unless prohibited by a NOT NULL constraint, the boolean data type also supports the truth value *UNKNOWN* as the null value.
127	VECTOR	The VECTOR data type represents a vector as a series of numbers stored in one of the following formats: • INT8 (8-bit integers) • FLOAT32 (32-bit floating-point numbers) • FLOAT64 (64-bit floating-point numbers) • BINARY FLOAT32 and FLOAT64 are IEEE standards. the databaseautomatically casts the values as needed.

The sections that follow describe the Oracle data types as they are stored in an Oracle database. For information on specifying these data types as literals, refer to Literals .

Character Data Types

Character data types store character (alphanumeric) data, which are words and free-form text, in the database character set or national character set. They are less restrictive than other data types and consequently have fewer properties. For example, character columns can store all alphanumeric values, but NUMBER columns can store only numeric values.

Character data is stored in strings with byte values corresponding to one of the character sets, such as 7-bit ASCII or EBCDIC, specified when the database was created. Oracle database supports both single-byte and multibyte character sets.

These data types are used for character data:

- CHAR Data Type
- NCHAR Data Type

Copyright © 1996, 2026, Oracle and/or its affiliates.

- VARCHAR2 Data Type
- NVARCHAR2 Data Type

For information on specifying character data types as literals, refer to Text Literals .

CHAR Data Type

The CHAR data type specifies a fixed-length character string in the database character set. You specify the database character set when you create your database.

When you create a table with a CHAR column, you specify the column length as *size* optionally followed by a length qualifier. The qualifier BYTE denotes byte length semantics while the qualifier CHAR denotes character length semantics. In the byte length semantics, *size* is the number of bytes to store in the column. In the character length semantics, *size* is the number of code points in the database character set to store in the column. A code point may have from 1 to 4 bytes depending on the database character set and the particular character encoded by the code point. Oracle recommends that you specify one of the length qualifiers to explicitly document the desired length semantics of the column. If you do not specify a qualifier, the value of the NLS_LENGTH_SEMANTICS parameter of the session creating the column defines the length semantics, unless the table belongs to the schema SYS, in which case the default semantics is BYTE.

Oracle ensures that all values stored in a CHAR column have the length specified by *size* in the selected length semantics. If you insert a value that is shorter than the column length, then Oracle blank-pads the value to column length. If you try to insert a value that is too long for the column, then Oracle returns an error. Note that if the column length is expressed in characters (code points), blank-padding does not guarantee that all column values have the same byte length.

You can omit *size* from the column definition. The default value is 1.

The maximum value of *size* is 2000, which means 2000 bytes or characters (code points), depending on the selected length semantics. However, independently, the absolute maximum length of any character value that can be stored into a CHAR column is 2000 bytes. For example, even if you define the column length to be 2000 characters, Oracle returns an error if you try to insert a 2000-character value in which one or more code points are wider than 1 byte. The value of *size* in characters is a length constraint, not guaranteed capacity. If you want a CHAR column to be always able to store *size* characters in any database character set, use a value of *size* that is less than or equal to 500.

To ensure proper data conversion between databases and clients with different character sets, you must ensure that CHAR data consists of well-formed strings.

> **See Also**
>
> *Oracle AI Database Globalization Support Guide* for more information on character set support and Data Type Comparison Rules for information on comparison semantics

NCHAR Data Type

The NCHAR data type specifies a fixed-length character string in the national character set. You specify the national character set as either AL16UTF16 or UTF8 when you create your database. AL16UTF16 and UTF8 are two encoding forms of the Unicode character set (UTF-16 and CESU-8, correspondingly) and hence NCHAR is a Unicode-only data type.

Copyright © 1996, 2026, Oracle and/or its affiliates.

When you create a table with an NCHAR column, you specify the column length as *size* characters, or more precisely, code points in the national character set. One code point has always 2 bytes in AL16UTF16 and from 1 to 3 bytes in UTF8, depending on the particular character encoded by the code point.

Oracle ensures that all values stored in an NCHAR column have the length of *size* characters. If you insert a value that is shorter than the column length, then Oracle blank-pads the value to the column length. If you try to insert a value that is too long for the column, then Oracle returns an error. Note that if the national character set is UTF8, blank-padding does not guarantee that all column values have the same byte length.

You can omit *size* from the column definition. The default value is 1.

The maximum value of *size* is 1000 characters when the national character set is AL16UTF16, and 2000 characters when the national character set is UTF8. However, independently, the absolute maximum length of any character value that can be stored into an NCHAR column is 2000 bytes. For example, even if you define the column length to be 1000 characters, Oracle returns an error if you try to insert a 1000-character value but the national character set is UTF8 and all code points are 3 bytes wide. The value of *size* is a length constraint, not guaranteed capacity. If you want an NCHAR column to be always able to store *size* characters in both national character sets, use a value of *size* that is less than or equal to 666.

To ensure proper data conversion between databases and clients with different character sets, you must ensure that NCHAR data consists of well-formed strings.

If you assign a CHAR value to an NCHAR column, the value is implicitly converted from the database character set to the national character set. If you assign an NCHAR value to a CHAR column, the value is implicitly converted from the national character set to the database character set. If some of the characters from the NCHAR value cannot be represented in the database character set, then if the value of the session parameter NLS_NCHAR_CONV_EXCP is TRUE, then Oracle reports an error. If the value of the parameter is FALSE, non-representable characters are replaced with the default replacement character of the database character set, which is usually the question mark '?' or the inverted question mark '¿'.

Oracle AI Database Globalization Support Guide for information on Unicode data type support

VARCHAR2 Data Type

The VARCHAR2 data type specifies a variable-length character string in the database character set. You specify the database character set when you create your database.

When you create a table with a VARCHAR2 column, you must specify the column length as *size* optionally followed by a length qualifier. The qualifier BYTE denotes byte length semantics while the qualifier CHAR denotes character length semantics. In the byte length semantics, *size* is the maximum number of bytes that can be stored in the column. In the character length semantics, *size* is the maximum number of code points in the database character set that can be stored in the column. A code point may have from 1 to 4 bytes depending on the database character set and the particular character encoded by the code point. Oracle recommends that you specify one of the length qualifiers to explicitly document the desired length semantics of the column. If you do not specify a qualifier, the value of the NLS_LENGTH_SEMANTICS parameter of the session creating the column defines the length semantics, unless the table belongs to the schema SYS, in which case the default semantics is BYTE.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Oracle stores a character value in a VARCHAR2 column exactly as you specify it, without any blank-padding, provided the value does not exceed the length of the column. If you try to insert a value that exceeds the specified length, then Oracle returns an error.

The minimum value of *size* is 1. The maximum value is:

- 32767 bytes if MAX_STRING_SIZE = EXTENDED
- 4000 bytes if MAX_STRING_SIZE = STANDARD

Refer to Extended Data Types for more information on the MAX_STRING_SIZE initialization parameter and the internal storage mechanisms for extended data types.

While *size* may be expressed in bytes or characters (code points) the independent absolute maximum length of any character value that can be stored into a VARCHAR2 column is 32767 or 4000 bytes, depending on MAX_STRING_SIZE. For example, even if you define the column length to be 32767 characters, Oracle returns an error if you try to insert a 32767-character value in which one or more code points are wider than 1 byte. The value of *size* in characters is a length constraint, not guaranteed capacity. If you want a VARCHAR2 column to be always able to store *size* characters in any database character set, use a value of *size* that is less than or equal to 8191, if MAX_STRING_SIZE = EXTENDED, or 1000, if MAX_STRING_SIZE = STANDARD.

Oracle compares VARCHAR2 values using non-padded comparison semantics.

To ensure proper data conversion between databases with different character sets, you must ensure that VARCHAR2 data consists of well-formed strings. See *Oracle AI Database Globalization Support Guide* for more information on character set support.

Data Type Comparison Rules for information on comparison semantics

VARCHAR Data Type

Do not use the VARCHAR data type. Use the VARCHAR2 data type instead. Although the VARCHAR data type is currently synonymous with VARCHAR2, the VARCHAR data type might be redefined in a future release as a separate data type used for variable-length character strings compared with different comparison semantics.

NVARCHAR2 Data Type

The NVARCHAR2 data type specifies a variable-length character string in the national character set. You specify the national character set as either AL16UTF16 or UTF8 when you create your database. AL16UTF16 and UTF8 are two encoding forms of the Unicode character set (UTF-16 and CESU-8, correspondingly) and hence NVARCHAR2 is a Unicode-only data type.

When you create a table with an NVARCHAR2 column, you must specify the column length as *size* characters, or more precisely, code points in the national character set. One code point has always 2 bytes in AL16UTF16 and from 1 to 3 bytes in UTF8, depending on the particular character encoded by the code point.

Oracle stores a character value in an NVARCHAR2 column exactly as you specify it, without any blank-padding, provided the value does not exceed the length of the column. If you try to insert a value that exceeds the specified length, then Oracle returns an error.

The minimum value of *size* is 1. The maximum value is:

Copyright © 1996, 2026, Oracle and/or its affiliates.

- 16383 if MAX_STRING_SIZE = EXTENDED and the national character set is AL16UTF16
- 32767 if MAX_STRING_SIZE = EXTENDED and the national character set is UTF8
- 2000 if MAX_STRING_SIZE = STANDARD and the national character set is AL16UTF16
- 4000 if MAX_STRING_SIZE = STANDARD and the national character set is UTF8

Refer to Extended Data Types for more information on the MAX_STRING_SIZE initialization parameter and the internal storage mechanisms for extended data types.

Independently of the maximum column length in characters, the absolute maximum length of any value that can be stored into an NVARCHAR2 column is 32767 or 4000 bytes, depending on MAX_STRING_SIZE. For example, even if you define the column length to be 16383 characters, Oracle returns an error if you try to insert a 16383-character value but the national character set is UTF8 and all code points are 3 bytes wide. The value of *size* is a length constraint, not guaranteed capacity. If you want an NVARCHAR2 column to be always able to store *size* characters in both national character sets, use a value of *size* that is less than or equal to 10922, if MAX_STRING_SIZE = EXTENDED, or 1333, if MAX_STRING_SIZE = STANDARD.

Oracle compares NVARCHAR2 values using non-padded comparison semantics.

To ensure proper data conversion between databases and clients with different character sets, you must ensure that NVARCHAR2 data consists of well-formed strings.

If you assign a VARCHAR2 value to an NVARCHAR2 column, the value is implicitly converted from the database character set to the national character set. If you assign an NVARCHAR2 value to a VARCHAR2 column, the value is implicitly converted from the national character set to the database character set. If some of the characters from the NVARCHAR2 value cannot be represented in the database character set, then if the value of the session parameter NLS_NCHAR_CONV_EXCP is TRUE, then Oracle reports an error. If the value of the parameter is FALSE, non-representable characters are replaced with the default replacement character of the database character set, which is usually the question mark '?' or the inverted question mark '¿'.

Numeric Data Types

The Oracle database numeric data types store positive and negative fixed and floating-point numbers, zero, infinity, and values that are the undefined result of an operation—"not a number" or NAN. For information on specifying numeric data types as literals, refer to Numeric Literals .

NUMBER Data Type

The NUMBER data type stores zero as well as positive and negative fixed numbers with absolute values from 1.0×10^{-130} to but not including 1.0×10^{126}. If you specify an arithmetic expression whose value has an absolute value greater than or equal to 1.0×10^{126}, then Oracle returns an error. Each NUMBER value requires from 1 to 22 bytes.

Specify a fixed-point number using the following form:

```
NUMBER(p,s)
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

where:

- *p* is the **precision**, or the maximum number of significant decimal digits, where the most significant digit is the left-most nonzero digit, and the least significant digit is the right-most known digit. Oracle guarantees the portability of numbers with precision of up to 20 base-100 digits, which is equivalent to 39 or 40 decimal digits depending on the position of the decimal point.
- *s* is the **scale**, or the number of digits from the decimal point to the least significant digit. The scale can range from -84 to 127.
  - Positive scale is the number of significant digits to the right of the decimal point to and including the least significant digit.
  - Negative scale is the number of significant digits to the left of the decimal point, to but not including the least significant digit. For negative scale the least significant digit is on the left side of the decimal point, because the actual data is rounded to the specified number of places to the left of the decimal point. For example, a specification of (10,-2) means to round to hundreds.

Scale can be greater than precision, most commonly when e notation is used. When scale is greater than precision, the precision specifies the maximum number of significant digits to the right of the decimal point. For example, a column defined as `NUMBER(4,5)` requires a zero for the first digit after the decimal point and rounds all values past the fifth digit after the decimal point.

It is good practice to specify the scale and precision of a fixed-point number column for extra integrity checking on input. Specifying scale and precision does not force all values to a fixed length. If a value exceeds the precision, then Oracle returns an error. If a value exceeds the scale, then Oracle rounds it.

Specify an integer using the following form:

```
NUMBER(p)
```

This represents a fixed-point number with precision *p* and scale 0 and is equivalent to `NUMBER(p,0)`.

Specify a floating-point number using the following form:

```
NUMBER
```

The absence of precision and scale designators specifies the maximum range and precision for an Oracle number.

> **See Also**
>
> Floating-Point Numbers

Table 2-2 show how Oracle stores data using different precisions and scales.

Table 2-2 Storage of Scale and Precision

Actual Data	Specified As	Stored As
123.89	`NUMBER`	123.89
123.89	`NUMBER(3)`	124

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 2-2 (Cont.) Storage of Scale and Precision

Actual Data	Specified As	Stored As
123.89	NUMBER(3,2)	exceeds precision
123.89	NUMBER(4,2)	exceeds precision
123.89	NUMBER(5,2)	123.89
123.89	NUMBER(6,1)	123.9
123.89	NUMBER(6,-2)	100
.01234	NUMBER(4,5)	.01234
.00012	NUMBER(4,5)	.00012
.000127	NUMBER(4,5)	.00013
.0000012	NUMBER(2,7)	.0000012
.00000123	NUMBER(2,7)	.0000012
1.2e-4	NUMBER(2,5)	0.00012
1.2e-5	NUMBER(2,5)	0.00001

FLOAT Data Type

The FLOAT data type is a subtype of NUMBER. It can be specified with or without precision, which has the same definition it has for NUMBER and can range from 1 to 126. Scale cannot be specified, but is interpreted from the data. Each FLOAT value requires from 1 to 22 bytes.

To convert from binary to decimal precision, multiply *n* by 0.30103. To convert from decimal to binary precision, multiply the decimal precision by 3.32193. The maximum of 126 digits of binary precision is roughly equivalent to 38 digits of decimal precision.

The difference between NUMBER and FLOAT is best illustrated by example. In the following example the same values are inserted into NUMBER and FLOAT columns:

```
CREATE TABLE test (col1 NUMBER(5,2), col2 FLOAT(5));

INSERT INTO test VALUES (1.23, 1.23);
INSERT INTO test VALUES (7.89, 7.89);
INSERT INTO test VALUES (12.79, 12.79);
INSERT INTO test VALUES (123.45, 123.45);

SELECT * FROM test;

      COL1       COL2
---------- ----------
      1.23        1.2
      7.89        7.9
     12.79         13
    123.45        120
```

In this example, the FLOAT value returned cannot exceed 5 binary digits. The largest decimal number that can be represented by 5 binary digits is 31. The last row contains decimal values that exceed 31. Therefore, the FLOAT value must be truncated so that its significant digits do not require more than 5 binary digits. Thus 123.45 is rounded to 120, which has only two significant decimal digits, requiring only 4 binary digits.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The database uses the Oracle FLOAT data type internally when converting ANSI FLOAT data. Oracle FLOAT is available for you to use, but Oracle recommends that you use the BINARY_FLOAT and BINARY_DOUBLE data types instead, as they are more robust. Refer to Floating-Point Numbers for more information.

Floating-Point Numbers

Floating-point numbers can have a decimal point anywhere from the first to the last digit or can have no decimal point at all. An exponent may optionally be used following the number to increase the range, for example, 1.777 e^{-20}. A scale value is not applicable to floating-point numbers, because the number of digits that can appear after the decimal point is not restricted.

Binary floating-point numbers differ from NUMBER in the way the values are stored internally by the database. Values are stored using decimal precision for NUMBER. All literals that are within the range and precision supported by NUMBER are stored exactly as NUMBER. Literals are stored exactly because literals are expressed using decimal precision (the digits 0 through 9). Binary floating-point numbers are stored using binary precision (the digits 0 and 1). Such a storage scheme cannot represent all values using decimal precision exactly. Frequently, the error that occurs when converting a value from decimal to binary precision is undone when the value is converted back from binary to decimal precision. The literal 0.1 is such an example.

The database provides two numeric data types exclusively for floating-point numbers:

BINARY_FLOAT

BINARY_FLOAT is a 32-bit, single-precision floating-point number data type. Each BINARY_FLOAT value requires 4 bytes.

BINARY_DOUBLE

BINARY_DOUBLE is a 64-bit, double-precision floating-point number data type. Each BINARY_DOUBLE value requires 8 bytes.

In a NUMBER column, floating point numbers have decimal precision. In a BINARY_FLOAT or BINARY_DOUBLE column, floating-point numbers have binary precision. The binary floating-point numbers support the special values infinity and NaN (not a number).

You can specify floating-point numbers within the limits listed in Table 2-3. The format for specifying floating-point numbers is defined in Numeric Literals .

Table 2-3 Floating Point Number Limits

Value	BINARY_FLOAT	BINARY_DOUBLE
Maximum positive finite value	3.40282E+38F	1.79769313486231E+308
Minimum positive finite value	1.17549E-38F	2.22507485850720E-308

IEEE754 Conformance

The Oracle implementation of floating-point data types conforms substantially with the Institute of Electrical and Electronics Engineers (IEEE) Standard for Binary Floating-Point Arithmetic, IEEE Standard 754-1985 (IEEE754). The floating-point data types conform to IEEE754 in the following areas:

- The SQL function SQRT implements square root. See SQRT .
- The SQL function REMAINDER implements remainder. See REMAINDER .

Copyright © 1996, 2026, Oracle and/or its affiliates.

- Arithmetic operators conform. See Arithmetic Operators .
- Comparison operators conform, except for comparisons with NaN. Oracle orders NaN greatest with respect to all other values, and evaluates NaN equal to NaN. See Floating-Point Conditions .
- Conversion operators conform. See Conversion Functions .
- The default rounding mode is supported.
- The default exception handling mode is supported.
- The special values INF, -INF, and NaN are supported. See Floating-Point Conditions .
- Rounding of BINARY_FLOAT and BINARY_DOUBLE values to integer-valued BINARY_FLOAT and BINARY_DOUBLE values is provided by the SQL functions ROUND, TRUNC, CEIL, and FLOOR.
- Rounding of BINARY_FLOAT/BINARY_DOUBLE to decimal and decimal to BINARY_FLOAT/BINARY_DOUBLE is provided by the SQL functions TO_CHAR, TO_NUMBER, TO_NCHAR, TO_BINARY_FLOAT, TO_BINARY_DOUBLE, and CAST.

The floating-point data types do not conform to IEEE754 in the following areas:

- -0 is coerced to +0.
- Comparison with NaN is not supported.
- All NaN values are coerced to either BINARY_FLOAT_NAN or BINARY_DOUBLE_NAN.
- Non-default rounding modes are not supported.
- Non-default exception handling mode are not supported.

Numeric Precedence

Numeric precedence determines, for operations that support numeric data types, the data type Oracle uses if the arguments to the operation have different data types. BINARY_DOUBLE has the highest numeric precedence, followed by BINARY_FLOAT, and finally by NUMBER. Therefore, in any operation on multiple numeric values:

- If any of the operands is BINARY_DOUBLE, then Oracle attempts to convert all the operands implicitly to BINARY_DOUBLE before performing the operation.
- If none of the operands is BINARY_DOUBLE but any of the operands is BINARY_FLOAT, then Oracle attempts to convert all the operands implicitly to BINARY_FLOAT before performing the operation.
- Otherwise, Oracle attempts to convert all the operands to NUMBER before performing the operation.

If any implicit conversion is needed and fails, then the operation fails. Refer to Table 2-9 for more information on implicit conversion.

In the context of other data types, numeric data types have lower precedence than the datetime/interval data types and higher precedence than character and all other data types.

Copyright © 1996, 2026, Oracle and/or its affiliates.

LONG Data Type

> **Note**
>
> All forms of LONG data types (LONG, LONG RAW, LONG VARCHAR, LONG VARRAW) were deprecated in Oracle8i Release 8.1.6. For succeeding releases, the LONG data type was provided for backward compatibility with existing applications. In new applications developed with later releases, Oracle strongly recommends that you use CLOB and NCLOB data types for large amounts of character data.

Do not create tables with LONG columns. Use LOB columns (CLOB, NCLOB, BLOB) instead. LONG columns are supported only for backward compatibility.

LONG columns store variable-length character strings containing up to 2 gigabytes -1, or 2^{31}-1 bytes. LONG columns have many of the characteristics of VARCHAR2 columns. You can use LONG columns to store long text strings. The length of LONG values may be limited by the memory available on your computer. LONG literals are formed as described for Text Literals .

Oracle also recommends that you convert existing LONG columns to LOB columns. LOB columns are subject to far fewer restrictions than LONG columns. Further, LOB functionality is enhanced in every release, whereas LONG functionality has been static for several releases. See the *modify_col_properties* clause of ALTER TABLE and TO_LOB for more information on converting LONG columns to LOB.

You can reference LONG columns in SQL statements in these places:

- SELECT lists
- SET clauses of UPDATE statements
- VALUES clauses of INSERT statements

The use of LONG values is subject to these restrictions:

- A table can contain only one LONG column.
- You cannot create an object type with a LONG attribute.
- LONG columns cannot appear in WHERE clauses or in integrity constraints (except that they can appear in NULL and NOT NULL constraints).
- LONG columns cannot be indexed.
- LONG data cannot be specified in regular expressions.
- A stored function cannot return a LONG value.
- You can declare a variable or argument of a PL/SQL program unit using the LONG data type. However, you cannot then call the program unit from SQL.
- Within a single SQL statement, all LONG columns, updated tables, and locked tables must be located on the same database.
- LONG and LONG RAW columns cannot be used in distributed SQL statements and cannot be replicated.
- If a table has both LONG and LOB columns, then you cannot bind more than 4000 bytes of data to both the LONG and LOB columns in the same SQL statement. However, you can bind more than 4000 bytes of data to either the LONG or the LOB column.

Copyright © 1996, 2026, Oracle and/or its affiliates.

In addition, LONG columns cannot appear in these parts of SQL statements:

- GROUP BY clauses, ORDER BY clauses, or CONNECT BY clauses or with the DISTINCT operator in SELECT statements
- The UNIQUE operator of a SELECT statement
- The column list of a CREATE CLUSTER statement
- The CLUSTER clause of a CREATE MATERIALIZED VIEW statement
- SQL built-in functions, expressions, or conditions
- SELECT lists of queries containing GROUP BY clauses
- SELECT lists of subqueries or queries combined by the UNION, INTERSECT, or MINUS set operators
- SELECT lists of CREATE TABLE ... AS SELECT statements
- ALTER TABLE ... MOVE statements
- SELECT lists in subqueries in INSERT statements

Triggers can use the LONG data type in the following manner:

- A SQL statement within a trigger can insert data into a LONG column.
- If data from a LONG column can be converted to a constrained data type (such as CHAR and VARCHAR2), then a LONG column can be referenced in a SQL statement within a trigger.
- Variables in triggers cannot be declared using the LONG data type.
- :NEW and :OLD cannot be used with LONG columns.

You can use Oracle Call Interface functions to retrieve a portion of a LONG value from the database.

Oracle Call Interface Developer's Guide

Datetime and Interval Data Types

The datetime data types are DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, and TIMESTAMP WITH LOCAL TIME ZONE. Values of datetime data types are sometimes called **datetimes**. The interval data types are INTERVAL YEAR TO MONTH and INTERVAL DAY TO SECOND. Values of interval data types are sometimes called **intervals**. For information on expressing datetime and interval values as literals, refer to Datetime Literals and Interval Literals.

Both datetimes and intervals are made up of fields. The values of these fields determine the value of the data type. Table 2-4 lists the datetime fields and their possible values for datetimes and intervals.

To avoid unexpected results in your DML operations on datetime data, you can verify the database and session time zones by querying the built-in SQL functions DBTIMEZONE and SESSIONTIMEZONE. If the time zones have not been set manually, then Oracle database uses the operating system time zone by default. If the operating system time zone is not a valid Oracle time zone, then Oracle uses UTC as the default value.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 2-4 Datetime Fields and Values

Datetime Field	Valid Values for Datetime	Valid Values for INTERVAL
YEAR	-4712 to 9999 (excluding year 0)	Any positive or negative integer
MONTH	01 to 12	0 to 11
DAY	01 to 31 (limited by the values of MONTH and YEAR, according to the rules of the current NLS calendar parameter)	Any positive or negative integer
HOUR	00 to 23	0 to 23
MINUTE	00 to 59	0 to 59
SECOND	00 to 59.9(n), where 9(n) is the precision of time fractional seconds. The 9(n) portion is not applicable for DATE.	0 to 59.9(n), where 9(n) is the precision of interval fractional seconds
TIMEZONE_HOUR	-12 to 14 (This range accommodates daylight saving time changes.) Not applicable for DATE or TIMESTAMP.	Not applicable
TIMEZONE_MINUTE (See note at end of table)	00 to 59. Not applicable for DATE or TIMESTAMP.	Not applicable
TIMEZONE_REGION	Query the TZNAME column of the V$TIMEZONE_NAMES data dictionary view. Not applicable for DATE or TIMESTAMP. For a complete listing of all time zone region names, refer to *Oracle AI Database Globalization Support Guide*.	Not applicable
TIMEZONE_ABBR	Query the TZABBREV column of the V$TIMEZONE_NAMES data dictionary view. Not applicable for DATE or TIMESTAMP.	Not applicable

> **Note**
>
> TIMEZONE_HOUR and TIMEZONE_MINUTE are specified together and interpreted as an entity in the format +|- *hh*:*mi*, with values ranging from -12:59 to +14:00. Refer to *Oracle Data Provider for .NET Developer's Guide* for information on specifying time zone values for that API.

DATE Data Type

The DATE data type stores date and time information. Although date and time information can be represented in both character and number data types, the DATE data type has special associated properties. For each DATE value, Oracle stores the following information: year, month, day, hour, minute, and second.

You can specify a DATE value as a literal, or you can convert a character or numeric value to a date value with the TO_DATE function. For examples of expressing DATE values in both these ways, refer to Datetime Literals .

Using Julian Days

A Julian day number is the number of days since January 1, 4712 BC. Julian days allow continuous dating from a common reference. You can use the date format model "J" with date

Copyright © 1996, 2026, Oracle and/or its affiliates.

functions TO_DATE and TO_CHAR to convert between Oracle DATE values and their Julian equivalents.

> **Note**
>
> The database uses the astronomical system of calculating Julian days, in which the year 4713 BC is specified as -4712. The historical system of calculating Julian days, in contrast, specifies 4713 BC as -4713. If you are comparing Oracle Julian days with values calculated using the historical system, then take care to allow for the 365-day difference in BC dates.

The default date values are determined as follows:

- The year is the current year, as returned by SYSDATE.
- The month is the current month, as returned by SYSDATE.
- The day is 01 (the first day of the month).
- The hour, minute, and second are all 0.

These default values are used in a query that requests date values where the date itself is not specified, as in the following example, which is issued in the month of May:

```
SELECT TO_DATE('2009', 'YYYY')
  FROM DUAL;

TO_DATE('
---------
01-MAY-09
```

Example

This statement returns the Julian equivalent of January 1, 2009:

```
SELECT TO_CHAR(TO_DATE('01-01-2009', 'MM-DD-YYYY'),'J')
    FROM DUAL;

TO_CHAR
-------
2454833
```

> **See Also**
>
> Selecting from the DUAL Table for a description of the DUAL table

TIMESTAMP Data Type

The TIMESTAMP data type is an extension of the DATE data type. It stores the year, month, and day of the DATE data type, plus hour, minute, and second values. This data type is useful for storing precise time values and for collecting and evaluating date information across geographic regions. Specify the TIMESTAMP data type as follows:

```
TIMESTAMP [(fractional_seconds_precision)]
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

where *fractional_seconds_precision* optionally specifies the number of digits Oracle stores in the fractional part of the SECOND datetime field. When you create a column of this data type, the value can be a number in the range 0 to 9. The default is 6.

> **See Also**
>
> TO_TIMESTAMP for information on converting character data to TIMESTAMP data

TIMESTAMP WITH TIME ZONE Data Type

TIMESTAMP WITH TIME ZONE is a variant of TIMESTAMP that includes a **time zone region name** or a **time zone offset** in its value. The time zone offset is the difference (in hours and minutes) between local time and UTC (Coordinated Universal Time—formerly Greenwich Mean Time). This data type is useful for preserving local time zone information.

Specify the TIMESTAMP WITH TIME ZONE data type as follows:

```
TIMESTAMP [(fractional_seconds_precision)] WITH TIME ZONE
```

where *fractional_seconds_precision* optionally specifies the number of digits Oracle stores in the fractional part of the SECOND datetime field. When you create a column of this data type, the value can be a number in the range 0 to 9. The default is 6.

Oracle time zone data is derived from the public domain information available at http://www.iana.org/time-zones/. Oracle time zone data may not reflect the most recent data available at this site.

> **See Also**

> - *Oracle AI Database Globalization Support Guide* for more information on Oracle time zone data
> - Support for Daylight Saving Times and Table 2-20 for information on daylight saving support
> - TO_TIMESTAMP_TZ for information on converting character data to TIMESTAMP WITH TIME ZONE data
> - ALTER SESSION for information on the ERROR_ON_OVERLAP_TIME session parameter

TIMESTAMP WITH LOCAL TIME ZONE Data Type

TIMESTAMP WITH LOCAL TIME ZONE is another variant of TIMESTAMP that is sensitive to time zone information. It differs from TIMESTAMP WITH TIME ZONE in that data stored in the database is normalized to the database time zone, and the time zone information is not stored as part of the column data. When a user retrieves the data, Oracle returns it in the user's local session time zone. This data type is useful for date information that is always to be displayed in the time zone of the client system in a two-tier application.

Specify the TIMESTAMP WITH LOCAL TIME ZONE data type as follows:

```
TIMESTAMP [(fractional_seconds_precision)] WITH LOCAL TIME ZONE
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

where *fractional_seconds_precision* optionally specifies the number of digits Oracle stores in the fractional part of the SECOND datetime field. When you create a column of this data type, the value can be a number in the range 0 to 9. The default is 6.

Oracle time zone data is derived from the public domain information available at http://www.iana.org/time-zones/. Oracle time zone data may not reflect the most recent data available at this site.

See Also

- *Oracle AI Database Globalization Support Guide* for more information on Oracle time zone data
- *Oracle AI Database Development Guide* for examples of using this data type and CAST for information on converting character data to TIMESTAMP WITH LOCAL TIME ZONE

INTERVAL YEAR TO MONTH Data Type

INTERVAL YEAR TO MONTH stores a period of time using the YEAR and MONTH datetime fields. This data type is useful for representing the difference between two datetime values when only the year and month values are significant.

Specify INTERVAL YEAR TO MONTH as follows:

```
INTERVAL YEAR [(year_precision)] TO MONTH
```

where *year_precision* is the number of digits in the YEAR datetime field. The default value of *year_precision* is 2.

You have a great deal of flexibility when specifying interval values as literals. Refer to Interval Literals for detailed information on specifying interval values as literals. Also see Datetime and Interval Examples for an example using intervals.

INTERVAL DAY TO SECOND Data Type

INTERVAL DAY TO SECOND stores a period of time in terms of days, hours, minutes, and seconds. This data type is useful for representing the precise difference between two datetime values.

Specify this data type as follows:

```
INTERVAL DAY [(day_precision)]
   TO SECOND [(fractional_seconds_precision)]
```

where

- *day_precision* is the number of digits in the DAY datetime field. Accepted values are 0 to 9. The default is 2.
- *fractional_seconds_precision* is the number of digits in the fractional part of the SECOND datetime field. Accepted values are 0 to 9. The default is 6.

You have a great deal of flexibility when specifying interval values as literals. Refer to Interval Literals for detailed information on specify interval values as literals. Also see Datetime and Interval Examples for an example using intervals.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Datetime/Interval Arithmetic

You can perform a number of arithmetic operations on date (DATE), timestamp (TIMESTAMP, TIMESTAMP WITH TIME ZONE, and TIMESTAMP WITH LOCAL TIME ZONE) and interval (INTERVAL DAY TO SECOND and INTERVAL YEAR TO MONTH) data. Oracle calculates the results based on the following rules:

- You can use NUMBER constants in arithmetic operations on date and timestamp values, but not interval values. Oracle internally converts timestamp values to date values and interprets NUMBER constants in arithmetic datetime and interval expressions as numbers of days. For example, SYSDATE + 1 is tomorrow. SYSDATE - 7 is one week ago. SYSDATE + (10/1440) is ten minutes from now. Subtracting the hire_date column of the sample table employees from SYSDATE returns the number of days since each employee was hired. You cannot multiply or divide date or timestamp values.
- Oracle implicitly converts BINARY_FLOAT and BINARY_DOUBLE operands to NUMBER.
- Each DATE value contains a time component, and the result of many date operations include a fraction. This fraction means a portion of one day. For example, 1.5 days is 36 hours. These fractions are also returned by Oracle built-in functions for common operations on DATE data. For example, the MONTHS_BETWEEN function returns the number of months between two dates. The fractional portion of the result represents that portion of a 31-day month.
- If one operand is a DATE value or a numeric value, neither of which contains time zone or fractional seconds components, then:
  - Oracle implicitly converts the other operand to DATE data. The exception is multiplication of a numeric value times an interval, which returns an interval.
  - If the other operand has a time zone value, then Oracle uses the session time zone in the returned value.
  - If the other operand has a fractional seconds value, then the fractional seconds value is lost.
- When you pass a timestamp, interval, or numeric value to a built-in function that was designed only for the DATE data type, Oracle implicitly converts the non-DATE value to a DATE value. Refer to Datetime Functions for information on which functions cause implicit conversion to DATE.
- When interval calculations return a datetime value, the result must be an actual datetime value or the database returns an error. For example, the next two statements return errors:

```
SELECT TO_DATE('31-AUG-2004','DD-MON-YYYY') + TO_YMINTERVAL('0-1')
  FROM DUAL;

SELECT TO_DATE('29-FEB-2004','DD-MON-YYYY') + TO_YMINTERVAL('1-0')
  FROM DUAL;
```

The first fails because adding one month to a 31-day month would result in September 31, which is not a valid date. The second fails because adding one year to a date that exists only every four years is not valid. However, the next statement succeeds, because adding four years to a February 29 date is valid:

```
SELECT TO_DATE('29-FEB-2004', 'DD-MON-YYYY') + TO_YMINTERVAL('4-0')
  FROM DUAL;

TO_DATE('
---------
29-FEB-08
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

- Oracle performs all timestamp arithmetic in UTC time. For `TIMESTAMP WITH LOCAL TIME ZONE`, Oracle converts the datetime value from the database time zone to UTC and converts back to the database time zone after performing the arithmetic. For `TIMESTAMP WITH TIME ZONE`, the datetime value is always in UTC, so no conversion is necessary.

Table 2-5 is a matrix of datetime arithmetic operations. Dashes represent operations that are not supported.

Table 2-5 Matrix of Datetime Arithmetic

Operand & Operator	DATE	TIMESTAMP	INTERVAL	Numeric
DATE				
+	–	–	DATE	DATE
-	NUMBER	INTERVAL	DATE	DATE
*****	–	–	–	–
/	–	–	–	–
TIMESTAMP				
+	–	–	TIMESTAMP	DATE
-	INTERVAL	INTERVAL	TIMESTAMP	DATE
*****	–	–	–	–
/	–	–	–	–
INTERVAL				
+	DATE	TIMESTAMP	INTERVAL	–
-	–	–	INTERVAL	–
*****	–	–	–	INTERVAL
/	–	–	–	INTERVAL
Numeric				
+	DATE	DATE	–	NA
-	–	–	–	NA
*****	–	–	INTERVAL	NA
/	–	–	–	NA

Examples

You can add an interval value expression to a start time. Consider the sample table `oe.orders` with a column `order_date`. The following statement adds 30 days to the value of the `order_date` column:

```
SELECT order_id, order_date + INTERVAL '30' DAY AS "Due Date"
  FROM orders
  ORDER BY order_id, "Due Date";
```

Support for Daylight Saving Times

The database automatically determines, for any given time zone region, whether daylight saving is in effect and returns local time values accordingly. The datetime value is sufficient for

Copyright © 1996, 2026, Oracle and/or its affiliates.

Oracle to determine whether daylight saving time is in effect for a given region in all cases except **boundary cases**. A boundary case occurs during the period when daylight saving goes into or comes out of effect. For example, in the US-Pacific region, when daylight saving goes into effect, the time changes from 2:00 a.m. to 3:00 a.m. The one hour interval between 2 and 3 a.m. does not exist. When daylight saving goes out of effect, the time changes from 2:00 a.m. back to 1:00 a.m., and the one-hour interval between 1 and 2 a.m. is repeated.

To resolve these boundary cases, Oracle uses the `TZR` and `TZD` format elements, as described in Table 2-20. `TZR` represents the time zone region name in datetime input strings. Examples are '`Australia/North`', '`UTC`', and '`Singapore`'. `TZD` represents an abbreviated form of the time zone region name with daylight saving information. Examples are '`PST`' for US/Pacific standard time and '`PDT`' for US/Pacific daylight time. To see a listing of valid values for the `TZR` and `TZD` format elements, query the `TZNAME` and `TZABBREV` columns of the `V$TIMEZONE_NAMES` dynamic performance view.

Note

Time zone region names are needed by the daylight saving feature. These names are stored in two types of time zone files: one large and one small. One of these files is the default file, depending on your environment and the release of the database you are using. For more information regarding time zone files and names, see *Oracle AI Database Globalization Support Guide*.

For a complete listing of the time zone region names in both files, refer to *Oracle AI Database Globalization Support Guide*.

Oracle time zone data is derived from the public domain information available at `http://www.iana.org/time-zones/`. Oracle time zone data may not reflect the most recent data available at this site.

Datetime and Interval Examples

The following example shows an `INTERVAL` aggregation query:

```
SELECT job_name,
       SUM( cpu_used )
  FROM DBA_SCHEDULER_JOB_RUN_DETAILS
  GROUP BY job_name
  HAVING SUM ( cpu_used ) > interval '5' minute;
```

The view `DBA_SCHEDULER_JOB_RUN_DETAILS` contains the log run details for all scheduler jobs in the database. The column `CPU_USED` of type `INTERVAL DAY(3) TO SECOND(2)` displays the amount of CPU used for the job run. This query returns the names of all the scheduler jobs that have lasted more than 5 minutes.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following example shows how to specify some datetime and interval data types.

```
CREATE TABLE time_table
  (start_time    TIMESTAMP,
   duration_1    INTERVAL DAY (6) TO SECOND (5),
   duration_2    INTERVAL YEAR TO MONTH);
```

The `start_time` column is of type `TIMESTAMP`. The implicit fractional seconds precision of `TIMESTAMP` is 6.

The `duration_1` column is of type `INTERVAL DAY TO SECOND`. The maximum number of digits in field `DAY` is 6 and the maximum number of digits in the fractional second is 5. The maximum number of digits in all other datetime fields is 2.

The `duration_2` column is of type `INTERVAL YEAR TO MONTH`. The maximum number of digits of the value in each field (`YEAR` and `MONTH`) is 2.

Interval data types do not have format models. Therefore, to adjust their presentation, you must combine character functions such as `EXTRACT` and concatenate the components. For example, the following examples query the `hr.employees` and `oe.orders` tables, respectively, and change interval output from the form "*yy-mm*" to "*yy* years *mm* months" and from "*dd-hh*" to "*dddd* days *hh* hours":

```
SELECT last_name, EXTRACT(YEAR FROM (SYSDATE - hire_date) YEAR TO MONTH)
       || ' years '
       || EXTRACT(MONTH FROM (SYSDATE - hire_date) YEAR TO MONTH)
       || ' months'  "Interval"
  FROM employees;

LAST_NAME                 Interval
------------------------- --------------------
OConnell                  2 years 3 months
Grant                     1 years 9 months
Whalen                    6 years 1 months
Hartstein                 5 years 8 months
Fay                       4 years 2 months
Mavris                    7 years 4 months
Baer                      7 years 4 months
Higgins                   7 years 4 months
Gietz                     7 years 4 months
. . .

SELECT order_id, EXTRACT(DAY FROM (SYSDATE - order_date) DAY TO SECOND)
       || ' days '
       || EXTRACT(HOUR FROM (SYSDATE - order_date) DAY TO SECOND)
       || ' hours' "Interval"
  FROM orders;

  ORDER_ID Interval
---------- --------------------
      2458 780 days 23 hours
      2397 685 days 22 hours
      2454 733 days 21 hours
      2354 447 days 20 hours
      2358 635 days 20 hours
      2381 508 days 18 hours
      2440 765 days 17 hours
      2357 1365 days 16 hours
      2394 602 days 15 hours
      2435 763 days 15 hours
. . .
```

RAW and LONG RAW Data Types

> **Note**
>
> All forms of LONG data types (LONG, LONG RAW, LONG VARCHAR, LONG VARRAW) were deprecated in Oracle8i Release 8.1.6. For succeeding releases, the LONG data type was provided for backward compatibility with existing applications. In new applications developed with later releases, Oracle strongly recommends that you use CLOB and NCLOB data types for large amounts of character data.

The RAW and LONG RAW data types store data that is not to be explicitly converted by Oracle database when moving data between different systems. These data types are intended for binary data or byte strings. For example, you can use LONG RAW to store graphics, sound, documents, or arrays of binary data, for which the interpretation is dependent on the use.

Oracle strongly recommends that you convert LONG RAW columns to binary LOB (BLOB) columns. LOB columns are subject to far fewer restrictions than LONG columns. See TO_LOB for more information.

RAW is a variable-length data type like VARCHAR2, except that Oracle Net (which connects client software to a database or one database to another) and the Oracle import and export utilities do not perform character conversion when transmitting RAW or LONG RAW data. In contrast, Oracle Net and the Oracle import and export utilities automatically convert CHAR, VARCHAR2, and LONG data between different database character sets, if data is transported between databases, or between the database character set and the client character set, if data is transported between a database and a client. The client character set is determined by the type of the client interface, such as OCI or JDBC, and the client configuration (for example, the NLS_LANG environment variable).

When Oracle implicitly converts RAW or LONG RAW data to character data, the resulting character value contains a hexadecimal representation of the binary input, where each character is a hexadecimal digit (0-9, A-F) representing four consecutive bits of RAW data. For example, one byte of RAW data with bits 11001011 becomes the value CB.

When Oracle implicitly converts character data to RAW or LONG RAW, it interprets each consecutive input character as a hexadecimal representation of four consecutive bits of binary data and builds the resulting RAW or LONG RAW value by concatenating those bits. If any of the input characters is not a hexadecimal digit (0-9, A-F, a-f), then an error is reported. If the number of characters is odd, then the result is undefined.

The SQL functions RAWTOHEX and HEXTORAW perform explicit conversions that are equivalent to the above implicit conversions. Other types of conversions between RAW and character data are possible with functions in the Oracle-supplied PL/SQL packages UTL_RAW and UTL_I18N.

Large Object (LOB) Data Types

The built-in LOB data types BLOB, CLOB, and NCLOB (stored internally) and BFILE (stored externally) can store large and unstructured data such as text, image, video, and spatial data. The size of BLOB, CLOB, and NCLOB data can be up to (2^{32}-1 bytes) * (the value of the CHUNK parameter of LOB storage). If the tablespaces in your database are of standard block size, and if you have used the default value of the CHUNK parameter of LOB storage when creating a LOB column, then this is equivalent to (2^{32}-1 bytes) * (database block size). BFILE data can be up to 2^{64}-1 bytes, although your operating system may impose restrictions on this maximum.

Copyright © 1996, 2026, Oracle and/or its affiliates.

When creating a table, you can optionally specify different tablespace and storage characteristics for LOB columns or LOB object attributes from those specified for the table.

`CLOB`, `NCLOB`, and `BLOB` values up to approximately 4000 bytes are stored inline if you enable storage in row at the time the LOB column is created. LOBs greater than 4000 bytes are always stored externally. Refer to ENABLE STORAGE IN ROW for more information.

LOB columns contain LOB locators that can refer to internal (in the database) or external (outside the database) LOB values. Selecting a LOB from a table actually returns the LOB locator and not the entire LOB value. The `DBMS_LOB` package and Oracle Call Interface (OCI) operations on LOBs are performed through these locators.

LOBs are similar to `LONG` and `LONG RAW` types, but differ in the following ways:

- LOBs can be attributes of an object type (user-defined data type).
- The LOB locator is stored in the table column, either with or without the actual LOB value. `BLOB`, `NCLOB`, and `CLOB` values can be stored in separate tablespaces. `BFILE` data is stored in an external file on the server.
- When you access a LOB column, the locator is returned.
- A LOB can be up to (2^{32}-1 bytes)*(database block size) in size. `BFILE` data can be up to 2^{64}-1 bytes, although your operating system may impose restrictions on this maximum.
- LOBs permit efficient, random, piece-wise access to and manipulation of data.
- You can define more than one LOB column in a table.
- With the exception of `NCLOB`, you can define one or more LOB attributes in an object.
- You can declare LOB bind variables.
- You can select LOB columns and LOB attributes.
- You can insert a new row or update an existing row that contains one or more LOB columns or an object with one or more LOB attributes. In update operations, you can set the internal LOB value to `NULL`, empty, or replace the entire LOB with data. You can set the `BFILE` to `NULL` or make it point to a different file.
- You can update a LOB row-column intersection or a LOB attribute with another LOB row-column intersection or LOB attribute.
- You can delete a row containing a LOB column or LOB attribute and thereby also delete the LOB value. For BFILEs, the actual operating system file is not deleted.

You can access and populate rows of an inline LOB column (a LOB column stored in the database) or a LOB attribute (an attribute of an object type column stored in the database) simply by issuing an `INSERT` or `UPDATE` statement.

Restrictions on LOB Columns

LOB columns are subject to a number of rules and restrictions. See *Oracle AI Database SecureFiles and Large Objects Developer's Guide* for a complete listing.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> - *Oracle AI Database PL/SQL Packages and Types Reference* and *Oracle Call Interface Developer's Guide* for more information about these interfaces and LOBs
> - the *modify_col_properties* clause of ALTER TABLE and TO_LOB for more information on converting LONG columns to LOB columns

BFILE Data Type

The BFILE data type enables access to binary file LOBs that are stored in file systems outside Oracle Database. A BFILE column or attribute stores a BFILE locator, which serves as a pointer to a binary file on the server file system. The locator maintains the directory name and the filename.

You can change the filename and path of a BFILE without affecting the base table by using the BFILENAME function. Refer to BFILENAME for more information on this built-in SQL function.

Binary file LOBs do not participate in transactions and are not recoverable. Rather, the underlying operating system provides file integrity and durability. BFILE data can be up to 2^{64}-1 bytes, although your operating system may impose restrictions on this maximum.

The database administrator must ensure that the external file exists and that Oracle processes have operating system read permissions on the file.

The BFILE data type enables read-only support of large binary files. You cannot modify or replicate such a file. Oracle provides APIs to access file data. The primary interfaces that you use to access file data are the DBMS_LOB package and Oracle Call Interface (OCI).

> **See Also**
>
> *Oracle Database SecureFiles and Large Objects Developer's Guide* and *Oracle Call Interface Programmer's Guide* for more information about LOBs and CREATE DIRECTORY

BLOB Data Type

The BLOB data type stores unstructured binary large objects. BLOB objects can be thought of as bitstreams with no character set semantics. BLOB objects can store binary data up to (4 gigabytes -1) * (the value of the CHUNK parameter of LOB storage). If the tablespaces in your database are of standard block size, and if you have used the default value of the CHUNK parameter of LOB storage when creating a LOB column, then this is equivalent to (4 gigabytes - 1) * (database block size).

BLOB objects have full transactional support. Changes made through SQL, the DBMS_LOB package, or Oracle Call Interface (OCI) participate fully in the transaction. BLOB value manipulations can be committed and rolled back. However, you cannot save a BLOB locator in a PL/SQL or OCI variable in one transaction and then use it in another transaction or session.

Copyright © 1996, 2026, Oracle and/or its affiliates.

CLOB Data Type

The CLOB data type stores single-byte and multibyte character data. Both fixed-width and variable-width character sets are supported, and both use the database character set. CLOB objects can store up to (4 gigabytes -1) * (the value of the CHUNK parameter of LOB storage) of character data. If the tablespaces in your database are of standard block size, and if you have used the default value of the CHUNK parameter of LOB storage when creating a LOB column, then this is equivalent to (4 gigabytes - 1) * (database block size).

CLOB objects have full transactional support. Changes made through SQL, the DBMS_LOB package, or Oracle Call Interface (OCI) participate fully in the transaction. CLOB value manipulations can be committed and rolled back. However, you cannot save a CLOB locator in a PL/SQL or OCI variable in one transaction and then use it in another transaction or session.

NCLOB Data Type

The NCLOB data type stores Unicode data. Both fixed-width and variable-width character sets are supported, and both use the national character set. NCLOB objects can store up to (4 gigabytes -1) * (the value of the CHUNK parameter of LOB storage) of character text data. If the tablespaces in your database are of standard block size, and if you have used the default value of the CHUNK parameter of LOB storage when creating a LOB column, then this is equivalent to (4 gigabytes - 1) * (database block size).

NCLOB objects have full transactional support. Changes made through SQL, the DBMS_LOB package, or OCI participate fully in the transaction. NCLOB value manipulations can be committed and rolled back. However, you cannot save an NCLOB locator in a PL/SQL or OCI variable in one transaction and then use it in another transaction or session.

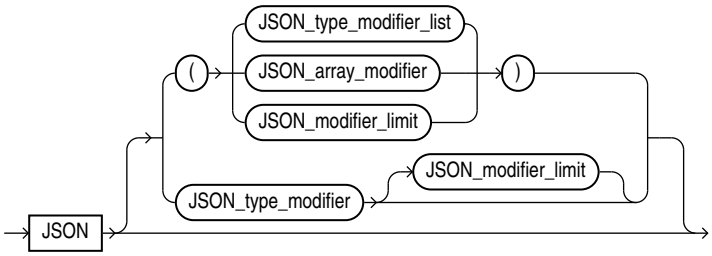
See Also

Oracle Database Globalization Support Guide for information on Unicode data type support

JSON Data Type

You can create a database table that has one or more JSON columns, alone or with relational columns. Oracle recommends that you use JSON data type for the JSON columns.

When using textual JSON data to perform an INSERT or UPDATE operation on a JSON type column, the data is implicitly wrapped with constructor JSON. If the column is not JSON but VARCHAR2, CLOB, or BLOB, then use condition IS JSON as a check constraint, to ensure that the data inserted is well-formed JSON data.



For examples see Creating Tables With JSON Columns of the *JSON Developer's Guide*.

> **Note**
>
> You can create tables with JSON data type only in ASSM tablespaces.

You can use the `JSON` data type to store JSON data natively in binary format. This improves query performance because textual JSON data no longer needs to be parsed. You can create `JSON` type instances from other SQL data, and conversely.

You must set the database initialization parameter `compatible` to `20` in order to use the new `JSON` data type.

The other SQL data types that support JSON data, besides `JSON` type, are `VARCHAR2`, `CLOB`, and `BLOB`. Non-JSON type data is called textual, or serialized, JSON data. It is unparsed character data.

You can use the `JSON` constructor function to convert textual JSON data to `JSON` type data.

To convert `JSON` type data to textual data, you can use the `JSON_SERIALIZE` function.

You can create complex `JSON` type data from non-`JSON` type data using the JSON generation functions: `JSON_OBJECT`, `JSON_ARRAY`, `JSON_OBJECTAGG`, and `JSON_ARRAYAGG`.

You can create a `JSON` type instance with a scalar JSON value using the function `JSON_SCALAR` .

In the other direction, you can use the function `JSON_VALUE` to query `JSON` type data and return an instance of a SQL object type or collection type.

When defining a JSON-type column you can follow the type keyword JSON with a JSON-type modifier, in parentheses: (`OBJECT`), (`ARRAY`), or (`SCALAR`). This requires the column content to be

Copyright © 1996, 2026, Oracle and/or its affiliates.

a JSON object, array, or scalar value, respectively. (This is similar to using `VARCHAR(42)` instead of just `VARCHAR2`.)

Modifier keyword `SCALAR` can be followed by a keyword that specifies the required type of scalar: `BOOLEAN`, `BINARY`, `BINARY_DOUBLE`, `BINARY_FLOAT`, `DATE`, `INTERVAL DAY TO SECOND` , `INTERVAL YEAR TO MONTH`, `NULL`, `NUMBER`, `STRING`, `TIMESTAMP`, or `TIMESTAMP WITH TIME ZONE`.

You can provide more than one modifier between the parentheses, separating them with commas. For example, (`OBJECT`, `ARRAY`) requires nonscalar values, and (`OBJECT`, `SCALAR DATE`) allows only objects or dates.

Create a Table with a JSON Type Column of JSON OBJECT: Example

The following table definition requires the JSON data type column `po_document` to be a JSON object by using a JSON modifier:

```
CREATE TABLE j_purchaseorder
  (id VARCHAR2 (32) NOT NULL PRIMARY KEY,
   date_loaded TIMESTAMP (6) WITH TIME ZONE,
   po_document JSON (OBJECT));
```

Restrictions

If you specify `SORT` in the clause *`json_array_modifer`*, then you must also specify *`JSON_array_size`*. When you use `SORT` you need to explicitly use * for *`JSON_array_size`* to show that there is no size limit.

See Also

- *JSON Data Type of the JSON Developer's Guide.*
- For more information on creating a JSON column see *Creating a Table with a JSON Column of the JSON developer's Guide.*
- For the syntax of JSON modifiers see IS JSON Condition

Extended Data Types

Beginning with Oracle Database 12*c*, you can specify a maximum size of 32767 bytes for the `VARCHAR2`, `NVARCHAR2`, and `RAW` data types. You can control whether your database supports this new maximum size by setting the initialization parameter `MAX_STRING_SIZE` as follows:

- If `MAX_STRING_SIZE` = `STANDARD`, then the size limits for releases prior to Oracle Database 12*c* apply: 4000 bytes for the `VARCHAR2` and `NVARCHAR2` data types, and 2000 bytes for the `RAW` data type. This is the default.
- If `MAX_STRING_SIZE` = `EXTENDED`, then the size limit is 32767 bytes for the `VARCHAR2`, `NVARCHAR2`, and `RAW` data types.

See Also

Setting `MAX_STRING_SIZE` = `EXTENDED` may update database objects and possibly invalidate them. Refer to *Oracle AI Database Reference* for complete information on the implications of this parameter and how to set and enable this new functionality.

Copyright © 1996, 2026, Oracle and/or its affiliates.

A VARCHAR2 or NVARCHAR2 data type with a declared size of greater than 4000 bytes, or a RAW data type with a declared size of greater than 2000 bytes, is an **extended data type**. Extended data type columns are stored out-of-line, leveraging Oracle's LOB technology. The LOB storage is always aligned with the table. In tablespaces managed with Automatic Segment Space Management (ASSM), extended data type columns are stored as SecureFiles LOBs. Otherwise, they are stored as BasicFiles LOBs. The use of LOBs as a storage mechanism is internal only. Therefore, you cannot manipulate these LOBs using the DBMS_LOB package.

Note

- Oracle strongly recommends the use of SecureFiles LOBs as a storage mechanism. Note that BasicFiles LOBs impose restrictions on the capabilities of extended data type columns.
- Extended data types are subject to the same rules and restrictions as LOBs. Refer to *Oracle AI Database SecureFiles and Large Objects Developer's Guide* for more information.

Note that, although you must set MAX_STRING_SIZE = EXTENDED in order to set the size of a RAW data type to greater than 2000 bytes, a RAW data type is stored as an out-of-line LOB only if it has a size of greater than 4000 bytes. For example, you must set MAX_STRING_SIZE = EXTENDED in order to declare a RAW(3000) data type. However, the column is stored inline.

You can use extended data types just as you would standard data types, with the following considerations:

- For special considerations when creating an index on an extended data type column, or when requiring an index to enforce a primary key or unique constraint, see Creating an Index on an Extended Data Type Column.
- If the partitioning key column for a list partition is an extended data type column, then the list of values that you want to specify for a partition may exceed the 4K byte limit for the partition bounds. See the *list_partitions* clause of CREATE TABLE for information on how to work around this issue.
- The value of the initialization parameter MAX_STRING_SIZE affects the following:
  - The maximum length of a text literal. See Text Literals for more information.
  - The size limit for concatenating two character strings. See Concatenation Operator for more information.
  - The length of the collation key returned by the NLSSORT function. See NLSSORT.
  - The size of some of the attributes of the XMLFormat object. See XML Format Model for more information.
  - The size of some expressions in the following XML functions: XMLCOLATTVAL, XMLELEMENT, XMLFOREST, XMLPI, and XMLTABLE.

Boolean Data Type

The data type boolean has the truth values TRUE and FALSE. If there is no NOT NULL constraint, the boolean data type also supports the truth value UNKNOWN as the null value.

Copyright © 1996, 2026, Oracle and/or its affiliates.

You can use the boolean data type wherever data type appears in Oracle SQL syntax. For example, you can specify a boolean column with the keywords `BOOLEAN` or `BOOL` in `CREATE TABLE`:

```
CREATE TABLE example (id NUMBER, c1 BOOLEAN, c2 BOOL);
```

You can use SQL keywords `TRUE`, `FALSE` and `NULL` to represent states “TRUE”, “FALSE”, and “NULL” respectively. For example, using the table `example` created above, you can insert the following:

```
INSERT INTO example VALUES (1, TRUE, NULL);
```

```
INSERT INTO example VALUES (2, FALSE, true);
```

You can use literals to represent "TRUE" and "FALSE" states. Case is not enforced in "TRUE" and "FALSE", you can have all lower case, all upper case, or a combination of upper and lower case. Leading and trailing white spaces are ignored.

Table 2-6 String Literals To Represent "TRUE" and "FALSE"

STATE	TRUE	FALSE
-	'true'	'false'
-	'yes'	'no'
-	'on'	'off'
-	'1'	'0'
-	't'	'f'
-	'y'	'n'

Note that numbers are translated into boolean as follows:

- 0 translates to `FALSE`.
- Non 0 values like 42 or -3.14 translate to `TRUE`.

Given the table `example` created below with two boolean columns `c1` and `c2`:

```
CREATE TABLE IF NOT EXISTS example (id NUMBER, c1 BOOLEAN, c2 BOOL);
```

Insert into `example` the following rows:

```
INSERT INTO example VALUES (1, TRUE, NULL);
INSERT INTO example VALUES (2, FALSE, true);
INSERT INTO example VALUES (3, 0, 'off');
INSERT INTO example VALUES (4, 'no', 'yes');
INSERT INTO example VALUES (5, 'f', 't' );
INSERT INTO example VALUES (6, false, true);
INSERT INTO example VALUES (7, 'on', 'off');
INSERT INTO example VALUES (8, -3.14, 1);
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

SELECT of a boolean type column always returns TRUE , FALSE. A value of NULL returns nothing.

```
SELECT * FROM example;
```

Result:

```
ID          C1      C2
---------- -----    -----
1          TRUE
2          FALSE    TRUE
3          FALSE    FALSE
4          FALSE    TRUE
5          FALSE    TRUE
6          FALSE    TRUE
7          TRUE     FALSE
8          TRUE     TRUE
8 rows selected.
```

Constraints on Boolean Columns

The following constraints are supported on boolean columns:

- NOT NULL
- UNIQUE
- PRIMARY KEY
- FOREIGN KEY
- CHECK

Comparison and Assignment of Booleans

The following comparison operators are supported to compare boolean values: =, !=, < >, <, <=, >, >=, GREATEST, LEAST, [NOT] IN

```
SELECT * FROM example WHERE c1 = c2;
```

Result:

```
    ID   C1    C2
---------   -------  --------
     3   FALSE    FALSE
     8   TRUE     TRUE
```

```
SELECT * FROM example e1
WHERE c1 >= ALL (SELECT c2 FROM example e2 WHERE e2.id > e1.id);
```

```
    ID    C1       C2
---------   -----    -------
     1    TRUE
     7    TRUE     FALSE
     8    TRUE     TRUE
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Operations on Booleans that Return Booleans

You can use the `NOT`, `AND`, and `OR` operators on SQL conditions, boolean columns, and boolean constants. For example:

```
SELECT * FROM example WHERE NOT c2;

    ID    C1     C2
---------    ------   ------
     3    FALSE     FALSE
     7    TRUE      FALSE

SELECT * FROM example WHERE c1 AND c2;

    ID   C1      C2
----------  -----  -------
     8   TRUE    TRUE

SELECT * FROM example WHERE c1 AND TRUE;

    ID    C1    C2
----------   -------  -------
     7    TRUE     FALSE
     8    TRUE     TRUE
     1    TRUE

SELECT * FROM example WHERE c1 OR c2;

    ID    C1      C2
----------   --------- ------
        1    TRUE
     2    FALSE     TRUE
     4    FALSE     TRUE
     5    FALSE     TRUE
     6    FALSE     TRUE
     7    TRUE      FALSE
     8    TRUE      TRUE

7 rows selected.
```

Boolean Operator `NOT`

The `NOT` (TRUE) is FALSE. `NOT` (FALSE) is true. `NOT` (NULL) is NULL.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Boolean Operator `AND`

Truth Table for the AND Boolean Operator

AND	TRUE	FALSE	NULL
TRUE	TRUE	FALSE	NULL
FALSE	FALSE	FALSE	FALSE
NULL	FALSE	FALSE	NULL

Boolean Operator `OR`

Truth Table for the OR Boolean Operator

OR	TRUE	FALSE	NULL
TRUE	TRUE	TRUE	TRUE
FALSE	TRUE	FALSE	NULL
NULL	TRUE	NULL	NULL

Boolean Operator `IS`

Truth Table for the IS Boolean Operator

IS	TRUE	FALSE	NULL
TRUE	TRUE	FALSE	FALSE
FALSE	FALSE	TRUE	FALSE
NULL	FALSE	FALSE	TRUE

Boolean Operator `IS NOT`

Truth Table for the IS NOT Boolean Operator

IS NOT	TRUE	FALSE	NULL
TRUE	FALSE	TRUE	TRUE
FALSE	TRUE	FALSE	TRUE
NULL	TRUE	TRUE	FALSE

In addition to supporting SQL conditions, the `NOT`, `AND`, and `OR` operators support operations on boolean columns and boolean constants. For example, these are all valid statements:

```
SELECT * FROM example WHERE NOT c2;
SELECT * FROM example WHERE c1 AND c2;
SELECT * FROM example WHERE c1 AND TRUE;
SELECT * FROM example WHERE c1 OR c2;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

You can use `IS [NOT] NULL` on a boolean value expression to determine its state. For example:

```
SELECT * FROM example WHERE c2 IS NULL;

     ID   C1    C2
-------   ----- ----
      1   TRUE
```

Booleans in SQL Expressions

Boolean expressions are supported in SQL syntax wherever *expr* is used.

SQL expressions and conditions have been enhanced to support the new boolean data type. Links to relevant SQL syntax:

BOOLEAN Expressions

CAST Between Boolean Data Type and Other Oracle Built-In Data Types

The rules to cast between `BOOLEAN` and other Oracle built-in data types are as follows:

When casting `BOOLEAN` to numeric :

- If the boolean value is true, then resulting value is 1.
- If the boolean value is false, then resulting value is 0.

When casting numeric to `BOOLEAN` :

- If the numeric value is non-zero (e.g., 1, 2, -3, 1.2), then resulting value is true.
- If the numeric value is zero, then resulting value is false.

When casting `BOOLEAN` to `CHAR(n)` and `NCHAR(n)`:

- If the boolean value is true and `n` is not less than 4, then the resulting value is 'TRUE' extended on the right by `n` - 4 spaces.
- If the boolean value is false and `n` is not less than 5, then the resulting value is 'FALSE' extended on the right by `n` – 5 spaces.
- Otherwise, a data exception error is raised.

When casting a character string to boolean, leading and trailing spaces of the character string are ignored. If the resulting character string is one of the accepted literals used to determine a valid boolean value, then the result is that valid boolean value.

When casting `BOOLEAN` to `VARCHAR(n)`, `NVARCHAR(n)`

- If the boolean value is true and `n` is not less than 4, then resulting value is true.
- If the boolean value is false and `n` is not less than 5, then resulting value is false.
- Otherwise, a data exception error is raised.

You can use the function `TO_BOOLEAN` to explicitly convert character value expressions or numeric value expressions to boolean values.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Functions `TO_CHAR`, `TO_NCHAR`, `TO_CLOB`, `TO_NCLOB`, `TO_NUMBER`, `TO_BINARY_DOUBLE`, and `TO_BINARY_FLOAT` have boolean overloads to convert boolean values to number or character types.

> **Note**
>
> TO_BOOLEAN

Vector Data Type

Vector is a new Oracle built-in data type. This data type represents a vector as an array of numbers, called dimensions stored in one of the following formats:

- `INT8` (8-bit integers)
- `FLOAT32` (32-bit, single precision floating-point numbers)
- `FLOAT64` (64-bit, double precision floating-point numbers)
- `BINARY` (packed `UINT8` bytes where each dimension is a single bit)

`FLOAT32` and `FLOAT64` are IEEE standards.

You can declare a column as vector data type, and optionally specify the dimension count and dimension format.

Syntax Examples:

```
CREATE TABLE t (v VECTOR);
CREATE TABLE t (v VECTOR(*, *));
CREATE TABLE t (v VECTOR(100));
CREATE TABLE t (v VECTOR(100, *));
CREATE TABLE t (v VECTOR(*, FLOAT32));
CREATE TABLE t (v VECTOR(100, FLOAT32));
```

Rules

- If you specify the number of dimensions at declaration, then you must input the same number of dimensions.

  If you do not specify the number of dimensions, then you can input any number of dimensions.
- If you specify the storage format at declaration and the input's format is different from the declared format, it is converted, either up or down, to the declared format.

  If the storage format is not specified, every vector will have its dimensions stored without format modification.
- The number of dimensions must be an integer greater than 0. Note that the number of dimensions must not be 0.
- Vectors are nullable, but dimensions are not (e.g., you cannot have `[1.1, NULL, 2.2]`).
- In an `UNION ALL` statement, if the number of dimensions and the storage format are different between any two branches, then the result vector's number of dimensions and format are flexible.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Declaration Formats for the VECTOR Data Type

The following table lists the possible declaration format for a VECTOR data type:

Possible Declaration Format	Explanation
VECTOR	Vectors can have an arbitrary number of dimensions and formats.
VECTOR(*, *)	Vectors can have an arbitrary number of dimensions and formats. VECTOR and VECTOR(*,*) are equivalent.
VECTOR(number_of_dimensions, *) equivalent to VECTOR(number_of_dimensions)	Vectors must all have the specified number of dimensions or an error is thrown. Every vector will have its dimensions stored without format modification.
VECTOR(*, dimension_element_format)	Vectors can have an arbitrary number of dimensions, but their format will be up-converted or down-converted to the specified dimension element format (INT8, FLOAT32, FLOAT64,).

A vector can be NULL but its dimensions cannot (for example, you cannot have a VECTOR with a NULL dimension such as [1.1, NULL, 2.2]).

The following example shows how the system interprets various vector definitions:

```
CREATE TABLE my_vect_tab (
     v1 VECTOR(3, FLOAT32),
     v2 VECTOR(2, FLOAT64),
     v3 VECTOR(1, INT8),
     v4 VECTOR(1, *),
     v5 VECTOR(*, FLOAT32),
     v6 VECTOR(*, *),
     v7 VECTOR
   );

Table created.

DESC my_vect_tab;
 Name                          Null?    Type
 ----------------------------- -------- ----------------------------
 V1                                     VECTOR(3 , FLOAT32)
 V2                                     VECTOR(2 , FLOAT64)
 V3                                     VECTOR(1 , INT8)
 V4                                     VECTOR(1 , *)
 V5                                     VECTOR(* , FLOAT32)
 V6                                     VECTOR(* , *)
 V7                                     VECTOR(* , *)
```

Restrictions

You cannot define VECTOR columns in:

- External Tables
- IOTs (neither as Primary Key nor as non-Key column)

Copyright © 1996, 2026, Oracle and/or its affiliates.

- Clusters or Cluster Tables
- Global Temporary Tables
- MSSM tablespaces (only SYS user can create VECTORs as Basicfiles in MSSM tablespace)
- CQN queries
- Non-vector indexes such as B-tree, Bitmap, Reverse Key, Text, Spatial indexes

You cannot define a `VECTOR` column as a:

- Partitioning or Subpartitioning Key
- Primary Key
- Foreign Key
- Unique Constraint
- Check Constraint
- Default Value
- Modify Column

Oracle Database does not support the following SQL constructs with `VECTOR` columns:

- Distinct, Count Distinct
- Order By, Group By
- Join condition
- Comparison operators (>, <, =)

Create Tables with Column as a VECTOR Data Type

Example 1: Create a table with a column of type vector

The following command creates a table `my_vectors` with two columns: `id` of type `NUMBER` and `embedding` of type `VECTOR`:

```
CREATE TABLE my_vectors (id NUMBER, embedding VECTOR);
```

Example 2: Create a table with a column of type vector and specify dimensions and format

```
CREATE TABLE my_vectors (id NUMBER, embedding VECTOR(768, INT8)) ;
```

In the `my_vectors` table above, each vector that is stored:

- Must have 768 dimensions.
- Each dimension must be formatted as `INT8`.
- The number of dimensions must be strictly greater than zero with no practical upper limit.

There are a new set of SQL functions that use the `VECTOR` data type. See Vector Functions

Rowid Data Types

Each row in the database has an address. The sections that follow describe the two forms of row address in the database.

Copyright © 1996, 2026, Oracle and/or its affiliates.

ROWID Data Type

The rows in heap-organized tables that are native to the databasehave row addresses called **rowids**. You can examine a rowid row address by querying the pseudocolumn `ROWID`. Values of this pseudocolumn are strings representing the address of each row. These strings have the data type `ROWID`. Refer to Pseudocolumns for more information on the `ROWID` pseudocolumn.

Rowids contain the following information:

- The **data block** of the data file containing the row. The length of this string depends on your operating system.
- The **row** in the data block.
- The **database file** containing the row. The first data file has the number 1. The length of this string depends on your operating system.
- The **data object number**, which is an identification number assigned to every database segment. You can retrieve the data object number from the data dictionary views `USER_OBJECTS`, `DBA_OBJECTS`, and `ALL_OBJECTS`. Objects that share the same segment (clustered tables in the same cluster, for example) have the same object number.

Rowids are stored as base 64 values that can contain the characters A-Z, a-z, 0-9, and the plus sign (+) and forward slash (/). Rowids are not available directly. You can use the supplied package `DBMS_ROWID` to interpret rowid contents. The package functions extract and provide information on the four rowid elements listed above.

> **See Also**
>
> *Oracle AI Database PL/SQL Packages and Types Reference* for information on the functions available with the `DBMS_ROWID` package and how to use them

UROWID Data Type

The rows of some tables have addresses that are not physical or permanent or were not generated by the database. For example, the row addresses of index-organized tables are stored in index leaves, which can move. Rowids of foreign tables (such as DB2 tables accessed through a gateway) are not standard Oracle rowids.

Oracle uses universal rowids (**urowids**) to store the addresses of index-organized and foreign tables. Index-organized tables have logical urowids and foreign tables have foreign urowids. Both types of urowid are stored in the `ROWID` pseudocolumn (as are the physical rowids of heap-organized tables).

Oracle creates logical rowids based on the primary key of the table. The logical rowids do not change as long as the primary key does not change. The `ROWID` pseudocolumn of an index-organized table has a data type of `UROWID`. You can access this pseudocolumn as you would the `ROWID` pseudocolumn of a heap-organized table (using a `SELECT ... ROWID` statement). If you want `to` store the rowids of an index-organized table, then you can define a column of type `UROWID` for the table and retrieve the value of the `ROWID` pseudocolumn into that column.

ANSI, DB2, and SQL/DS Data Types

SQL statements that create tables and clusters can also use ANSI data types and data types from the IBM products SQL/DS and DB2. Oracle recognizes the ANSI or IBM data type name

Copyright © 1996, 2026, Oracle and/or its affiliates.

that differs from the database data type name. It converts the data type to the equivalent Oracle data type, records the Oracle data type as the name of the column data type, and stores the column data in the Oracle data type based on the conversions shown in the tables that follow.

Table 2-7 ANSI Data Types Converted to Oracle Data Types

ANSI SQL Data Type	Oracle Data Type
`CHARACTER(n)` `CHAR(n)`	`CHAR(n)`
`CHARACTER VARYING(n)` `CHAR VARYING(n)`	`VARCHAR2(n)`

`NATIONAL CHARACTER(n)`
`NATIONAL CHAR(n)`
`NCHAR(n)`
	`NCHAR(n)`

`NATIONAL CHARACTER VARYING(n)`
`NATIONAL CHAR VARYING(n)`
`NCHAR VARYING(n)`
	`NVARCHAR2(n)`

`NUMERIC[(p,s)]` `DECIMAL[(p,s)]` (**Note 1**)	`NUMBER(p,s)`

`INTEGER`
`INT`
`SMALLINT`
	`NUMBER(38)`

`FLOAT` (**Note 2**)
`DOUBLE PRECISION` (**Note 3**)
`REAL` (**Note 4**)
	`FLOAT(126)`
	`FLOAT(126)`
	`FLOAT(63)`

Notes:

1. The `NUMERIC` and `DECIMAL` data types can specify only fixed-point numbers. For those data types, the scale (`s`) defaults to 0.
2. The `FLOAT` data type is a floating-point number with a binary precision b. The default precision for this data type is 126 binary, or 38 decimal.
3. The `DOUBLE PRECISION` data type is a floating-point number with binary precision 126.
4. The `REAL` data type is a floating-point number with a binary precision of 63, or 18 decimal.

Do not define columns with the following SQL/DS and DB2 data types, because they have no corresponding Oracle data type:

- `GRAPHIC`
- `LONG VARGRAPHIC`
- `VARGRAPHIC`
- `TIME`

Note that data of type `TIME` can also be expressed as Oracle datetime data.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> Datetime and Interval Data Types

Table 2-8 SQL/DS and DB2 Data Types Converted to Oracle Data Types

SQL/DS or DB2 Data Type	Oracle Data Type
`CHARACTER(n)`	`CHAR(n)`
`VARCHAR(n)`	`VARCHAR(n)`
`LONG VARCHAR`	`LONG`
`DECIMAL(p,s)` (**Note 1**)	`NUMBER(p,s)`
`INTEGER` `SMALLINT`	`NUMBER(p,0)`
`FLOAT` (**Note 2**)	`NUMBER`

Notes:

1. The `DECIMAL` data type can specify only fixed-point numbers. For this data type, *s* defaults to 0.
2. The `FLOAT` data type is a floating-point number with a binary precision *b*. The default precision for this data type is 126 binary or 38 decimal.

User-Defined Types

User-defined data types use Oracle built-in data types and other user-defined data types as the building blocks of object types that model the structure and behavior of data in applications. The sections that follow describe the various categories of user-defined types.

> **See Also**
>
> - *Oracle AI Database Concepts* for information about Oracle built-in data types
> - CREATE TYPE and the CREATE TYPE BODY for information about creating user-defined types
> - *Oracle AI Database Object-Relational Developer's Guide* for information about using user-defined types

Object Types

Object types are abstractions of the real-world entities, such as purchase orders, that application programs deal with. An object type is a schema object with three kinds of components:

- A **name**, which identifies the object type uniquely within that schema.
- **Attributes**, which are built-in types or other user-defined types. Attributes model the structure of the real-world entity.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- **Methods**, which are functions or procedures written in PL/SQL and stored in the database, or written in a language like C or Java and stored externally. Methods implement operations the application can perform on the real-world entity.

REF Data Types

An **object identifier** (represented by the keyword `OID`) uniquely identifies an object and enables you to reference the object from other objects or from relational tables. A data type category called `REF` represents such references. A `REF` data type is a container for an object identifier. `REF` values are pointers to objects.

When a `REF` value points to a nonexistent object, the `REF` is said to be "dangling". A dangling `REF` is different from a null `REF`. To determine whether a `REF` is dangling or not, use the condition `IS [NOT] DANGLING`. For example, given object view `oc_orders` in the sample schema `oe`, the column `customer_ref` is of type `REF` to type `customer_typ`, which has an attribute `cust_email`:

```
SELECT o.customer_ref.cust_email
  FROM oc_orders o
  WHERE o.customer_ref IS NOT DANGLING;
```

Varrays

An array is an ordered set of data elements. All elements of a given array are of the same data type. Each element has an **index**, which is a number corresponding to the position of the element in the array.

The number of elements in an array is the size of the array. Oracle arrays are of variable size, which is why they are called **varrays**. You must specify a maximum size when you declare the varray.

When you declare a varray, it does not allocate space. It defines a type, which you can use as:

- The data type of a column of a relational table
- An object type attribute
- A PL/SQL variable, parameter, or function return type

Oracle normally stores an array object either in line (as part of the row data) or out of line (in a LOB), depending on its size. However, if you specify separate storage characteristics for a varray, then Oracle stores it out of line, regardless of its size. Refer to the *varray_col_properties* of CREATE TABLE for more information about varray storage.

Nested Tables

A nested table type models an unordered set of elements. The elements may be built-in types or user-defined types. You can view a nested table as a single-column table or, if the nested table is an object type, as a multicolumn table, with a column for each attribute of the object type.

A nested table definition does not allocate space. It defines a type, which you can use to declare:

- The data type of a column of a relational table
- An object type attribute
- A PL/SQL variable, parameter, or function return type

Copyright © 1996, 2026, Oracle and/or its affiliates.

When a nested table appears as the type of a column in a relational table or as an attribute of the underlying object type of an object table, Oracle stores all of the nested table data in a single table, which it associates with the enclosing relational or object table.

Oracle-Supplied Types

Oracle provides SQL-based interfaces for defining new types when the built-in or ANSI-supported types are not sufficient. The behavior for these types can be implemented in C/C++, Java, or PL/ SQL. The database automatically provides the low-level infrastructure services needed for input-output, heterogeneous client-side access for new data types, and optimizations for data transfers between the application and the database.

These interfaces can be used to build user-defined (or object) types and are also used by Oracle to create some commonly useful data types. Several such data types are supplied with the server, and they serve both broad horizontal application areas (for example, the `Any` types) and specific vertical ones (for example, the spatial types).

The Oracle-supplied types, along with cross-references to the documentation of their implementation and use, are described in the following sections:

- Any Types
- XML Types
- Spatial Types

Any Types

The `Any` types provide highly flexible modeling of procedure parameters and table columns where the actual type is not known. These data types let you dynamically encapsulate and access type descriptions, data instances, and sets of data instances of any other SQL type. These types have OCI and PL/SQL interfaces for construction and access.

ANYTYPE

This type can contain a type description of any named SQL type or unnamed transient type.

ANYDATA

This type contains an instance of a given type, with data, plus a description of the type. `ANYDATA` can be used as a table column data type and lets you store heterogeneous values in a single column. The values can be of SQL built-in types as well as user-defined types.

ANYDATASET

This type contains a description of a given type plus a set of data instances of that type. `ANYDATASET` can be used as a procedure parameter data type where such flexibility is needed. The values of the data instances can be of SQL built-in types as well as user-defined types.

Copyright © 1996, 2026, Oracle and/or its affiliates.

XML Types

Extensible Markup Language (XML) is a standard format developed by the World Wide Web Consortium (W3C) for representing structured and unstructured data on the World Wide Web. Universal resource identifiers (URIs) identify resources such as Web pages anywhere on the Web. Oracle provides types to handle XML and URI data, as well as a class of URIs called `DBURIRef` types to access data stored within the database itself. It also provides a set of types to store and access both external and internal URIs from within the database.

XMLType

This Oracle-supplied type can be used to store and query XML data in the database. `XMLType` has member functions you can use to access, extract, and query the XML data using XPath expressions. XPath is another standard developed by the W3C committee to traverse XML documents. Oracle `XMLType` functions support many W3C XPath expressions. Oracle also provides a set of SQL functions and PL/SQL packages to create `XMLType` values from existing relational or object-relational data.

`XMLType` is a system-defined type, so you can use it as an argument of a function or as the data type of a table or view column. You can also create tables and views of `XMLType`. When you create an `XMLType` column in a table, you can choose to store the XML data in a `CLOB` column, as binary XML (stored internally as a `BLOB`), or object relationally.

You can also register the schema (using the `DBMS_XMLSCHEMA` package) and create a table or column conforming to the registered schema. In this case Oracle stores the XML data in underlying object-relational columns by default, but you can specify storage in a `CLOB` or binary XML column even for schema-based data.

Queries and DML on `XMLType` columns operate the same regardless of the storage mechanism.

> **See Also**
>
> *Oracle XML DB Developer's Guide*for information about using XMLType columns

URI Data Types

Oracle supplies a family of URI types—`URIType`, `DBURIType`, `XDBURIType`, and `HTTPURIType`—which are related by an inheritance hierarchy. `URIType` is an object type and the others are subtypes of `URIType`. Since `URIType` is the supertype, you can create columns of this type and store `DBURIType` or `HTTPURIType` type instances in this column.

HTTPURIType

You can use `HTTPURIType` to store URLs to external Web pages or to files. Oracle accesses these files using HTTP (Hypertext Transfer Protocol).

XDBURIType

You can use `XDBURIType` to expose documents in the XML database hierarchy as URIs that can be embedded in any `URIType` column in a table. The `XDBURIType` consists of a URL, which comprises the hierarchical name of the XML document to which it refers and an optional

Copyright © 1996, 2026, Oracle and/or its affiliates.

fragment representing the XPath syntax. The fragment is separated from the URL part by a pound sign (#). The following lines are examples of XDBURIType:

```
/home/oe/doc1.xml
/home/oe/doc1.xml#/orders/order_item
```

DBURIType

DBURIType can be used to store DBURIRef values, which reference data inside the database. Storing DBURIRef values lets you reference data stored inside or outside the database and access the data consistently.

DBURIRef values use an XPath-like representation to reference data inside the database. If you imagine the database as an XML tree, then you would see the tables, rows, and columns as elements in the XML document. For example, the sample human resources user hr would see the following XML tree:

```
<HR>
  <EMPLOYEES>
    <ROW>
      <EMPLOYEE_ID>205</EMPLOYEE_ID>
      <LAST_NAME>Higgins</LAST_NAME>
      <SALARY>12008</SALARY>
      .. <!-- other columns -->
    </ROW>
    ... <!-- other rows -->
  </EMPLOYEES>
  <!-- other tables..-->
</HR>
<!-- other user schemas on which you have some privilege on..-->
```

The DBURIRef is an XPath expression over this virtual XML document. So to reference the SALARY value in the EMPLOYEES table for the employee with employee number 205, you can write a DBURIRef as,

```
/HR/EMPLOYEES/ROW[EMPLOYEE_ID=205]/SALARY
```

Using this model, you can reference data stored in CLOB columns or other columns and expose them as URLs to the external world.

URIFactory Package

Oracle also provides the URIFactory package, which can create and return instances of the various subtypes of the URITypes. The package analyzes the URL string, identifies the type of URL (HTTP, DBURI, and so on), and creates an instance of the subtype. To create a DBURI instance, the URL must begin with the prefix /oradb. For example, URIFactory.getURI('/oradb/HR/EMPLOYEES') would create a DBURIType instance and URIFactory.getUri('/sys/schema') would create an XDBURIType instance.

Spatial Types

Oracle Spatial and Graph is designed to make spatial data management easier and more natural to users of location-enabled applications, geographic information system (GIS) applications, and geoimaging applications. After the spatial data is stored in an Oracle database, you can easily manipulate, retrieve, and relate it to all the other data stored in the database. The following data types are available only if you have installed Oracle Spatial and Graph.

SDO_GEOMETRY

The geometric description of a spatial object is stored in a single row, in a single column of object type `SDO_GEOMETRY` in a user-defined table. Any table that has a column of type `SDO_GEOMETRY` must have another column, or set of columns, that defines a unique primary key for that table. Tables of this sort are sometimes called geometry tables.

The `SDO_GEOMETRY` object type has the following definition:

```
CREATE TYPE SDO_GEOMETRY AS OBJECT
  (sgo_gtype        NUMBER,
   sdo_srid         NUMBER,
   sdo_point        SDO_POINT_TYPE,
   sdo_elem_info    SDO_ELEM_INFO_ARRAY,
   sdo_ordinates    SDO_ORDINATE_ARRAY);
/
```

SDO_TOPO_GEOMETRY

This type describes a topology geometry, which is stored in a single row, in a single column of object type `SDO_TOPO_GEOMETRY` in a user-defined table.

The `SDO_TOPO_GEOMETRY` object type has the following definition:

```
CREATE TYPE SDO_TOPO_GEOMETRY AS OBJECT
  (tg_type        NUMBER,
   tg_id          NUMBER,
   tg_layer_id    NUMBER,
   topology_id    NUMBER);
/
```

SDO_GEORASTER

In the GeoRaster object-relational model, a raster grid or image object is stored in a single row, in a single column of object type `SDO_GEORASTER` in a user-defined table. Tables of this sort are called GeoRaster tables.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The SDO_GEORASTER object type has the following definition:

```
CREATE TYPE SDO_GEORASTER AS OBJECT
  (rasterType         NUMBER,
   spatialExtent      SDO_GEOMETRY,
   rasterDataTable    VARCHAR2(32),
   rasterID           NUMBER,
   metadata           XMLType);
/
```

Data Type Comparison Rules

This section describes how the database compares values of each data type.

Numeric Values

A larger value is considered greater than a smaller one. All negative numbers are less than zero and all positive numbers. Thus, -1 is less than 100; -100 is less than -1.

The floating-point value NaN (not a number) is greater than any other numeric value and is equal to itself.

See Also

Numeric Precedence and Floating-Point Numbers for more information on comparison semantics

Datetime Values

A later date or timestamp is considered greater than an earlier one. For example, the date equivalent of '29-MAR-2005' is less than that of '05-JAN-2006' and the timestamp equivalent of '05-JAN-2006 1:35pm' is greater than that of '05-JAN-2005 10:09am'.

When two timestamps with time zone are compared, they are first normalized to UTC, that is, to the timezone offset '+00:00'. For example, the timestamp with time zone equivalent of '16-OCT-2016 05:59am Europe/Warsaw' is equal to that of '15-OCT-2016 08:59pm US/Pacific'. Both represent the same absolute point in time, which represented in UTC is October 16th, 2016, 03:59am.

Binary Values

A binary value of the data type RAW or BLOB is a sequence of bytes. When two binary values are compared, the corresponding, consecutive bytes of the two byte sequences are compared in turn. If the first bytes of both compared values are different, the binary value that contains the byte with the lower numeric value is considered smaller. If the first bytes are equal, second

Copyright © 1996, 2026, Oracle and/or its affiliates.

bytes are compared analogously, and so on, until either the compared bytes differ or the comparison process reaches the end of one of the values. In the latter case, the value that is shorter is considered smaller.

Binary values of the data type `BLOB` cannot be compared directly in comparison conditions. However, they can be compared with the PL/SQL function `DBMS_LOB.COMPARE`.

> **See Also**
>
> *Oracle AI Database PL/SQL Packages and Types Reference* for more information on the `DBMS_LOB.COMPARE` function

Character Values

Character values are compared on the basis of two measures:

- Binary or linguistic collation
- Blank-padded or nonpadded comparison semantics

The following subsections describe the two measures.

Binary and Linguistic Collation

In binary collation, which is the default, Oracle compares character values like binary values. Two sequences of bytes that form the encodings of two character values in their storage character set are treated as binary values and compared as described in Binary Values . The result of this comparison is returned as the result of the binary comparison of the source character values.

> **See Also**
>
> *Oracle AI Database Globalization Support Guide* for more information on character sets

For many languages, the binary collation can yield a linguistically incorrect ordering of character values. For example, in most common character sets, all the uppercase Latin letters have character codes with lower values than all the lowercase Latin letters. Hence, the binary collation yields the following order:

```
MacDonald
MacIntosh
Macdonald
Macintosh
```

However, most users expect these four values to be presented in the order:

```
MacDonald
Macdonald
MacIntosh
Macintosh
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

This shows that binary collation may not be suitable even for English character values.

Oracle Database supports linguistic collations that order strings according to rules of various spoken languages. It also supports collation variants that match character values case- and accent-insensitively. Linguistic collations are more expensive but they provide superior user experience.

> **See Also**
>
> *Oracle AI Database Globalization Support Guide* for more information about linguistic sorting

Restrictions for Linguistic Collations

Comparison conditions, `ORDER BY`, `GROUP BY` and `MATCH_RECOGNIZE` query clauses, `COUNT(DISTINCT)` and statistical aggregate functions, `LIKE` conditions, and `ORDER BY` and `PARTITION BY` analytic clauses generate collation keys when using linguistic collations. The collation keys are the same values that are returned by the function `NLSSORT` and are subject to the same restrictions that are described in NLSSORT .

Blank-Padded and Nonpadded Comparison Semantics

With blank-padded semantics, if the two values have different lengths, then Oracle first adds blanks to the end of the shorter one so their lengths are equal. Oracle then compares the values character by character up to the first character that differs. The value with the greater character in the first differing position is considered greater. If two values have no differing characters, then they are considered equal. This rule means that two values are equal if they differ only in the number of trailing blanks. Oracle uses blank-padded comparison semantics only when both values in the comparison are either expressions of data type `CHAR`, `NCHAR`, text literals, or values returned by the `USER` function.

With nonpadded semantics, Oracle compares two values character by character up to the first character that differs. The value with the greater character in that position is considered greater. If two values of different length are identical up to the end of the shorter one, then the longer value is considered greater. If two values of equal length have no differing characters, then the values are considered equal. Oracle uses nonpadded comparison semantics whenever one or both values in the comparison have the data type `VARCHAR2` or `NVARCHAR2`.

The results of comparing two character values using different comparison semantics may vary. The table that follows shows the results of comparing five pairs of character values using each comparison semantic. Usually, the results of blank-padded and nonpadded comparisons are the same. The last comparison in the table illustrates the differences between the blank-padded and nonpadded comparison semantics.

Blank-Padded	Nonpadded
`'ac' > 'ab'`	`'ac' > 'ab'`
`'ab' > 'a '`	`'ab' > 'a '`
`'ab' > 'a'`	`'ab' > 'a'`
`'ab' = 'ab'`	`'ab' = 'ab'`
`'a ' = 'a'`	**`'a ' > 'a'`**

Copyright © 1996, 2026, Oracle and/or its affiliates.

Data-Bound Collation

Starting with Oracle Database 12*c* Release 2 (12.2), the collation to use when comparing or matching a given character value is associated with the value itself. It is called the **data-bound collation**. The data-bound collation can be viewed as an attribute of the data type of the value.

In previous Oracle Database releases, the session parameters `NLS_COMP` and `NLS_SORT` coarsely determined the collation for all collation-sensitive SQL operations in a database session. The data-bound collation architecture enables applications to consistently apply language-specific comparison rules to exactly the data that needs these rules.

Oracle Database 12*c* Release 2 (12.2) allows you to declare a collation for a table column. When a column is passed as an argument to a collation-sensitive SQL operation, the SQL operation uses the column's declared collation to process the column's values. If the SQL operation has multiple character arguments that are compared to each other, the **collation determination rules** determine the collation to use.

There are two types of data-bound collations:

- Named Collation: This collation is a particular set of collating rules specified by a collation name. Named collations are the same collations that are specified as values for the `NLS_SORT` parameter. A named collation can be either a binary collation or a linguistic collation.
- Pseudo-collation: This collation does not directly specify the collating rules for a SQL operation. Instead, it instructs the operation to check the values of the session parameters `NLS_SORT` and `NLS_COMP` for the actual named collation to use. Pseudo-collations are the bridge between the new declarative method of specifying collations and the old method that uses session parameters. In particular, the pseudo-collation `USING_NLS_COMP` directs a SQL operation to behave exactly as it used to behave before Oracle Database 12*c* Release 2.

When you declare a named collation for a column, you statically determine how the column values are compared. When you declare a pseudo-collation, you can dynamically control comparison behavior with the session parameter `NLS_COMP` and `NLS_SORT`. However, static objects, such as indexes and constraints, defined on a column declared with a pseudo-collation, fall back to using a binary collation. Dynamically settable collating rules cannot be used to compare values for a static object.

The collation for a character literal or bind variable that is used in an expression is derived from the default collation of the database object containing the expression, such as a view or materialized view query, a PL/SQL stored unit code, a user-defined type method code, or a standalone DML or query statement. In Oracle Database 12*c* Release 2, the default collation of PL/SQL stored units, user-defined type methods, and standalone SQL statements is always the pseudo-collation `USING_NLS_COMP`. The default collation of views and materialized views can be specified in the `DEFAULT COLLATION` clause of the `CREATE VIEW` and `CREATE MATERIALIZED VIEW` statements.

If a SQL operation returns character values, the **collation derivation rules** determine the **derived collation** for the result, so that its collation is known, when the result is passed as an argument to another collation-sensitive SQL operation in the expression tree or to a top-level consumer, such as an SQL statement clause in a `SELECT` statement. If a SQL operation operates on character argument values, then the derived collation of its character result is based on the collations of the arguments. Otherwise, the derivation rules are the same as for a character literal.

You can override the derived collation of an expression node, such as a simple expression or an operator result, by using the `COLLATE` operator.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Oracle Database allows you to declare a case-insensitive collation for a column, table or schema, so that the column or all character columns in a table or a schema can be always compared in a case-insensitive way.

See Also

- *Oracle AI Database Globalization Support Guide* for more information on data-bound collation architecture, including the detailed collation derivation and determination rules
- COLLATE Operator

Object Values

Object values are compared using one of two comparison functions: `MAP` and `ORDER`. Both functions compare object type instances, but they are quite different from one another. These functions must be specified as part of any object type that will be compared with other object types.

See Also

CREATE TYPE for a description of `MAP` and `ORDER` methods and the values they return

Varrays and Nested Tables

Comparison of nested tables is described in Comparison Conditions .

Data Type Precedence

Oracle uses data type precedence to determine implicit data type conversion, which is discussed in the section that follows. Oracle data types take the following precedence:

- Datetime and interval data types
- `BINARY_DOUBLE`
- `BINARY_FLOAT`
- `NUMBER`
- Character data types
- All other built-in data types

Data Conversion

Generally an expression cannot contain values of different data types. For example, an expression cannot multiply 5 by 10 and then add 'JAMES'. However, Oracle supports both implicit and explicit conversion of values from one data type to another.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Implicit and Explicit Data Conversion

Oracle recommends that you specify explicit conversions, rather than rely on implicit or automatic conversions, for these reasons:

- SQL statements are easier to understand when you use explicit data type conversion functions.
- Implicit data type conversion can have a negative impact on performance, especially if the data type of a column value is converted to that of a constant rather than the other way around.
- Implicit conversion depends on the context in which it occurs and may not work the same way in every case. For example, implicit conversion from a datetime value to a `VARCHAR2` value may return an unexpected year depending on the value of the `NLS_DATE_FORMAT` parameter.
- Algorithms for implicit conversion are subject to change across software releases and among Oracle products. Behavior of explicit conversions is more predictable.
- If implicit data type conversion occurs in an index expression, then Oracle Database might not use the index because it is defined for the pre-conversion data type. This can have a negative impact on performance.

Implicit Data Conversion

The database automatically converts a value from one data type to another when such a conversion makes sense.

Table 2-9 is a matrix of Oracle implicit conversions. The table shows all possible conversions, without regard to the direction of the conversion or the context in which it is made.

The cells with an 'X' indicate the possible implicit conversions from source to destination data type.

Table 2-9 Implicit Type Conversion Matrix

Data Type	CHAR	VARCHAR2	NCHAR	NVARCHAR2	DATE	DATETIME/INTERVAL	NUMBER	BINARY_FLOAT	BINARY_DOUBLE	LONG	RAW	ROWID	CLOB	BLOB	NCLOB	BOOLEAN
CHAR	--	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
VARCHAR2	X	--	X	X	X	X	X	X	X	X	X	X	X	--	X	--
NCHAR	X	X	--	X	X	X	X	X	X	X	X	X	X	--	X	X
NVARCHAR2	X	X	X	--	X	X	X	X	X	X	X	X	X	--	X	--
DATE	X	X	X	X	--	--	--	--	--	--	--	--	--	--	--	--
DATETIME/INTERVAL	X	X	X	X	--	--	--	--	--	X	--	--	--	--	--	--
NUMBER	X	X	X	X	--	--	--	X	X	--	--	--	--	--	--	X

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 2-9 (Cont.) Implicit Type Conversion Matrix

Data Type	CHAR	VARCHAR2	NCHAR	NVARCHAR2	DATE	DATETIME/INTERVAL	NUMBER	BINARY_FLOAT	BINARY_DOUBLE	LONG	RAW	ROWID	CLOB	BLOB	NCLOB	BOOLEAN
BINARY_FLOAT	X	X	X	X	--	--	X	--	X	--	--	--	--	--	--	X
BINARY_DOUBLE	X	X	X	X	--	--	X	X	--	--	--	--	--	--	--	X
LONG	X	X	X	X	--	X[1]	--	--	--	--	X	--	X	--	X	--
RAW	X	X	X	X	--	--	--	--	--	X	--	--	--	X	--	--
ROWID	X	X	X	X	--	--	--	--	--	--	--	--	--	--	--	--
CLOB	X	X	X	X	--	--	--	--	-	X	--	--	--	--	X	--
BLOB	--	--	--	--	--	--	--	--	-	--	X	--	--	--	--	--
NCLOB	X	X	X	X	--	--	--	--	-	X	--	--	X	--	--	--
JSON	--	X	--	--	--	--	--	--	--	--	--	--	X	X	--	--
BOOLEAN	X	X	X	X	--	--	X	X	X	--	--	--	--	--	--	--

[1] You cannot convert `LONG` to `INTERVAL` directly, but you can convert `LONG` to `VARCHAR2` using `TO_CHAR(`*`interval`*`)`, and then convert the resulting `VARCHAR2` value to `INTERVAL`.

Implicit Data Type Conversion Rules

- During `INSERT` and `UPDATE` operations, Oracle converts the value to the data type of the affected column.
- During `SELECT FROM` operations, Oracle converts the data from the column to the type of the target variable.
- When manipulating numeric values, Oracle usually adjusts precision and scale to allow for maximum capacity. In such cases, the numeric data type resulting from such operations can differ from the numeric data type found in the underlying tables.
- When comparing a character value with a numeric value, Oracle converts the character data to a numeric value.
- Conversions between character values or `NUMBER` values and floating-point number values can be inexact, because the character types and `NUMBER` use decimal precision to represent the numeric value, and the floating-point numbers use binary precision.
- When converting a `CLOB` value into a character data type such as `VARCHAR2`, or converting `BLOB` to `RAW` data, if the data to be converted is larger than the target data type, then the database returns an error.
- During conversion from a timestamp value to a `DATE` value, the fractional seconds portion of the timestamp value is truncated.
- Conversions from `BINARY_FLOAT` to `BINARY_DOUBLE` are exact.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- Conversions from BINARY_DOUBLE to BINARY_FLOAT are inexact if the BINARY_DOUBLE value uses more bits of precision that supported by the BINARY_FLOAT.
- When comparing a character value with a DATE value, Oracle converts the character data to DATE.
- When you use a SQL function or operator with an argument of a data type other than the one it accepts, Oracle converts the argument to the accepted data type.
- When making assignments, Oracle converts the value on the right side of the equal sign (=) to the data type of the target of the assignment on the left side.
- During concatenation operations, Oracle converts from noncharacter data types to CHAR or NCHAR.
- During arithmetic operations on and comparisons between character and noncharacter data types, Oracle converts from any character data type to a numeric, date, or rowid, as appropriate. In arithmetic operations between CHAR/VARCHAR2 and NCHAR/NVARCHAR2, Oracle converts to a NUMBER.
- Most SQL character functions are enabled to accept CLOBs as parameters, and Oracle performs implicit conversions between CLOB and character types. Therefore, functions that are not yet enabled for CLOBs can accept CLOBs through implicit conversion. In such cases, Oracle converts the CLOBs to CHAR or VARCHAR2 before the function is invoked. If the CLOB is larger than 4000 bytes, then Oracle converts only the first 4000 bytes to CHAR.
- When converting RAW or LONG RAW data to or from character data, the binary data is represented in hexadecimal form, with one hexadecimal character representing every four bits of RAW data. Refer to "RAW and LONG RAW Data Types " for more information.
- Comparisons between CHAR and VARCHAR2 and between NCHAR and NVARCHAR2 types may entail different character sets. The default direction of conversion in such cases is from the database character set to the national character set. Table 2-10 shows the direction of implicit conversions between different character types.

Table 2-10 Conversion Direction of Different Character Types

Source Data Type	to CHAR	to VARCHAR2	to NCHAR	to NVARCHAR2
from CHAR	-	VARCHAR2	NCHAR	NVARCHAR2
from VARCHAR2	VARCHAR2	-	NVARCHAR2	NVARCHAR2
from NCHAR	NCHAR	NCHAR	-	NVARCHAR2
from NVARCHAR2	NVARCHAR2	NVARCHAR2	NVARCHAR2	-

User-defined types such as collections cannot be implicitly converted, but must be explicitly converted using CAST ... MULTISET.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Implicit Data Conversion Examples

Text Literal Example

The text literal '10' has data type `CHAR`. Oracle implicitly converts it to the `NUMBER` data type if it appears in a numeric expression as in the following statement:

```
SELECT salary + '10'
  FROM employees;
```

Character and Number Values Example

When a condition compares a character value and a `NUMBER` value, Oracle implicitly converts the character value to a `NUMBER` value, rather than converting the `NUMBER` value to a character value. In the following statement, Oracle implicitly converts '200' to 200:

```
SELECT last_name
  FROM employees
  WHERE employee_id = '200';
```

Date Example

In the following statement, Oracle implicitly converts '`24-JUN-06`' to a `DATE` value using the default date format '`DD-MON-YY`':

```
SELECT last_name
  FROM employees
  WHERE hire_date = '24-JUN-06';
```

Explicit Data Conversion

You can explicitly specify data type conversions using SQL conversion functions. Table 2-11 shows SQL functions that explicitly convert a value from one data type to another.

You cannot specify `LONG` and `LONG RAW` values in cases in which Oracle can perform implicit data type conversion. For example, `LONG` and `LONG RAW` values cannot appear in expressions with functions or operators. Refer to LONG Data Type for information on the limitations on `LONG` and `LONG RAW` data types.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Security Considerations for Data Conversion

When a datetime value is converted to text, either by implicit conversion or by explicit conversion that does not specify a format model, the format model is defined by one of the globalization session parameters. Depending on the source data type, the parameter name is `NLS_DATE_FORMAT`, `NLS_TIMESTAMP_FORMAT`, or `NLS_TIMESTAMP_TZ_FORMAT`. The values of these parameters can be specified in the client environment or in an `ALTER SESSION` statement.

The dependency of format models on session parameters can have a negative impact on database security when conversion without an explicit format model is applied to a datetime value that is being concatenated to text of a dynamic SQL statement. Dynamic SQL statements are those statements whose text is concatenated from fragments before being passed to a database for execution. Dynamic SQL is frequently associated with the built-in PL/SQL package `DBMS_SQL` or with the PL/SQL statement `EXECUTE IMMEDIATE`, but these are not the only places where dynamically constructed SQL text may be passed as argument. For example:

```
EXECUTE IMMEDIATE
'SELECT last_name FROM employees WHERE hire_date > ''' || start_date || '''';
```

where *`start_date`* has the data type `DATE`.

In the above example, the value of *`start_date`* is converted to text using a format model specified in the session parameter `NLS_DATE_FORMAT`. The result is concatenated into SQL text. A datetime format model can consist simply of literal text enclosed in double quotation marks. Therefore, any user who can explicitly set globalization parameters for a session can decide what text is produced by the above conversion. If the SQL statement is executed by a PL/SQL procedure, the procedure becomes vulnerable to SQL injection through the session parameter. If the procedure runs with definer's rights, with higher privileges than the session itself, the user can gain unauthorized access to sensitive data.

> **See Also**
>
> *Oracle AI Database PL/SQL Language Reference* for further examples and for recommendations on avoiding this security risk

> **Note**
>
> This security risk also applies to middle-tier applications that construct SQL text from datetime values converted to text by the database or by OCI datetime functions. Those applications are vulnerable if session globalization parameters are obtained from a user preference.

Implicit and explicit conversion for numeric values may also suffer from the analogous problem, as the conversion result may depend on the session parameter `NLS_NUMERIC_CHARACTERS`. This parameter defines the decimal and group separator characters. If the decimal separator is defined to be the quotation mark or the double quotation mark, some potential for SQL injection emerges.

> - Format Models for information on the format models

Literals

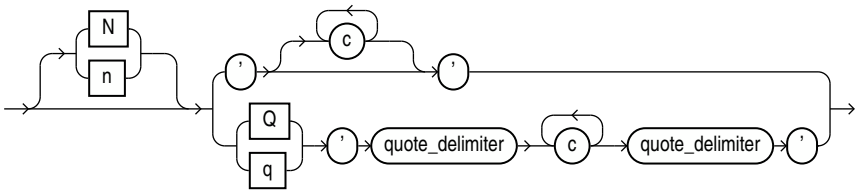
The terms **literal** and **constant value** are synonymous and refer to a fixed data value. For example, 'JACK', 'BLUE ISLAND', and '101' are all character literals; 5001 is a numeric literal. Character literals are enclosed in single quotation marks so that Oracle can distinguish them from schema object names.

This section contains these topics:

- Text Literals
- Numeric Literals
- Datetime Literals
- Interval Literals

Many SQL statements and functions require you to specify character and numeric literal values. You can also specify literals as part of expressions and conditions. You can specify character literals with the '*text*' notation, national character literals with the *N'text'* notation, and numeric literals with the *integer*, or *number* notation, depending on the context of the literal. The syntactic forms of these notations appear in the sections that follow.

To specify a datetime or interval data type as a literal, you must take into account any optional precisions included in the data types. Examples of specifying datetime and interval data types as literals are provided in the relevant sections of Data Types .



Copyright © 1996, 2026, Oracle and/or its affiliates.

Text Literals

Use the text literal notation to specify values whenever *string* appears in the syntax of expressions, conditions, SQL functions, and SQL statements in other parts of this reference. This reference uses the terms **text literal**, **character literal**, and **string** interchangeably. Text, character, and string literals are always surrounded by single quotation marks. If the syntax uses the term *char*, then you can specify either a text literal or another expression that resolves to character data — for example, the `last_name` column of the `hr.employees` table. When *char* appears in the syntax, the single quotation marks are not used.

The syntax of text literals or strings follows:

***string*::=**

where `N` or `n` specifies the literal using the national character set (`NCHAR` or `NVARCHAR2` data). By default, text entered using this notation is translated into the national character set by way of the database character set when used by the server. To avoid potential loss of data during the text literal conversion to the database character set, set the environment variable `ORA_NCHAR_LITERAL_REPLACE` to `TRUE`. Doing so transparently replaces the `n'` internally and preserves the text literal for SQL processing.

> **See Also**
>
> *Oracle AI Database Globalization Support Guide* for more information about N-quoted literals

In the top branch of the syntax:

- *c* is any member of the user's character set. A single quotation mark (') within the literal must be preceded by an escape character. To represent one single quotation mark within a literal, enter two single quotation marks.
- `' '` are two single quotation marks that begin and end text literals.

In the bottom branch of the syntax:

- `Q` or `q` indicates that the alternative quoting mechanism will be used. This mechanism allows a wide range of delimiters for the text string.
- The outermost `' '` are two single quotation marks that precede and follow, respectively, the opening and closing *quote_delimiter*.
- *c* is any member of the user's character set. You can include quotation marks (") in the text literal made up of `c` characters. You can also include the *quote_delimiter*, as long as it is not immediately followed by a single quotation mark.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- *quote_delimiter* is any single- or multibyte character except space, tab, and return. The *quote_delimiter* can be a single quotation mark. However, if the *quote_delimiter* appears in the text literal itself, ensure that it is not immediately followed by a single quotation mark.

  If the opening *quote_delimiter* is one of [, {, <, or (, then the closing *quote_delimiter* must be the corresponding], }, >, or). In all other cases, the opening and closing *quote_delimiter* must be the same character.

Text literals have properties of both the CHAR and VARCHAR2 data types:

- Within expressions and conditions, Oracle treats text literals as though they have the data type CHAR by comparing them using blank-padded comparison semantics.
- A text literal can have a maximum length of 4000 bytes if the initialization parameter MAX_STRING_SIZE = STANDARD, and 32767 bytes if MAX_STRING_SIZE = EXTENDED. See Extended Data Types for more information.

Here are some valid text literals:

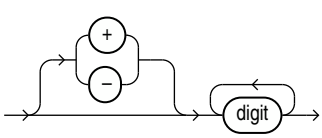
```
'Hello'
'ORACLE.dbs'
'Jackie''s raincoat'
'09-MAR-98'
N'nchar literal'
```

Here are some valid text literals using the alternative quoting mechanism:

```
q'!name LIKE '%DBMS_%%'!'
q'<'So,' she said, 'It's finished.'>'
q'{SELECT * FROM employees WHERE last_name = 'Smith';}'
nq'ï Ÿ1234 ï'
q'"name like '['"'
```

> **See Also**
>
> Blank-Padded and Nonpadded Comparison Semantics

Numeric Literals



Use numeric literal notation to specify fixed and floating-point numbers.

Integer Literals

You must use the integer notation to specify an integer whenever *integer* appears in expressions, conditions, SQL functions, and SQL statements described in other parts of this reference.

The syntax of *integer* follows:

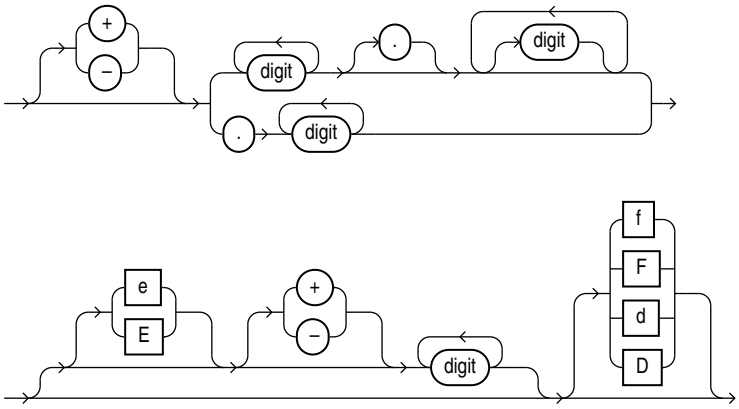
***integer*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

where *digit* is one of 0, 1, 2, 3, 4, 5, 6, 7, 8, 9.

An integer can store a maximum of 38 digits of precision.

Here are some valid integers:



```
7
+255
```

NUMBER and Floating-Point Literals

You must use the number or floating-point notation to specify values whenever *number* or *n* appears in expressions, conditions, SQL functions, and SQL statements in other parts of this reference.

The syntax of *number* follows:

***number*::=**

where

- + or - indicates a positive or negative value. If you omit the sign, then a positive value is the default.
- *digit* is one of 0, 1, 2, 3, 4, 5, 6, 7, 8 or 9.
- e or E indicates that the number is specified in scientific notation. The digits after the E specify the exponent. The exponent can range from -130 to 125.
- f or F indicates that the number is a 32-bit binary floating point number of type `BINARY_FLOAT`.
- d or D indicates that the number is a 64-bit binary floating point number of type `BINARY_DOUBLE`.

  If you omit f or F and d or D, then the number is of type `NUMBER`.

  The suffixes f (F) and d (D) are supported only in floating-point number literals, not in character strings that are to be converted to `NUMBER`. For example, if the database is expecting a `NUMBER` and it encounters the string `'9'`, then it converts the string to the number 9. However, if Oracle encounters the string `'9f'`, then conversion fails and an error is returned.

A number of type `NUMBER` can store a maximum of 38 digits of precision. If the literal requires more precision than provided by `NUMBER`, `BINARY_FLOAT`, or `BINARY_DOUBLE`, then the database

Copyright © 1996, 2026, Oracle and/or its affiliates.

truncates the value. If the range of the literal exceeds the range supported by `NUMBER`, `BINARY_FLOAT`, or `BINARY_DOUBLE`, then the database raises an error.

Numeric literals are SQL syntax elements, which are not sensitive to NLS settings. The decimal separator character in numeric literals is always the period (.). However, if a text literal is specified where a numeric value is expected, then the text literal is implicitly converted to a number in an NLS-sensitive way. The decimal separator contained in the text literal must be the one established with the initialization parameter `NLS_NUMERIC_CHARACTERS`. The recommendation is that you use numeric literals in SQL scripts to make them work independently of the NLS environment.

The following examples illustrate the behavior of decimal separators in numeric literals and text literals. These examples assume that you have established the comma (,) as the NLS decimal separator for the current session with the following statement:

```
ALTER SESSION SET NLS_NUMERIC_CHARACTERS=',.';
```

The previous statement also establishes the period (.) as the NLS group separator, but that is irrelevant for these examples.

This example uses the required decimal separator (.) in the numeric literal `1.23` and the established NLS decimal separator (,) in the text literal `'2,34'`. The text literal is converted to the numeric value 2.34, and the output is displayed using commas for the decimal separators.

```
SELECT 2 * 1.23, 3 * '2,34' FROM DUAL;

    2*1.23   3*'2,34'
---------- ----------
      2,46       7,02
```

The next example shows that a comma is not treated as part of a numeric literal. Rather, the comma is treated as the delimiter in a list of two numeric expressions: `2*1` and `23`.

```
SELECT 2 * 1,23 FROM DUAL;

      2*1         23
---------- ----------
         2         23
```

The next example shows that the decimal separator in a text literal must match the NLS decimal separator in order for implicit text-to-number conversion to succeed. The following statement fails because the decimal separator (.) does not match the established NLS decimal separator (,):

```
SELECT 3 * '2.34' FROM DUAL;
           *
ERROR at line 1:
ORA-01722: invalid number
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> ALTER SESSION and *Oracle AI Database Reference*

Here are some valid NUMBER literals:

```
25
+6.34
0.5
25e-03
-1
```

Here are some valid floating-point number literals:

```
25f
+6.34F
0.5d
-1D
```

You can also use the following supplied floating-point literals in situations where a value cannot be expressed as a numeric literal:

Table 2-12 Floating-Point Literals

Literal	Meaning	Example
binary_float_nan	A value of type BINARY_FLOAT for which the condition IS NAN is true	SELECT COUNT(*) FROM employees WHERE TO_BINARY_FLOAT(commission_pct) != BINARY_FLOAT_NAN;
binary_float_infinity	Single-precision positive infinity	SELECT COUNT(*) FROM employees WHERE salary < BINARY_FLOAT_INFINITY;
binary_double_nan	A value of type BINARY_DOUBLE for which the condition IS NAN is true	SELECT COUNT(*) FROM employees WHERE TO_BINARY_FLOAT(commission_pct) != BINARY_FLOAT_NAN;
binary_double_infinity	Double-precision positive infinity	SELECT COUNT(*) FROM employees WHERE salary < BINARY_DOUBLE_INFINITY;

Datetime Literals

The database supports four datetime data types: DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, and TIMESTAMP WITH LOCAL TIME ZONE.

Date Literals

You can specify a DATE value as a string literal, or you can convert a character or numeric value to a date value with the TO_DATE function. DATE literals are the only case in which the database accepts a TO_DATE expression in place of a string literal.

Copyright © 1996, 2026, Oracle and/or its affiliates.

To specify a DATE value as a literal, you must use the Gregorian calendar. You can specify an ANSI literal, as shown in this example:

```
DATE '1998-12-25'
```

The ANSI date literal contains no time portion, and must be specified in the format 'YYYY-MM-DD'. Alternatively you can specify an Oracle date value, as in the following example:

```
TO_DATE('98-DEC-25 17:30','YY-MON-DD HH24:MI')
```

The default date format for an Oracle DATE value is specified by the initialization parameter NLS_DATE_FORMAT. This example date format includes a two-digit number for the day of the month, an abbreviation of the month name, the last two digits of the year, and a 24-hour time designation.

Oracle automatically converts character values that are in the default date format into date values when they are used in date expressions.

If you specify a date value without a time component, then the default time is midnight (00:00:00 or 12:00:00 for 24-hour and 12-hour clock time, respectively). If you specify a date value without a date, then the default date is the first day of the current month.

Oracle DATE columns always contain both the date and time fields. Therefore, if you query a DATE column, then you must either specify the time field in your query or ensure that the time fields in the DATE column are set to midnight. Otherwise, Oracle may not return the query results you expect. You can use the TRUNC date function to set the time field to midnight, or you can include a greater-than or less-than condition in the query instead of an equality or inequality condition.

Examples

The following example create a table my_table with a number column row_num and a DATE column datecol:

```
CREATE TABLE IF NOT EXISTS my_table (
  row_num NUMBER,
  datecol DATE);

INSERT INTO my_table VALUES (1, SYSDATE);
INSERT INTO my_table VALUES (2, TRUNC(SYSDATE));

SELECT *
  FROM my_table;

SELECT *
  FROM my_table
  WHERE datecol > TO_DATE('01-JUN-26', 'DD-MON-YY');

SELECT *
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
  FROM my_table
  WHERE datecol = TO_DATE('18-JUN-26','DD-MON-YY');
```

If you know that the time fields of your DATE column are set to midnight, then you can query your DATE column as shown in the immediately preceding example, or by using the DATE literal:

```
SELECT *
  FROM my_table
  WHERE datecol = DATE '2026-06-18';
```

However, if the DATE column contains values other than midnight, then you must filter out the time fields in the query to get the correct result. For example:

```
SELECT *
  FROM my_table
  WHERE TRUNC(datecol) = DATE '2026-06-18';
```

Oracle applies the TRUNC function to each row in the query, so performance is better if you ensure the midnight value of the time fields in your data. To ensure that the time fields are set to midnight, use one of the following methods during inserts and updates:

- Use the TO_DATE function to mask out the time fields:

  ```
  INSERT INTO my_table
    VALUES (3, TO_DATE('3-OCT-2002','DD-MON-YYYY'));
  ```

- Use the DATE literal:

  ```
  INSERT INTO my_table
    VALUES (4, '03-OCT-02');
  ```

- Use the TRUNC function:

  ```
  INSERT INTO my_table
    VALUES (5, TRUNC(SYSDATE));
  ```

The date function SYSDATE returns the current system date and time. The function CURRENT_DATE returns the current session date. For information on SYSDATE, the TO_* datetime functions, and the default date format, see Datetime Functions .

TIMESTAMP Literals

The TIMESTAMP data type stores year, month, day, hour, minute, and second, and fractional second values. When you specify TIMESTAMP as a literal, the *fractional_seconds_precision* value can be any number of digits up to 9, as follows:

```
TIMESTAMP '1997-01-31 09:26:50.124'
```

TIMESTAMP WITH TIME ZONE Literals

The TIMESTAMP WITH TIME ZONE data type is a variant of TIMESTAMP that includes a time zone region name or time zone offset. When you specify TIMESTAMP WITH TIME ZONE as a literal, the *fractional_seconds_precision* value can be any number of digits up to 9. For example:

```
TIMESTAMP '1997-01-31 09:26:56.66 +02:00'
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Two TIMESTAMP WITH TIME ZONE values are considered identical if they represent the same instant in UTC, regardless of the TIME ZONE offsets stored in the data. For example,

```
TIMESTAMP '1999-04-15 8:00:00 -8:00'
```

is the same as

```
TIMESTAMP '1999-04-15 11:00:00 -5:00'
```

8:00 a.m. Pacific Standard Time is the same as 11:00 a.m. Eastern Standard Time.

You can replace the UTC offset with the TZR (time zone region name) format element. For example, the following example has the same value as the preceding example:

```
TIMESTAMP '1999-04-15 8:00:00 US/Pacific'
```

To eliminate the ambiguity of boundary cases when the daylight saving time switches, use both the TZR and a corresponding TZD format element. The following example ensures that the preceding example will return a daylight saving time value:

```
TIMESTAMP '1999-10-29 01:30:00 US/Pacific PDT'
```

You can also express the time zone offset using a datetime expression:

```
SELECT TIMESTAMP '2009-10-29 01:30:00' AT TIME ZONE 'US/Pacific'
  FROM DUAL;
```

See Also

Datetime Expressions for more information

If you do not add the TZD format element, and the datetime value is ambiguous, then Oracle returns an error if you have the ERROR_ON_OVERLAP_TIME session parameter set to TRUE. If that parameter is set to FALSE, then Oracle interprets the ambiguous datetime as standard time in the specified region.

TIMESTAMP WITH LOCAL TIME ZONE Literals

The TIMESTAMP WITH LOCAL TIME ZONE data type differs from TIMESTAMP WITH TIME ZONE in that data stored in the database is normalized to the database time zone. The time zone offset is not stored as part of the column data. There is no literal for TIMESTAMP WITH LOCAL TIME ZONE. Rather, you represent values of this data type using any of the other valid datetime literals. The table that follows shows some of the formats you can use to insert a value into a TIMESTAMP WITH LOCAL TIME ZONE column, along with the corresponding value returned by a query.

Table 2-13 TIMESTAMP WITH LOCAL TIME ZONE Literals

Value Specified in INSERT Statement	Value Returned by Query
'19-FEB-2004'	19-FEB-2004.00.00.000000 AM
SYSTIMESTAMP	19-FEB-04 02.54.36.497659 PM
TO_TIMESTAMP('19-FEB-2004', 'DD-MON-YYYY')	19-FEB-04 12.00.00.000000 AM
SYSDATE	19-FEB-04 02.55.29.000000 PM
TO_DATE('19-FEB-2004', 'DD-MON-YYYY')	19-FEB-04 12.00.00.000000 AM
TIMESTAMP'2004-02-19 8:00:00 US/Pacific'	19-FEB-04 08.00.00.000000 AM

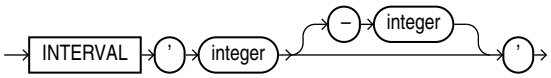
Copyright © 1996, 2026, Oracle and/or its affiliates.

Notice that if the value specified does not include a time component (either explicitly or implicitly), then the value returned defaults to midnight.

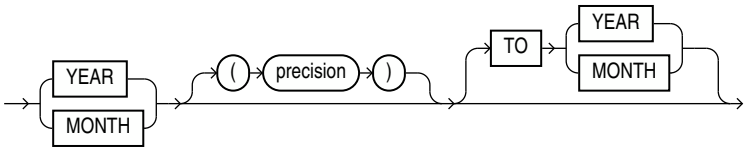
Interval Literals

An interval literal specifies a period of time. You can specify these differences in terms of years and months, or in terms of days, hours, minutes, and seconds. The database supports two types of interval literals, `YEAR TO MONTH` and `DAY TO SECOND`. Each type contains a leading field and may contain a trailing field. The leading field defines the basic unit of date or time being measured. The trailing field defines the smallest increment of the basic unit being considered. For example, a `YEAR TO MONTH` interval considers an interval of years to the nearest month. A `DAY TO MINUTE` interval considers an interval of days to the nearest minute.

If you have date data in numeric form, then you can use the `NUMTOYMINTERVAL` or `NUMTODSINTERVAL` conversion function to convert the numeric data into interval values.



Interval literals are used primarily with analytic functions.



> **See Also**
>
> Analytic Functions , NUMTODSINTERVAL , and NUMTOYMINTERVAL

INTERVAL YEAR TO MONTH

Specify `YEAR TO MONTH` interval literals using the following syntax:

***interval_year_to_month*::=**

where

- *'integer [-integer]'* specifies integer values for the leading and optional trailing field of the literal. If the leading field is `YEAR` and the trailing field is `MONTH`, then the range of integer values for the month field is 0 to 11.
- *precision* is the maximum number of digits in the leading field. The valid range of the leading field precision is 0 to 9 and its default value is 2.

Restriction on the Leading Field

If you specify a trailing field, then it must be less significant than the leading field. For example, `INTERVAL '0-1' MONTH TO YEAR` is not valid.

The following `INTERVAL YEAR TO MONTH` literal indicates an interval of 123 years, 2 months:

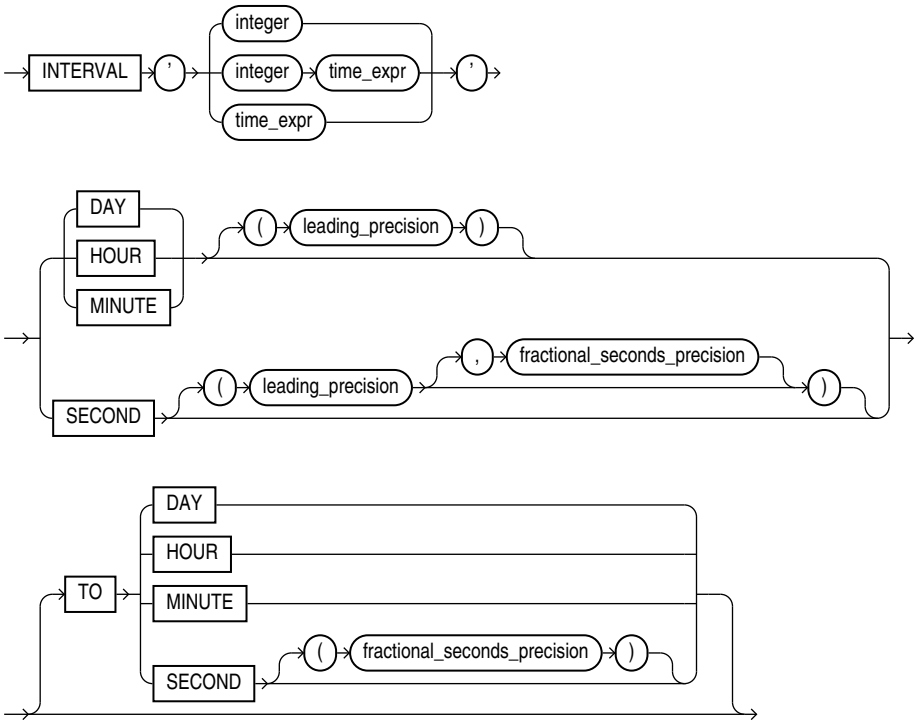
```
INTERVAL '123-2' YEAR(3) TO MONTH
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples of the other forms of the literal follow, including some abbreviated versions:

Table 2-14 Forms of INTERVAL YEAR TO MONTH Literals

Form of Interval Literal	Interpretation
`INTERVAL '123-2' YEAR(3) TO MONTH`	An interval of 123 years, 2 months. You must specify the leading field precision if it is greater than the default of 2 digits.
`INTERVAL '123' YEAR(3)`	An interval of 123 years 0 months.
`INTERVAL '300' MONTH(3)`	An interval of 300 months.
`INTERVAL '4' YEAR`	Maps to `INTERVAL '4-0' YEAR TO MONTH` and indicates 4 years.
`INTERVAL '50' MONTH`	Maps to `INTERVAL '4-2' YEAR TO MONTH` and indicates 50 months or 4 years 2 months.
`INTERVAL '123' YEAR`	Returns an error, because the default precision is 2, and '123' has 3 digits.



You can add or subtract one `INTERVAL YEAR TO MONTH` literal to or from another to yield another `INTERVAL YEAR TO MONTH` literal. For example:

```
INTERVAL '5-3' YEAR TO MONTH + INTERVAL'20' MONTH =
INTERVAL '6-11' YEAR TO MONTH
```

INTERVAL DAY TO SECOND

Specify `DAY TO SECOND` interval literals using the following syntax:

***interval_day_to_second*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

where

- *integer* specifies the number of days. If this value contains more digits than the number specified by the leading precision, then Oracle returns an error.
- *time_expr* specifies a time in the format *HH*[:*MI*[:*SS*[.*n*]]] or *MI*[:*SS*[.*n*]] or *SS*[.*n*], where *n* specifies the fractional part of a second. If *n* contains more digits than the number specified by *fractional_seconds_precision*, then *n* is rounded to the number of digits specified by the *fractional_seconds_precision* value. You can specify *time_expr* following an integer and a space only if the leading field is DAY.
- *leading_precision* is the number of digits in the leading field. Accepted values are 0 to 9. The default is 2.
- *fractional_seconds_precision* is the number of digits in the fractional part of the SECOND datetime field. Accepted values are 1 to 9. The default is 6.

Restriction on the Leading Field:

If you specify a trailing field, then it must be less significant than the leading field. For example, INTERVAL MINUTE TO DAY is not valid. As a result of this restriction, if SECOND is the leading field, the interval literal cannot have any trailing field.

The valid range of values for the trailing field are as follows:

- HOUR: 0 to 23
- MINUTE: 0 to 59
- SECOND: 0 to 59.999999999

Examples of the various forms of INTERVAL DAY TO SECOND literals follow, including some abbreviated versions:

Table 2-15 Forms of INTERVAL DAY TO SECOND Literals

Form of Interval Literal	Interpretation
INTERVAL '4 5:12:10.222' DAY TO SECOND(3)	4 days, 5 hours, 12 minutes, 10 seconds, and 222 thousandths of a second.
INTERVAL '4 5:12' DAY TO MINUTE	4 days, 5 hours and 12 minutes.
INTERVAL '400 5' DAY(3) TO HOUR	400 days 5 hours.
INTERVAL '400' DAY(3)	400 days.
INTERVAL '11:12:10.2222222' HOUR TO SECOND(7)	11 hours, 12 minutes, and 10.2222222 seconds.
INTERVAL '11:20' HOUR TO MINUTE	11 hours and 20 minutes.
INTERVAL '10' HOUR	10 hours.
INTERVAL '10:22' MINUTE TO SECOND	10 minutes 22 seconds.
INTERVAL '10' MINUTE	10 minutes.
INTERVAL '4' DAY	4 days.
INTERVAL '25' HOUR	25 hours.
INTERVAL '40' MINUTE	40 minutes.
INTERVAL '120' HOUR(3)	120 hours.
INTERVAL '30.12345' SECOND(2,4)	30.1235 seconds. The fractional second '12345' is rounded to '1235' because the precision is 4.

Copyright © 1996, 2026, Oracle and/or its affiliates.

You can add or subtract one DAY TO SECOND interval literal from another DAY TO SECOND literal. For example.

```
INTERVAL'20' DAY - INTERVAL'240' HOUR = INTERVAL'10-0' DAY TO SECOND
```

Format Models

A **format model** is a character literal that describes the format of datetime or numeric data stored in a character string. A format model does not change the internal representation of the value in the database. When you convert a character string into a date or number, a format model determines how the database interprets the string. In SQL statements, you can use a format model as an argument of the TO_CHAR and TO_DATE functions to specify:

- The format for Oracle to use to return a value from the database
- The format for a value you have specified for Oracle to store in the database

For example:

- The datetime format model for the string '17:45:29' is 'HH24:MI:SS'.
- The datetime format model for the string '11-Nov-1999' is 'DD-Mon-YYYY'.
- The number format model for the string '$2,304.25' is '$9,999.99'.

For lists of number and datetime format model elements, see Table 2-16 and Table 2-18.

The values of some formats are determined by the value of initialization parameters. For such formats, you can specify the characters returned by these format elements implicitly using the initialization parameter NLS_TERRITORY. You can change the default date format for your session with the ALTER SESSION statement.

See Also

- ALTER SESSION for information on changing the values of these parameters and Format Model Examples for examples of using format models
- TO_CHAR (datetime) , TO_CHAR (number) , and TO_DATE
- *Oracle AI Database Reference* and *Oracle AI Database Globalization Support Guide* for information on these parameters

This remainder of this section describes how to use the following format models:

- Number Format Models
- Datetime Format Models
- Format Model Modifiers

Number Format Models

You can use number format models in the following functions:

- In the TO_CHAR function to translate a value of NUMBER, BINARY_FLOAT, or BINARY_DOUBLE data type to VARCHAR2 data type
- In the TO_NUMBER function to translate a value of CHAR or VARCHAR2 data type to NUMBER data type

Copyright © 1996, 2026, Oracle and/or its affiliates.

- In the TO_BINARY_FLOAT and TO_BINARY_DOUBLE functions to translate CHAR and VARCHAR2 expressions to BINARY_FLOAT or BINARY_DOUBLE values

All number format models cause the number to be rounded to the specified number of significant digits. If a value has more significant digits to the left of the decimal place than are specified in the format, then pound signs (#) replace the value. This event typically occurs when you are using TO_CHAR with a restrictive number format string, causing a rounding operation.

- If a positive NUMBER value is extremely large and cannot be represented in the specified format, then the infinity sign (~) replaces the value. Likewise, if a negative NUMBER value is extremely small and cannot be represented by the specified format, then the negative infinity sign replaces the value (-~).
- If a BINARY_FLOAT or BINARY_DOUBLE value is converted to CHAR or NCHAR, and the input is either infinity or NaN (not a number), then Oracle always returns the pound signs to replace the value. However, if you omit the format model, then Oracle returns either Inf or Nan as a string.

Number Format Elements

A number format model is composed of one or more number format elements. The tables that follow list the elements of a number format model and provide some examples.

Negative return values automatically contain a leading negative sign and positive values automatically contain a leading space unless the format model contains the MI, S, or PR format element.

Table 2-16 Number Format Elements

Element	Example	Description
, (comma)	9,999	Returns a comma in the specified position. You can specify multiple commas in a number format model. **Restrictions:** • A comma element cannot begin a number format model. • A comma cannot appear to the right of a decimal character or period in a number format model.
. (period)	99.99	Returns a decimal point, which is a period (.) in the specified position. **Restriction:** You can specify only one period in a number format model.
$	$9999	Returns value with a leading dollar sign.
0	0999 9990	Returns leading zeros. Returns trailing zeros.
9	9999	Returns value with the specified number of digits with a leading space if positive or with a leading minus if negative. Leading zeros are blank, except for a zero value, which returns a zero for the integer part of the fixed-point number.
B	B9999	Returns blanks for the integer part of a fixed-point number when the integer part is zero (regardless of zeros in the format model).
C	C999	Returns in the specified position the ISO currency symbol (the current value of the NLS_ISO_CURRENCY parameter).
D	99D99	Returns in the specified position the decimal character, which is the current value of the NLS_NUMERIC_CHARACTER parameter. The default is a period (.). **Restriction:** You can specify only one decimal character in a number format model.
EEEE	9.9EEEE	Returns a value using in scientific notation.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 2-16 (Cont.) Number Format Elements

Element	Example	Description
G	`9G999`	Returns in the specified position the group separator (the current value of the `NLS_NUMERIC_CHARACTER` parameter). You can specify multiple group separators in a number format model. **Restriction:** A group separator cannot appear to the right of a decimal character or period in a number format model.
L	`L999`	Returns in the specified position the local currency symbol (the current value of the `NLS_CURRENCY` parameter).
MI	`9999MI`	Returns negative value with a trailing minus sign (-). Returns positive value with a trailing blank. **Restriction:** The MI format element can appear only in the last position of a number format model.
PR	`9999PR`	Returns negative value in <angle brackets>. Returns positive value with a leading and trailing blank. **Restriction:** The PR format element can appear only in the last position of a number format model.
RN rn	`RN` `rn`	Returns a value as Roman numerals in uppercase. Returns a value as Roman numerals in lowercase. Value can be an integer between 1 and 3999.
S	`S9999` `9999S`	Returns negative value with a leading minus sign (-). Returns positive value with a leading plus sign (+). Returns negative value with a trailing minus sign (-). Returns positive value with a trailing plus sign (+). **Restriction:** The S format element can appear only in the first or last position of a number format model.
TM	`TM`	The text minimum number format model returns (in decimal output) the smallest number of characters possible. This element is case insensitive. The default is TM9, which returns the number in fixed notation unless the output exceeds 64 characters. If the output exceeds 64 characters, then Oracle Database automatically returns the number in scientific notation. **Restrictions:** • You cannot precede this element with any other element. • You can follow this element only with one 9 or one E (or e), but not with any combination of these. The following statement returns an error: `SELECT TO_CHAR(1234, 'TM9e') FROM DUAL;`
U	`U9999`	Returns in the specified position the Euro (or other) dual currency symbol, determined by the current value of the `NLS_DUAL_CURRENCY` parameter.
V	`999V99`	Returns a value multiplied by 10^n (and if necessary, round it up), where *n* is the number of 9's after the V.
X	`XXXX` `xxxx`	Returns the hexadecimal value of the specified number of digits. If the specified number is not an integer, then Oracle Database rounds it to an integer. **Restrictions:** • This element accepts only positive values or 0. Negative values return an error. • You can precede this element only with 0 (which returns leading zeroes) or FM. Any other elements return an error. If you specify neither 0 nor FM with X, then the return always has one leading blank. Refer to the format model modifier FM for more information.

+123.456	FM9.9EEEE	'1.2E+02'
+123.45	FM999.009	'123.45'
+123.0	FM999.009	'123.00'
+123.45	L999.99	' $123.45'
+123.45	FML999.99	'$123.45'
+1234567890	9999999999S	'1234567890+'

Datetime Format Models

You can use datetime format models in the following functions:

- In the `TO_*` datetime functions to translate a character value that is in a format other than the default format into a datetime value. (The `TO_*` datetime functions are `TO_DATE`, `TO_TIMESTAMP`, and `TO_TIMESTAMP_TZ`.)
- In the `TO_CHAR` function to translate a datetime value into a character value that is in a format other than the default format (for example, to print the date from an application)

The total length of a datetime format model cannot exceed 22 characters.

The default datetime formats are specified either explicitly with the NLS session parameters `NLS_DATE_FORMAT`, `NLS_TIMESTAMP_FORMAT`, and `NLS_TIMESTAMP_TZ_FORMAT`, or implicitly with

Copyright © 1996, 2026, Oracle and/or its affiliates.

the NLS session parameter NLS_TERRITORY. You can change the default datetime formats for your session with the ALTER SESSION statement.

> **See Also**
>
> ALTER SESSION and *Oracle AI Database Globalization Support Guide* for information on the NLS parameters

Datetime Format Elements

A datetime format model is composed of one or more datetime format elements as listed in Table 2-18.

- For input format models, format items cannot appear twice, and format items that represent similar information cannot be combined. For example, you cannot use 'SYYYY' and 'BC' in the same format string.
- The second column indicates whether the format element can be used in the TO_* datetime functions. All format elements can be used in the TO_CHAR function.
- The following datetime format elements can be used in timestamp and interval format models, but not in the original DATE format model: FF, TZD, TZH, TZM, and TZR.
- Many datetime format elements are padded with blanks or leading zeroes to a specific length. Refer to the format model modifier FM for more information.

> **Note**
>
> Oracle recommends that you use the 4-digit year element (YYYY) instead of the shorter year elements for these reasons:
>
> - The 4-digit year element eliminates ambiguity.
> - The shorter year elements may affect query optimization because the year is not known at query compile time and can only be determined at run time.

Uppercase Letters in Date Format Elements

Capitalization in a spelled-out word, abbreviation, or Roman numeral follows capitalization in the corresponding format element. For example, the date format model 'DAY' produces capitalized words like 'MONDAY'; 'Day' produces 'Monday'; and 'day' produces 'monday'.

Punctuation and Character Literals in Datetime Format Models

You can include these characters in a date format model:

- Punctuation such as hyphens, slashes, commas, periods, and colons
- Character literals, enclosed in double quotation marks

These characters appear in the return value in the same location as they appear in the format model.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 2-18 Datetime Format Elements

Element	TO_* datetime functions?	Description

`-`
`/`
`,`
`.`
`;`
`:`
`"text"`
	Yes	Punctuation and quoted text is reproduced in the result

`AD` `A.D.`	Yes	Gregorian calendar era indicator with or without periods [1]
`AM` `A.M.`	Yes	Meridian indicator with or without periods [1]
`BC` `B.C.`	Yes	Gregorian calendar era indicator with or without periods [1]
`CC` `SCC`		Century • If the last 2 digits of a 4-digit year are between 01 and 99 (inclusive), then the century is one greater than the first 2 digits of that year. • If the last 2 digits of a 4-digit year are 00, then the century is the same as the first 2 digits of that year. For example: 2002 returns 21, 2000 returns 20.
`D`	Yes	Day of week (1-7). This element depends on the NLS territory of the session.
`DAY`	Yes	Name of day
`DD`	Yes	Day of month (1-31)
`DDD`	Yes	Day of year (1-366)
`DL`	Yes	Returns a value in the long date format, which is an extension of the Oracle Database `DATE` format, determined by the current value of the `NLS_DATE_FORMAT` parameter. Makes the appearance of the date components (day name, month number, and so forth) depend on the `NLS_TERRITORY` and `NLS_LANGUAGE` parameters. For example, in the `AMERICAN_AMERICA` locale, this is equivalent to specifying the format `'fmDay, Month dd, yyyy'`. In the `GERMAN_GERMANY` locale, it is equivalent to specifying the format `'fmDay, dd. Month yyyy'`. **Restriction:** You can specify this format only with the `TS` element, separated by white space.
`DS`	Yes	Returns a value in the short date format. Makes the appearance of the date components (day name, month number, and so forth) depend on the `NLS_TERRITORY` and `NLS_LANGUAGE` parameters. For example, in the `AMERICAN_AMERICA` locale, this is equivalent to specifying the format `'MM/DD/RRRR'`. In the `ENGLISH_UNITED_KINGDOM` locale, it is equivalent to specifying the format `'DD/MM/RRRR'`. **Restriction:** You can specify this format only with the `TS` element, separated by white space.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 2-18 (Cont.) Datetime Format Elements

Element	TO_* datetime functions?	Description
DY	Yes	Abbreviated name of day
E	Yes	Abbreviated era name (Japanese Imperial, ROC Official, and Thai Buddha calendars)
EE	Yes	Full era name (Japanese Imperial, ROC Official, and Thai Buddha calendars)
FF [1..9]	Yes	Fractional seconds; no decimal character is printed. Use the X format element to add the decimal character. Use the numbers 1 to 9 after FF to specify the number of digits in the fractional second portion of the datetime value returned. If you do not specify a digit, then Oracle Database uses the precision specified for the datetime data type or the data type's default precision. Valid in timestamp formats, but not in DATE formats. **Examples:** `'HH:MI:SS.FF'` `SELECT TO_CHAR(SYSTIMESTAMP, 'SS.FF3') from DUAL;`
FM	Yes	Returns a value with no leading or trailing blanks. **See Also**: FM
FX	Yes	Requires exact matching between the character data and the format model. **See Also**: FX
HH HH12	Yes	Hour of day (1-12)
HH24	Yes	Hour of day (0-23)
IW		Calendar week of year (1-52 or 1-53), as defined by the ISO 8601 standard: • A calendar week starts on Monday • The first calendar week of the year includes January 4 • The first calendar week of the year may include December 29, 30 and 31 • The last calendar week of the year may include January 1, 2, and 3
IYYY		4-digit year of the year containing the calendar week, as defined by the ISO 8601 standard
IYY IY I		Last 3, 2, or 1 digit(s) of the year containing the calendar week, as defined by the ISO 8601 standard
J	Yes	Julian day: the number of days since January 1, 4712 BC. The number specified with J must be an integer.
MI	Yes	Minute (0-59)
MM	Yes	Month (01-12; January = 01)
MON	Yes	Abbreviated name of month

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 2-18 (Cont.) Datetime Format Elements

Element	TO_* datetime functions?	Description
MONTH	Yes	Name of month
PM P.M.	Yes	Meridian indicator with or without periods [1]
Q		Quarter of year (1, 2, 3, 4; January - March = 1)
RM	Yes	Roman numeral month (I-XII; January = I)
RR	Yes	Lets you store 20th century dates in the 21st century using only two digits. **See Also:** The RR Datetime Format Element
RRRR	Yes	Round year. Accepts either 4-digit or 2-digit input. If 2-digit, provides the same return as RR. If you do not want this functionality, enter 4-digit year.
SS	Yes	Second (0-59)
SSSSS	Yes	Seconds past midnight (0-86399)
TS	Yes	Returns a value in the short time format. Makes the appearance of the time components (hour, minutes, and so forth) depend on the NLS_TERRITORY and NLS_LANGUAGE initialization parameters. **Restriction:** You can specify this format only with the DL or DS element, separated by white space.
TZD	Yes	Daylight saving information. The TZD value is an abbreviated time zone string with daylight saving information. It must correspond with the region specified in TZR. Valid in timestamp with time zone format models only. **Example:** PST (for US/Pacific standard time); PDT (for US/Pacific daylight time).
TZH	Yes	Time zone hour. (See TZM format element.) Valid in timestamp with time zone format models only. **Example:** 'HH:MI:SS.FFTZH:TZM'.
TZM	Yes	Time zone minute. (See TZH format element.) Valid in timestamp with time zone format models only. **Example:** 'HH:MI:SS.FFTZH:TZM'.
TZR	Yes	Time zone region information. On input, the value must be one of the time zone region names supported in the database or a time zone offset in the form [+-]hours:minutes. Valid in timestamp with time zone format models only. **Example:** US/Pacific
WW		Week of year (1-53) where week 1 starts on the first day of the year and continues to the seventh day of the year
W		Week of month (1-5) where week 1 starts on the first day of the month and ends on the seventh day of the month

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 2-18 (Cont.) Datetime Format Elements

Element	TO_* datetime functions?	Description
X	Yes	Decimal character **Example:** 'HH:MI:SSXFF'
Y,YYY SY,YYY	Yes	Year with group separator in the position of the comma S prefixes BC dates with a minus sign (-)
YEAR SYEAR		Year, spelled out S prefixes BC dates with a minus sign (-)
YYYY SYYYY	Yes	4-digit year S prefixes BC dates with a minus sign
YYY YY Y	Yes	Last 3, 2, or 1 digit(s) of year

[1] If the NLS_DATE_LANGUAGE parameter is AMERICAN, the format model elements AD, BC, AM, and PM output or expect the corresponding indicators without periods. The format model elements A.D., B.C., A.M., and P.M. output or expect the corresponding indicators with periods. If the NLS_DATE_FORMAT parameter is not AMERICAN, the format model elements AD, BC, AM, and PM with and without periods are equivalent, and output or expect indicators that are defined for the given language in Oracle locale data. You can view this language-specific indicator text in the Oracle Locale Builder utility.

Oracle Database converts strings to dates with some flexibility. For example, when the TO_DATE function is used, a format model containing punctuation characters matches an input string lacking some or all of these characters, provided each numerical element in the input string contains the maximum allowed number of digits—for example, two digits '05' for 'MM' or four digits '2007' for 'YYYY'. The following statement does not return an error:

```
SELECT TO_CHAR(TO_DATE('0207','MM/YY'), 'MM/YY') FROM DUAL;

TO_CH
-----
02/07
```

However, the following format string does return an error, because the FX (format exact) format modifier requires an exact match of the expression and the format string:

```
SELECT TO_CHAR(TO_DATE('0207', 'fxmm/yy'), 'mm/yy') FROM DUAL;
SELECT TO_CHAR(TO_DATE('0207', 'fxmm/yy'), 'mm/yy') FROM DUAL;
                       *
ERROR at line 1:
ORA-01861: literal does not match format string
```

Any non-alphanumeric character is allowed to match the punctuation characters in the format model. For example, the following statement does not return an error:

```
SELECT TO_CHAR (TO_DATE('02#07','MM/YY'), 'MM/YY') FROM DUAL;

TO_CH
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
-----
02/07
```

> Format Model Modifiers and String-to-Date Conversion Rules for more information

Datetime Format Elements and Globalization Support

The functionality of some datetime format elements depends on the country and language in which you are using Oracle Database. For example, these datetime format elements return or accept spelled values:

- MONTH
- MON
- DAY
- DY
- BC or AD or B.C. or A.D.
- AM or PM or A.M or P.M.

The language in which these values are returned or accepted is specified either explicitly with the initialization parameter `NLS_DATE_LANGUAGE` or implicitly with the initialization parameter `NLS_LANGUAGE`. The values returned by the `YEAR` and `SYEAR` datetime format elements are always in English.

The datetime format element `D` returns or accepts the number of the day of the week (1-7). The day of the week that is numbered 1 is specified implicitly by the initialization parameter `NLS_TERRITORY`.

The datetime format model element `X` returns or accepts the decimal character to be output before the fractional seconds. The decimal character is the first character in the value of the initialization parameter `NLS_NUMERIC_CHARACTERS`, which can be specified explicitly or determined implicitly by the initialization parameter `NLS_TERRITORY`.

The format model elements `Y,YYY` and `SY,YYY` return or accept the numeric group separator in place of the comma. The group separator is the second character in the value of the initialization parameter `NLS_NUMERIC_CHARACTERS`, which can be specified explicitly or determined implicitly by the initialization parameter `NLS_TERRITORY`.

All format model elements returning or accepting year, month, or day of the month are sensitive to the user calendar specified by the initialization parameter `NLS_CALENDAR`. The selected user calendar makes the dependent format model elements return or accept the date values as they are expressed in this calendar. Note that the `DATE` and `TIMESTAMP` values that are output or returned are stored internally always in the Gregorian calendar. `NLS_CALENDAR` affects the textual representation of datetime values.

The parameter `NLS_CALENDAR` overrides the parameter `NLS_DATE_LANGUAGE`, determining the month names to display or accept, which may be different from what is expected for dates in the Gregorian calendar. For example, when `NLS_DATE_LANGUAGE` is set to `ARABIC` and `NLS_CALENDAR` is set to `GREGORIAN`, the name of the first month is `yanayir` (in the Arabic script). However, if `NLS_CALENDAR` is set to `ARABIC HIJRAH`, the name of the first month is `muharram` (in the Arabic script).

> *Oracle AI Database Reference* and *Oracle AI Database Globalization Support Guide* for information on globalization support initialization parameters

ISO Standard Date Format Elements

Oracle calculates the values returned by the datetime format elements IYYY, IYY, IY, I, and IW according to the ISO standard. For information on the differences between these values and those returned by the datetime format elements YYYY, YYY, YY, Y, and WW, see the discussion of globalization support in *Oracle AI Database Globalization Support Guide*.

The RR Datetime Format Element

The `RR` datetime format element is similar to the `YY` datetime format element, but it provides additional flexibility for storing date values in other centuries. The `RR` datetime format element lets you store 20th century dates in the 21st century by specifying only the last two digits of the year.

If you use the `TO_DATE` function with the `YY` datetime format element, then the year returned always has the same first 2 digits as the current year. If you use the `RR` datetime format element instead, then the century of the return value varies according to the specified two-digit year and the last two digits of the current year.

That is:

- If the specified two-digit year is 00 to 49, then
  - If the last two digits of the current year are 00 to 49, then the returned year has the same first two digits as the current year.
  - If the last two digits of the current year are 50 to 99, then the first 2 digits of the returned year are 1 greater than the first 2 digits of the current year.
- If the specified two-digit year is 50 to 99, then
  - If the last two digits of the current year are 00 to 49, then the first 2 digits of the returned year are 1 less than the first 2 digits of the current year.
  - If the last two digits of the current year are 50 to 99, then the returned year has the same first two digits as the current year.

The following examples demonstrate the behavior of the RR datetime format element.

RR Datetime Format Examples

Assume these queries are issued between 1950 and 1999:

```
SELECT TO_CHAR(TO_DATE('27-OCT-98', 'DD-MON-RR'), 'YYYY') "Year" FROM DUAL;

Year
----
1998

SELECT TO_CHAR(TO_DATE('27-OCT-17', 'DD-MON-RR'), 'YYYY') "Year" FROM DUAL;

Year
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
----
2017
```

Now assume these queries are issued between 2000 and 2049:

```
SELECT TO_CHAR(TO_DATE('27-OCT-98', 'DD-MON-RR'), 'YYYY') "Year" FROM DUAL;

Year
----
1998

SELECT TO_CHAR(TO_DATE('27-OCT-17', 'DD-MON-RR'), 'YYYY') "Year" FROM DUAL;

Year
----
2017
```

Note that the queries return the same values regardless of whether they are issued before or after the year 2000. The RR datetime format element lets you write SQL statements that will return the same values from years whose first two digits are different.

Datetime Format Element Suffixes

Table 2-19 lists suffixes that can be added to datetime format elements:

Table 2-19 Date Format Element Suffixes

Suffix	Meaning	Example Element	Example Value
TH	Ordinal Number	DDTH	4TH
SP	Spelled Number	DDSP	FOUR
SPTH or THSP	Spelled, ordinal number	DDSPTH	FOURTH

Notes on date format element suffixes:

- When you add one of these suffixes to a datetime format element, the return value is always in English.
- Datetime suffixes are valid only to format output. You cannot use them to insert a date into the database.

Format Model Modifiers

The FM and FX modifiers, used in format models in the TO_CHAR function, control blank padding and exact format checking.

A modifier can appear in a format model more than once. In such a case, each subsequent occurrence toggles the effects of the modifier. Its effects are enabled for the portion of the model following its first occurrence, and then disabled for the portion following its second, and then reenabled for the portion following its third, and so on.

FM

Fill mode. Oracle uses trailing blank characters and leading zeroes to fill format elements to a constant width. The width is equal to the display width of the largest element for the relevant format model:

Copyright © 1996, 2026, Oracle and/or its affiliates.

- Numeric elements are padded with leading zeros to the width of the maximum value allowed for the element. For example, the YYYY element is padded to four digits (the length of '9999'), HH24 to two digits (the length of '23'), and DDD to three digits (the length of '366').
- The character elements MONTH, MON, DAY, and DY are padded with trailing blanks to the width of the longest full month name, the longest abbreviated month name, the longest full date name, or the longest abbreviated day name, respectively, among valid names determined by the values of NLS_DATE_LANGUAGE and NLS_CALENDAR parameters. For example, when NLS_DATE_LANGUAGE is AMERICAN and NLS_CALENDAR is GREGORIAN (the default), the largest element for MONTH is SEPTEMBER, so all values of the MONTH format element are padded to nine display characters. The values of the NLS_DATE_LANGUAGE and NLS_CALENDAR parameters are specified in the third argument to TO_CHAR and TO_* datetime functions or they are retrieved from the NLS environment of the current session.
- The character element RM is padded with trailing blanks to the length of 4, which is the length of 'viii'.
- Other character elements and spelled-out numbers (SP, SPTH, and THSP suffixes) are not padded.

The FM modifier suppresses the above padding in the return value of the TO_CHAR function.

FX

Format exact. This modifier specifies exact matching for the character argument and datetime format model of a TO_DATE function:

- Punctuation and quoted text in the character argument must exactly match (except for case) the corresponding parts of the format model.
- The character argument cannot have extra blanks. Without FX, Oracle ignores extra blanks.
- Numeric data in the character argument must have the same number of digits as the corresponding element in the format model. Without FX, numbers in the character argument can omit leading zeros.

  When FX is enabled, you can disable this check for leading zeros by using the FM modifier as well.

If any portion of the character argument violates any of these conditions, then Oracle returns an error message.

Format Model Examples

The following statement uses a date format model to return a character expression:

```
SELECT TO_CHAR(SYSDATE, 'fmDDTH') || ' of ' ||
       TO_CHAR(SYSDATE, 'fmMonth') || ', ' ||
       TO_CHAR(SYSDATE, 'YYYY') "Ides"
  FROM DUAL;
```

The preceding statement also uses the FM modifier. If FM is omitted, then the month is blank-padded to nine characters:

```
SELECT TO_CHAR(SYSDATE, 'DDTH') || ' of ' ||
   TO_CHAR(SYSDATE, 'Month') || ', ' ||
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
   TO_CHAR(SYSDATE, 'YYYY') "Ides"
  FROM DUAL;
```

The following statement places a single quotation mark in the return value by using a date format model that includes two consecutive single quotation marks:

```
SELECT TO_CHAR(SYSDATE, 'fmDay') || '''s Special' "Menu"
  FROM DUAL;
```

Two consecutive single quotation marks can be used for the same purpose within a character literal in a format model.

Table 2-20 shows whether the following statement meets the matching conditions for different values of *char* and '*fmt*' using FX (the table named table has a column date_column of data type DATE):

```
UPDATE table
  SET date_column = TO_DATE(char, 'fmt');
```

Table 2-20 Matching Character Data and Format Models with the FX Format Model Modifier

char	'fmt'	Match or Error?
'15/ JAN /1998'	'DD-MON-YYYY'	Match
' 15! JAN % /1998'	'DD-MON-YYYY'	Error
'15/JAN/1998'	'FXDD-MON-YYYY'	Error
'15-JAN-1998'	'FXDD-MON-YYYY'	Match
'1-JAN-1998'	'FXDD-MON-YYYY'	Error
'01-JAN-1998'	'FXDD-MON-YYYY'	Match
'1-JAN-1998'	'FXFMDD-MON-YYYY'	Match

Format of Return Values: Examples

You can use a format model to specify the format for Oracle to use to return values from the database to you.

The following statement selects the salaries of the employees in Department 80 and uses the TO_CHAR function to convert these salaries into character values with the format specified by the number format model '$99,990.99':

```
SELECT last_name employee, TO_CHAR(salary, '$99,990.99')
  FROM hr.employees
  WHERE department_id = 80;
```

Because of this format model, Oracle returns salaries with leading dollar signs, commas every three digits, and two decimal places.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following statement selects the date on which each employee from Department 20 was hired and uses the `TO_CHAR` function to convert these dates to character strings with the format specified by the date format model '`fmMonth DD, YYYY`':

```
SELECT last_name employee, TO_CHAR(hire_date,'fmMonth DD, YYYY') hiredate
  FROM hr.employees
  WHERE department_id = 20;
```

With this format model, Oracle returns the hire dates without blank padding (as specified by `fm`), two digits for the day, and the century included in the year.

>
> Format Model Modifiers for a description of the `fm` format element

Supplying the Correct Format Model: Examples

When you insert or update a column value, the data type of the value that you specify must correspond to the column data type of the column. You can use format models to specify the format of a value that you are converting from one data type to another data type required for a column.

For example, a value that you insert into a `DATE` column must be a value of the `DATE` data type or a character string in the default date format (Oracle implicitly converts character strings in the default date format to the `DATE` data type). If the value is in another format, then you must use the `TO_DATE` function to convert the value to the `DATE` data type. You must also use a format model to specify the format of the character string.

The following statement updates `Hunold's` hire date using the `TO_DATE` function with the format mask '`YYYY MM DD`' to convert the character string '`2008 05 20`' to a `DATE` value:

```
UPDATE employees
  SET hire_date = TO_DATE('2008 05 20','YYYY MM DD')
  WHERE last_name = 'Hunold';
```

String-to-Date Conversion Rules

The following additional formatting rules apply when converting string values to date values (unless you have used the `FX` or `FXFM` modifiers in the format model to control exact format checking):

- You can omit punctuation included in the format string from the date string if all the digits of the numerical format elements, including leading zeros, are specified. For example, specify 02 and not 2 for two-digit format elements such as MM, DD, and YY.
- You can omit time fields found at the end of a format string from the date string.
- You can use any non-alphanumeric character in the date string to match the punctuation symbol in the format string.
- If a match fails between a datetime format element and the corresponding characters in the date string, then Oracle attempts alternative format elements, as shown in Table 2-21.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 2-21 Oracle Format Matching

Original Format Element	Additional Format Elements to Try in Place of the Original
'MM'	'MON' and 'MONTH'
'MON	'MONTH'
'MONTH'	'MON'
'YY'	'YYYY'
'RR'	'RRRR'

XML Format Model

The SYS_XMLAgg and SYS_XMLGen (deprecated) functions return an instance of type XMLType containing an XML document. Oracle provides the XMLFormat object, which lets you format the output of these functions.

Table 2-22 lists and describes the attributes of the XMLFormat object. The function that implements this type follows the table.

See Also

- SYS_XMLAGG for information on the SYS_XMLAgg function
- SYS_XMLGEN for information on the SYS_XMLGen function
- *Oracle XML DB Developer's Guide* for more information on the implementation of the XMLFormat object and its use

Table 2-22 Attributes of the XMLFormat Object

Attribute	Data Type	Purpose
enclTag	VARCHAR2(4000) or VARCHAR2(32767)[1]	The name of the enclosing tag for the result of the SYS_XMLAgg or SYS_XMLGen (deprecated) function. SYS_XMLAgg: The default is ROWSET. SYS_XMLGen: If the input to the function is a column name, then the default is the column name. Otherwise the default is ROW. When schemaType is set to USE_GIVEN_SCHEMA, this attribute also gives the name of the XMLSchema element.
schemaType	VARCHAR2(100)	The type of schema generation for the output document. Valid values are 'NO_SCHEMA' and 'USE_GIVEN_SCHEMA'. The default is 'NO_SCHEMA'.
schemaName	VARCHAR2(4000) or VARCHAR2(32767)[1]	The name of the target schema Oracle uses if the value of the schemaType is 'USE_GIVEN_SCHEMA'. If you specify schemaName, then Oracle uses the enclosing tag as the element name.
targetNameSpace	VARCHAR2(4000) or VARCHAR2(32767)[1]	The target namespace if the schema is specified (that is, schemaType is GEN_SCHEMA_*, or USE_GIVEN_SCHEMA)
dburlPrefix	VARCHAR2(4000) or VARCHAR2(32767)[1]	The URL to the database to use if WITH_SCHEMA is specified. If this attribute is not specified, then Oracle declares the URL to the types as a relative URL reference.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 2-22 (Cont.) Attributes of the XMLFormat Object

Attribute	Data Type	Purpose
processingIns	VARCHAR2(4000) or VARCHAR2(32767)[1]	User-provided processing instructions, which are appended to the top of the function output before the element.

[1] The data type for this attribute is VARCHAR2(4000) if the initialization parameter MAX_STRING_SIZE = STANDARD, and VARCHAR2(32767) if MAX_STRING_SIZE = EXTENDED. See Extended Data Types for more information.

The function that implements the XMLFormat object follows:

```
STATIC FUNCTION createFormat(
     enclTag IN varchar2 := 'ROWSET',
     schemaType IN varchar2 := 'NO_SCHEMA',
     schemaName IN varchar2 := null,
     targetNameSpace IN varchar2 := null,
     dburlPrefix IN varchar2 := null,
     processingIns IN varchar2 := null) RETURN XMLGenFormatType
       deterministic parallel_enable,
  MEMBER PROCEDURE genSchema (spec IN varchar2),
  MEMBER PROCEDURE setSchemaName(schemaName IN varchar2),
  MEMBER PROCEDURE setTargetNameSpace(targetNameSpace IN varchar2),
  MEMBER PROCEDURE setEnclosingElementName(enclTag IN varchar2),
  MEMBER PROCEDURE setDbUrlPrefix(prefix IN varchar2),
  MEMBER PROCEDURE setProcessingIns(pi IN varchar2),
  CONSTRUCTOR FUNCTION XMLGenFormatType (
     enclTag IN varchar2 := 'ROWSET',
     schemaType IN varchar2 := 'NO_SCHEMA',
     schemaName IN varchar2 := null,
     targetNameSpace IN varchar2 := null,
     dbUrlPrefix IN varchar2 := null,
     processingIns IN varchar2 := null) RETURN SELF AS RESULT
      deterministic parallel_enable,
  STATIC function createFormat2(
      enclTag in varchar2 := 'ROWSET',
      flags in raw) return sys.xmlgenformattype
      deterministic parallel_enable
);
```

Nulls

If a column in a row has no value, then the column is said to be **null**, or to contain null. Nulls can appear in columns of any data type that are not restricted by NOT NULL or PRIMARY KEY integrity constraints. Use a null when the actual value is not known or when a value would not be meaningful.

The database treats a character value with a length of zero as null. However, do not use null to represent a numeric value of zero, because they are not equivalent.

> **Note**
>
> The database currently treats a character value with a length of zero as null. However, this may not continue to be true in future releases, and Oracle recommends that you do not treat empty strings the same as nulls.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Any arithmetic expression containing a null always evaluates to null. For example, null added to 10 is null. In fact, all operators (except concatenation) return null when given a null operand.

Nulls in SQL Functions

For information on null handling in SQL functions, see Nulls in SQL Functions .

Nulls with Comparison Conditions

To test for nulls, use only the comparison conditions `IS NULL` and `IS NOT NULL`. If you use any other condition with nulls and the result depends on the value of the null, then the result is `UNKNOWN`. Because null represents a lack of data, a null cannot be equal or unequal to any value or to another null. However, Oracle considers two nulls to be equal when evaluating a `DECODE` function. Refer to DECODE for syntax and additional information.

Oracle also considers two nulls to be equal if they appear in compound keys. That is, Oracle considers identical two compound keys containing nulls if all the non-null components of the keys are equal.

Nulls in Conditions

A condition that evaluates to `UNKNOWN` acts almost like `FALSE`. For example, a `SELECT` statement with a condition in the `WHERE` clause that evaluates to `UNKNOWN` returns no rows. However, a condition evaluating to `UNKNOWN` differs from `FALSE` in that further operations on an `UNKNOWN` condition evaluation will evaluate to `UNKNOWN`. Thus, `NOT FALSE` evaluates to `TRUE`, but `NOT UNKNOWN` evaluates to `UNKNOWN`.

Table 2-23 shows examples of various evaluations involving nulls in conditions. If the conditions evaluating to `UNKNOWN` were used in a `WHERE` clause of a `SELECT` statement, then no rows would be returned for that query.

Table 2-23 Conditions Containing Nulls

Condition	Value of A	Evaluation
`a IS NULL`	`10`	`FALSE`
`a IS NOT NULL`	`10`	`TRUE`
`a IS NULL`	`NULL`	`TRUE`
`a IS NOT NULL`	`NULL`	`FALSE`
`a = NULL`	`10`	`UNKNOWN`
`a != NULL`	`10`	`UNKNOWN`
`a = NULL`	`NULL`	`UNKNOWN`
`a != NULL`	`NULL`	`UNKNOWN`
`a = 10`	`NULL`	`UNKNOWN`
`a != 10`	`NULL`	`UNKNOWN`

For the truth tables showing the results of logical conditions containing nulls, see Table 6-5, Table 6-6, and Table 6-7.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Comments

You can create two types of comments:

- Comments within SQL statements are stored as part of the application code that executes the SQL statements.
- Comments associated with individual schema or nonschema objects are stored in the data dictionary along with metadata on the objects themselves.

Comments Within SQL Statements

Comments can make your application easier for you to read and maintain. For example, you can include a comment in a statement that describes the purpose of the statement within your application. With the exception of hints, comments within SQL statements do not affect the statement execution. Refer to Hints on using this particular form of comment.

A comment can appear between any keywords, parameters, or punctuation marks in a statement. You can include a comment in a statement in two ways:

- Begin the comment with a slash and an asterisk (/*). Proceed with the text of the comment. This text can span multiple lines. End the comment with an asterisk and a slash (*/). The opening and terminating characters need not be separated from the text by a space or a line break.
- Begin the comment with -- (two hyphens). Proceed with the text of the comment. This text cannot extend to a new line. End the comment with a line break.

Some of the tools used to enter SQL have additional restrictions. For example, if you are using SQL*Plus, by default you cannot have a blank line inside a multiline comment. For more information, refer to the documentation for the tool you use as an interface to the database.

A SQL statement can contain multiple comments of both styles. The text of a comment can contain any printable characters in your database character set.

Example

These statements contain many comments:

```
SELECT last_name, employee_id, salary + NVL(commission_pct, 0),
       job_id, e.department_id
  /* Select all employees whose compensation is
  greater than that of Pataballa.*/
  FROM employees e, departments d
  /*The DEPARTMENTS table is used to get the department name.*/
  WHERE e.department_id = d.department_id
    AND salary + NVL(commission_pct,0) >   /* Subquery:       */
      (SELECT salary + NVL(commission_pct,0)
        /* total compensation is salary + commission_pct */
        FROM employees
        WHERE last_name = 'Pataballa')
  ORDER BY last_name, employee_id;

SELECT last_name,                                  -- select the name
       employee_id                                 -- employee id
       salary + NVL(commission_pct, 0),            -- total compensation
       job_id,                                     -- job
       e.department_id                             -- and department
  FROM employees e,                                -- of all employees
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
      departments d
  WHERE e.department_id = d.department_id
    AND salary + NVL(commission_pct, 0) >           -- whose compensation
                                                    -- is greater than
        (SELECT salary + NVL(commission_pct,0)      -- the compensation
          FROM employees
          WHERE last_name = 'Pataballa')            -- of Pataballa
  ORDER BY last_name                                -- and order by last name
           employee_id                              -- and employee id.
;
```

Comments on Schema and Nonschema Objects

You can use the `COMMENT` command to associate a comment with a schema object (table, view, materialized view, operator, indextype, mining model) or a nonschema object (edition) using the `COMMENT` command. You can also create a comment on a column, which is part of a table schema object. Comments associated with schema and nonschema objects are stored in the data dictionary. Refer to COMMENT for a description of this form of comment.

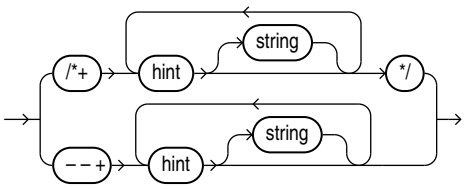
Hints

Hints are comments in a SQL statement that pass instructions to the database optimizer. The optimizer uses these hints to choose an execution plan for the statement, unless some condition exists that prevents the optimizer from doing so.

Hints were introduced in Oracle7, when users had little recourse if the optimizer generated suboptimal plans. Now Oracle provides a number of tools, including the SQL Tuning Advisor, SQL plan management, and SQL Performance Analyzer, to help you address performance problems that are not solved by the optimizer. Oracle strongly recommends that you use those tools rather than hints. The tools are far superior to hints, because when used on an ongoing basis, they provide fresh solutions as your data and database environment change.

Hints should be used sparingly, and only after you have collected statistics on the relevant tables and evaluated the optimizer plan without hints using the `EXPLAIN PLAN` statement. Changing database conditions as well as query performance enhancements in subsequent releases can have significant impact on how hints in your code affect performance.

The remainder of this section provides information on some commonly used hints. If you decide to use hints rather than the more advanced tuning tools, be aware that any short-term benefit resulting from the use of hints may not continue to result in improved performance over the long term.



Using Hints

A statement block can have only one comment containing hints, and that comment must follow the `SELECT`, `UPDATE`, `INSERT`, `MERGE`, or `DELETE` keyword.

The following syntax diagram shows hints contained in both styles of comments that Oracle supports within a statement block. The hint syntax must follow immediately after an `INSERT`, `UPDATE`, `DELETE`, `SELECT`, or `MERGE` keyword that begins the statement block.

Copyright © 1996, 2026, Oracle and/or its affiliates.

***hint*::=**

where:

- The plus sign (+) causes Oracle to interpret the comment as a list of hints. The plus sign must follow immediately after the comment delimiter. No space is permitted.
- *hint* is one of the hints discussed in this section. The space between the plus sign and the hint is optional. If the comment contains multiple hints, then separate the hints by at least one space.
- *string* is other commenting text that can be interspersed with the hints.

The `--+` syntax requires that the entire comment be on a single line.

The database ignores hints and does not return an error under the following circumstances:

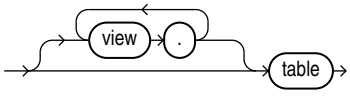
- The hint contains misspellings or syntax errors. However, the database does consider other correctly specified hints in the same comment.
- The comment containing the hint does not follow a `DELETE`, `INSERT`, `MERGE`, `SELECT`, or `UPDATE` keyword.
- A combination of hints conflict with each other. However, the database does consider other hints in the same comment.
- The database environment uses PL/SQL version 1, such as Forms version 3 triggers, Oracle Forms 4.5, and Oracle Reports 2.5.
- A global hint refers to multiple query blocks. Refer to Specifying Multiple Query Blocks in a Global Hint for more information.

With 19c you can use `DBMS_XPLAN` to find out whether a hint is used or not used. For more information, see the *Database SQL Tuning Guide*.

Specifying a Query Block in a Hint

You can specify an optional query block name in many hints to specify the query block to which the hint applies. This syntax lets you specify in the outer query a hint that applies to an inline view.

The syntax of the query block argument is of the form *@queryblock*, where *queryblock* is an identifier that specifies a query block in the query. The *queryblock* identifier can either be system-generated or user-specified. When you specify a hint in the query block itself to which the hint applies, you omit the *@queryblock* syntax.

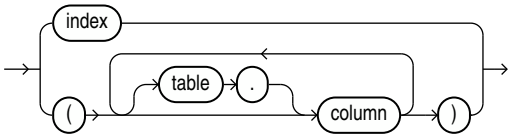


- The system-generated identifier can be obtained by using `EXPLAIN PLAN` for the query. Pretransformation query block names can be determined by running `EXPLAIN PLAN` for the query using the `NO_QUERY_TRANSFORMATION` hint. See NO_QUERY_TRANSFORMATION Hint .
- The user-specified name can be set with the `QB_NAME` hint. See QB_NAME Hint .

Copyright © 1996, 2026, Oracle and/or its affiliates.

Specifying Global Hints

Many hints can apply both to specific tables or indexes and more globally to tables within a view or to columns that are part of indexes. The syntactic elements *tablespec* and *indexspec* define these **global hints**.



***tablespec*::=**

You must specify the table to be accessed exactly as it appears in the statement. If the statement uses an alias for the table, then use the alias rather than the table name in the hint. However, do not include the schema name with the table name within the hint, even if the schema name appears in the statement.

> **Note**
>
> Specifying a global hint using the *tablespec* clause does not work for queries that use ANSI joins, because the optimizer generates additional views during parsing. Instead, specify *@queryblock* to indicate the query block to which the hint applies.

***indexspec*::=**

When *tablespec* is followed by *indexspec* in the specification of a hint, a comma separating the table name and index name is permitted but not required. Commas are also permitted, but not required, to separate multiple occurrences of *indexspec*.

Specifying Multiple Query Blocks in a Global Hint

The database ignores global hints that refer to multiple query blocks. To avoid this issue, Oracle recommends that you specify the object alias in the hint instead of using *tablespec* and *indexspec*.

For example, consider the following view v and table t:

```
CREATE VIEW v AS
  SELECT e.last_name, e.department_id, d.location_id
  FROM employees e, departments d
  WHERE e.department_id = d.department_id;

CREATE TABLE t AS
  SELECT * from employees
  WHERE employee_id < 200;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **Note**
>
> The following examples use the `EXPLAIN PLAN` statement, which enables you to display the execution plan and determine if a hint is honored or ignored. Refer to EXPLAIN PLAN for more information.

The `LEADING` hint is ignored in the following query because it refers to multiple query blocks, that is, the main query block containing table `t` and the view query block v:

```
EXPLAIN PLAN
  SET STATEMENT_ID = 'Test 1'
  INTO plan_table FOR
    (SELECT /*+ LEADING(v.e v.d t) */ *
     FROM t, v
     WHERE t.department_id = v.department_id);
```

The following `SELECT` statement returns the execution plan, which shows that the `LEADING` hint was ignored:

```
SELECT id, LPAD(' ',2*(LEVEL-1))||operation operation, options, object_name,
object_alias
  FROM plan_table
  START WITH id = 0 AND statement_id = 'Test 1'
  CONNECT BY PRIOR id = parent_id AND statement_id = 'Test 1'
  ORDER BY id;

 ID OPERATION            OPTIONS    OBJECT_NAME   OBJECT_ALIAS
--- -------------------- ---------- ------------- --------------------
  0 SELECT STATEMENT
  1   HASH JOIN
  2     HASH JOIN
  3       TABLE ACCESS   FULL       DEPARTMENTS   D@SEL$2
  4       TABLE ACCESS   FULL       EMPLOYEES     E@SEL$2
  5     TABLE ACCESS     FULL       T             T@SEL$1
```

The `LEADING` hint is honored in the following query because it refers to object aliases, which can be found in the execution plan that was returned by the previous query:

```
EXPLAIN PLAN
  SET STATEMENT_ID = 'Test 2'
  INTO plan_table FOR
    (SELECT /*+ LEADING(E@SEL$2 D@SEL$2 T@SEL$1) */ *
     FROM t, v
     WHERE t.department_id = v.department_id);
```

The following `SELECT` statement returns the execution plan, which shows that the `LEADING` hint was honored:

```
SELECT id, LPAD(' ',2*(LEVEL-1))||operation operation, options,
  object_name, object_alias
  FROM plan_table
  START WITH id = 0 AND statement_id = 'Test 2'
  CONNECT BY PRIOR id = parent_id AND statement_id = 'Test 2'
  ORDER BY id;

 ID OPERATION            OPTIONS    OBJECT_NAME   OBJECT_ALIAS
--- -------------------- ---------- ------------- --------------------
  0 SELECT STATEMENT
  1   HASH JOIN
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
2     HASH JOIN
3       TABLE ACCESS   FULL       EMPLOYEES     E@SEL$2
4       TABLE ACCESS   FULL       DEPARTMENTS   D@SEL$2
5     TABLE ACCESS     FULL       T             T@SEL$1
```

Alphabetical Listing of Hints

This section provides syntax and semantics for all hints in alphabetical order.

ALL_ROWS Hint

The `ALL_ROWS` hint instructs the optimizer to optimize a statement block with a goal of best throughput, which is minimum total resource consumption. For example, the optimizer uses the query optimization approach to optimize this statement for best throughput:

```
SELECT /*+ ALL_ROWS */ employee_id, last_name, salary, job_id
  FROM employees
  WHERE employee_id = 107;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

If you specify either the ALL_ROWS or the FIRST_ROWS hint in a SQL statement, and if the data dictionary does not have statistics about tables accessed by the statement, then the optimizer uses default statistical values, such as allocated storage for such tables, to estimate the missing statistics and to subsequently choose an execution plan. These estimates might not be as accurate as those gathered by the DBMS_STATS package, so you should use the DBMS_STATS package to gather statistics.

If you specify hints for access paths or join operations along with either the ALL_ROWS or FIRST_ROWS hint, then the optimizer gives precedence to the access paths and join operations specified by the hints.

APPEND Hint

The APPEND hint instructs the optimizer to use direct-path INSERT with the subquery syntax of the INSERT statement.

- Conventional INSERT is the default in serial mode. In serial mode, direct path can be used only if you include the APPEND hint.
- Direct-path INSERT is the default in parallel mode. In parallel mode, conventional insert can be used only if you specify the NOAPPEND hint.

The decision whether the INSERT will go parallel or not is independent of the APPEND hint.

In direct-path INSERT, data is appended to the end of the table, rather than using existing space currently allocated to the table. As a result, direct-path INSERT can be considerably faster than conventional INSERT.

The APPEND hint is only supported with the subquery syntax of the INSERT statement, not the VALUES clause. If you specify the APPEND hint with the VALUES clause, it is ignored and conventional insert will be used. To use direct-path INSERT with the VALUES clause, refer to "APPEND_VALUES Hint ".

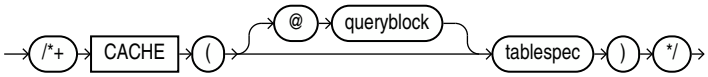
> **See Also**
>
> NOAPPEND Hint for information on that hint and *Oracle AI Database Administrator's Guide* for information on direct-path inserts

APPEND_VALUES Hint

The APPEND_VALUES hint instructs the optimizer to use direct-path INSERT with the VALUES clause. If you do not specify this hint, then conventional INSERT is used.

In direct-path INSERT, data is appended to the end of the table, rather than using existing space currently allocated to the table. As a result, direct-path INSERT can be considerably faster than conventional INSERT.

Copyright © 1996, 2026, Oracle and/or its affiliates.



The APPEND_VALUES hint can be used to greatly enhance performance. Some examples of its uses are:

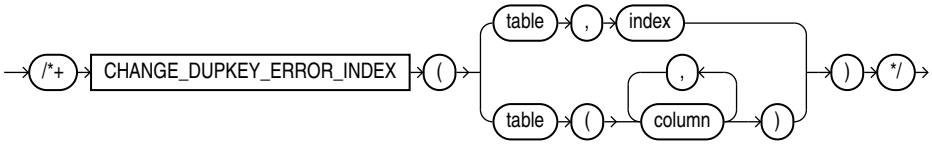
- In an Oracle Call Interface (OCI) program, when using large array binds or array binds with row callbacks
- In PL/SQL, when loading a large number of rows with a FORALL loop that has an INSERT statement with a VALUES clause

The APPEND_VALUES hint is only supported with the VALUES clause of the INSERT statement. If you specify the APPEND_VALUES hint with the subquery syntax of the INSERT statement, it is ignored and conventional insert will be used. To use direct-path INSERT with a subquery, refer to "APPEND Hint ".

> **See Also**
>
> *Oracle AI Database Administrator's Guide* for information on direct-path inserts

CACHE Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)



The CACHE hint instructs the optimizer to place the blocks retrieved for the table at the most recently used end of the LRU list in the buffer cache when a full table scan is performed. This hint is useful for small lookup tables.

In the following example, the CACHE hint overrides the default caching specification of the table:

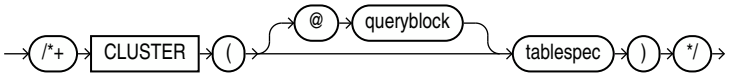
```
SELECT /*+ FULL (hr_emp) CACHE(hr_emp) */ last_name
  FROM employees hr_emp;
```

The CACHE and NOCACHE hints affect system statistics `table scans (long tables)` and `table scans (short tables)`, as shown in the V$SYSSTAT data dictionary view.

CHANGE_DUPKEY_ERROR_INDEX Hint

> **Note**
>
> The CHANGE_DUPKEY_ERROR_INDEX, IGNORE_ROW_ON_DUPKEY_INDEX, and RETRY_ON_ROW_CHANGE hints are unlike other hints in that they have a semantic effect. The general philosophy explained in Hints does not apply for these three hints.

Copyright © 1996, 2026, Oracle and/or its affiliates.



The CHANGE_DUPKEY_ERROR_INDEX hint provides a mechanism to unambiguously identify a unique key violation for a specified set of columns or for a specified index. When a unique key violation occurs for the specified index, an ORA-38911 error is reported instead of an ORA-001.

This hint applies to INSERT, UPDATE operations. If you specify an index, then the index must exist and be unique. If you specify a column list instead of an index, then a unique index whose columns match the specified columns in number and order must exist.

This use of this hint results in error messages if specific rules are violated. Refer to IGNORE_ROW_ON_DUPKEY_INDEX Hint for details.

> **Note**
>
> This hint disables both APPEND mode and parallel DML.

CLUSTER Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The CLUSTER hint instructs the optimizer to use a cluster scan to access the specified table. This hint applies only to tables in an indexed cluster.

CLUSTERING Hint

This hint is valid only for INSERT and MERGE operations on tables that are enabled for attribute clustering. The CLUSTERING hint enables attribute clustering for direct-path inserts (serial or parallel). This results in partially-clustered data, that is, data that is clustered per each insert or merge operation. This hint overrides a NO ON LOAD setting in the DDL that created or altered the table. This hint has no effect on tables that are not enabled for attribute clustering.

> **See Also**
>
> - clustering_when clause of CREATE TABLE for more information on the NO ON LOAD setting
> - NO_CLUSTERING Hint

Copyright © 1996, 2026, Oracle and/or its affiliates.

COMPRESS_IMMEDIATE Hint

Syntax

`COMPRESS_IMMEDIATE` forces compression to happen immediately during direct load.

When Automatic Storage Compression is enabled via `DBMS_ILM_ADMIN.ENABLE_AUTO_OPTIMIZE`, compression is delayed for new direct loads. Use this hint to overide the delay and compress the direct load immediately.

CONTAINERS Hint

The `CONTAINERS` hint is useful in a multitenant container database (CDB). You can specify this hint in a `SELECT` statement that contains the `CONTAINERS()` clause. Such a statement lets you query data in the specified table or view across all containers in a CDB or application container.

- To query data in a CDB, you must be a common user connected to the CDB root, and the table or view must exist in the root and all PDBs. The query returns all rows from the table or view in the CDB root and in all open PDBs.
- To query data in an application container, you must be a common user connected to the application root, and the table or view must exist in the application root and all PDBs in the application container. The query returns all rows from the table or view in the application root and in all open PDBs in the application container.

Statements that contain the `CONTAINERS()` clause generate and execute recursive SQL statements in each queried PDB. You can use the `CONTAINERS` hint to pass a default PDB hint to each recursive SQL statement. For *`hint`*, you can specify any SQL hint that is appropriate for the `SELECT` statement.

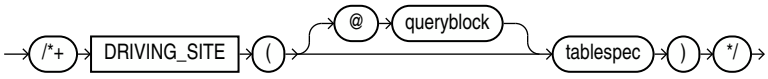
In the following example, the `NO_PARALLEL` hint is passed to each recursive SQL statement that is executed as part of the evaluation of the `CONTAINERS()` clause:

```
SELECT /*+ CONTAINERS(DEFAULT_PDB_HINT='NO_PARALLEL') */
  (CASE WHEN COUNT(*) < 10000
        THEN 'Less than 10,000'
        ELSE '10,000 or more' END) "Number of Tables"
  FROM CONTAINERS(DBA_TABLES);
```

> **See Also**
>
> *containers_clause* for more information on the `CONTAINERS()` clause

Copyright © 1996, 2026, Oracle and/or its affiliates.

CURSOR_SHARING_EXACT Hint



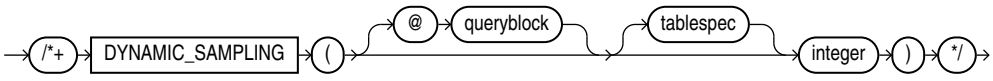
Oracle can replace literals in SQL statements with bind variables, when it is safe to do so. This replacement is controlled with the `CURSOR_SHARING` initialization parameter. The `CURSOR_SHARING_EXACT` hint instructs the optimizer to switch this behavior off. When you specify this hint, Oracle executes the SQL statement without any attempt to replace literals with bind variables.

DISABLE_PARALLEL_DML Hint

The `DISABLE_PARALLEL_DML` hint disables parallel DML for `DELETE`, `INSERT`, `MERGE`, and `UPDATE` statements. You can use this hint to disable parallel DML for an individual statement when parallel DML is enabled for the session with the `ALTER SESSION ENABLE PARALLEL DML` statement.

DRIVING_SITE Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)



The `DRIVING_SITE` hint instructs the optimizer to execute the query at a different site than that selected by the database. This hint is useful if you are using distributed query optimization.

For example:

```
SELECT /*+ DRIVING_SITE(departments) */ *
  FROM employees, departments@rsite
  WHERE employees.department_id = departments.department_id;
```

If this query is executed without the hint, then rows from `departments` are sent to the local site, and the join is executed there. With the hint, the rows from `employees` are sent to the remote site, and the query is executed there and the result set is returned to the local site.

DYNAMIC_SAMPLING Hint

Copyright © 1996, 2026, Oracle and/or its affiliates.

(See Specifying a Query Block in a Hint , *tablespec*::=)

The `DYNAMIC_SAMPLING` hint instructs the optimizer how to control dynamic sampling to improve server performance by determining more accurate predicate selectivity and statistics for tables and indexes.

You can set the value of `DYNAMIC_SAMPLING` to a value from 0 to 10. The higher the level, the more effort the compiler puts into dynamic sampling and the more broadly it is applied. Sampling defaults to cursor level unless you specify *`tablespec`*.

The *`integer`* value is `0` to `10`, indicating the degree of sampling.

If a cardinality statistic already exists for the table, then the optimizer uses it. Otherwise, the optimizer enables dynamic sampling to estimate the cardinality statistic.

If you specify *`tablespec`* and the cardinality statistic already exists, then:

- If there is no single-table predicate (a `WHERE` clause that evaluates only one table), then the optimizer trusts the existing statistics and ignores this hint. For example, the following query will not result in any dynamic sampling if `employees` is analyzed:

  ```
  SELECT /*+ DYNAMIC_SAMPLING(e 1) */ count(*)
    FROM employees e;
  ```

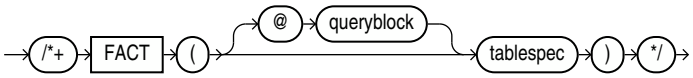
- If there is a single-table predicate, then the optimizer uses the existing cardinality statistic and estimates the selectivity of the predicate using the existing statistics.

To apply dynamic sampling to a specific table, use the following form of the hint:

```
SELECT /*+ DYNAMIC_SAMPLING(employees 1) */ *
  FROM employees
  WHERE ...
```

> **See Also**
>
> *Oracle AI Database SQL Tuning Guide* for information about dynamic sampling and the sampling levels that you can set

ENABLE_PARALLEL_DML Hint



The `ENABLE_PARALLEL_DML` hint enables parallel DML for `DELETE`, `INSERT`, `MERGE`, and `UPDATE` statements. You can use this hint to enable parallel DML for an individual statement, rather than enabling parallel DML for the session with the `ALTER SESSION ENABLE PARALLEL DML` statement.

> **See Also**
>
> *Oracle AI Database VLDB and Partitioning Guide* for information about enabling parallel DML

Copyright © 1996, 2026, Oracle and/or its affiliates.

FACT Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The `FACT` hint is used in the context of the star transformation. It instructs the optimizer that the table specified in *`tablespec`* should be considered as a fact table.

FIRST_ROWS Hint

The `FIRST_ROWS` hint instructs Oracle to optimize an individual SQL statement for fast response, choosing the plan that returns the first *n* rows most efficiently. For *`integer`*, specify the number of rows to return.

For example, the optimizer uses the query optimization approach to optimize the following statement for best response time:

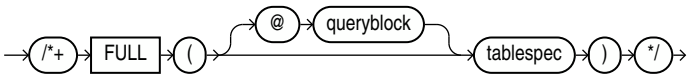
```
SELECT /*+ FIRST_ROWS(10) */ employee_id, last_name, salary, job_id
  FROM employees
  WHERE department_id = 20;
```

In this example each department contains many employees. The user wants the first 10 employees of department 20 to be displayed as quickly as possible.

The optimizer ignores this hint in `DELETE` and `UPDATE` statement blocks and in `SELECT` statement blocks that include any blocking operations, such as sorts or groupings. Such statements cannot be optimized for best response time, because Oracle Database must retrieve all rows accessed by the statement before returning the first row. If you specify this hint in any such statement, then the database optimizes for best throughput.

> **See Also**
>
> ALL_ROWS Hint for additional information on the `FIRST_ROWS` hint and statistics

FRESH_MV Hint



The `FRESH_MV` hint applies when querying a real-time materialized view. This hint instructs the optimizer to use on-query computation to fetch up-to-date data from the materialized view, even if the materialized view is stale.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The optimizer ignores this hint in `SELECT` statement blocks that query an object that is not a real-time materialized view, and in all `UPDATE`, `INSERT`, `MERGE`, and `DELETE` statement blocks.

> **See Also**
>
> The { ENABLE | DISABLE } ON QUERY COMPUTATION clause of `CREATE MATERIALIZED VIEW` for more information on real-time materialized views

FULL Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The `FULL` hint instructs the optimizer to perform a full table scan for the specified table. For example:

```
SELECT /*+ FULL(e) */ employee_id, last_name
  FROM hr.employees e
  WHERE last_name LIKE :b1;
```

Oracle Database performs a full table scan on the `employees` table to execute this statement, even if there is an index on the `last_name` column that is made available by the condition in the `WHERE` clause.

The `employees` table has alias `e` in the `FROM` clause, so the hint must refer to the table by its alias rather than by its name. Do not specify schema names in the hint even if they are specified in the `FROM` clause.

GATHER_OPTIMIZER_STATISTICS Hint

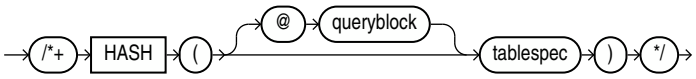
The `GATHER_OPTIMIZER_STATISTICS` hint instructs the optimizer to enable statistics gathering during the following types of bulk loads:

- `CREATE TABLE ... AS SELECT`
- `INSERT INTO ... SELECT` into an empty table using a direct-path insert

> **See Also**
>
> *Oracle AI Database SQL Tuning Guide* for more information on statistics gathering for bulk loads

Copyright © 1996, 2026, Oracle and/or its affiliates.

GROUPING Hint

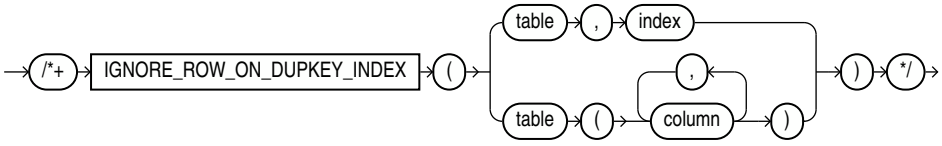


The `GROUPING` hint applies to data mining scoring functions when scoring partitioned models. This hint results in partitioning the input data set into distinct data slices so that each partition is scored in its entirety before advancing to the next partition; however, parallelism by partition is still available. Data slices are determined by the partitioning key columns that were used when the model was built. This method can be used with any data mining function against a partitioned model. The hint may yield a query performance gain when scoring large data that is associated with many partitions, but may negatively impact performance when scoring large data with few partitions on large systems. Typically, there is no performance gain if you use this hint for single row queries.

In the following example, the `GROUPING` hint is used in the `PREDICTION` function.

```
SELECT PREDICTION(/*+ GROUPING */my_model USING *) pred FROM <input table>;
```

> **See Also**
>
> Oracle Machine Learning for SQL Functions



HASH Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The `HASH` hint instructs the optimizer to use a hash scan to access the specified table. This hint applies only to tables in a hash cluster.

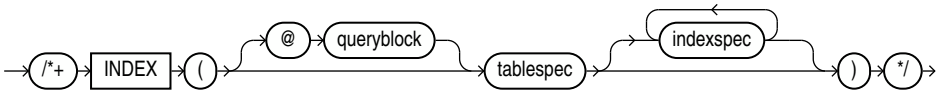
IGNORE_ROW_ON_DUPKEY_INDEX Hint

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **Note**
>
> The `CHANGE_DUPKEY_ERROR_INDEX`, `IGNORE_ROW_ON_DUPKEY_INDEX`, and `RETRY_ON_ROW_CHANGE` hints are unlike other hints in that they have a semantic effect. The general philosophy explained in Hints does not apply for these three hints.

The `IGNORE_ROW_ON_DUPKEY_INDEX` hint applies only to single-table `INSERT` operations. It is not supported for `UPDATE`, `DELETE`, `MERGE`, or multitable insert operations. `IGNORE_ROW_ON_DUPKEY_INDEX` causes the statement to ignore a unique key violation for a specified set of columns or for a specified index. When a unique key violation is encountered, a row-level rollback occurs and execution resumes with the next input row. If you specify this hint when inserting data with DML error logging enabled, then the unique key violation is not logged and does not cause statement termination.

The semantic effect of this hint results in error messages if specific rules are violated:



- If you specify *`index`*, then the index must exist and be unique. Otherwise, the statement causes ORA-38913.
- You must specify exactly one index. If you specify no index, then the statement causes ORA-38912. If you specify more than one index, then the statement causes ORA-38915.
- You can specify either a `CHANGE_DUPKEY_ERROR_INDEX` or `IGNORE_ROW_ON_DUPKEY_INDEX` hint in an `INSERT` statement, but not both. If you specify both, then the statement causes ORA-38915.

As with all hints, a syntax error in the hint causes it to be silently ignored. The result will be that ORA-00001 will be caused, just as if no hint were used.

> **Note**
>
> This hint disables both `APPEND` mode and parallel `DML`.

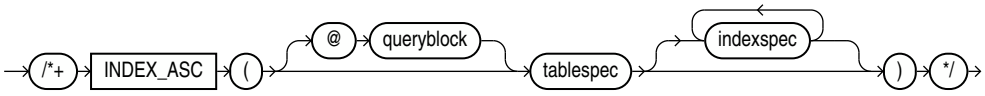
> **See Also**
>
> CHANGE_DUPKEY_ERROR_INDEX Hint

INDEX Hint

(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)

The `INDEX` hint instructs the optimizer to use an index scan for the specified table. You can use the `INDEX` hint for function-based, domain, B-tree, bitmap, and bitmap join indexes.

The behavior of the hint depends on the *`indexspec`* specification:



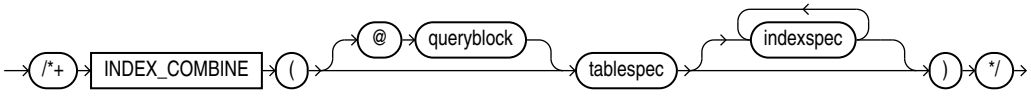
Copyright © 1996, 2026, Oracle and/or its affiliates.

- If the `INDEX` hint specifies a single available index, then the database performs a scan on this index. The optimizer does not consider a full table scan or a scan of another index on the table.
- For a hint on a combination of multiple indexes, Oracle recommends using `INDEX_COMBINE` rather than `INDEX`, because it is a more versatile hint. If the `INDEX` hint specifies a list of available indexes, then the optimizer considers the cost of a scan on each index in the list and then performs the index scan with the lowest cost. The database can also choose to scan multiple indexes from this list and merge the results, if such an access path has the lowest cost. The database does not consider a full table scan or a scan on an index not listed in the hint.
- If the `INDEX` hint specifies no indexes, then the optimizer considers the cost of a scan on each available index on the table and then performs the index scan with the lowest cost. The database can also choose to scan multiple indexes and merge the results, if such an access path has the lowest cost. The optimizer does not consider a full table scan.

For example:

```
SELECT /*+ INDEX (employees emp_department_ix)*/ employee_id, department_id
  FROM employees
  WHERE department_id > 50;
```

INDEX_ASC Hint



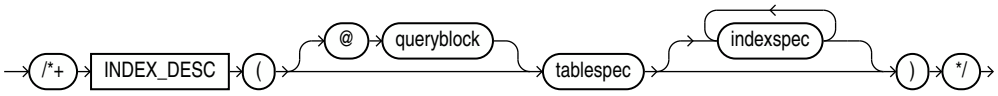
(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)

The `INDEX_ASC` hint instructs the optimizer to use an index scan for the specified table. If the statement uses an index range scan, then Oracle Database scans the index entries in ascending order of their indexed values. Each parameter serves the same purpose as in INDEX Hint .

The default behavior for a range scan is to scan index entries in ascending order of their indexed values, or in descending order for a descending index. This hint does not change the default order of the index, and therefore does not specify anything more than the `INDEX` hint. However, you can use the `INDEX_ASC` hint to specify ascending range scans explicitly should the default behavior change.

INDEX_COMBINE Hint

(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)



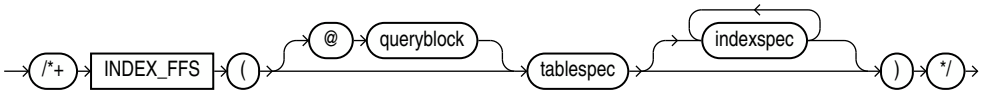
The `INDEX_COMBINE` hint can use any type of index: bitmap, b-tree, or domain. If you do not specify *`indexspec`* in the `INDEX_COMBINE` hint, the optimizer implicitly applies the`INDEX` hint to all indexes, using as many indexes as possible. If you specify *`indexspec`*, then the optimizer uses

Copyright © 1996, 2026, Oracle and/or its affiliates.

all the hinted indexes that are legal and valid to use, regardless of cost. Each parameter serves the same purpose as in INDEX Hint . For example:

```
SELECT /*+ INDEX_COMBINE(e emp_manager_ix emp_department_ix) */ *
  FROM employees e
  WHERE manager_id = 108
     OR department_id = 110;
```

INDEX_DESC Hint



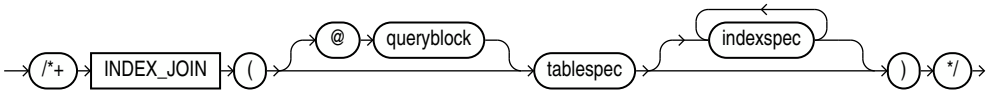
(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)

The `INDEX_DESC` hint instructs the optimizer to use a descending index scan for the specified table. If the statement uses an index range scan and the index is ascending, then Oracle scans the index entries in descending order of their indexed values. In a partitioned index, the results are in descending order within each partition. For a descending index, this hint effectively cancels out the descending order, resulting in a scan of the index entries in ascending order. Each parameter serves the same purpose as in INDEX Hint . For example:

```
SELECT /*+ INDEX_DESC(e emp_name_ix) */ *
  FROM employees e;
```

> **See Also**
>
> *Oracle AI Database SQL Tuning Guide* for information on full scans

INDEX_FFS Hint



(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)

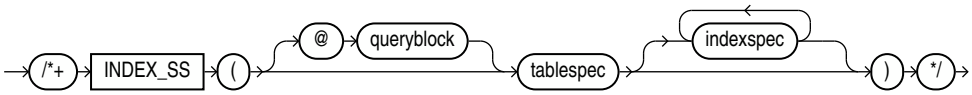
The `INDEX_FFS` hint instructs the optimizer to perform a fast full index scan rather than a full table scan.

Each parameter serves the same purpose as in INDEX Hint . For example:

```
SELECT /*+ INDEX_FFS(e emp_name_ix) */ first_name
  FROM employees e;
```

INDEX_JOIN Hint

Copyright © 1996, 2026, Oracle and/or its affiliates.



(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)

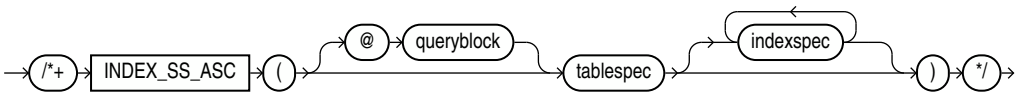
The `INDEX_JOIN` hint instructs the optimizer to use an index join as an access path. For the hint to have a positive effect, a sufficiently small number of indexes must exist that contain all the columns required to resolve the query.

Each parameter serves the same purpose as in INDEX Hint . For example, the following query uses an index join to access the `manager_id` and `department_id` columns, both of which are indexed in the `employees` table.

```
SELECT /*+ INDEX_JOIN(e emp_manager_ix emp_department_ix) */ department_id
  FROM employees e
  WHERE manager_id < 110
    AND department_id < 50;
```

INDEX_SS Hint

(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)



The `INDEX_SS` hint instructs the optimizer to perform an index skip scan for the specified table. If the statement uses an index range scan, then Oracle scans the index entries in ascending order of their indexed values. In a partitioned index, the results are in ascending order within each partition.

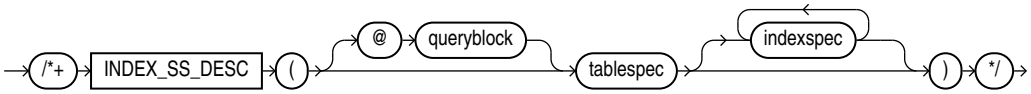
Each parameter serves the same purpose as in INDEX Hint . For example:

```
SELECT /*+ INDEX_SS(e emp_name_ix) */ last_name
  FROM employees e
  WHERE first_name = 'Steven';
```

> **See Also**
>
> *Oracle AI Database SQL Tuning Guide* for information on index skip scans

INDEX_SS_ASC Hint

(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)



The `INDEX_SS_ASC` hint instructs the optimizer to perform an index skip scan for the specified table. If the statement uses an index range scan, then Oracle Database scans the index entries in ascending order of their indexed values. In a partitioned index, the results are in ascending order within each partition. Each parameter serves the same purpose as in INDEX Hint .

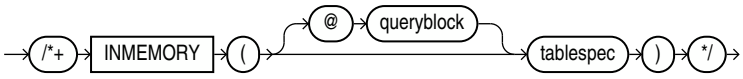
Copyright © 1996, 2026, Oracle and/or its affiliates.

The default behavior for a range scan is to scan index entries in ascending order of their indexed values, or in descending order for a descending index. This hint does not change the default order of the index, and therefore does not specify anything more than the `INDEX_SS` hint. However, you can use the `INDEX_SS_ASC` hint to specify ascending range scans explicitly should the default behavior change.

> **See Also**
>
> *Oracle AI Database SQL Tuning Guide* for information on index skip scans

INDEX_SS_DESC Hint

(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)



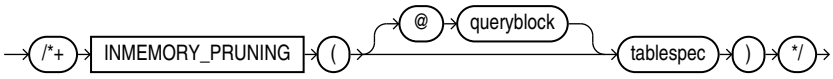
The `INDEX_SS_DESC` hint instructs the optimizer to perform an index skip scan for the specified table. If the statement uses an index range scan and the index is ascending, then Oracle scans the index entries in descending order of their indexed values. In a partitioned index, the results are in descending order within each partition. For a descending index, this hint effectively cancels out the descending order, resulting in a scan of the index entries in ascending order.

Each parameter serves the same purpose as in the INDEX Hint . For example:

```
SELECT /*+ INDEX_SS_DESC(e emp_name_ix) */ last_name
  FROM employees e
  WHERE first_name = 'Steven';
```

> **See Also**
>
> *Oracle AI Database SQL Tuning Guide* for information on index skip scans

INMEMORY Hint



(See Specifying a Query Block in a Hint , *tablespec*::=)

The `INMEMORY` hint enables In-Memory queries.

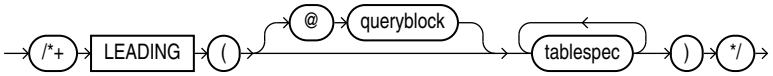
This hint does not instruct the optimizer to perform a full table scan. If a full table scan is desired, then also specify the FULL Hint .

Copyright © 1996, 2026, Oracle and/or its affiliates.

INMEMORY_PRUNING Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The `INMEMORY_PRUNING` hint enables pruning of In-Memory queries.



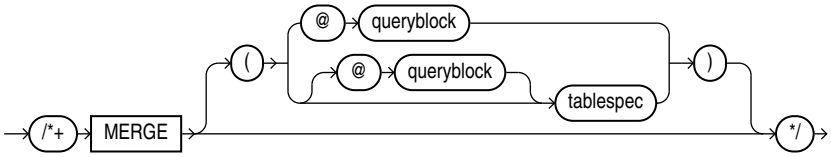
IVF_ITERATION Hint

Use the `IVF_ITERATION` hint to specify a terminable iteration IVF index.

For more on terminable iteration for an IVF index see Terminable Iteration for IVF Index of the *AI Vector Search User's Guide*.

LEADING Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)



The `LEADING` hint is a multitable hint that can specify more than one table or view. `LEADING` instructs the optimizer to use the specified set of tables as the prefix in the execution plan. The first table specified is used to start the join.

This hint is more versatile than the `ORDERED` hint. For example:

```
SELECT /*+ LEADING(e j) */ *
    FROM employees e, departments d, job_history j
    WHERE e.department_id = d.department_id
      AND e.hire_date = j.start_date;
```

The `LEADING` hint is ignored if the tables specified cannot be joined first in the order specified because of dependencies in the join graph. If you specify two or more conflicting `LEADING` hints, then all of them are ignored. If you specify the `ORDERED` hint, it overrides all `LEADING` hints.

MERGE Hint

Copyright © 1996, 2026, Oracle and/or its affiliates.

(See Specifying a Query Block in a Hint , *tablespec*::=)

The MERGE hint lets you merge views in a query.

If a view's query block contains a GROUP BY clause or DISTINCT operator in the SELECT list, then the optimizer can merge the view into the accessing statement only if complex view merging is enabled. Complex merging can also be used to merge an IN subquery into the accessing statement if the subquery is uncorrelated.

For example:

```
SELECT /*+ MERGE(v) */ e1.last_name, e1.salary, v.avg_salary
   FROM employees e1,
        (SELECT department_id, avg(salary) avg_salary
           FROM employees e2
           GROUP BY department_id) v
   WHERE e1.department_id = v.department_id
     AND e1.salary > v.avg_salary
   ORDER BY e1.last_name;
```

When the MERGE hint is used without an argument, it should be placed in the view query block. When MERGE is used with the view name as an argument, it should be placed in the surrounding query.

MODEL_MIN_ANALYSIS Hint

The MODEL_MIN_ANALYSIS hint instructs the optimizer to omit some compile-time optimizations of spreadsheet rules—primarily detailed dependency graph analysis. Other spreadsheet optimizations, such as creating filters to selectively populate spreadsheet access structures and limited rule pruning, are still used by the optimizer.

This hint reduces compilation time because spreadsheet analysis can be lengthy if the number of spreadsheet rules is more than several hundreds.

MONITOR Hint

The MONITOR hint forces real-time SQL monitoring for the query, even if the statement is not long running. This hint is valid only when the parameter CONTROL_MANAGEMENT_PACK_ACCESS is set to DIAGNOSTIC+TUNING.

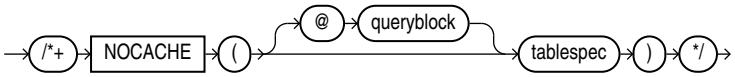
> **See Also**
>
> *Oracle Database SQL Tuning Guide* for more information about real-time SQL monitoring

Copyright © 1996, 2026, Oracle and/or its affiliates.

NATIVE_FULL_OUTER_JOIN Hint

The `NATIVE_FULL_OUTER_JOIN` hint instructs the optimizer to use native full outer join, which is a native execution method based on a hash join.

See Also



- NO_NATIVE_FULL_OUTER_JOIN Hint
- *Oracle AI Database SQL Tuning Guide* for more information about native full outer joins

NOAPPEND Hint

The `NOAPPEND` hint instructs the optimizer to use conventional `INSERT` even when `INSERT` is performed in parallel mode.

NOCACHE Hint

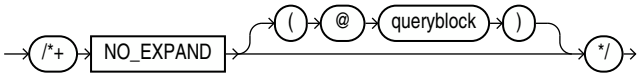
(See Specifying a Query Block in a Hint , *tablespec*::=)

The `NOCACHE` hint instructs the optimizer to place the blocks retrieved for the table at the least recently used end of the LRU list in the buffer cache when a full table scan is performed. This is the normal behavior of blocks in the buffer cache. For example:

```
SELECT /*+ FULL(hr_emp) NOCACHE(hr_emp) */ last_name
  FROM employees hr_emp;
```

The `CACHE` and `NOCACHE` hints affect system statistics `table scans(long tables)` and `table scans(short tables)`, as shown in the `V$SYSSTAT` view.

NO_CLUSTERING Hint



Copyright © 1996, 2026, Oracle and/or its affiliates.

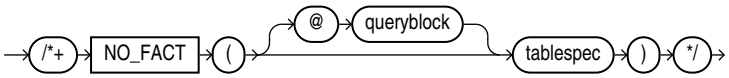
This hint is valid only for `INSERT` and `MERGE` operations on tables that are enabled for attribute clustering. The `NO_CLUSTERING` hint disables attribute clustering for direct-path inserts (serial or parallel). This hint overrides a `YES ON LOAD` setting in the DDL that created or altered the table. This hint has no effect on tables that are not enabled for attribute clustering.

See Also

- clustering_when clause of `CREATE TABLE` for more information on the `YES ON LOAD` setting
- CLUSTERING Hint

NO_EXPAND Hint

(See Specifying a Query Block in a Hint)



The `NO_EXPAND` hint instructs the optimizer not to consider `OR`-expansion for queries having `OR` conditions or `IN`-lists in the `WHERE` clause. Usually, the optimizer considers using `OR` expansion and uses this method if it decides that the cost is lower than not using it. For example:

```
SELECT /*+ NO_EXPAND */ *
  FROM employees e, departments d
  WHERE e.manager_id = 108
     OR d.department_id = 110;
```

See Also

The USE_CONCAT Hint , which is the opposite of this hint

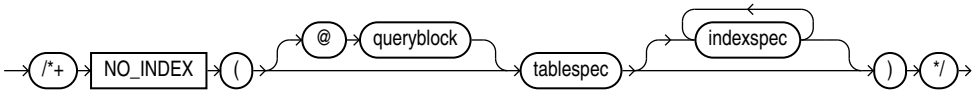
NO_FACT Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The `NO_FACT` hint is used in the context of the star transformation. It instruct the optimizer that the queried table should not be considered as a fact table.

NO_GATHER_OPTIMIZER_STATISTICS Hint

Copyright © 1996, 2026, Oracle and/or its affiliates.



The NO_GATHER_OPTIMIZER_STATISTICS hint instructs the optimizer to disable statistics gathering during the following types of bulk loads:

- CREATE TABLE AS SELECT
- INSERT INTO ... SELECT into an empty table using a direct path insert

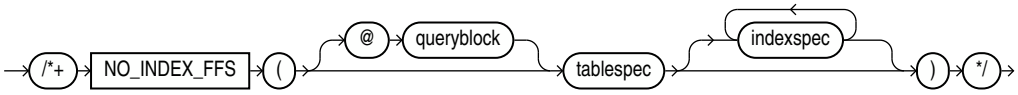
The NO_GATHER_OPTIMIZER_STATISTICS hint is applicable to a conventional load. If this hint is specified in the conventional insert statement, Oracle will obey the hint and not collect real-time statistics.

> **See Also**
>
> *Oracle AI Database SQL Tuning Guide* for more information on online statistics gathering for conventional loads.

NO_INDEX Hint

(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)

The NO_INDEX hint instructs the optimizer not to use one or more indexes for the specified table. For example:



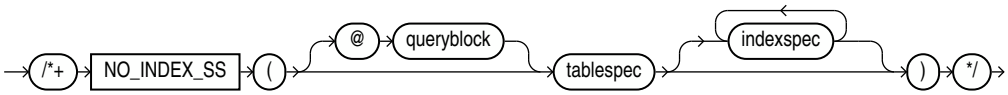
```
SELECT /*+ NO_INDEX(employees emp_empid) */ employee_id
  FROM employees
  WHERE employee_id > 200;
```

Each parameter serves the same purpose as in INDEX Hint with the following modifications:

- If this hint specifies a single available index, then the optimizer does not consider a scan on this index. Other indexes not specified are still considered.
- If this hint specifies a list of available indexes, then the optimizer does not consider a scan on any of the specified indexes. Other indexes not specified in the list are still considered.
- If this hint specifies no indexes, then the optimizer does not consider a scan on any index on the table. This behavior is the same as a NO_INDEX hint that specifies a list of all available indexes for the table.

The NO_INDEX hint applies to function-based, B-tree, bitmap, cluster, or domain indexes. If a NO_INDEX hint and an index hint (INDEX, INDEX_ASC, INDEX_DESC, INDEX_COMBINE, or INDEX_FFS) both specify the same indexes, then the database ignores both the NO_INDEX hint and the index hint for the specified indexes and considers those indexes for use during execution of the statement.

NO_INDEX_FFS Hint



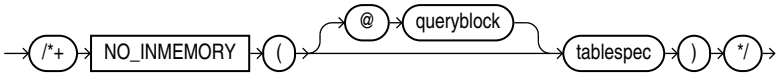
Copyright © 1996, 2026, Oracle and/or its affiliates.

(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)

The `NO_INDEX_FFS` hint instructs the optimizer to exclude a fast full index scan of the specified indexes on the specified table. Each parameter serves the same purpose as in the NO_INDEX Hint . For example:

```
SELECT /*+ NO_INDEX_FFS(items item_order_ix) */ order_id
  FROM order_items items;
```

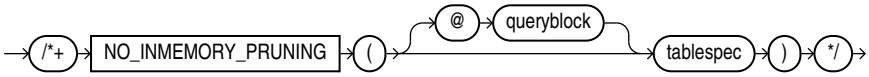
NO_INDEX_SS Hint



(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)

The `NO_INDEX_SS` hint instructs the optimizer to exclude a skip scan of the specified indexes on the specified table. Each parameter serves the same purpose as in the NO_INDEX Hint .

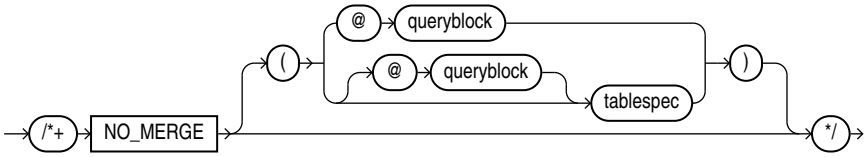
> **See Also**
>
> *Oracle AI Database SQL Tuning Guide* for information on index skip scans



NO_INMEMORY Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The `NO_INMEMORY` hint disables In-Memory queries.



NO_INMEMORY_PRUNING Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The `NO_INMEMORY_PRUNING` hint disables pruning of In-Memory queries.

NO_MERGE Hint

Copyright © 1996, 2026, Oracle and/or its affiliates.

(See Specifying a Query Block in a Hint , *tablespec*::=)

The NO_MERGE hint instructs the optimizer not to combine the outer query and any inline view queries into a single query.

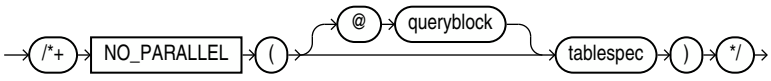
This hint lets you have more influence over the way in which the view is accessed. For example, the following statement causes view seattle_dept not to be merged:

```
SELECT /*+ NO_MERGE(seattle_dept) */ e1.last_name, seattle_dept.department_name
  FROM employees e1,
       (SELECT location_id, department_id, department_name
          FROM departments
          WHERE location_id = 1700) seattle_dept
  WHERE e1.department_id = seattle_dept.department_id;
```

When you use the NO_MERGE hint in the view query block, specify it without an argument. When you specify NO_MERGE in the surrounding query, specify it with the view name as an argument.

NO_MONITOR Hint

The NO_MONITOR hint disables real-time SQL monitoring for the query, even if the query is long running.



NO_NATIVE_FULL_OUTER_JOIN Hint

The NO_NATIVE_FULL_OUTER_JOIN hint instructs the optimizer to exclude the native execution method when joining each specified table. Instead, the full outer join is executed as a union of left outer join and anti-join.

> **See Also**
>
> NATIVE_FULL_OUTER_JOIN Hint

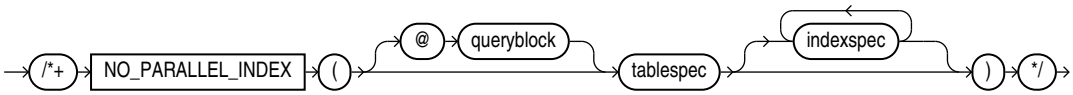
NO_PARALLEL Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The NO_PARALLEL hint instructs the optimizer to run the statement serially. This hint overrides the value of the PARALLEL_DEGREE_POLICY initialization parameter. It also overrides a PARALLEL

Copyright © 1996, 2026, Oracle and/or its affiliates.

parameter in the DDL that created or altered the table. For example, the following `SELECT` statement will run serially:



```
ALTER TABLE employees PARALLEL 8;
SELECT /*+ NO_PARALLEL(hr_emp) */ last_name
  FROM employees hr_emp;
```

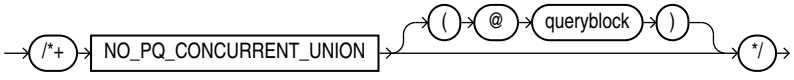
> **See Also**
>
> - Note on Parallel Hints for more information on the parallel hints
> - *Oracle AI Database Reference* for more information on the `PARALLEL_DEGREE_POLICY` initialization parameter

NOPARALLEL Hint

The `NOPARALLEL` hint has been deprecated. Use the `NO_PARALLEL` hint instead.

NO_PARALLEL_INDEX Hint

(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)



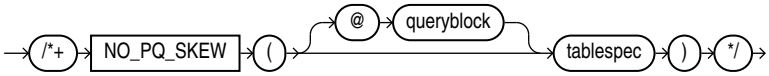
The `NO_PARALLEL_INDEX` hint overrides a `PARALLEL` parameter in the DDL that created or altered the index, thus avoiding a parallel index scan operation.

> **See Also**
>
> Note on Parallel Hints for more information on the parallel hints

NOPARALLEL_INDEX Hint

The `NOPARALLEL_INDEX` hint has been deprecated. Use the `NO_PARALLEL_INDEX` hint instead.

NO_PQ_CONCURRENT_UNION Hint

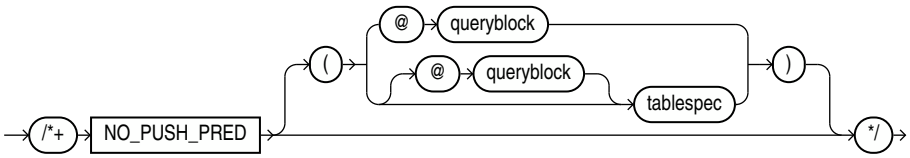


(See Specifying a Query Block in a Hint)

The `NO_PQ_CONCURRENT_UNION` hint instructs the optimizer to disable concurrent processing of `UNION` and `UNION ALL` operations.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> - PQ_CONCURRENT_UNION Hint
> - *Oracle AI Database VLDB and Partitioning Guide* for information about using this hint

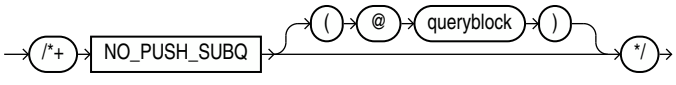


NO_PQ_SKEW Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The `NO_PQ_SKEW` hint advises the optimizer that the distribution of the values of the join keys for a parallel join is not skewed—that is, a high percentage of rows do not have the same join key values. The table specified in *`tablespec`* is the probe table of the hash join.

NO_PUSH_PRED Hint



(See Specifying a Query Block in a Hint , *tablespec*::=)

The `NO_PUSH_PRED` hint instructs the optimizer not to push a join predicate into the view. For example:

```
SELECT /*+ NO_MERGE(v) NO_PUSH_PRED(v) */ *
  FROM employees e,
       (SELECT manager_id
          FROM employees) v
  WHERE e.manager_id = v.manager_id(+)
    AND e.employee_id = 100;
```

NO_PUSH_SUBQ Hint

(See Specifying a Query Block in a Hint)

The `NO_PUSH_SUBQ` hint instructs the optimizer to evaluate nonmerged subqueries as the last step in the execution plan. Doing so can improve performance if the subquery is relatively expensive or does not reduce the number of rows significantly.

Copyright © 1996, 2026, Oracle and/or its affiliates.

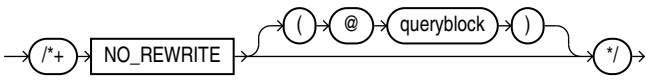
NO_PX_JOIN_FILTER Hint

This hint prevents the optimizer from using parallel join bitmap filtering.

NO_QUERY_TRANSFORMATION Hint

The `NO_QUERY_TRANSFORMATION` hint instructs the optimizer to skip all query transformations, including but not limited to `OR`-expansion, view merging, subquery unnesting, star transformation, and materialized view rewrite. For example:

```
SELECT /*+ NO_QUERY_TRANSFORMATION */ employee_id, last_name
  FROM (SELECT * FROM employees e) v
  WHERE v.last_name = 'Smith';
```



NO_RESULT_CACHE Hint

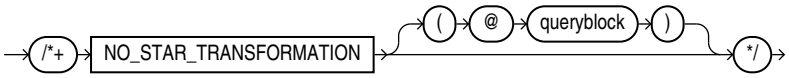
The optimizer caches query results in the result cache if the `RESULT_CACHE_MODE` initialization parameter is set to `FORCE`. In this case, the `NO_RESULT_CACHE` hint disables such caching for the current query.

If the query is executed from OCI client and OCI client result cache is enabled, then the `NO_RESULT_CACHE` hint disables caching for the current query.

NO_REWRITE Hint

(See Specifying a Query Block in a Hint)

The `NO_REWRITE` hint instructs the optimizer to disable query rewrite for the query block, overriding the setting of the parameter `QUERY_REWRITE_ENABLED`. For example:



```
SELECT /*+ NO_REWRITE */ sum(s.amount_sold) AS dollars
  FROM sales s, times t
  WHERE s.time_id = t.time_id
  GROUP BY t.calendar_month_desc;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

NOREWRITE Hint

The `NOREWRITE` hint has been deprecated. Use the `NO_REWRITE` hint instead.

NO_STAR_TRANSFORMATION Hint

(See Specifying a Query Block in a Hint)

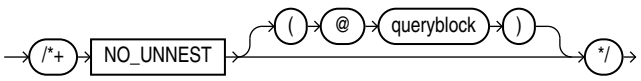
The `NO_STAR_TRANSFORMATION` hint instructs the optimizer not to perform star query transformation.

NO_STATEMENT_QUEUING Hint

The `NO_STATEMENT_QUEUING` hint influences whether or not a statement is queued with parallel statement queuing.

When `PARALLEL_DEGREE_POLICY` is set to `AUTO`, this hint enables a statement to bypass the parallel statement queue. However, a statement that bypasses the statement queue can potentially cause the system to exceed the maximum number of parallel execution servers defined by the value of the `PARALLEL_SERVERS_TARGET` initialization parameter, which determines the limit at which parallel statement queuing is initiated.

There is no guarantee that the statement that bypasses the parallel statement queue receives the number of parallel execution servers requested because only the number of parallel execution servers available on the system, up to the value of the `PARALLEL_MAX_SERVERS` initialization parameter, can be allocated.



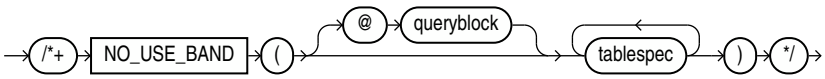
For example:

```
SELECT /*+ NO_STATEMENT_QUEUING */ emp.last_name, dpt.department_name
  FROM employees emp, departments dpt
  WHERE emp.department_id = dpt.department_id;
```

See Also

STATEMENT_QUEUING Hint

NO_UNNEST Hint

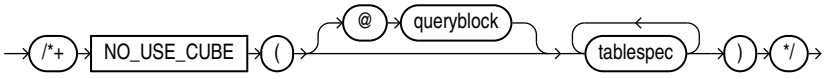


Copyright © 1996, 2026, Oracle and/or its affiliates.

(See Specifying a Query Block in a Hint)

Use of the NO_UNNEST hint turns off unnesting .

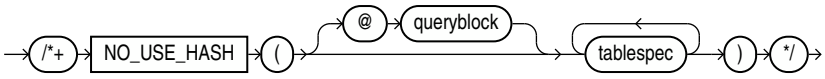
NO_USE_BAND Hint



(See Specifying a Query Block in a Hint , *tablespec*::=)

The NO_USE_BAND hint instructs the optimizer to exclude band joins when joining each specified table to another row source. For example:

```
SELECT /*+ NO_USE_BAND(e1 e2) */
  e1.last_name
  || ' has salary between 100 less and 100 more than '
  || e2.last_name AS "SALARY COMPARISON"
FROM employees e1, employees e2
WHERE e1.salary BETWEEN e2.salary - 100 AND e2.salary + 100;
```

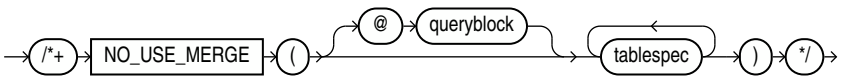


NO_USE_CUBE Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The NO_USE_CUBE hint instructs the optimizer to exclude cube joins when joining each specified table to another row source using the specified table as the inner table.

NO_USE_HASH Hint

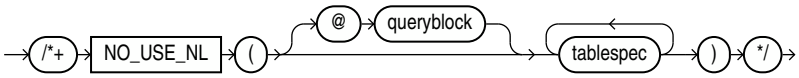


(See Specifying a Query Block in a Hint , *tablespec*::=)

The NO_USE_HASH hint instructs the optimizer to exclude hash joins when joining each specified table to another row source using the specified table as the inner table. For example:

```
SELECT /*+ NO_USE_HASH(e d) */ *
  FROM employees e, departments d
  WHERE e.department_id = d.department_id;
```

NO_USE_MERGE Hint



Copyright © 1996, 2026, Oracle and/or its affiliates.

(See Specifying a Query Block in a Hint , *tablespec*::=)

The NO_USE_MERGE hint instructs the optimizer to exclude sort-merge joins when joining each specified table to another row source using the specified table as the inner table. For example:

```
SELECT /*+ NO_USE_MERGE(e d) */ *
   FROM employees e, departments d
   WHERE e.department_id = d.department_id
   ORDER BY d.department_id;
```

NO_USE_NL Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The NO_USE_NL hint instructs the optimizer to exclude nested loops joins when joining each specified table to another row source using the specified table as the inner table. For example:

```
SELECT /*+ NO_USE_NL(l h) */ *
  FROM orders h, order_items l
  WHERE l.order_id = h.order_id
    AND l.order_id > 2400;
```

When this hint is specified, only hash join and sort-merge joins are considered for the specified tables. However, in some cases tables can be joined only by using nested loops. In such cases, the optimizer ignores the hint for those tables.

NO_XML_QUERY_REWRITE Hint

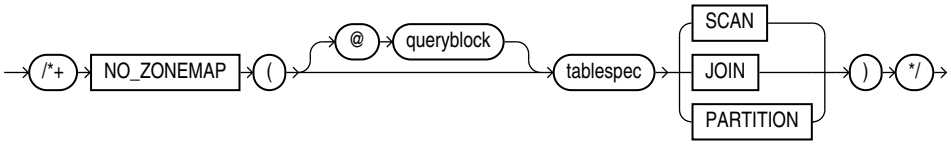
The NO_XML_QUERY_REWRITE hint instructs the optimizer to prohibit the rewriting of XPath expressions in SQL statements. By prohibiting the rewriting of XPath expressions, this hint also prohibits the use of any XMLIndexes for the current query. For example:

```
SELECT /*+NO_XML_QUERY_REWRITE*/ XMLQUERY('<A/>' RETURNING CONTENT)
  FROM DUAL;
```

See Also

NO_XMLINDEX_REWRITE Hint

NO_XMLINDEX_REWRITE Hint



Copyright © 1996, 2026, Oracle and/or its affiliates.

The `NO_XMLINDEX_REWRITE` hint instructs the optimizer not to use any XMLIndex indexes for the current query. For example:

```
SELECT /*+NO_XMLINDEX_REWRITE*/ count(*)
  FROM warehouses
  WHERE existsNode(warehouse_spec, '/Warehouse/Building') = 1;
```

> **See Also**
>
> NO_XML_QUERY_REWRITE Hint for another way to disable the use of XMLIndexes

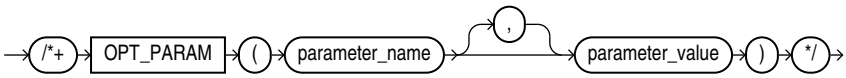
NO_ZONEMAP Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The `NO_ZONEMAP` hint disables the use of a zone map for different types of pruning. This hint overrides an `ENABLE PRUNING` setting in the DDL that created or altered the zone map.

Specify one of the following options:

- `SCAN` - Disables the use of a zone map for scan pruning.
- `JOIN` - Disables the use of a zone map for join pruning.
- `PARTITION` - Disables the use of a zone map for partition pruning.



> **See Also**
>
> - ENABLE | DISABLE PRUNING clause of `CREATE MATERIALIZED ZONEMAP`
> - *Oracle AI Database Data Warehousing Guide* for more information on pruning with zone maps

OPTIMIZER_FEATURES_ENABLE Hint

This hint is fully documented in the Database Reference book.

Please see Database Reference for details.

OPT_PARAM Hint

Copyright © 1996, 2026, Oracle and/or its affiliates.

The OPT_PARAM hint lets you set an initialization parameter for the duration of the current query only. This hint is valid only for the following parameters: APPROX_FOR_AGGREGATION, APPROX_FOR_COUNT_DISTINCT, APPROX_FOR_PERCENTILE, OPTIMIZER_DYNAMIC_SAMPLING, OPTIMIZER_INDEX_CACHING, OPTIMIZER_INDEX_COST_ADJ, and STAR_TRANSFORMATION_ENABLED.

For example, the following hint sets the parameter STAR_TRANSFORMATION_ENABLED to TRUE for the statement to which it is added:

```
SELECT /*+ OPT_PARAM('star_transformation_enabled' 'true') */ *
  FROM ... ;
```

Parameter values that are strings are enclosed in single quotation marks. Numeric parameter values are specified without quotation marks.

ORDERED Hint

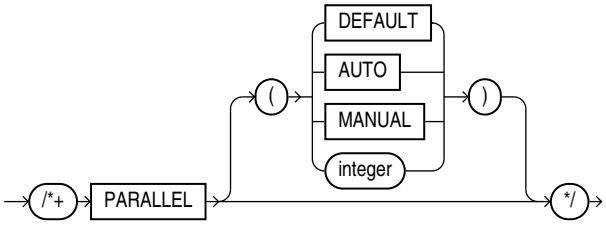
The ORDERED hint instructs Oracle to join tables in the order in which they appear in the FROM clause. Oracle recommends that you use the LEADING hint, which is more versatile than the ORDERED hint.

When you omit the ORDERED hint from a SQL statement requiring a join, the optimizer chooses the order in which to join the tables. You might want to use the ORDERED hint to specify a join order if you know something that the optimizer does not know about the number of rows selected from each table. Such information lets you choose an inner and outer table better than the optimizer could.

The following query is an example of the use of the ORDERED hint:

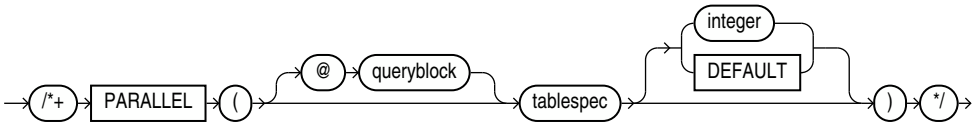
```
SELECT  /*+ ORDERED */ o.order_id, c.customer_id, l.unit_price * l.quantity
  FROM customers c, order_items l, orders o
  WHERE c.cust_last_name = 'Taylor'
    AND o.customer_id = c.customer_id
    AND o.order_id = l.order_id;
```

PARALLEL Hint



Note on Parallel Hints

Beginning with Oracle Database 11*g* Release 2, the PARALLEL and NO_PARALLEL hints are statement-level hints and supersede the earlier object-level hints: PARALLEL_INDEX, NO_PARALLEL_INDEX, and previously specified PARALLEL and NO_PARALLEL hints. For PARALLEL, if you specify *integer*, then that degree of parallelism will be used for the statement. If you omit *integer*, then the database computes the degree of parallelism. All the access paths that can use parallelism will use the specified or computed degree of parallelism.



In the syntax diagrams below, *parallel_hint_statement* shows the syntax for statement-level hints, and *parallel_hint_object* shows the syntax for object-level hints. Object-level hints are supported for backward compatibility, and are superseded by statement-level hints.

Copyright © 1996, 2026, Oracle and/or its affiliates.

***parallel_hint_statement*::=**

***parallel_hint_object*::=**

(See Specifying a Query Block in a Hint , *tablespec*::=)

The `PARALLEL` hint instructs the optimizer to use the specified number of concurrent servers for a parallel operation. This hint overrides the value of the `PARALLEL_DEGREE_POLICY` initialization parameter. It applies to the `SELECT`, `INSERT`, `MERGE`, `UPDATE`, and `DELETE` portions of a statement, as well as to the table scan portion. If any parallel restrictions are violated, then the hint is ignored.

> **Note**
>
> The number of servers that can be used is twice the value in the `PARALLEL` hint, if sorting or grouping operations also take place.

For a **statement-level PARALLEL hint**:

- `PARALLEL`: The statement results in a degree of parallelism equal to or greater than the computed degree of parallelism, except when parallelism is not feasible for the lowest cost plan. When parallelism is is not feasible, the statement runs serially.
- `PARALLEL (DEFAULT)`: The optimizer calculates a degree of parallelism equal to the number of CPUs available on all participating instances times the value of the `PARALLEL_THREADS_PER_CPU` initialization parameter.
- `PARALLEL (AUTO)`: The statement results in a degree of parallelism that is equal to or greater than the computed degree of parallelism, except when parallelism is not feasible for the lowest cost plan. When parallelism is is not feasible, the statement runs serially.
- `PARALLEL (MANUAL)`: The optimizer is forced to use the parallel settings of the objects in the statement.
- `PARALLEL (`*`integer`*`)`: The optimizer uses the degree of parallelism specified by *`integer`*.

In the following example, the optimizer calculates the degree of parallelism. The statement always runs in parallel.

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT /*+ PARALLEL */ last_name
  FROM employees;
```

In the following example, the optimizer calculates the degree of parallelism, but that degree may be 1, in which case the statement will run serially.

```
SELECT /*+ PARALLEL (AUTO) */ last_name
  FROM employees;
```

In the following example, the `PARALLEL` hint advises the optimizer to use the degree of parallelism currently in effect for the table itself, which is 5:

```
CREATE TABLE parallel_table (col1 number, col2 VARCHAR2(10)) PARALLEL 5;

SELECT /*+ PARALLEL (MANUAL) */ col2
  FROM parallel_table;
```

For an **object-level PARALLEL hint**:

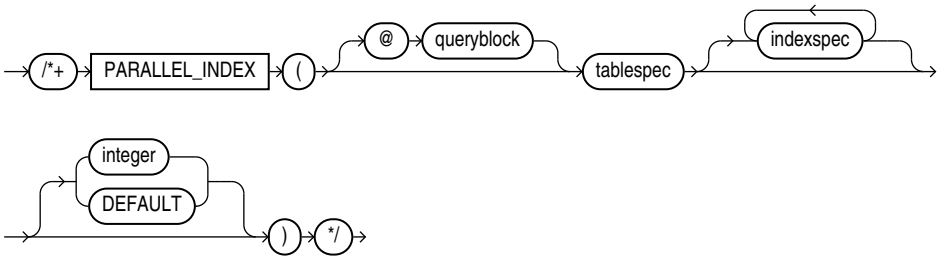
- `PARALLEL`: The query coordinator should examine the settings of the initialization parameters to determine the default degree of parallelism.
- `PARALLEL` (*`integer`*): The optimizer uses the degree of parallelism specified by *`integer`*.
- `PARALLEL (DEFAULT)`: The optimizer calculates a degree of parallelism equal to the number of CPUs available on all participating instances times the value of the `PARALLEL_THREADS_PER_CPU` initialization parameter.

In the following example, the `PARALLEL` hint overrides the degree of parallelism specified in the `employees` table definition:

```
SELECT /*+ FULL(hr_emp) PARALLEL(hr_emp, 5) */ last_name
  FROM employees hr_emp;
```

In the next example, the `PARALLEL` hint overrides the degree of parallelism specified in the `employees` table definition and instructs the optimizer to calculate a degree of parallelism equal to the number of CPUs available on all participating instances times the value of the `PARALLEL_THREADS_PER_CPU` initialization parameter.

```
SELECT /*+ FULL(hr_emp) PARALLEL(hr_emp, DEFAULT) */ last_name
  FROM employees hr_emp;
```



Refer to CREATE TABLE and *Oracle AI Database Concepts* for more information on parallel execution.

ⓘ See Also

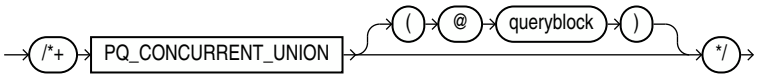
- NO_PARALLEL Hint

Copyright © 1996, 2026, Oracle and/or its affiliates.

PARALLEL_INDEX Hint

(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)



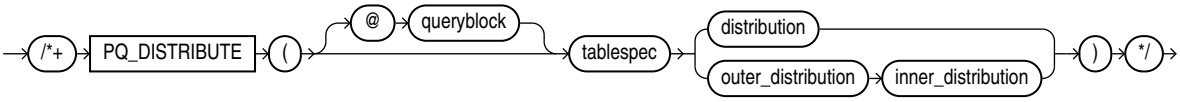
The `PARALLEL_INDEX` hint instructs the optimizer to use the specified number of concurrent servers to parallelize index range scans, full scans, and fast full scans for partitioned indexes.

The *`integer`* value indicates the degree of parallelism for the specified index. Specifying `DEFAULT` or no value signifies that the query coordinator should examine the settings of the initialization parameters to determine the default degree of parallelism. For example, the following hint indicates three parallel execution processes are to be used:

```
SELECT /*+ PARALLEL_INDEX(table1, index1, 3) */
```

> **See Also**
>
> Note on Parallel Hints for more information on the parallel hints

PQ_CONCURRENT_UNION Hint



(See Specifying a Query Block in a Hint)

The `PQ_CONCURRENT_UNION` hint instructs the optimizer to enable concurrent processing of `UNION` and `UNION ALL` operations.

> **See Also**
>
> - NO_PQ_CONCURRENT_UNION Hint
> - *Oracle AI Database VLDB and Partitioning Guide* for information about using this hint

Copyright © 1996, 2026, Oracle and/or its affiliates.

PQ_DISTRIBUTE Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The `PQ_DISTRIBUTE` hint instructs the optimizer how to distribute rows among producer and consumer query servers. You can control the distribution of rows for either joins or for load.

Control of Distribution for Load

You can control the distribution of rows for parallel `INSERT ... SELECT` and parallel `CREATE TABLE ... AS SELECT` statements to direct how rows should be distributed between the producer (query) and the consumer (load) servers. Use the upper branch of the syntax by specifying a single distribution method. The values of the distribution methods and their semantics are described in Table 2-25.

Table 2-25 Distribution Values for Load

Distribution	Description
`NONE`	No distribution. That is the query and load operation are combined into each query server. All servers will load all partitions. This lack of distribution is useful to avoid the overhead of distributing rows where there is no skew. Skew can occur due to empty segments or to a predicate in the statement that filters out all rows evaluated by the query. If skew occurs due to using this method, then use either `RANDOM` or `RANDOM_LOCAL` distribution instead. **Note**: Use this distribution with care. Each partition loaded requires a minimum of 512 KB per process of PGA memory. If you also use compression, then approximately 1.5 MB of PGA memory is consumer per server.
`PARTITION`	This method uses the partitioning information of *`tablespec`* to distribute the rows from the query servers to the load servers. Use this distribution method when it is not possible or desirable to combine the query and load operations, when the number of partitions being loaded is greater than or equal to the number of load servers, and the input data will be evenly distributed across the partitions being loaded—that is, there is no skew.
`RANDOM`	This method distributes the rows from the producers in a round-robin fashion to the consumers. Use this distribution method when the input data is highly skewed.
`RANDOM_LOCAL`	This method distributes the rows from the producers to a set of servers that are responsible for maintaining a given set of partitions. Two or more servers can be loading the same partition, but no servers are loading all partitions. Use this distribution method when the input data is skewed and combining query and load operations is not possible due to memory constraints.

For example, in the following direct-path insert operation, the query and load portions of the operation are combined into each query server:

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
INSERT /*+ APPEND PARALLEL(target_table, 16) PQ_DISTRIBUTE(target_table, NONE) */
  INTO target_table
  SELECT * FROM source_table;
```

In the following table creation example, the optimizer uses the partitioning of target_table to distribute the rows:

```
CREATE /*+ PQ_DISTRIBUTE(target_table, PARTITION) */ TABLE target_table
  NOLOGGING PARALLEL 16
  PARTITION BY HASH (l_orderkey) PARTITIONS 512
  AS SELECT * FROM source_table;
```

Control of Distribution for Joins

You control the distribution method for joins by specifying two distribution methods, as shown in the lower branch of the syntax diagram, one distribution for the outer table and one distribution for the inner table.

- *outer_distribution* is the distribution for the outer table.
- *inner_distribution* is the distribution for the inner table.

The values of the distributions are HASH, BROADCAST, PARTITION, and NONE. Only six combinations table distributions are valid, as described in Table 2-26:

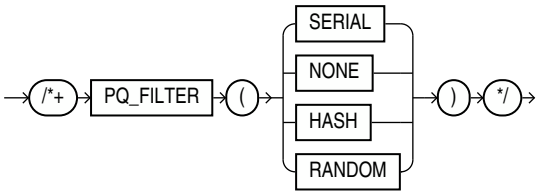
Table 2-26 Distribution Values for Joins

Distribution	Description
HASH, HASH	The rows of each table are mapped to consumer query servers, using a hash function on the join keys. When mapping is complete, each query server performs the join between a pair of resulting partitions. This distribution is recommended when the tables are comparable in size and the join operation is implemented by hash-join or sort merge join.
BROADCAST, NONE	All rows of the outer table are broadcast to each query server. The inner table rows are randomly partitioned. This distribution is recommended when the outer table is very small compared with the inner table. As a general rule, use this distribution when the inner table size multiplied by the number of query servers is greater than the outer table size.
NONE, BROADCAST	All rows of the inner table are broadcast to each consumer query server. The outer table rows are randomly partitioned. This distribution is recommended when the inner table is very small compared with the outer table. As a general rule, use this distribution when the inner table size multiplied by the number of query servers is less than the outer table size.
PARTITION, NONE	The rows of the outer table are mapped using the partitioning of the inner table. The inner table must be partitioned on the join keys. This distribution is recommended when the number of partitions of the outer table is equal to or nearly equal to a multiple of the number of query servers; for example, 14 partitions and 15 query servers. **Note**: The optimizer ignores this hint if the inner table is not partitioned or not equijoined on the partitioning key.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 2-26 (Cont.) Distribution Values for Joins

Distribution	Description
NONE, PARTITION	The rows of the inner table are mapped using the partitioning of the outer table. The outer table must be partitioned on the join keys. This distribution is recommended when the number of partitions of the outer table is equal to or nearly equal to a multiple of the number of query servers; for example, 14 partitions and 15 query servers. **Note**: The optimizer ignores this hint if the outer table is not partitioned or not equijoined on the partitioning key.
NONE, NONE	Each query server performs the join operation between a pair of matching partitions, one from each table. Both tables must be equipartitioned on the join keys.



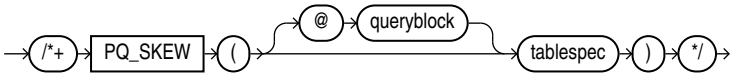
For example, given two tables `r` and `s` that are joined using a hash join, the following query contains a hint to use hash distribution:

```
SELECT /*+ORDERED PQ_DISTRIBUTE(s HASH, HASH) USE_HASH (s)*/ column_list
  FROM r,s
  WHERE r.c=s.c;
```

To broadcast the outer table `r`, the query is:

```
SELECT /*+ORDERED PQ_DISTRIBUTE(s BROADCAST, NONE) USE_HASH (s) */ column_list
  FROM r,s
  WHERE r.c=s.c;
```

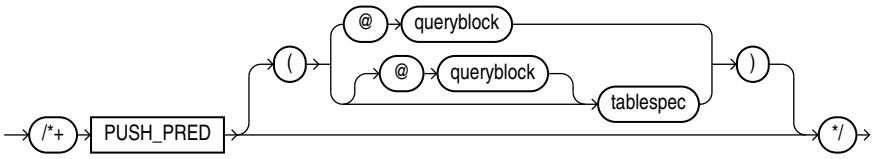
PQ_FILTER Hint



The `PQ_FILTER` hint instructs the optimizer on how to process rows when filtering correlated subqueries.

- `SERIAL`: Process rows serially on the left and right sides of the filter. Use this option when the overhead of parallelization is too high for the query, for example, when the left side has very few rows.
- `NONE`: Process rows in parallel on the left and right sides of the filter. Use this option when there is no skew in the distribution of the data on the left side of the filter and you would like to avoid distribution of the left side, for example, due to the large size of the left side.
- `HASH`: Process rows in parallel on the left side of the filter using a hash distribution. Process rows serially on the right side of the filter. Use this option when there is no skew in the distribution of data on the left side of the filter.
- `RANDOM`: Process rows in parallel on the left side of the filter using a random distribution. Process rows serially on the right side of the filter. Use this option when there is skew in the distribution of data on the left side of the filter.

Copyright © 1996, 2026, Oracle and/or its affiliates.

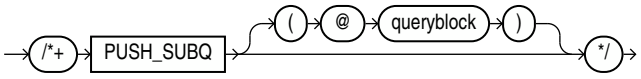


PQ_SKEW Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)

The `PQ_SKEW` hint advises the optimizer that the distribution of the values of the join keys for a parallel join is highly skewed—that is, a high percentage of rows have the same join key values. The table specified in *`tablespec`* is the probe table of the hash join.

PUSH_PRED Hint



(See Specifying a Query Block in a Hint , *tablespec*::=)

The `PUSH_PRED` hint instructs the optimizer to push a join predicate into the view. For example:

```
SELECT /*+ NO_MERGE(v) PUSH_PRED(v) */ *
  FROM employees e,
    (SELECT manager_id
      FROM employees) v
  WHERE e.manager_id = v.manager_id(+)
    AND e.employee_id = 100;
```

PUSH_SUBQ Hint

(See Specifying a Query Block in a Hint)

The `PUSH_SUBQ` hint instructs the optimizer to evaluate nonmerged subqueries at the earliest possible step in the execution plan. Generally, subqueries that are not merged are executed as the last step in the execution plan. If the subquery is relatively inexpensive and reduces the number of rows significantly, then evaluating the subquery earlier can improve performance.

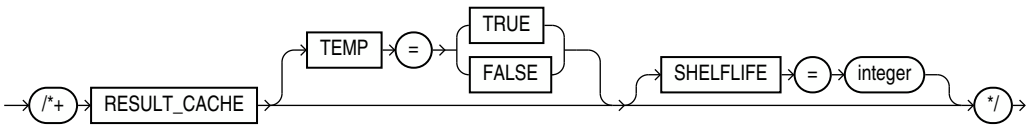
This hint has no effect if the subquery is applied to a remote table or one that is joined using a merge join.

Copyright © 1996, 2026, Oracle and/or its affiliates.

PX_JOIN_FILTER Hint

This hint forces the optimizer to use parallel join bitmap filtering.

QB_NAME Hint



(See Specifying a Query Block in a Hint)

Use the `QB_NAME` hint to define a name for a query block. This name can then be used in a hint in the outer query or even in a hint in an inline view to affect query execution on the tables appearing in the named query block.

If two or more query blocks have the same name, or if the same query block is hinted twice with different names, then the optimizer ignores all the names and the hints referencing that query block. Query blocks that are not named using this hint have unique system-generated names. These names can be displayed in the plan table and can also be used in hints within the query block, or in query block hints. For example:

```
SELECT /*+ QB_NAME(qb) FULL(@qb e) */ employee_id, last_name
  FROM employees e
  WHERE last_name = 'Smith';
```

RESULT_CACHE Hint

The `RESULT_CACHE` hint instructs the database to cache the results of the current query or query fragment in memory and then to use the cached results in future executions of the query or query fragment. The hint is recognized in the top-level query, the *`subquery_factoring_clause`*, or `FROM` clause inline view. The cached results reside in the result cache memory portion of the shared pool.

A cached result is automatically invalidated whenever a database object used in its creation is successfully modified.

TEMP = TRUE | FALSE

If `TEMP` has a value of `TRUE` , then the query will be allowed to spill to disk and allocate space in the temporary tablespace, if needed.

If `TEMP` has a value of `FALSE` , then the query will not be allowed to spill to disk and use the temporary tablespace for caching the result.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Both values TRUE and FALSE override the value of the RESULT_CACHE_MODE initialization parameter.

If you do not specify TEMP, then the value of RESULT_CACHE_MODE holds.

SHELFLIFE

Use SHELFLIFE to specify how long (in seconds) the result of a query or a query fragment should be cached in memory.

SHELFLIFE has two purposes:

- It specifies how long results will be cached for objects where the database has no knowledge about when to invalidate. These are results based on objects like fixed objects, objects accessed via DB or Cloud Links, or Data Link objects.
- It specifies how long results will be cached for local objects. Without SHELFLIFE, results on local objects are cached until they are aged out of the result cache. With this object you can define when a result will be automatically invalidated even if no DML happened on the objects.

The SHELFLIFE value must be a positive integer. The maximum value is 4294967295 seconds.

Example: RESULT_CACHE with SHELFLIFE

The following example shows a RESULT_CACHE hint with a value of 120 forSHELFLIFE. This means that the result of the query or query fragment in which this hint appears will be cached for 120 seconds.

```
/*+ RESULT_CACHE (SHELFLIFE=120) */
```

After 120 seconds, the cached result is marked as invalid.

If the query result is large and does not fit in memory, use both the SHELFLIFE and the TEMP options to indicate that the result should be written to disk in the temporary tablespace.

Example: RESULT_CACHE with TEMP and SHELFLIFE

```
/*+ RESULT_CACHE ( TEMP= true SHELFLIFE=120) */
```

RESULT_CACHE_INTEGRITY Parameter

The initialization parameter RESULT_CACHE_INTEGRITY specifies whether the result cache will consider queries using non-deterministic constructs - such as PL/SQL functions that are not declared as deterministic, as queries that can be cached.

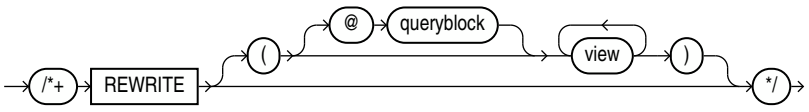
- If you set RESULT_CACHE_INTEGRITY to ENFORCED, then only deterministic constructs will be eligible for result caching. The ENFORCED setting overrides the setting of RESULT_CACHE_MODE or specified hints. For example, queries using PL/SQL functions that are not declared as deterministic will never be cached and must be declared as deterministic.
- If you set RESULT_CACHE_INTEGRITY to TRUSTED, then the database honors the setting of RESULT_CACHE_MODE and specified hints and considers queries using possibly non-deterministic constructs as candidates for result caching. For example, queries using PL/SQL functions that are not declared as deterministic can be cached. Note, however, that results that are known to be nondeterministic will not be cached, e.g. SYSDATE or constructs involving SYSDATE.

Copyright © 1996, 2026, Oracle and/or its affiliates.

If the query is executed from an OCI client and the OCI client result cache is enabled, then the `RESULT_CACHE` hint enables client caching for the current query.

> **See Also**
>
> *Oracle AI Database Performance Tuning Guide* for information about using this hint, *Oracle AI Database Reference* for information about the `RESULT_CACHE_MODE` initialization parameter, and *Oracle Call Interface Developer's Guide* for more information about the OCI result cache and usage guidelines

RETRY_ON_ROW_CHANGE Hint



> **Note**
>
> The `CHANGE_DUPKEY_ERROR_INDEX`, `IGNORE_ROW_ON_DUPKEY_INDEX`, and `RETRY_ON_ROW_CHANGE` hints are unlike other hints in that they have a semantic effect. The general philosophy explained in Hints does not apply for these three hints.

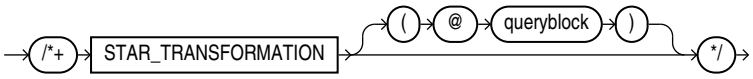
This hint is valid only for `UPDATE` and `DELETE` operations. It is not supported for `INSERT` or `MERGE` operations. When you specify this hint, the operation is retried when the `ORA_ROWSCN` for one or more rows in the set has changed from the time the set of rows to be modified is determined to the time the block is actually modified.

> **See Also**
>
> IGNORE_ROW_ON_DUPKEY_INDEX Hint and CHANGE_DUPKEY_ERROR_INDEX Hint

REWRITE Hint

(See Specifying a Query Block in a Hint)

The `REWRITE` hint instructs the optimizer to rewrite a query in terms of materialized views, when possible, without cost consideration. Use the `REWRITE` hint with or without a view list. If you use `REWRITE` with a view list and the list contains an eligible materialized view, then Oracle uses that view regardless of its cost.



Copyright © 1996, 2026, Oracle and/or its affiliates.

Oracle does not consider views outside of the list. If you do not specify a view list, then Oracle searches for an eligible materialized view and always uses it regardless of the cost of the final plan.

See Also

- *Oracle AI Database Concepts* for more information on materialized views
- *Oracle AI Database Data Warehousing Guide* for more information on using `REWRITE` with materialized views

STAR_TRANSFORMATION Hint

(See Specifying a Query Block in a Hint)

The `STAR_TRANSFORMATION` hint instructs the optimizer to use the best plan in which the transformation has been used. Without the hint, the optimizer could make a query optimization decision to use the best plan generated without the transformation, instead of the best plan for the transformed query. For example:

```
SELECT /*+ STAR_TRANSFORMATION */ s.time_id, s.prod_id, s.channel_id
  FROM sales s, times t, products p, channels c
  WHERE s.time_id = t.time_id
    AND s.prod_id = p.prod_id
    AND s.channel_id = c.channel_id
    AND c.channel_desc = 'Tele Sales';
```

Even if the hint is specified, there is no guarantee that the transformation will take place. The optimizer generates the subqueries only if it seems reasonable to do so. If no subqueries are generated, then there is no transformed query, and the best plan for the untransformed query is used, regardless of the hint.

See Also

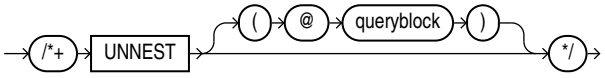
- *Oracle AI Database Data Warehousing Guide* for a full discussion of star transformation.
- *Oracle AI Database Reference* for more information on the `STAR_TRANSFORMATION_ENABLED` initialization parameter.

STATEMENT_QUEUING Hint

Copyright © 1996, 2026, Oracle and/or its affiliates.

The NO_STATEMENT_QUEUING hint influences whether or not a statement is queued with parallel statement queuing.

When PARALLEL_DEGREE_POLICY is not set to AUTO, this hint enables a statement to be considered for parallel statement queuing, but to run only when enough parallel processes are available to run at the requested DOP. The number of available parallel execution servers, before queuing is enabled, is equal to the difference between the number of parallel execution servers in use and the maximum number allowed in the system, which is defined by the PARALLEL_SERVERS_TARGET initialization parameter.



For example:

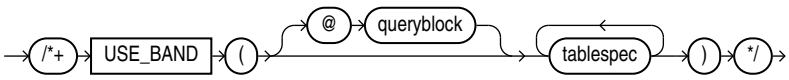
```
SELECT /*+ STATEMENT_QUEUING */ emp.last_name, dpt.department_name
  FROM employees emp, departments dpt
  WHERE emp.department_id = dpt.department_id;
```

See Also

NO_STATEMENT_QUEUING Hint

UNNEST Hint

(See Specifying a Query Block in a Hint)



The UNNEST hint instructs the optimizer to unnest and merge the body of the subquery into the body of the query block that contains it, allowing the optimizer to consider them together when evaluating access paths and joins.

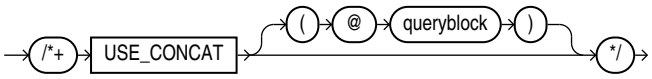
Before a subquery is unnested, the optimizer first verifies whether the statement is valid. The statement must then pass heuristic and query optimization tests. The UNNEST hint instructs the optimizer to check the subquery block for validity only. If the subquery block is valid, then subquery unnesting is enabled without checking the heuristics or costs.

See Also

- Collection Unnesting: Examples for more information on unnesting nested subqueries and the conditions that make a subquery block valid
- *Oracle AI Database SQL Tuning Guide* for additional information on subquery unnesting

USE_BAND Hint

Copyright © 1996, 2026, Oracle and/or its affiliates.



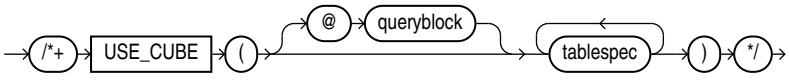
(See Specifying a Query Block in a Hint , *tablespec*::=)

The USE_BAND hint instructs the optimizer to join each specified table with another row source using a band join. For example:

```
SELECT /*+ USE_BAND(e1 e2) */
  e1.last_name
  || ' has salary between 100 less and 100 more than '
  || e2.last_name AS "SALARY COMPARISON"
FROM employees e1, employees e2
WHERE e1.salary BETWEEN e2.salary - 100 AND e2.salary + 100;
```

The order the tables are listed in the USE_BAND hint does not specify a join order. To hint a specific join order, the LEADING hint is required.

USE_CONCAT Hint



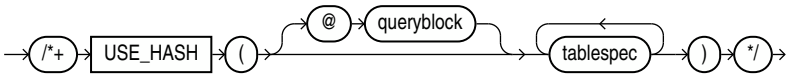
(See Specifying a Query Block in a Hint)

The USE_CONCAT hint instructs the optimizer to transform combined OR-conditions in the WHERE clause of a query into a compound query using the UNION ALL set operator. Without this hint, this transformation occurs only if the cost of the query using the concatenations is cheaper than the cost without them. The USE_CONCAT hint overrides the cost consideration. For example:

```
SELECT /*+ USE_CONCAT */ *
  FROM employees e
  WHERE manager_id = 108
     OR department_id = 110;
```

> **See Also**
>
> The NO_EXPAND Hint , which is the opposite of this hint

USE_CUBE Hint

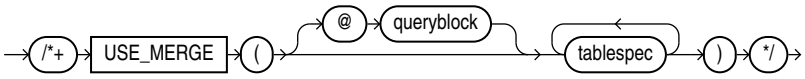


(See Specifying a Query Block in a Hint , *tablespec*::=)

When the right-hand side of the join is a cube, the USE_CUBE hint instructs the optimizer to join each specified table with another row source using a cube join. If the optimizer decides not to use the cube join based on statistical analysis, then you can use USE_CUBE to override that decision.

Copyright © 1996, 2026, Oracle and/or its affiliates.

USE_HASH Hint



(See Specifying a Query Block in a Hint , *tablespec*::=)

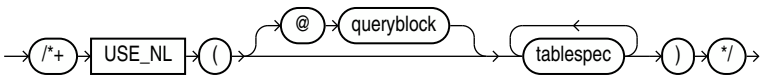
The `USE_HASH` hint instructs the optimizer to join each specified table with another row source using a hash join. For example:

```
SELECT /*+ USE_HASH(l h) */ *
  FROM orders h, order_items l
  WHERE l.order_id = h.order_id
    AND l.order_id > 2400;
```

The order the tables are listed in the `USE_HASH` hint does not specify a join order. To hint a specific join order, the `LEADING` hint is required.

USE_MERGE Hint

(See Specifying a Query Block in a Hint , *tablespec*::=)



The `USE_MERGE` hint instructs the optimizer to join each specified table with another row source using a sort-merge join. For example:

```
SELECT /*+ USE_MERGE(employees departments) */ *
  FROM employees, departments
  WHERE employees.department_id = departments.department_id;
```

Use of the `USE_NL` and `USE_MERGE` hints is recommended with the `LEADING` and `ORDERED` hints. The optimizer uses those hints when the referenced table is forced to be the inner table of a join. The hints are ignored if the referenced table is the outer table.

USE_NL Hint

The `USE_NL` hint instructs the optimizer to join each specified table to another row source with a nested loops join, using the specified table as the inner table.

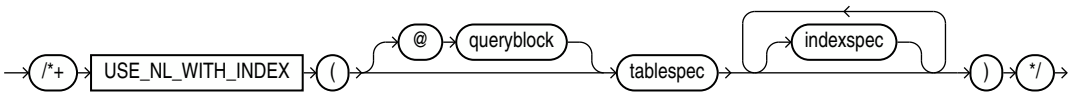
(See Specifying a Query Block in a Hint , *tablespec*::=)

Use of the `USE_NL` and `USE_MERGE` hints is recommended with the `LEADING` and `ORDERED` hints. The optimizer uses those hints when the referenced table is forced to be the inner table of a join. The hints are ignored if the referenced table is the outer table.

Copyright © 1996, 2026, Oracle and/or its affiliates.

In the following example, where a nested loop is forced through a hint, `orders` is accessed through a full table scan and the filter condition `l.order_id = h.order_id` is applied to every row. For every row that meets the filter condition, `order_items` is accessed through the index `order_id`.

```
SELECT /*+ USE_NL(l h) */ h.customer_id, l.unit_price * l.quantity
  FROM orders h, order_items l
  WHERE l.order_id = h.order_id;
```



The order the tables are listed in the `USE_NL` hint does not specify a join order. To hint a specific join order, the `LEADING` hint is required.

Example

```
select /*+ LEADING(t2) USE_NL(t1) */ sum(t1.a),sum(t2.a)
from   t1 , t2
where   t1.b = t2.b;
select * from table(dbms_xplan.display_cursor()) ;
```

Adding an `INDEX` hint to the query could avoid the full table scan on `orders`, resulting in an execution plan similar to one used on larger systems, even though it might not be particularly efficient here.

USE_NL_WITH_INDEX Hint

(See Specifying a Query Block in a Hint , *tablespec*::=, *indexspec*::=)

The `USE_NL_WITH_INDEX` hint instructs the optimizer to join the specified table to another row source with a nested loops join using the specified table as the inner table. For example:

```
SELECT /*+ USE_NL_WITH_INDEX(l item_product_ix) */ *
  FROM orders h, order_items l
  WHERE l.order_id = h.order_id
    AND l.order_id > 2400;
```

The following conditions apply:

- If no index is specified, then the optimizer must be able to use some index with at least one join predicate as the index key.
- If an index is specified, then the optimizer must be able to use that index with at least one join predicate as the index key.

Database Objects

The database recognizes objects that are associated with a particular schema and objects that are not associated with any particular schema, as described in the sections that follow.

Schema Objects

A **schema** is a collection of logical structures of data, or schema objects. A schema is owned by a database user and has the same name as that user. Each user owns a single schema.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Schema objects can be created and manipulated with SQL and include the following types of objects:

- Analytic views
- Assertions
- Attribute dimensions
- Clusters
- Constraints
- Database links
- Database triggers
- Dimensions
- External procedure libraries
- Hierarchies
- Index-organized tables
- Indexes
- Indextypes
- Java classes
- Java resources
- Java sources
- Join groups
- Materialized views
- Materialized view logs
- Mining models
- Object tables
- Object types
- Object views
- Operators
- Packages
- Property Graphs
- Sequences
- Stored functions
- Stored procedures
- Synonyms
- Tables
- Views
- Zone maps

Nonschema Objects

Other types of objects are also stored in the database and can be created and manipulated with SQL but are not contained in a schema:

- Contexts
- Directories
- Editions
- Flashback archives
- Lockdown profiles
- Profiles
- Restore points
- Roles
- Rollback segments

Copyright © 1996, 2026, Oracle and/or its affiliates.

Tablespaces
Tablespace sets
Unified audit policies
Users

In this reference, each type of object is described in the section devoted to the statement that creates the database object. These statements begin with the keyword `CREATE`. For example, for the definition of a cluster, see CREATE CLUSTER .

> **See Also**
>
> *Oracle AI Database Concepts* for an overview of database objects

You must provide names for most types of database objects when you create them. These names must follow the rules listed in the sections that follow.

Database Object Names and Qualifiers

Some database objects are made up of parts that you can or must name, such as the columns in a table or view, index and table partitions and subpartitions, integrity constraints on a table, and objects that are stored within a package, including procedures and stored functions. This section provides:

- Rules for naming database objects and database object location qualifiers
- Guidelines for naming database objects and qualifiers

> **Note**
>
> Oracle uses system-generated names beginning with "`SYS_`" for implicitly generated database objects and subobjects, and names beginning with "`ORA_`" for some Oracle-supplied objects. Oracle discourages you from using these prefixes in the names you explicitly provide to your database objects and subobjects to avoid possible conflict in name resolution.

Database Object Naming Rules

Every database object has a name. In a SQL statement, you represent the name of an object with a **quoted identifier** or a **nonquoted identifier**.

- A quoted identifier begins and ends with double quotation marks ("). If you name a schema object using a quoted identifier, then you must use the double quotation marks whenever you refer to that object.
- A nonquoted identifier is not surrounded by any punctuation.

You must use double quotation marks (") for schema names that begin with numbers or special characters.

You can use either quoted or nonquoted identifiers to name any database object. However, database names, global database names, database link names, disk group names, and pluggable database (PDB) names are always case insensitive and are stored as uppercase. If you specify such names as quoted identifiers, then the quotation marks are silently ignored.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> CREATE USER for additional rules for naming users and passwords

> **Note**
>
> Oracle does not recommend using quoted identifiers for database object names. These quoted identifiers are accepted by SQL*Plus, but they may not be valid when using other tools that manage database objects.

The following list of rules applies to both quoted and nonquoted identifiers unless otherwise indicated:

1. The maximum length of identifier names depends on the value of the `COMPATIBLE` initialization parameter.
   - **If COMPATIBLE is set to a value of 12.2 or higher,** then names must be from 1 to 128 bytes long with these exceptions:
     - Names of databases are limited to 8 bytes.
     - Names of disk groups, pluggable databases (PDBs), rollback segments, tablespaces, and tablespace sets are limited to 30 bytes.
     - From Release 21c onwards names of pluggable databases are limited to 64 bytes.

     If an identifier includes multiple parts separated by periods, then each attribute can be up to 128 bytes long. Each period separator, as well as any surrounding double quotation marks, counts as one byte. For example, suppose you identify a column like this:

     ```
     "schema"."table"."column"
     ```

     The schema name can be 128 bytes, the table name can be 128 bytes, and the column name can be 128 bytes. Each of the quotation marks and periods is a single-byte character, so the total length of the identifier in this example can be up to 392 bytes.
   - **If COMPATIBLE is set to a value lower than 12.2,** then names must be from 1 to 30 bytes long with these exceptions:
     - Names of databases are limited to 8 bytes.
     - Names of database links can be as long as 128 bytes.

     If an identifier includes multiple parts separated by periods, then each attribute can be up to 30 bytes long. Each period separator, as well as any surrounding double quotation marks, counts as one byte. For example, suppose you identify a column like this:

     ```
     "schema"."table"."column"
     ```

     The schema name can be 30 bytes, the table name can be 30 bytes, and the column name can be 30 bytes. Each of the quotation marks and periods is a single-byte character, so the total length of the identifier in this example can be up to 98 bytes.
2. Nonquoted identifiers cannot be Oracle SQL reserved words. Quoted identifiers can be reserved words, although this is not recommended.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Depending on the Oracle product you plan to use to access a database object, names might be further restricted by other product-specific reserved words.

> **Note**
>
> The reserved word `ROWID` is an exception to this rule. You cannot use the uppercase word `ROWID`, either quoted or nonquoted, as a column name. However, you can use the uppercase word as a quoted identifier that is not a column name, and you can use the word with one or more lowercase letters (for example, `"Rowid"` or `"rowid"`) as any quoted identifier, including a column name.

> **See Also**
>
> - Oracle SQL Reserved Words for a listing of all Oracle SQL reserved words
> - The manual for a specific product, such as *Oracle AI Database PL/SQL Language Reference*, for a list of the reserved words of that product

3. The Oracle SQL language contains other words that have special meanings. These words include data types, schema names, function names, the dummy system table `DUAL`, and keywords (the uppercase words in SQL statements, such as `DIMENSION`, `SEGMENT`, `ALLOCATE`, `DISABLE`, and so forth). These words are not reserved. However, Oracle uses them internally in specific ways. Therefore, if you use these words as names for objects and object parts, then your SQL statements may be more difficult to read and may lead to unpredictable results.

   In particular, do not use words beginning with `SYS_` or `ORA_` as schema object names, and do not use the names of SQL built-in functions for the names of schema objects or user-defined functions.

   > **See Also**
   >
   > - Oracle SQL Keywords for information how to obtain a list of keywords
   > - Data Types , About SQL Functions , and Selecting from the DUAL Table

4. You must use characters from the ASCII repertoire in database names, global database names, and database link names, because these characters provide optimal compatibility across different platforms and operating systems. You must use only characters from the ASCII repertoire in the names of common users, common roles, and common profiles in a multitenant container database (CDB).
5. You can include multibyte characters in passwords.
6. Nonquoted identifiers must begin with an alphabetic character from your database character set. Quoted identifiers can begin with any character.
7. Nonquoted identifiers can only contain alphanumeric characters from your database character set and the underscore (_), dollar sign ($), and pound sign (#). Database links can also contain periods (.) and "at" signs (@). Oracle strongly discourages you from using $ and # in nonquoted identifiers.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Quoted identifiers can contain any characters and punctuations marks as well as spaces. However, neither quoted nor nonquoted identifiers can contain double quotation marks or the null character (`\0`).

8. Within a namespace, no two objects can have the same name.

   The following schema objects share one namespace:

   - Packages
   - Private synonyms
   - Sequences
   - Stand-alone procedures
   - Stand-alone stored functions
   - Tables
   - User-defined operators
   - User-defined types
   - Views

   Each of the following schema objects has its own namespace:

   - Clusters
   - Constraints
   - Database triggers
   - Dimensions
   - Indexes
   - Materialized views (When you create a materialized view, the database creates an internal table of the same name. This table has the same namespace as the other tables in the schema. Therefore, a schema cannot contain a table and a materialized view of the same name.)
   - Private database links

   Because tables and sequences are in the same namespace, a table and a sequence in the same schema cannot have the same name. However, tables and indexes are in different namespaces. Therefore, a table and an index in the same schema can have the same name.

   Each schema in the database has its own namespaces for the objects it contains. This means, for example, that two tables in different schemas are in different namespaces and can have the same name.

   Each of the following nonschema objects also has its own namespace:

   - Editions
   - Parameter files (`PFILE`s) and server parameter files (`SPFILE`s)
   - Profiles
   - Public database links
   - Public synonyms
   - Tablespaces
   - User roles

Copyright © 1996, 2026, Oracle and/or its affiliates.

Because the objects in these namespaces are not contained in schemas, these namespaces span the entire database.

9. Nonquoted identifiers are not case sensitive. Oracle interprets them as uppercase. Quoted identifiers are case sensitive.

   By enclosing names in double quotation marks, you can give the following names to different objects in the same namespace:

   ```
   "employees"
   "Employees"
   "EMPLOYEES"
   ```

   Note that Oracle interprets the following names the same, so they cannot be used for different objects in the same namespace:

   ```
   employees
   EMPLOYEES
   "EMPLOYEES"
   ```

10. When Oracle stores or compares identifiers in uppercase, the uppercase form of each character in the identifiers is determined by applying the uppercasing rules of the database character set. Language-specific rules determined by the session setting `NLS_SORT` are not considered. This behavior corresponds to applying the SQL function `UPPER` to the identifier rather than the function `NLS_UPPER`.

    The database character set uppercasing rules can yield results that are incorrect when viewed as being in a certain natural language. For example, small letter sharp s ("ß"), used in German, does not have an uppercase form according to the database character set uppercasing rules. It is not modified when an identifier is converted into uppercase, while the expected uppercase form in German is the sequence of two characters capital letter S ("SS"). Similarly, the uppercase form of small letter i, according to the database character set uppercasing rules, is capital letter I. However, the expected uppercase form in Turkish and Azerbaijani is capital letter I with dot above.

    The database character set uppercasing rules ensure that identifiers are interpreted the same in any linguistic configuration of a session. If you want an identifier to look correctly in a certain natural language, then you can quote it to preserve the lowercase form or you can use the linguistically correct uppercase form whenever you use that identifier.

11. Columns in the same table or view cannot have the same name. However, columns in different tables or views can have the same name.

12. Procedures or functions contained in the same package can have the same name, if their arguments are not of the same number and data types. Creating multiple procedures or functions with the same name in the same package with different arguments is called **overloading** the procedure or function.

13. Tablespace names are case sensitive, unlike other identifiers that are limited to 30 bytes.

Schema Object Naming Examples

The following examples are valid schema object names:

```
last_name
horse
hr.hire_date
"EVEN THIS & THAT!"
a_very_long_and_valid_name
```

All of these examples adhere to the rules listed in Database Object Naming Rules .

Copyright © 1996, 2026, Oracle and/or its affiliates.

Schema Object Naming Guidelines

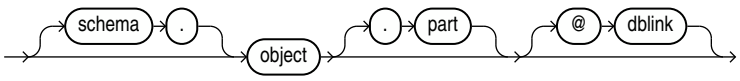
Here are several helpful guidelines for naming objects and their parts:

- Use full, descriptive, pronounceable names (or well-known abbreviations).
- Use consistent naming rules.
- Use the same name to describe the same entity or attribute across tables.

When naming objects, balance the objective of keeping names short and easy to use with the objective of making names as descriptive as possible. When in doubt, choose the more descriptive name, because the objects in the database may be used by many people over a period of time. Your counterpart ten years from now may have difficulty understanding a table column with a name like `pmdd` instead of `payment_due_date`.

Using consistent naming rules helps users understand the part that each table plays in your application. One such rule might be to begin the names of all tables belonging to the `FINANCE` application with `fin_`.

Use the same names to describe the same things across tables. For example, the department number columns of the sample `employees` and `departments` tables are both named `department_id`.



Syntax for Schema Objects and Parts in SQL Statements

This section tells you how to refer to schema objects and their parts in the context of a SQL statement. This section shows you:

- The general syntax for referring to an object
- How Oracle resolves a reference to an object
- How to refer to objects in schemas other than your own
- How to refer to objects in remote databases
- How to refer to table and index partitions and subpartitions

The following diagram shows the general syntax for referring to an object or a part:

***database_object_or_part*::=**

(*dblink*::=)

where:

- *object* is the name of the object.
- *schema* is the schema containing the object. The schema qualifier lets you refer to an object in a schema other than your own. You must be granted privileges to refer to objects in other schemas. If you omit *schema*, then Oracle assumes that you are referring to an object in your own schema.

  Only schema objects can be qualified with *schema*. Schema objects are shown with list item 8. Nonschema objects, also shown with list item 8, cannot be qualified with *schema*

Copyright © 1996, 2026, Oracle and/or its affiliates.

because they are not schema objects. An exception is public synonyms, which can optionally be qualified with "PUBLIC". The quotation marks are required.

- *part* is a part of the object. This identifier lets you refer to a part of a schema object, such as a column or a partition of a table. Not all types of objects have parts.
- *dblink* applies only when you are using the database distributed functionality. This is the name of the database containing the object. The *dblink* qualifier lets you refer to an object in a database other than your local database. If you omit *dblink*, then Oracle assumes that you are referring to an object in your local database. Not all SQL statements allow you to access objects on remote databases.

You can include spaces around the periods separating the components of the reference to the object, but it is conventional to omit them.

How Oracle AI Database Resolves Schema Object References

When you refer to an object in a SQL statement, the database considers the context of the SQL statement and locates the object in the appropriate namespace. After locating the object, the database performs the operation specified by the statement on the object. If the named object cannot be found in the appropriate namespace, then the database returns an error.

The following example illustrates how the database resolves references to objects within SQL statements. Consider this statement that adds a row of data to a table identified by the name `departments`:

```
INSERT INTO departments
  VALUES (280, 'ENTERTAINMENT_CLERK', 206, 1700);
```

Based on the context of the statement, the database determines that `departments` can be:

- A table in your own schema
- A view in your own schema
- A private synonym for a table or view
- A public synonym

The database always attempts to resolve an object reference within the namespaces in your own schema before considering namespaces outside your schema. In this example, the database attempts to resolve the name `departments` as follows:

1. First, the database attempts to locate the object in the namespace in your own schema containing tables, views, and private synonyms. If the object is a private synonym, then the database locates the object for which the synonym stands. This object could be in your own schema, another schema, or on another database. The object could also be another synonym, in which case the databaselocates the object for which this synonym stands.
2. If the object is in the namespace, then the database attempts to perform the statement on the object. In this example, the database attempts to add the row of data to `departments`. If the object is not of the correct type for the statement, then the database returns an error. In this example, `departments` must be a table, view, or a private synonym resolving to a table or view. If `departments` is a sequence, then the database returns an error.
3. If the object is not in any namespace searched in thus far, then the database searches the namespace containing public synonyms. If the object is in that namespace, then the database attempts to perform the statement on it. If the object is not of the correct type for the statement, then the database returns an error. In this example, if `departments` is a public synonym for a sequence, then the database returns an error.

Copyright © 1996, 2026, Oracle and/or its affiliates.

If a public synonym has any dependent tables or user-defined types, then you cannot create an object with the same name as the synonym in the same schema as the dependent objects.

If a synonym does not have any dependent tables or user-defined types, then you can create an object with the same name in the same schema as the dependent objects. the database invalidates any dependent objects and attempts to revalidate them when they are next accessed.

> *Oracle AI Database PL/SQL Language Reference* for information about how PL/SQL resolves identifier names

References to Objects in Other Schemas

To refer to objects in schemas other than your own, prefix the object name with the schema name:

```
schema.object
```

For example, this statement drops the `employees` table in the sample schema `hr`:

```
DROP TABLE hr.employees;
```

References to Objects in Remote Databases

To refer to objects in databases other than your local database, follow the object name with the name of the database link to that database. A database link is a schema object that causes Oracle to connect to a remote database to access an object there. This section tells you:

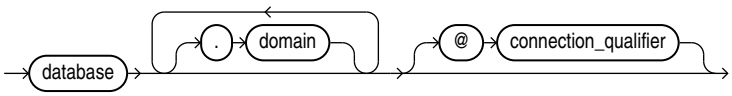
- How to create database links
- How to use database links in your SQL statements

Creating Database Links

You create a database link with the statement CREATE DATABASE LINK . The statement lets you specify this information about the database link:

- The name of the database link
- The database connect string to access the remote database
- The username and password to connect to the remote database

Oracle stores this information in the data dictionary.



Database Link Names

When you create a database link, you must specify its name. Database link names are different from names of other types of objects. They can be as long as 128 bytes and can contain periods (.) and the "at" sign (@).

The name that you give to a database link must correspond to the name of the database to which the database link refers and the location of that database in the hierarchy of database names. The following syntax diagram shows the form of the name of a database link:

Copyright © 1996, 2026, Oracle and/or its affiliates.

***dblink*::=**

where:

- *database* should specify the *name* portion of the global name of the remote database to which the database link connects. This global name is stored in the data dictionary of the remote database. You can see this name in the GLOBAL_NAME data dictionary view.
- *domain* should specify the *domain* portion of the global name of the remote database to which the database link connects. If you omit *domain* from the name of a database link, then Oracle qualifies the database link name with the domain of your local database as it currently exists in the data dictionary.
- *connection_qualifier* lets you further qualify a database link. Using connection qualifiers, you can create multiple database links to the same database. For example, you can use connection qualifiers to create multiple database links to different instances of the Oracle Real Application Clusters that access the same database.

> **See Also**
>
> *Oracle AI Database Administrator's Guide*for more information on connection qualifiers

The combination *database.domain* is sometimes called the **service name**.

> **See Also**
>
> *Oracle AI Database Net Services Administrator's Guide*

Username and Password

Oracle uses the username and password to connect to the remote database. The username and password for a database link are optional.

Database Connect String

The database connect string is the specification used by Oracle Net to access the remote database. For information on writing database connect strings, see the Oracle Net documentation for your specific network protocol. The database connect string for a database link is optional.

References to Database Links

Database links are available only if you are using Oracle distributed functionality. When you issue a SQL statement that contains a database link, you can specify the database link name in one of these forms:

Copyright © 1996, 2026, Oracle and/or its affiliates.

- The complete database link name as stored in the data dictionary, including the *database*, *domain*, and optional *connection_qualifier* components.
- The *partial* database link name is the *database* and optional *connection_qualifier* components, but not the *domain* component.

Oracle performs these tasks before connecting to the remote database:

1. If the database link name specified in the statement is partial, then Oracle expands the name to contain the domain of the local database as found in the global database name stored in the data dictionary. (You can see the current global database name in the `GLOBAL_NAME` data dictionary view.)
2. Oracle first searches for a private database link in your own schema with the same name as the database link in the statement. Then, if necessary, it searches for a public database link with the same name.
   - Oracle always determines the username and password from the first matching database link (either private or public). If the first matching database link has an associated username and password, then Oracle uses it. If it does not have an associated username and password, then Oracle uses your current username and password.
   - If the first matching database link has an associated database string, then Oracle uses it. Otherwise Oracle searches for the next matching (public) database link. If no matching database link is found, or if no matching link has an associated database string, then Oracle returns an error.
3. Oracle uses the database string to access the remote database. After accessing the remote database, if the value of the `GLOBAL_NAMES` parameter is `true`, then Oracle verifies that the *database.domain* portion of the database link name matches the complete global name of the remote database. If this condition is true, then Oracle proceeds with the connection, using the username and password chosen in Step 2. If not, Oracle returns an error.
4. If the connection using the database string, username, and password is successful, then Oracle attempts to access the specified object on the remote database using the rules for resolving object references and referring to objects in other schemas discussed earlier in this section.

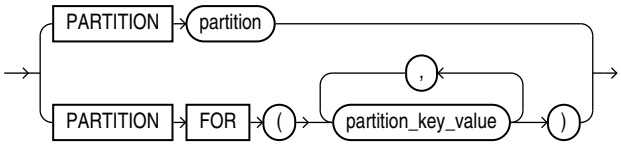
You can disable the requirement that the *database.domain* portion of the database link name must match the complete global name of the remote database by setting to `FALSE` the initialization parameter `GLOBAL_NAMES` or the `GLOBAL_NAMES` parameter of the `ALTER SYSTEM` or `ALTER SESSION` statement.

> **See Also**
>
> *Oracle AI Database Administrator's Guide* for more information on remote name resolution

References to Partitioned Tables and Indexes

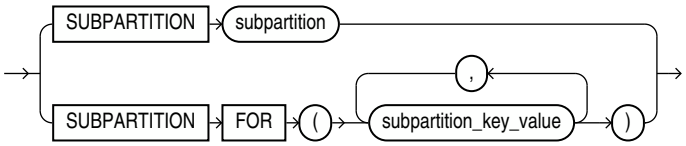
Tables and indexes can be partitioned. When partitioned, these schema objects consist of a number of parts called **partitions**, all of which have the same logical attributes. For example, all partitions in a table share the same column and constraint definitions, and all partitions in an index share the same index columns.

Copyright © 1996, 2026, Oracle and/or its affiliates.



Partition-extended and subpartition-extended names let you perform some partition-level and subpartition-level operations, such as deleting all rows from a partition or subpartition, on only one partition or subpartition. Without extended names, such operations would require that you specify a predicate (`WHERE` clause). For range- and list-partitioned tables, trying to phrase a partition-level operation with a predicate can be cumbersome, especially when the range partitioning key uses more than one column. For hash partitions and subpartitions, using a predicate is more difficult still, because these partitions and subpartitions are based on a system-defined hash function.

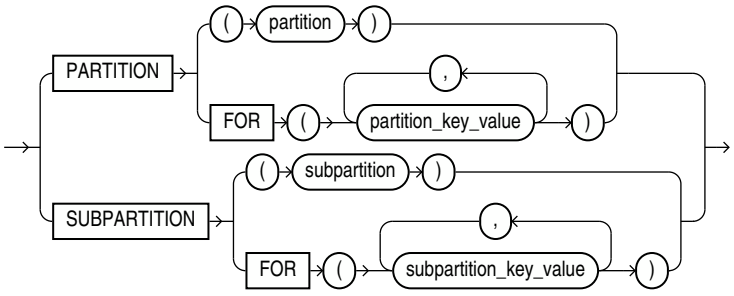
Partition-extended names let you use partitions as if they were tables. An advantage of this method, which is most useful for range-partitioned tables, is that you can build partition-level access control mechanisms by granting (or revoking) privileges on these views to (or from) other users or roles. To use a partition as a table, create a view by selecting data from a single partition, and then use the view as a table.



Syntax

You can specify partition-extended or subpartition-extended table names in any SQL statement in which the *`partition_extended_name`* or *`subpartition_extended_name`* element appears in the syntax.

***partition_extended_name*::=**



***subpartition_extended_name*::=**

The DML statements `INSERT`, `UPDATE`, and `DELETE` and the `ANALYZE` statement require parentheses around the partition or subpartition name. This small distinction is reflected in the *`partition_extension_clause`*:

***partition_extension_clause*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

In *partition_extended_name*, *subpartition_extended_name*, and *partition_extension_clause*, the PARTITION FOR and SUBPARTITION FOR clauses let you refer to a partition without using its name. They are valid with any type of partitioning and are especially useful for interval partitions. Interval partitions are created automatically as needed when data is inserted into a table.

For the respective *partition_key_value* or *subpartition_key_value*, specify one value for each partitioning key column. For multicolumn partitioning keys, specify one value for each partitioning key. For composite partitions, specify one value for each partitioning key, followed by one value for each subpartitioning key. All partitioning key values are comma separated. For interval partitions, you can specify only one *partition_key_value*, and it must be a valid NUMBER or datetime value. Your SQL statement will operate on the partition or subpartitions that contain the values you specify.

> **See Also**
>
> The CREATE TABLE INTERVAL Clause for more information on interval partitions

Restrictions on Extended Names

Currently, the use of partition-extended and subpartition-extended table names has the following restrictions:

- No remote tables: A partition-extended or subpartition-extended table name cannot contain a database link (dblink) or a synonym that translates to a table with a dblink. To use remote partitions and subpartitions, create a view at the remote site that uses the extended table name syntax and then refer to the remote view.
- No synonyms: A partition or subpartition extension must be specified with a base table. You cannot use synonyms, views, or any other objects.
- The PARTITION FOR and SUBPARTITION FOR clauses are not valid for DDL operations on views.
- In the PARTITION FOR and SUBPARTITION FOR clauses, you cannot specify the keywords DEFAULT or MAXVALUE or a bind variable for the *partition_key_value* or *subpartition_key_value*.
- In the PARTITION and SUBPARTITION clauses, you cannot specify a bind variable for the partition or subpartition name.

Example

In the following statement, sales is a partitioned table with partition sales_q1_2000. You can create a view of the single partition sales_q1_2000, and then use it as if it were a table. This example deletes rows from the partition.

```
CREATE VIEW Q1_2000_sales AS
  SELECT *
    FROM sales PARTITION (SALES_Q1_2000);

DELETE FROM Q1_2000_sales
  WHERE amount_sold < 0;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

References to Object Type Attributes and Methods

To refer to object type attributes or methods in a SQL statement, you must fully qualify the reference with a table alias. Consider the following example from the sample schema oe, which contains a type cust_address_typ and a table customers with a cust_address column based on the cust_address_typ:

```
CREATE TYPE cust_address_typ
  OID '82A4AF6A4CD1656DE034080020E0EE3D'
  AS OBJECT
    (street_address    VARCHAR2(40),
     postal_code       VARCHAR2(10),
     city              VARCHAR2(30),
     state_province    VARCHAR2(10),
     country_id        CHAR(2));
/
CREATE TABLE customers
  (customer_id        NUMBER(6),
   cust_first_name    VARCHAR2(20) CONSTRAINT cust_fname_nn NOT NULL,
   cust_last_name     VARCHAR2(20) CONSTRAINT cust_lname_nn NOT NULL,
   cust_address       cust_address_typ,
. . .
```

In a SQL statement, reference to the postal_code attribute must be fully qualified using a table alias, as illustrated in the following example:

```
SELECT c.cust_address.postal_code
  FROM customers c;

UPDATE customers c
  SET c.cust_address.postal_code = '14621-2604'
  WHERE c.cust_address.city = 'Rochester'
    AND c.cust_address.state_province = 'NY';
```

To reference a member method that does not accept arguments, you must provide empty parentheses. For example, the sample schema oe contains an object table categories_tab, based on catalog_typ, which contains the member function getCatalogName. In order to call this method in a SQL statement, you must provide empty parentheses as shown in this example:

```
SELECT TREAT(VALUE(c) AS catalog_typ).getCatalogName() "Catalog Type"
  FROM categories_tab c
  WHERE category_id = 90;

Catalog Type
-----------------------------------
online catalog
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

3

Pseudocolumns

A **pseudocolumn** behaves like a table column, but is not actually stored in the table. You can select from pseudocolumns, but you cannot insert, update, or delete their values. A pseudocolumn is also similar to a function without arguments (refer to Functions). However, functions without arguments typically return the same value for every row in the result set, whereas pseudocolumns typically return a different value for each row.

This chapter contains the following sections:

- Hierarchical Query Pseudocolumns
- Sequence Pseudocolumns
- Version Query Pseudocolumns
- COLUMN_VALUE Pseudocolumn
- OBJECT_ID Pseudocolumn
- OBJECT_VALUE Pseudocolumn
- ORA_ROWSCN Pseudocolumn
- ROWID Pseudocolumn
- ROWNUM Pseudocolumn
- XMLDATA Pseudocolumn

Hierarchical Query Pseudocolumns

The hierarchical query pseudocolumns are valid only in hierarchical queries. The hierarchical query pseudocolumns are:

- CONNECT_BY_ISCYCLE Pseudocolumn
- CONNECT_BY_ISLEAF Pseudocolumn
- LEVEL Pseudocolumn

To define a hierarchical relationship in a query, you must use the `CONNECT BY` clause.

CONNECT_BY_ISCYCLE Pseudocolumn

The `CONNECT_BY_ISCYCLE` pseudocolumn returns 1 if the current row has a child which is also its ancestor. Otherwise it returns 0.

You can specify `CONNECT_BY_ISCYCLE` only if you have specified the `NOCYCLE` parameter of the `CONNECT BY` clause. `NOCYCLE` enables Oracle to return the results of a query that would otherwise fail because of a `CONNECT BY` loop in the data.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> Hierarchical Queries for more information about the `NOCYCLE` parameter and Hierarchical Query Examples for an example that uses the `CONNECT_BY_ISCYCLE` pseudocolumn

CONNECT_BY_ISLEAF Pseudocolumn

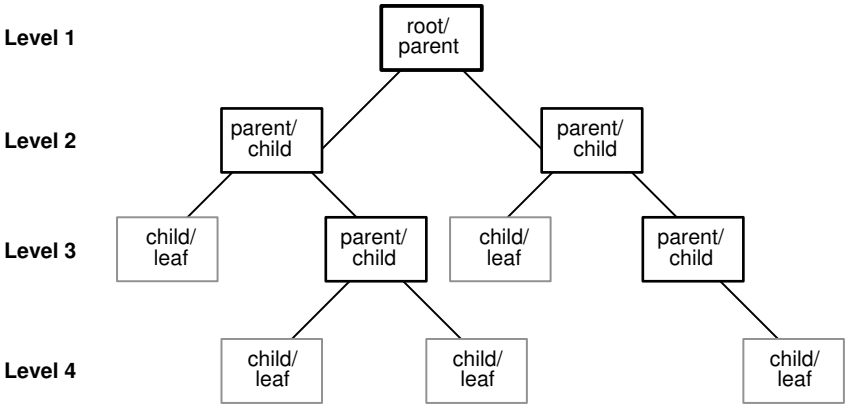
The `CONNECT_BY_ISLEAF` pseudocolumn returns 1 if the current row is a leaf of the tree defined by the `CONNECT BY` condition. Otherwise it returns 0. This information indicates whether a given row can be further expanded to show more of the hierarchy.

CONNECT_BY_ISLEAF Example

The following example shows the first three levels of the `hr.employees` table, indicating for each row whether it is a leaf row (indicated by 1 in the `IsLeaf` column) or whether it has child rows (indicated by 0 in the `IsLeaf` column):

```
SELECT last_name "Employee", CONNECT_BY_ISLEAF "IsLeaf",
       LEVEL, SYS_CONNECT_BY_PATH(last_name, '/') "Path"
  FROM employees
  WHERE LEVEL <= 3 AND department_id = 80
  START WITH employee_id = 100
  CONNECT BY PRIOR employee_id = manager_id AND LEVEL <= 4
  ORDER BY "Employee", "IsLeaf";

Employee                       IsLeaf      LEVEL Path
------------------------- ---------- ---------- ------------------------
Abel                                1          3 /King/Zlotkey/Abel
Ande                                1          3 /King/Errazuriz/Ande
Banda                               1          3 /King/Errazuriz/Banda
Bates                               1          3 /King/Cambrault/Bates
Bernstein                           1          3 /King/Russell/Bernstein
Bloom                               1          3 /King/Cambrault/Bloom
Cambrault                           0          2 /King/Cambrault
Cambrault                           1          3 /King/Russell/Cambrault
Doran                               1          3 /King/Partners/Doran
Errazuriz                           0          2 /King/Errazuriz
Fox                                 1          3 /King/Cambrault/Fox
. . .
```



> **See Also**
>
> Hierarchical Queries and SYS_CONNECT_BY_PATH

LEVEL Pseudocolumn

For each row returned by a hierarchical query, the `LEVEL` pseudocolumn returns 1 for a root row, 2 for a child of a root, and so on. A **root row** is the highest row within an inverted tree. A **child row** is any nonroot row. A **parent row** is any row that has children. A **leaf row** is any row without children. Figure 3-1 shows the nodes of an inverted tree with their `LEVEL` values.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Figure 3-1 Hierarchical Tree

> **See Also**
>
> Hierarchical Queries for information on hierarchical queries in general and IN Condition for restrictions on using the `LEVEL` pseudocolumn

Sequence Pseudocolumns

A **sequence** is a schema object that can generate unique sequential values. These values are often used for primary and unique keys. You can refer to sequence values in SQL statements with these pseudocolumns:

- `CURRVAL`: Returns the current value of a sequence
- `NEXTVAL`: Increments the sequence and returns the next value

You must qualify `CURRVAL` and `NEXTVAL` with the name of the sequence:

```
sequence.CURRVAL
sequence.NEXTVAL
```

To refer to the current or next value of a sequence in the schema of another user, you must have been granted either `SELECT` object privilege on the sequence or `SELECT ANY SEQUENCE` system privilege, and you must qualify the sequence with the schema containing it:

```
schema.sequence.CURRVAL
schema.sequence.NEXTVAL
```

To refer to the value of a sequence on a remote database, you must qualify the sequence with a complete or partial name of a database link:

```
schema.sequence.CURRVAL@dblink
schema.sequence.NEXTVAL@dblink
```

A sequence can be accessed by many users concurrently with no waiting or locking.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> References to Objects in Remote Databases for more information on referring to database links

Where to Use Sequence Values

You can use CURRVAL and NEXTVAL in the following locations:

- The select list of a SELECT statement that is not contained in a subquery, materialized view, or view
- The select list of a subquery in an INSERT statement
- The VALUES clause of an INSERT statement
- The SET clause of an UPDATE statement

Restrictions on Sequence Values

You cannot use CURRVAL and NEXTVAL in the following constructs:

- A subquery in a DELETE, SELECT, or UPDATE statement
- A query of a view or of a materialized view
- A SELECT statement with the DISTINCT operator
- A SELECT statement with a GROUP BY clause or ORDER BY clause
- A SELECT statement that is combined with another SELECT statement with the UNION, INTERSECT, or MINUS set operator
- The WHERE clause of a SELECT statement
- The condition of a CHECK constraint

Within a single SQL statement that uses CURRVAL or NEXTVAL, all referenced LONG columns, updated tables, and locked tables must be located on the same database.

How to Use Sequence Values

When you create a sequence, you can define its initial value and the increment between its values. The first reference to NEXTVAL returns the initial value of the sequence. Subsequent references to NEXTVAL increment the sequence value by the defined increment and return the new value. Any reference to CURRVAL always returns the current value of the sequence, which is the value returned by the last reference to NEXTVAL.

Before you use CURRVAL for a sequence in your session, you must first initialize the sequence with NEXTVAL. Refer to CREATE SEQUENCE for information on sequences.

Within a single SQL statement containing a reference to NEXTVAL, Oracle increments the sequence once:

- For each row returned by the outer query block of a SELECT statement. Such a query block can appear in the following places:
  - A top-level SELECT statement

Copyright © 1996, 2026, Oracle and/or its affiliates.

  - An INSERT ... SELECT statement (either single-table or multitable). For a multitable insert, the reference to NEXTVAL must appear in the VALUES clause, and the sequence is updated once for each row returned by the subquery, even though NEXTVAL may be referenced in multiple branches of the multitable insert.
  - A CREATE TABLE ... AS SELECT statement
  - A CREATE MATERIALIZED VIEW ... AS SELECT statement
- For each row updated in an UPDATE statement
- For each INSERT statement containing a VALUES clause
- For each INSERT ... [ALL | FIRST] statement (multitable insert). A multitable insert is considered a single SQL statement. Therefore, a reference to the NEXTVAL of a sequence will increase the sequence only once for each input record coming from the SELECT portion of the statement. If NEXTVAL is specified more than once in any part of the INSERT ... [ALL | FIRST] statement, then the value will be the same for all insert branches, regardless of how often a given record might be inserted.
- For each row merged by a MERGE statement. The reference to NEXTVAL can appear in the *merge_insert_clause* or the *merge_update_clause* or both. The NEXTVALUE value is incremented for each row updated and for each row inserted, even if the sequence number is not actually used in the update or insert operation. If NEXTVAL is specified more than once in any of these locations, then the sequence is incremented once for each row and returns the same value for all occurrences of NEXTVAL for that row.
- For each input row in a multitable INSERT ALL statement. NEXTVAL is incremented once for each row returned by the subquery, regardless of how many occurrences of the *insert_into_clause* map to each row.

If any of these locations contains more than one reference to NEXTVAL, then Oracle increments the sequence once and returns the same value for all occurrences of NEXTVAL.

If any of these locations contains references to both CURRVAL and NEXTVAL, then Oracle increments the sequence and returns the same value for both CURRVAL and NEXTVAL.

Finding the next value of a sequence: Example

This example selects the next value of the employee sequence in the sample schema hr:

```
SELECT employees_seq.nextval
  FROM DUAL;
```

Inserting sequence values into a table: Example

This example increments the employee sequence and uses its value for a new employee inserted into the sample table hr.employees:

```
INSERT INTO employees
  VALUES (employees_seq.nextval, 'John', 'Doe', 'jdoe', '555-1212',
          TO_DATE(SYSDATE), 'PU_CLERK', 2500, null, null, 30);
```

Reusing the current value of a sequence: Example

This example adds a new order with the next order number to the master order table. It then adds suborders with this number to the detail order table:

```
INSERT INTO orders (order_id, order_date, customer_id)
  VALUES (orders_seq.nextval, TO_DATE(SYSDATE), 106);

INSERT INTO order_items (order_id, line_item_id, product_id)
  VALUES (orders_seq.currval, 1, 2359);
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
INSERT INTO order_items (order_id, line_item_id, product_id)
  VALUES (orders_seq.currval, 2, 3290);

INSERT INTO order_items (order_id, line_item_id, product_id)
  VALUES (orders_seq.currval, 3, 2381);
```

Version Query Pseudocolumns

The version query pseudocolumns are valid only in Oracle Flashback Version Query, which is a form of Oracle Flashback Query. The version query pseudocolumns are:

- `VERSIONS_STARTSCN` and `VERSIONS_STARTTIME`: Starting System Change Number (SCN) or `TIMESTAMP` when the row version was created. This pseudocolumn identifies the time when the data first had the values reflected in the row version. Use this pseudocolumn to identify the past target time for Oracle Flashback Table or Oracle Flashback Query. If this pseudocolumn is `NULL`, then the row version was created before start.
- `VERSIONS_ENDSCN` and `VERSIONS_ENDTIME`: SCN or `TIMESTAMP` when the row version expired. If the pseudocolumn is `NULL`, then either the row version was current at the time of the query or the row corresponds to a `DELETE` operation.
- `VERSIONS_XID`: Identifier (a `RAW` number) of the transaction that created the row version.
- `VERSIONS_OPERATION`: Operation performed by the transaction: `I` for insertion, `D` for deletion, or `U` for update. The version is that of the row that was inserted, deleted, or updated; that is, the row after an `INSERT` operation, the row before a `DELETE` operation, or the row affected by an `UPDATE` operation.

  For user updates of an index key, Oracle Flashback Version Query might treat an `UPDATE` operation as two operations, `DELETE` plus `INSERT`, represented as two version rows with a `D` followed by an `I` `VERSIONS_OPERATION`.

See Also

- *flashback_query_clause* for more information on version queries
- *Oracle AI Database Development Guide* for more information on using Oracle Flashback Version Query
- Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules for values of the `VERSIONS_OPERATION` pseudocolumn

COLUMN_VALUE Pseudocolumn

When you refer to an `XMLTable` construct without the `COLUMNS` clause, or when you use the `TABLE` collection expression to refer to a scalar nested table type, the database returns a virtual table with a single column. This name of this pseudocolumn is `COLUMN_VALUE`.

In the context of `XMLTable`, the value returned is of data type `XMLType`. For example, the following two statements are equivalent, and the output for both shows `COLUMN_VALUE` as the name of the column being returned:

```
SELECT *
  FROM XMLTABLE('<a>123</a>');

COLUMN_VALUE
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
--------------------------------------
<a>123</a>

SELECT COLUMN_VALUE
  FROM (XMLTable('<a>123</a>'));

COLUMN_VALUE
----------------------------------------
<a>123</a>
```

In the context of a `TABLE` collection expression, the value returned is the data type of the collection element. The following statements create the two levels of nested tables illustrated in Creating a Table: Multilevel Collection Example to show the uses of `COLUMN_VALUE` in this context:

```
CREATE TYPE phone AS TABLE OF NUMBER;
/
CREATE TYPE phone_list AS TABLE OF phone;
/
```

The next statement uses `COLUMN_VALUE` to select from the `phone` type:

```
SELECT t.COLUMN_VALUE
  FROM TABLE(phone(1,2,3)) t;

COLUMN_VALUE
------------
           1
           2
           3
```

In a nested type, you can use the `COLUMN_VALUE` pseudocolumn in both the select list and the `TABLE` collection expression:

```
SELECT t.COLUMN_VALUE
  FROM TABLE(phone_list(phone(1,2,3))) p, TABLE(p.COLUMN_VALUE) t;

COLUMN_VALUE
------------
           1
           2
           3
```

The keyword `COLUMN_VALUE` is also the name that Oracle Database generates for the scalar value of an inner nested table without a column or attribute name, as shown in the example that follows. In this context, `COLUMN_VALUE` is not a pseudocolumn, but an actual column name.

```
CREATE TABLE my_customers (
    cust_id       NUMBER,
    name          VARCHAR2(25),
    phone_numbers phone_list,
    credit_limit  NUMBER)
  NESTED TABLE phone_numbers STORE AS outer_ntab
  (NESTED TABLE COLUMN_VALUE STORE AS inner_ntab);
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

- Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules for values of the `COLUMN_VALUE` pseudocolumn

OBJECT_ID Pseudocolumn

The `OBJECT_ID` pseudocolumn returns the object identifier of a column of an object table or view. Oracle uses this pseudocolumn as the primary key of an object table. `OBJECT_ID` is useful in `INSTEAD OF` triggers on views and for identifying the ID of a substitutable row in an object table.

Note

In earlier releases, this pseudocolumn was called `SYS_NC_OID$`. That name is still supported for backward compatibility. However, Oracle recommends that you use the more intuitive name `OBJECT_ID`.

See Also

Oracle AI Database Object-Relational Developer's Guide for examples of the use of this pseudocolumn

OBJECT_VALUE Pseudocolumn

The `OBJECT_VALUE` pseudocolumn returns system-generated names for the columns of an object table, `XMLType` table, object view, or `XMLType` view. This pseudocolumn is useful for identifying the value of a substitutable row in an object table and for creating object views with the `WITH OBJECT IDENTIFIER` clause.

Note

In earlier releases, this pseudocolumn was called `SYS_NC_ROWINFO$`. That name is still supported for backward compatibility. However, Oracle recommends that you use the more intuitive name `OBJECT_VALUE`.

- *Oracle AI Database Object-Relational Developer's Guide* for examples of the use of this pseudocolumn

ORA_ROWSCN Pseudocolumn

ORA_ROWSCN reflects the system change-number (SCN) of the most recent change to a row. This change can be at the level of a block (coarse) or at the level of a row (fine-grained). The latter is provided by row-level dependency tracking. Refer to CREATE TABLE ... NOROWDEPENDENCIES | ROWDEPENDENCIES for more information on row-level dependency tracking. In the absence of row-level dependencies, ORA_ROWSCN reflects block-level dependencies.

Whether at the block level or at the row level, the ORA_ROWSCN should not be considered to be an exact SCN. For example, if a transaction changed row R in a block and committed at SCN 10, it is not always true that the ORA_ROWSCN for the row would return 10. While a value less than 10 would never be returned, any value greater than or equal to 10 could be returned. That is, the ORA_ROWSCN of a row is not always guaranteed to be the exact commit SCN of the transaction that last modified that row. However, with fine-grained ORA_ROWSCN, if two transactions T1 and T2 modified the same row R, one after another, and committed, a query on the ORA_ROWSCN of row R after the commit of T1 will return a value lower than the value returned after the commit of T2. If a block is queried twice, then it is possible for the value of ORA_ROWSCN to change between the queries even though rows have not been updated in the time between the queries. The only guarantee is that the value of ORA_ROWSCN in both queries is greater than the commit SCN of the transaction that last modified that row.

You cannot use the ORA_ROWSCN pseudocolumn in a query to a view. However, you can use it to refer to the underlying table when creating a view. You can also use this pseudocolumn in the WHERE clause of an UPDATE or DELETE statement.

ORA_ROWSCN is not supported for Flashback Query. Instead, use the version query pseudocolumns, which are provided explicitly for Flashback Query. Refer to the SELECT ... *flashback_query_clause* for information on Flashback Query and Version Query Pseudocolumns for additional information on those pseudocolumns.

Restriction on ORA_ROWSCN: This pseudocolumn is not supported for external tables.

Example

The first statement below uses the ORA_ROWSCN pseudocolumn to get the system change number of the last operation on the employees table. The second statement uses the pseudocolumn with the SCN_TO_TIMESTAMP function to determine the timestamp of the operation:

```
SELECT ORA_ROWSCN, last_name
  FROM employees
  WHERE employee_id = 188;

SELECT SCN_TO_TIMESTAMP(ORA_ROWSCN), last_name
  FROM employees
  WHERE employee_id = 188;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

SCN_TO_TIMESTAMP

ORA_SHARDSPACE_NAME Pseudocolumn

You can use the `ORA_SHARDSPACE_NAME` pseudocolumn to run queries across shards instead of a sharding key.

Before you can run cross-shard queries from the catalog, you must create users in the catalog with shared DDL enabled. Then you must grant these users access to the privately sharded tables.

The queries referencing the privately sharded tables will run across the shards in the catalog using the pseudocolumn `ORA_SHARDSPACE_NAME` associated to them. To run a cross shard query on a given shard, you must filter the query with the predicate `ORA_SHARDSPACE_NAME = <shardspace_name_belonging_to_name>`.

Examples

```
SELECT CUST_NAME, CUST_ID FROM CUSTOMER WHERE ORA_SHARDSPACE_NAME = 'EUROPE'
```

This query will run on one of the shards belonging to the shardspace named Europe. The query will run on the primary shard of the sharspace Europe or on one of its standbys, depending on the value of the parameter `MULTISHARD_QUERY_DATA_CONSISTENCY`.

A query like:

```
SELECT CUST_NAME, CUST_ID FROM CUSTOMER
```

where the table `CUSTOMER` is marked as privately sharded, will run on all shards.

ROWID Pseudocolumn

For each row in the database, the `ROWID` pseudocolumn returns the address of the row. Oracle Database rowid values contain information necessary to locate a row:

- The data object number of the object
- The data block in the data file in which the row resides
- The position of the row in the data block (first row is 0)
- The data file in which the row resides (first file is 1). The file number is relative to the tablespace.

Usually, a rowid value uniquely identifies a row in the database. However, rows in different tables that are stored together in the same cluster can have the same rowid.

Values of the `ROWID` pseudocolumn have the data type `ROWID` or `UROWID`. Refer to Rowid Data Types and UROWID Data Type for more information.

Rowid values have several important uses:

- They are the fastest way to access a single row.
- They can show you how the rows in a table are stored.
- They are unique identifiers for rows in a table.

Copyright © 1996, 2026, Oracle and/or its affiliates.

You should not use ROWID as the primary key of a table. If you delete and reinsert a row with the Import and Export utilities, for example, then its rowid may change. If you delete a row, then Oracle may reassign its rowid to a new row inserted later.

Although you can use the ROWID pseudocolumn in the SELECT and WHERE clause of a query, these pseudocolumn values are not actually stored in the database. You cannot insert, update, or delete a value of the ROWID pseudocolumn.

Example

This statement selects the address of all rows that contain data for employees in department 20:

```
SELECT ROWID, last_name
  FROM employees
  WHERE department_id = 20;
```

ROWNUM Pseudocolumn

> **Note**
>
> - The ROW_NUMBER built-in SQL function provides superior support for ordering the results of a query. Refer to ROW_NUMBER for more information.
> - The *row_limiting_clause* of the SELECT statement provides superior support for limiting the number of rows returned by a query. Refer to *row_limiting_clause* for more information.

For each row returned by a query, the ROWNUM pseudocolumn returns a number indicating the order in which Oracle selects the row from a table or set of joined rows. The first row selected has a ROWNUM of 1, the second has 2, and so on.

You can use ROWNUM to limit the number of rows returned by a query, as in this example:

```
SELECT *
  FROM employees
  WHERE ROWNUM < 11;
```

If an ORDER BY clause follows ROWNUM in the same query, then the rows will be reordered by the ORDER BY clause. The results can vary depending on the way the rows are accessed. For example, if the ORDER BY clause causes Oracle to use an index to access the data, then Oracle may retrieve the rows in a different order than without the index. Therefore, the following statement does not necessarily return the same rows as the preceding example:

```
SELECT *
  FROM employees
  WHERE ROWNUM < 11
  ORDER BY last_name;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

If you embed the ORDER BY clause in a subquery and place the ROWNUM condition in the top-level query, then you can force the ROWNUM condition to be applied after the ordering of the rows. For example, the following query returns the employees with the 10 smallest employee numbers. This is sometimes referred to as **top-N reporting**:

```
SELECT *
  FROM (SELECT * FROM employees ORDER BY employee_id)
  WHERE ROWNUM < 11;
```

In the preceding example, the ROWNUM values are those of the top-level SELECT statement, so they are generated after the rows have already been ordered by employee_id in the subquery.

Conditions testing for ROWNUM values greater than a positive integer are always false. For example, this query returns no rows:

```
SELECT *
  FROM employees
  WHERE ROWNUM > 1;
```

The first row fetched is assigned a ROWNUM of 1 and makes the condition false. The second row to be fetched is now the first row and is also assigned a ROWNUM of 1 and makes the condition false. All rows subsequently fail to satisfy the condition, so no rows are returned.

You can also use ROWNUM to assign unique values to each row of a table, as in this example:

```
UPDATE my_table
  SET column1 = ROWNUM;
```

Refer to the function ROW_NUMBER for an alternative method of assigning unique numbers to rows.

> **Note**
>
> Using ROWNUM in a query can affect view optimization.

XMLDATA Pseudocolumn

Oracle stores XMLType data either in LOB or object-relational columns, based on XMLSchema information and how you specify the storage clause. The XMLDATA pseudocolumn lets you access the underlying LOB or object relational column to specify additional storage clause parameters, constraints, indexes, and so forth.

Examples

The following statements illustrate the use of this pseudocolumn. Suppose you create a simple table of XMLType with one CLOB column:

```
CREATE TABLE xml_lob_tab of XMLTYPE
  XMLTYPE STORE AS CLOB;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

To change the storage characteristics of the underlying LOB column, you can use the following statement:

```
ALTER TABLE xml_lob_tab
  MODIFY LOB (XMLDATA) (STORAGE (MAXSIZE 2G) CACHE);
```

Now suppose you have created an XMLSchema-based table like the `xwarehouses` table created in Using XML in SQL Statements . You could then use the `XMLDATA` column to set the properties of the underlying columns, as shown in the following statement:

```
ALTER TABLE xwarehouses
  ADD (UNIQUE(XMLDATA."WarehouseId"));
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Operators

An **operator** manipulates data items and returns a result. Syntactically, an operator appears before or after an operand or between two operands.

This chapter contains these sections:

- About SQL Operators
- Arithmetic Operators
- COLLATE Operator
- Data Quality Operators
- Concatenation Operator
- GRAPH_TABLE Operator
- Hierarchical Query Operators
- Multiset Operators
- Set Operators
- SHARD_CHUNK_ID Operator
- User-Defined Operators

This chapter discusses nonlogical (non-Boolean) operators. These operators cannot by themselves serve as the condition of a `WHERE` or `HAVING` clause in queries or subqueries. For information on logical operators, which serve as conditions, refer to Conditions.

About SQL Operators

Operators manipulate individual data items called **operands** or **arguments**. Operators are represented by special characters or by keywords. For example, the multiplication operator is represented by an asterisk (*).

If you have installed Oracle Text, then you can use the `SCORE` operator, which is part of that product, in Oracle Text queries. You can also create conditions with the built-in Text operators, including `CONTAINS`, `CATSEARCH`, and `MATCHES`. For more information on these Oracle Text elements, refer to *Oracle Text Reference*.

Unary and Binary Operators

The two general classes of operators are:

- **unary**: A unary operator operates on only one operand. A unary operator typically appears with its operand in this format:

  ```
  operator operand
  ```

- **binary**: A binary operator operates on two operands. A binary operator appears with its operands in this format:

  ```
  operand1 operator operand2
  ```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Other operators with special formats accept more than two operands. If an operator is given a null operand, then the result is always null. The only operator that does not follow this rule is concatenation (||).

Operator Precedence

Precedence is the order in which Oracle Database evaluates different operators in the same expression. When evaluating an expression containing multiple operators, Oracle evaluates operators with higher precedence before evaluating those with lower precedence. Oracle evaluates operators with equal precedence from left to right within an expression.

Table 4-1 lists the levels of precedence among SQL operators from high to low. Operators listed on the same line have the same precedence.

Table 4-1 SQL Operator Precedence

Operator	Operation
`+, -` (as unary operators), `PRIOR`, `CONNECT_BY_ROOT`, `COLLATE`	Identity, negation, location in hierarchy
`*, /`	Multiplication, division
`+, -` (as binary operators), `||`	Addition, subtraction, concatenation
<-> is the Euclidian distance operator, <=> is the cosine distance operator, <#> is the negative dot product operator	Shorthand Operators for Distances
SQL conditions are evaluated after SQL operators	See "Condition Precedence"

Precedence Example

In the following expression, multiplication has a higher precedence than addition, so Oracle first multiplies 2 by 3 and then adds the result to 1.

```
1+2*3
```

You can use parentheses in an expression to override operator precedence. Oracle evaluates expressions inside parentheses before evaluating those outside.

SQL also supports set operators (`UNION`, `UNION ALL`, `INTERSECT`, and `MINUS`), which combine sets of rows returned by queries, rather than individual data items. All set operators have equal precedence.

> **See Also**
>
> Hierarchical Query Operators and Hierarchical Queries for information on the `PRIOR` operator, which is used only in hierarchical queries

Arithmetic Operators

You can use an arithmetic operator with one or two arguments to negate, add, subtract, multiply, and divide numeric values. Some of these operators are also used in datetime and interval arithmetic. The arguments to the operator must resolve to numeric data types or to any data type that can be implicitly converted to a numeric data type.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Unary arithmetic operators return the same data type as the numeric data type of the argument. For binary arithmetic operators, Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type. Table 4-2 lists arithmetic operators.

> **See Also**
>
> Table 2-9 for more information on implicit conversion, Numeric Precedence for information on numeric precedence, and Datetime/Interval Arithmetic

Arithmetic Operators: Examples

Plus Minus Operator as a Positive or Negative Expression

When the plus and minus operator (+-) denote a positive or negative expression they are unary operators.

```
SELECT *
  FROM order_items
  WHERE quantity = -1
  ORDER BY order_id,
    line_item_id, product_id;
```

```
SELECT *
  FROM employees
  WHERE -salary < 0
  ORDER BY employee_id;
```

Plus Minus Operators as Addition and Subtraction Operators

When the plus and minus operator (+-) are used to add or subtract, they are binary operators:

```
SELECT hire_date
  FROM employees
  WHERE SYSDATE - hire_date > 365
  ORDER BY hire_date;
```

Multiply Divide Operators

Multiply and divide operators (*/) are binary operators:

```
UPDATE employees
  SET salary = salary * 1.1;
```

Note that you must ensure you have the appropriate privileges to run `UPDATE` commands.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 4-2 Arithmetic Operators

Operator	Purpose	Example

+ -	When these denote a positive or negative expression, they are unary operators.	`SELECT *`
		`  FROM order_items`
		`  WHERE quantity = -1`
		`  ORDER BY order_id,`
		`  line_item_id, product_id;`
		
		`SELECT *`
		`  FROM employees`
		`  WHERE -salary < 0`
		`  ORDER BY employee_id;`

+ -	When they add or subtract, they are binary operators.	`SELECT hire_date`
		`  FROM employees`
		`  WHERE SYSDATE - hire_date > 365`
		`  ORDER BY hire_date;`

* /	Multiply, divide. These are binary operators.	`UPDATE employees` `  SET salary = salary * 1.1;`

Do not use two consecutive minus signs (--) in arithmetic expressions to indicate double negation or the subtraction of a negative value. The characters -- are used to begin comments within SQL statements. You should separate consecutive minus signs with a space or parentheses. Refer to Comments for more information on comments within SQL statements.

COLLATE Operator

The `COLLATE` operator determines the collation for an expression. This operator enables you to override the collation that the database would have derived for the expression using standard collation derivation rules.

`COLLATE` is a postfix unary operator. It has the same precedence as other unary operators, but it is evaluated after all prefix unary operators have been evaluated.

You can apply this operator to expressions of type `VARCHAR2`, `CHAR`, `LONG`, `NVARCHAR`, or `NCHAR`.

The `COLLATE` operator takes one argument, *`collation_name`*, for which you can specify a named collation or pseudo-collation. If the collation name contains a space, then you must enclose the name in double quotation marks.

Table 4-3 describes the `COLLATE` operator.

COLLATE Operator: Example

The following query sorts employee last names using the named collation `GENERIC_M`:

```
SELECT last_name
  FROM employees
  ORDER BY last_name COLLATE GENERIC_M;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 4-3 COLLATE Operator

Operator	Purpose	Example
`COLLATE` *`collation_name`*	Determines the collation for an expression	`SELECT last_name FROM employees ORDER BY last_name COLLATE GENERIC_M;`

> **See Also**
>
> - Compound Expressions for information on using the `COLLATE` operator in a compound expression
> - *Oracle AI Database Globalization Support Guide* for more information on the `COLLATE` operator

Concatenation Operator

The concatenation operator manipulates character strings and `CLOB` data. Table 4-4 describes the concatenation operator.

Table 4-4 Concatenation Operator

Operator	Purpose	Example
||	Concatenates character strings and `CLOB` data.	`SELECT 'Name is ' || last_name FROM employees ORDER BY last_name;`

The result of concatenating two or more character strings is another character string. If both character strings are of data type `CHAR`, then the result has data type `CHAR` and is limited to 2000 characters. If either string is of data type `VARCHAR2`, then the result has data type `VARCHAR2` and is limited to 32767 characters if the initialization parameter `MAX_STRING_SIZE = EXTENDED` and 4000 characters if `MAX_STRING_SIZE = STANDARD`. Refer to Extended Data Types for more information. If either argument is a `CLOB`, the result is a temporary `CLOB`. Trailing blanks in character strings are preserved by concatenation, regardless of the data types of the string or `CLOB`.

On most platforms, the concatenation operator is two solid vertical bars, as shown in Table 4-4. However, some IBM platforms use broken vertical bars for this operator. When moving SQL script files between systems having different character sets, such as between ASCII and EBCDIC, vertical bars might not be translated into the vertical bar required by the target Oracle Database environment. Oracle provides the `CONCAT` character function as an alternative to the vertical bar operator for cases when it is difficult or impossible to control translation performed by operating system or network utilities. Use this function in applications that will be moved between environments with differing character sets.

Although Oracle treats zero-length character strings as nulls, concatenating a zero-length character string with another operand always results in the other operand, so null can result only from the concatenation of two null strings. However, this may not continue to be true in

Copyright © 1996, 2026, Oracle and/or its affiliates.

future versions of Oracle Database. To concatenate an expression that might be null, use the NVL function to explicitly convert the expression to a zero-length string.

See Also

- Character Data Types for more information on the differences between the CHAR and VARCHAR2 data types
- The functions CONCAT and NVL
- *Oracle AI Database SecureFiles and Large Objects Developer's Guide* for more information about CLOBs
- *Oracle AI Database Globalization Support Guide* for the collation derivation rules for the concatenation operator

Concatenation Example

This example creates a table with both CHAR and VARCHAR2 columns, inserts values both with and without trailing blanks, and then selects these values and concatenates them. Note that for both CHAR and VARCHAR2 columns, the trailing blanks are preserved.

```
CREATE TABLE IF NOT EXISTS tab1 (col1 VARCHAR2(6), col2 CHAR(6),
                  col3 VARCHAR2(6), col4 CHAR(6));

INSERT INTO tab1 (col1,  col2,     col3,     col4)
          VALUES ('abc', 'def   ', 'ghi   ', 'jkl');

SELECT col1 || col2 || col3 || col4 "Concatenation"
  FROM tab1;
```

Result:

```
Concatenation
------------------------
abcdef   ghi   jkl
```

Hierarchical Query Operators

Two operators, PRIOR and CONNECT_BY_ROOT, are valid only in hierarchical queries.

PRIOR

In a hierarchical query, one expression in the CONNECT BY *condition* must be qualified by the PRIOR operator. If the CONNECT BY *condition* is compound, then only one condition requires the PRIOR operator, although you can have multiple PRIOR conditions. PRIOR evaluates the immediately following expression for the parent row of the current row in a hierarchical query.

PRIOR is most commonly used when comparing column values with the equality operator. (The PRIOR keyword can be on either side of the operator.) PRIOR causes Oracle to use the value of the parent row in the column. Operators other than the equal sign (=) are theoretically possible in CONNECT BY clauses. However, the conditions created by these other operators can result in an infinite loop through the possible combinations. In this case Oracle detects the loop at run

Copyright © 1996, 2026, Oracle and/or its affiliates.

time and returns an error. Refer to Hierarchical Queries for more information on this operator, including examples.

CONNECT_BY_ROOT

`CONNECT_BY_ROOT` is a unary operator that is valid only in hierarchical queries. When you qualify a column with this operator, Oracle returns the column value using data from the root row. This operator extends the functionality of the `CONNECT BY [PRIOR]` condition of hierarchical queries.

Restriction on CONNECT_BY_ROOT

You cannot specify this operator in the `START WITH` condition or the `CONNECT BY` condition.

> **See Also**
>
> CONNECT_BY_ROOT Examples

Set Operators

Set operators combine the results of two component queries into a single result. Queries containing set operators are called compound queries. Table 4-5 lists the SQL set operators. They are fully described with examples in The Set Operators.

Table 4-5 Set Operators

Operator	Returns
`UNION`	All distinct rows selected by either query
`UNION ALL`	All rows selected by either query, including duplicates
`INTERSECT`	All distinct rows selected by both queries
`INTERSECT ALL`	All rows selected by both queries including duplicates
`MINUS`	All distinct rows selected by the first query but not the second
`MINUS ALL`	All rows selected by the first query but not the second including duplicates
`EXCEPT`	All distinct rows selected by the first query but not the second
`EXCEPT ALL`	All rows selected by the first query but not the second including duplicates

Multiset Operators

Multiset operators combine the results of two nested tables into a single nested table.

The examples related to multiset operators require that two nested tables be created and loaded with data as follows:

First, make a copy of the `oe.customers` table called `customers_demo`:

```
CREATE TABLE customers_demo AS
  SELECT * FROM customers;
```

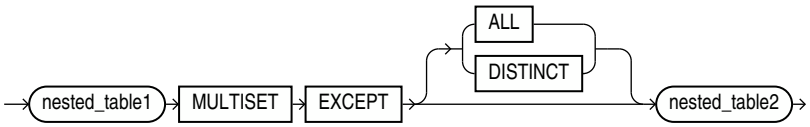
Copyright © 1996, 2026, Oracle and/or its affiliates.

Next, create a table type called `cust_address_tab_typ`. This type will be used when creating the nested table columns.

```
CREATE TYPE cust_address_tab_typ AS
  TABLE OF cust_address_typ;
/
```

Now, create two nested table columns in the `customers_demo` table:

```
ALTER TABLE customers_demo
  ADD (cust_address_ntab cust_address_tab_typ,
       cust_address2_ntab cust_address_tab_typ)
    NESTED TABLE cust_address_ntab STORE AS cust_address_ntab_store
    NESTED TABLE cust_address2_ntab STORE AS cust_address2_ntab_store;
```



Finally, load data into the two new nested table columns using data from the `cust_address` column of the `oe.customers` table:

```
UPDATE customers_demo cd
  SET cust_address_ntab =
    CAST(MULTISET(SELECT cust_address
                  FROM customers c
                  WHERE c.customer_id =
                        cd.customer_id) as cust_address_tab_typ);

UPDATE customers_demo cd
  SET cust_address2_ntab =
    CAST(MULTISET(SELECT cust_address
                  FROM customers c
                  WHERE c.customer_id =
                        cd.customer_id) as cust_address_tab_typ);
```

MULTISET EXCEPT

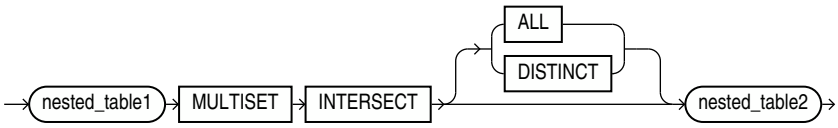
`MULTISET EXCEPT` takes as arguments two nested tables and returns a nested table whose elements are in the first nested table but not in the second nested table. The two input nested tables must be of the same type, and the returned nested table is of the same type as well.

- The `ALL` keyword instructs Oracle to return all elements in *`nested_table1`* that are not in *`nested_table2`*. For example, if a particular element occurs *`m`* times in *`nested_table1`* and *`n`* times in *`nested_table2`*, then the result will have *`(m-n)`* occurrences of the element if *`m`* >*`n`* and 0 occurrences if *`m`*<=*`n`*. `ALL` is the default.
- The `DISTINCT` keyword instructs Oracle to eliminate any element in *`nested_table1`* which is also in *`nested_table2`*, regardless of the number of occurrences.
- The element types of the nested tables must be comparable. Refer to Comparison Conditions for information on the comparability of nonscalar types.

Example

The following example compares two nested tables and returns a nested table of those elements found in the first nested table but not in the second nested table:

Copyright © 1996, 2026, Oracle and/or its affiliates.



```
SELECT customer_id, cust_address_ntab
  MULTISET EXCEPT DISTINCT cust_address2_ntab multiset_except
  FROM customers_demo
  ORDER BY customer_id;

CUSTOMER_ID MULTISET_EXCEPT(STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID)
----------- --------------------------------------------------------------------------------
        101 CUST_ADDRESS_TAB_TYP()
        102 CUST_ADDRESS_TAB_TYP()
        103 CUST_ADDRESS_TAB_TYP()
        104 CUST_ADDRESS_TAB_TYP()
        105 CUST_ADDRESS_TAB_TYP()
. . .
```

The preceding example requires the table `customers_demo` and two nested table columns containing data. Refer to Multiset Operators to create this table and nested table columns.

MULTISET INTERSECT

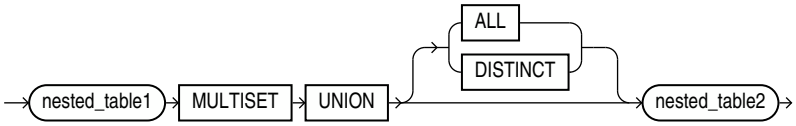
`MULTISET INTERSECT` takes as arguments two nested tables and returns a nested table whose values are common in the two input nested tables. The two input nested tables must be of the same type, and the returned nested table is of the same type as well.

- The `ALL` keyword instructs Oracle to return all common occurrences of elements that are in the two input nested tables, including duplicate common values and duplicate common `NULL` occurrences. For example, if a particular value occurs `m` times in *`nested_table1`* and `n` times in *`nested_table2`*, then the result would contain the element `min(m,n)` times. `ALL` is the default.
- The `DISTINCT` keyword instructs Oracle to eliminate duplicates from the returned nested table, including duplicates of `NULL`, if they exist.
- The element types of the nested tables must be comparable. Refer to Comparison Conditions for information on the comparability of nonscalar types.

Example

The following example compares two nested tables and returns a nested table of those elements found in both input nested tables:

```
SELECT customer_id, cust_address_ntab
  MULTISET INTERSECT DISTINCT cust_address2_ntab multiset_intersect
  FROM customers_demo
  ORDER BY customer_id;



CUSTOMER_ID MULTISET_INTERSECT(STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID
----------- -------------------------------------------------------------------------------
        101 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('514 W Superior St', '46901', 'Kokomo', 'IN', 'US'))
        102 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('2515 Bloyd Ave', '46218', 'Indianapolis', 'IN', 'US'))
        103 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('8768 N State Rd 37', '47404', 'Bloomington', 'IN', 'US'))
        104 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('6445 Bay Harbor Ln', '46254', 'Indianapolis', 'IN', 'US'))
        105 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('4019 W 3Rd St', '47404', 'Bloomington', 'IN', 'US'))
. . .
```

The preceding example requires the table `customers_demo` and two nested table columns containing data. Refer to Multiset Operators to create this table and nested table columns.

Copyright © 1996, 2026, Oracle and/or its affiliates.

MULTISET UNION

`MULTISET UNION` takes as arguments two nested tables and returns a nested table whose values are those of the two input nested tables. The two input nested tables must be of the same type, and the returned nested table is of the same type as well.

- The `ALL` keyword instructs Oracle to return all elements that are in the two input nested tables, including duplicate values and duplicate `NULL` occurrences. This is the default.
- The `DISTINCT` keyword instructs Oracle to eliminate duplicates from the returned nested table, including duplicates of `NULL`, if they exist.
- The element types of the nested tables must be comparable. Refer to Comparison Conditions for information on the comparability of nonscalar types.

Example

The following example compares two nested tables and returns a nested table of elements from both input nested tables:

```
SELECT customer_id, cust_address_ntab
  MULTISET UNION cust_address2_ntab multiset_union
  FROM customers_demo
  ORDER BY customer_id;

CUSTOMER_ID MULTISET_UNION(STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID)
----------- --------------------------------------------------------------------------
        101 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('514 W Superior St', '46901', 'Kokomo', 'IN', 'US'),
                                 CUST_ADDRESS_TYP('514 W Superior St', '46901', 'Kokomo', 'IN', 'US'))
        102 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('2515 Bloyd Ave', '46218', 'Indianapolis', 'IN', 'US'),
                                 CUST_ADDRESS_TYP('2515 Bloyd Ave', '46218', 'Indianapolis', 'IN','US'))
        103 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('8768 N State Rd 37', '47404', 'Bloomington', 'IN', 'US'),
                                 CUST_ADDRESS_TYP('8768 N State Rd 37', '47404', 'Bloomington', 'IN', 'US'))
        104 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('6445 Bay Harbor Ln', '46254', 'Indianapolis', 'IN', 'US'),
                                 CUST_ADDRESS_TYP('6445 Bay Harbor Ln', '46254', 'Indianapolis', 'IN', 'US'))
        105 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('4019 W 3Rd St', '47404', 'Bloomington', 'IN', 'US'),
                                 CUST_ADDRESS_TYP('4019 W 3Rd St', '47404', 'Bloomington', 'IN', 'US'))
. . .
```

The preceding example requires the table `customers_demo` and two nested table columns containing data. Refer to Multiset Operators to create this table and nested table columns.

SHARD_CHUNK_ID Operator

You can use the SQL operator `SHARD_CHUNK_ID` to get the chunk ID in a sharding environment. You must provide the table family ID and the sharding key as input.

This operator can be used in all three sharding types: system, user-defined, and composite. You can run the operator from the catalog and the shard.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Syntax

```
SELECT SHARD_CHUNK_ID( table_family, sharding_key1 [, sharding_key2 ...])
FROM table_name ...
```

Semantics

table_family

The first operand *table_family* refers to the identifier of the table family. It can be:

- The table family id that can be queried from the GSMADMIN_INTERNAL.TABLE_FAMILY table, or
- The name of the root table in the form of SCHEMA_NAME.TABLE_NAME .

If there is only one table family across the entire sharding environment, table_family can take NULL as input. This will default to the existing single table family.

sharding_key

The second operand *sharding_key* refers to a list of sharding keys. It can be a constant value or column name.

You must order the list of sharding keys as follows:

1. List of super-sharding keys in the order they are defined.
2. List of sharding keys in the order they are defined. For this refer to GSMADMIN_INTERNAL.SHARDKEY_COLUMNS .

In system and user-defined sharding environments, where super-sharding keys are not used, you only need to supply sharding keys.

Example

Given the composite sharded table customers defined as follows:

```
CREATE SHARDED TABLE customers (
    custno         NUMBER NOT NULL,
    name           VARCHAR2(50) NOT NULL,
    signup         DATE DEFAULT NULL,
    class          VARCHAR2(3) NOT NULL,
CONSTRAINT cust_pk PRIMARY KEY(custno,name))
PARTITIONSET BY LIST (class)
PARTITION BY CONSISTENT HASH (custno,name)
PARTITIONS AUTO
(PARTITIONSET gold VALUES ('gld') TABLESPACE SET tbs1,
 PARTITIONSET silver VALUES ('slv') TABLESPACE SET tbs2)
;
```

You can query it for the chunk ID with the following statement:

```
SELECT SHARD_CHUNK_ID(null, class, custno, name) FROM customers;
```

User-Defined Operators

Like built-in operators, user-defined operators take a set of operands as input and return a result. However, you create them with the `CREATE OPERATOR` statement, and they are identified by user-defined names. They reside in the same namespace as tables, views, types, and standalone functions.

After you have defined a new operator, you can use it in SQL statements like any other built-in operator. For example, you can use user-defined operators in the select list of a `SELECT` statement, the condition of a `WHERE` clause, or in `ORDER BY` clauses and `GROUP BY` clauses. However, you must have `EXECUTE` privilege on the operator to do so, because it is a user-defined object.

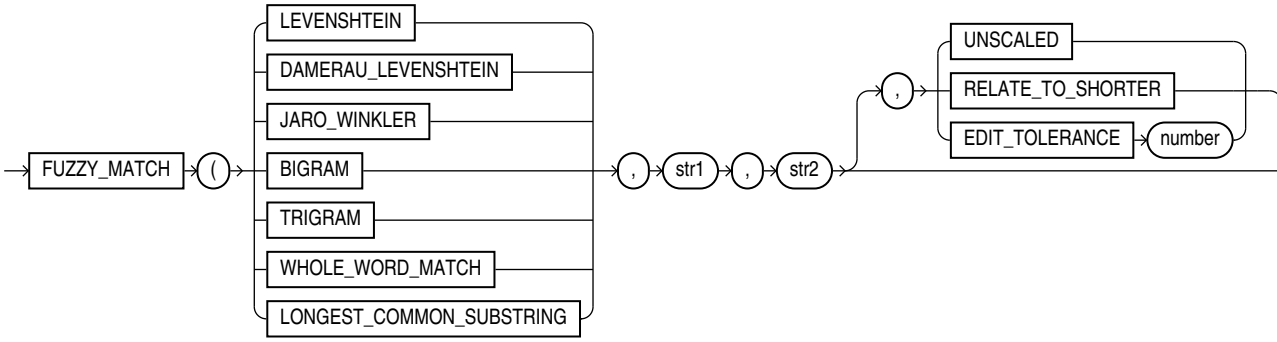
CREATE OPERATOR for an example of creating an operator and *Oracle AI Database Data Cartridge Developer's Guide* for more information on user-defined operators

Data Quality Operators



You can expand data quality capabilities within Oracle Database with string matching operators `PHONIC_ENCODE` and `FUZZY_MATCH`.

These operators can help you find near duplicate rows by matching strings that sounds alike or have small differences in spelling, for example:

- "Chris" and "Kris", in strings that sound alike
- "kitten" and "sitten", in strings that have small differences in spelling

FUZZY_MATCH

`FUZZY_MATCH` takes the algorithm to be used as the first argument, the strings to be processed as the second and third arguments, and some optional arguments that control the quality of the desired output.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The UTL_MATCH package evaluates byte by byte, while FUZZY_MATCH evaluates character by character. Therefore UTL_MATCH only works for comparison between single-byte strings while FUZZY_MATCH handles multi-byte charactersets.

When the UNSCALED option is specified, FUZZY_MATCH returns a measure in characters for the following algorithms: LEVENSHTEIN , DAMERAU_LEVENSHTEIN , BIGRAM , TRIGRAM , LONGEST_COMMON_SUBSTRING .

Arguments

The supported algorithms are:

- LEVENSHTEIN corresponds to UTL_MATCH.EDIT_DISTANCE or UTL_MATCH.EDIT_SIMILARITY and gives a measure of character edit distance or similarity.
- DAMERAU_LEVENSHTEIN distance differs from the classical LEVENSHTEIN distance by including transpositions among its allowable operations in addition to the three classical single-character edit operations (insertions, deletions and substitutions).
- JARO_WINKLER corresponds to UTL_MATCH.JARO_WINKLER (a percentage between 0-1) or UTL_MATCH.JARO_WINKLER_SIMILARITY (the same but scaled from 0-100).
- BIGRAM and TRIGRAM are instances of the N-gram matching technique, which counts the number of common contiguous sub-strings (grams) between the two strings.
- WHOLE_WORD_MATCH corresponds to Word Match Percentage or Count comparison in Oracle Enterprise Data Quality. It calculates the LEVENSHTEIN or edit distance of two phrases with words (instead of letters) as matching units.
- LONGEST_COMMON_SUBSTRING finds the longest common substring between the two strings.

Both *str* arguments can be any of the datatypes CHAR, VARCHAR2, NCHAR, NVARCHAR2.

UNSCALED

The keyword UNSCALED is optional. If you specify UNSCALED the return is one of :

- LEVENSHTEIN or edit distance
- JARO_WINKLER value in percentage
- N-grams, the number of common substrings
- LCS, the length of the longest common substring

RELATE_TO_SHORTER

The keyword RELATE_TO_SHORTER is optional. If you specify RELATE_TO_SHORTER, then the similarity measure is scaled by the length of the shorter input string. If you do not specify RELATE_TO_SHORTER, then the default behavior is that the longer string length is used as the denominator.

EDIT_TOLERANCE

The keyword EDIT_TOLERANCE is optional. You can only specify EDIT_TOLERANCE with the WHOLE_WORD_MATCH algorithm. If you specify EDIT_TOLERANCE, the character error tolerance is the maximum percentage of the number of characters in a word that you allow to be different, while still considering each word as the same.

Returns

The operator returns NUMBER. By default, it is a similarity score normalized to be a percentage between 0-100.

Examples

PHONIC_ENCODE

PHONIC_ENCODE takes the algorithm to be used as the first argument, the string to be processed as the second argument, and an optional max_code_len argument that controls the length of the desired output. max_code_len must be an integer between 1 and 12.

Arguments

DOUBLE_METAPHONE returns the primary code. DOUBLE_METAPHONE_ALT returns the alternative code if present. If the alternative code is not present, it returns the primary code.

str can be any of the datatypes CHAR, VARCHAR2, NCHAR, NVARCHAR2.

The optional argument *max_code_len* must be an integer. It allows codes longer than the default 4 characters to be returned for the original Metaphone algorithm.

Returns

The operator returns VARCHAR2.

Examples

```
SQL> select phonic_encode(DOUBLE_METAPHONE,     'smith') c1,
  2         phonic_encode(DOUBLE_METAPHONE_ALT, 'smith') c2 from dual;

GRAPH_TABLE Operator

Purpose

The `GRAPH_TABLE` operator can be used as a table expression in a `FROM` clause. It takes a graph as input against which it matches a specified graph pattern. It then outputs a set of solutions in tabular form.

This topic consists of the following sub-topics:

- Graph Reference
- Graph Pattern
- Graph Table Shape
- Value Expressions for GRAPH_TABLE

Syntax

***graph_table*::=**

(graph_reference ::=, graph_pattern ::=, graph_table_shape ::=)

Semantics

The`GRAPH_TABLE` operator starts with the keyword `GRAPH_TABLE` and consists of the following three parts that are placed between parentheses:

- *`graph_reference`*: a reference to a graph to perform the pattern matching on. Note that any graph first needs to be created through a `CREATE PROPERTY GRAPH` statement before it can be referenced in a `GRAPH_TABLE`.
- *`graph_pattern`*: a graph pattern consisting of vertex and edge patterns together with search conditions. The pattern is matched against the graph to obtain a set of solutions.
- *`graph_table_shape`*: a `COLUMNS` clause that projects the solutions into a tabular form.

A `FROM` clause in SQL may contain any number of `GRAPH_TABLE` operators as well as other types of table expressions. This allows for joining data from multiple graphs or for joining graph data with tabular, JSON, XML, or other types of data.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

Setting Up Sample Data

This example creates a property graph, `students_graph`, using `persons`,`university`, `friendships`, and `students` as the underlying database tables for the graph.

The following statements first create the necessary tables and fill them with sample data:

```
CREATE TABLE IF NOT EXISTS university (
    id NUMBER GENERATED ALWAYS AS IDENTITY (START WITH 1 INCREMENT BY 1),
    name VARCHAR2(10),
    CONSTRAINT u_pk PRIMARY KEY (id));
INSERT INTO university (name) VALUES ('ABC');
INSERT INTO university (name) VALUES ('XYZ');

CREATE TABLE IF NOT EXISTS persons (
     person_id NUMBER GENERATED ALWAYS AS IDENTITY (START WITH 1 INCREMENT
     BY 1),
     name VARCHAR2(10),
     birthdate DATE,
     height FLOAT DEFAULT ON NULL 0,
     person_data JSON,
     CONSTRAINT person_pk PRIMARY KEY (person_id));

INSERT INTO persons (name, height, birthdate, person_data)
       VALUES ('John', 1.80, to_date('13/06/1963', 'DD/MM/YYYY'),
'{"department":"IT","role":"Software Developer"}');

INSERT INTO persons (name, height, birthdate, person_data)
       VALUES ('Mary', 1.65, to_date('25/09/1982', 'DD/MM/YYYY'),
'{"department":"HR","role":"HR Manager"}');

INSERT INTO persons (name, height, birthdate, person_data)
       VALUES ('Bob', 1.75, to_date('11/03/1966', 'DD/MM/YYYY'),
'{"department":"IT","role":"Technical Consultant"}');

INSERT INTO persons (name, height, birthdate, person_data)
       VALUES ('Alice', 1.70, to_date('01/02/1987', 'DD/MM/YYYY'),
'{"department":"HR","role":"HR Assistant"}');

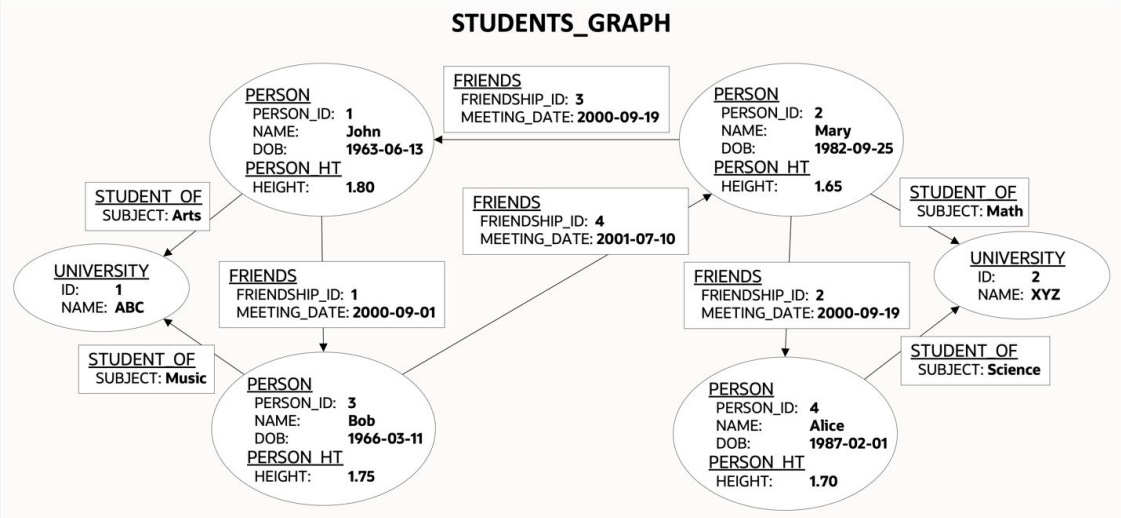
CREATE TABLE IF NOT EXISTS students (
      s_id NUMBER GENERATED ALWAYS AS IDENTITY (START WITH 1 INCREMENT BY 1),
      s_univ_id NUMBER,
      s_person_id NUMBER,
      subject VARCHAR2(10),
      CONSTRAINT stud_pk PRIMARY KEY (s_id),
      CONSTRAINT stud_fk_person FOREIGN KEY (s_person_id) REFERENCES
persons(person_id),
      CONSTRAINT stud_fk_univ FOREIGN KEY (s_univ_id) REFERENCES
university(id)
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
    );

INSERT INTO students(s_univ_id, s_person_id,subject) VALUES (1,1,'Arts');
INSERT INTO students(s_univ_id, s_person_id,subject) VALUES (1,3,'Music');
INSERT INTO students(s_univ_id, s_person_id,subject) VALUES (2,2,'Math');
INSERT INTO students(s_univ_id, s_person_id,subject) VALUES (2,4,'Science');

CREATE TABLE IF NOT EXISTS friendships (
    friendship_id NUMBER GENERATED ALWAYS AS IDENTITY (START WITH 1 INCREMENT
BY 1),
    person_a NUMBER,
    person_b NUMBER,
    meeting_date DATE,
    CONSTRAINT fk_person_a_id FOREIGN KEY (person_a) REFERENCES
persons(person_id),
    CONSTRAINT fk_person_b_id FOREIGN KEY (person_b) REFERENCES
persons(person_id),
    CONSTRAINT fs_pk PRIMARY KEY (friendship_id)
);



INSERT INTO friendships (person_a, person_b, meeting_date) VALUES (1, 3,
to_date('01/09/2000', 'DD/MM/YYYY'));
INSERT INTO friendships (person_a, person_b, meeting_date) VALUES (2, 4,
to_date('19/09/2000', 'DD/MM/YYYY'));
INSERT INTO friendships (person_a, person_b, meeting_date) VALUES (2, 1,
to_date('19/09/2000', 'DD/MM/YYYY'));
INSERT INTO friendships (person_a, person_b, meeting_date) VALUES (3, 2,
to_date('10/07/2001', 'DD/MM/YYYY'));
```

The following statement creates a graph on top of the tables:

```
CREATE PROPERTY GRAPH IF NOT EXISTS students_graph
  VERTEX TABLES (
    persons KEY (person_id)
      LABEL person
        PROPERTIES (person_id, name, birthdate AS dob)
      LABEL person_ht
        PROPERTIES (height),
    university KEY (id)
  )
  EDGE TABLES (
    friendships AS friends
      KEY (friendship_id)
      SOURCE KEY (person_a) REFERENCES persons(person_id)
      DESTINATION KEY (person_b) REFERENCES persons(person_id)
      PROPERTIES (friendship_id, meeting_date),
    students AS student_of
      SOURCE KEY (s_person_id) REFERENCES persons(person_id)
      DESTINATION KEY (s_univ_id) REFERENCES university(id)
      PROPERTIES (subject)
  );
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

This creates the following graph:

Example: GRAPH_TABLE Query

The following query matches a pattern on graph `students_graph` to find friends of a person named `John`:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (a IS person) -[e IS friends]- (b IS person)
  WHERE a.name = 'John'
  COLUMNS (b.name)
);
```

In the query:

- `(a IS person)` is a vertex pattern that matches vertices labeled person and binds the solutions to a variable `a`.
- `-[e IS friends]-` is an edge pattern that matches either incoming or outgoing edges labeled friends and binds the solutions to a variable `e`.
- `(b IS person)` is another vertex pattern that matches vertices labeled person and binds the solutions to a variable `b`.
- `WHERE a.name = 'John'` is a search condition that accesses the property `name` from vertices bound to variable a to compare against the value `John`.
- `COLUMNS (b.name)` specifies to return the property `name` of vertex `b` as part of the output table.

The output is:

```
NAME
----------
Mary
Bob
```

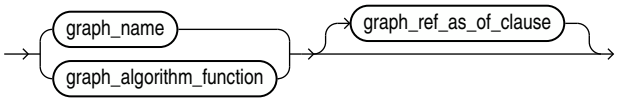
- *SQL Property Graph*
- For property graph definitions and terminology , see *CREATE PROPERTY GRAPH*.

Graph Reference

Purpose

Each `GRAPH_TABLE` starts with a graph reference that references the graph to perform the pattern matching on.

Prerequisites

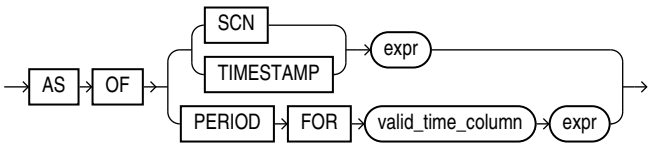


To query a property graph, you must have `READ` or `SELECT` object privilege on the graph. Note that you do not require `READ` or `SELECT` object privilege on the tables or views that underlie the graph.

To issue an Oracle Flashback Query using the *`graph_ref_as_of_clause`* in `GRAPH_TABLE`, you must additionally have `FLASHBACK` object privilege on the tables and materialized views that underlie the graph. This is needed only for those tables and views that are accessed by the query, based on the specified graph pattern and label expressions used therein. Alternatively, you must have `FLASHBACK ANY TABLE` system privilege.

To invoke a graph algorithm function (GAF), you must have `EXECUTE` privilege on the `DBMS_OGA` and `DBMS_GAF` packages. By default, this privilege is granted to `PUBLIC` for both packages.

Syntax



***graph_reference*::=**

***graph_name*::=**

***graph_ref_as_of_clause*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

Semantics

A graph name may be qualified with a schema name to allow for querying graphs created by other users. Furthermore, you can specify the *graph_ref_as_of_clause* clause to retrieve the result of the graph query at a particular change number (SCN) or timestamp. If you specify SCN, then *expr* must evaluate to a number. If you specify TIMESTAMP, then *expr* must evaluate to a timestamp value. In either case, *expr* cannot evaluate to NULL.

Example 1

The following query counts the number of persons in the students_graph :

```
SELECT COUNT(*)
FROM GRAPH_TABLE ( students_graph
  MATCH (a IS person)
  COLUMNS (a.name)
);
```

The output is:

```
  COUNT(*)
----------
         4
```

Example 2

The following example queries a graph at two different timestamps. It first inserts a new row into the university table that underlies the students_graph. It then queries versions of the graph before and after the insertion.

```
INSERT INTO university (name) VALUES ('u3');

SELECT COUNT(*)
FROM GRAPH_TABLE (
  students_graph
  MATCH (u IS university)
  COLUMNS (u.*)
);

SELECT COUNT(*)
FROM GRAPH_TABLE (
  students_graph AS OF TIMESTAMP (SYSTIMESTAMP - INTERVAL '2' MINUTE)
  MATCH (u IS university)
  COLUMNS (u.*)
);

DELETE FROM university WHERE name = 'u3';
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Result of first query:

```
  COUNT(*)
----------
         3
```

Result of second query:

```
  COUNT(*)
----------
         2
```

Note: this example assumes that the second `SELECT` query is run at least two minutes after the graph was created and within two minutes after running the `INSERT` statement, otherwise the output is different.

Graph Algorithm Functions

You can combine graph algorithm computation with graph queries using Graph Algorithm Functions (GAFs) with the `GRAPH_TABLE` operator.

GAFs are PL/SQL functions that take a graph as input and return a new graph as output. You can use this new graph as input to `GRAPH_TABLE` in the first argument.

A graph algorithm function computes one or more new properties on a given graph, but does not change its topology. Computed properties may be vertex or edge properties. These properties can then be accessed like any other property of the graph in the enclosing `GRAPH_TABLE` operator.

Example

```
SELECT *
FROM GRAPH_TABLE(
  dbms_oga.pagerank(
    students_graph,
    PROPERTY(VERTEX OUTPUT rank),
    100, 1e-6, 0.85d, TRUE
  )
  MATCH (p IS person)
  COLUMNS (
    p.name,
    p.rank
  )
)
ORDER BY rank DESC;
```

The output is:

```
NAME RANK
---------- ----------
Mary 1.493E-001
Bob 1.437E-001
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
John 1.305E-001
Alice 1.305E-001
```

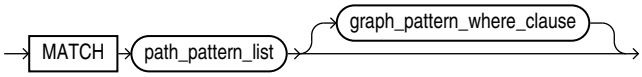
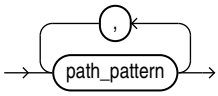
Graph Pattern

Purpose



A graph pattern consists of a set of vertex and edge patterns together with search conditions. A graph pattern is matched against a graph to obtain a set of solutions containing bindings for each vertex and edge variable in the pattern.

This topic has the following sub-topics:



- Path Pattern
- Element Pattern
- Quantified Path Pattern
- Parenthesized Path Pattern
- Graph Pattern WHERE Clause

Syntax

***graph_pattern*::=**

***path_pattern_list*::=**

Semantics

A graph pattern contains the following parts:

- `MATCH` keyword.
- *`path_pattern_list`*: a list containing one or more comma-separated path patterns.
- *`graph_pattern_where_clause`*: an optional `WHERE` clause defining a search condition that may reference vertices and edges from the pattern.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Two path patterns inside the same GRAPH_TABLE may share vertex and edge variables to allow for creating more complex, non-linear patterns. Variables may also be repeated within a single path pattern to create a cyclic pattern. If multiple vertex or edge patterns share a variable then all the label expressions and element pattern WHERE clauses in those patterns must satisfy for binding to the element variable to occur.

If there are no shared variables between two path patterns, then the solution set is a cross product of the solutions of the individual path patterns.

Restrictions

A vertex variable may not have the same name as an edge variable.

Examples

Example 1

The following query finds cyclic paths from Mary via two other persons back to Mary. Only incoming edges are matched (<-[..]-).

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (a IS person) <-[e1 IS friends]- (b IS person)
           <-[e2 IS friends]- (c IS person)
              <-[e3 is friends]- (a IS person)
  WHERE a.name= 'Mary'
  COLUMNS (a.name AS person_a, b.name AS person_b, c.name AS person_c)
);
```

Here, the graph pattern consists of a single path pattern that has four vertex patterns and three edge patterns. The first vertex pattern shares a variable a with the last vertex pattern so that the pattern matches cyclic paths.

Only a single path matches the pattern:

```
PERSON_A   PERSON_B   PERSON_C
---------- ---------- ----------
Mary       Bob        John
```

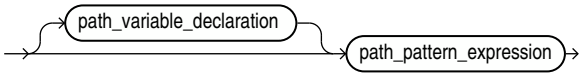
Here, the output shows that a path was matched that starts in Mary with an incoming edge to Bob, followed by an incoming edge to John, followed by an incoming edge back to Mary.

The same query may also be expressed by breaking up the single path pattern into multiple path patterns as follows:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (a IS person) <-[e1 IS friends]- (b IS person),
        (b) <-[e2 IS friends]- (c IS person),
        (c) <-[e3 is friends]- (a IS person)
  WHERE a.name= 'Mary'
  COLUMNS (a.name AS person_a, b.name AS person_b, c.name AS person_c)
);
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Here, the first path pattern shares variable `b` with the second path pattern, the second path pattern shares variable `c` with the third path pattern, and the third path pattern shares variable `a` with the first path pattern.



Path Pattern

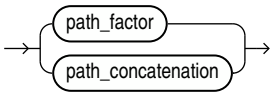
Purpose

A path pattern specifies a linear pattern that matches a string of vertices and edges. Path patterns are made up of the concatenation of one or more vertex and edge patterns. Vertex and edge patterns may be quantified as well as parenthesized.

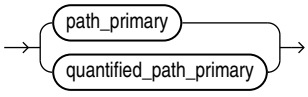
Syntax

***path_pattern*::=**

***path_variable_declaration*::=**



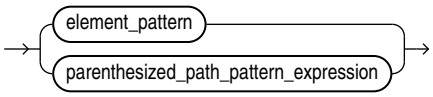
***path_variable*::=**



***path_pattern_expression*::=**

***path_term*::=**

***path_factor*::=**



Copyright © 1996, 2026, Oracle and/or its affiliates.

***path_concatenation*::=**

***path_primary*::=**

Semantics

Syntactically, a path pattern starts with an optional path variable declaration followed by one or more element patterns, which are either vertex patterns or edge patterns.

The element patterns of a path pattern are not required to alternate between vertex and edge patterns; there may be two consecutive edge patterns or two consecutive vertex patterns. These topologically inconsistent patterns are understood during pattern matching as follows:

- Two consecutive vertex patterns bind to the same vertex.
- Two consecutive edge patterns conceptually have an implicit vertex pattern between them.

Restrictions

Path patterns have the following restrictions:

- A path pattern may only contain two consecutive vertex patterns if one of the vertex patterns is contained in a parenthesized path pattern while the other one is not.
- A parenthesized path pattern must be quantified.
- Path variables cannot be multiply declared. This means that a path variable may not be declared with the same name as an element variable, an iterator variable, or another path variable.

Examples

Example 1

The following query counts the number of vertices in the graph:

```
SELECT COUNT(*)
FROM GRAPH_TABLE ( students_graph
  MATCH (v)
  COLUMNS (1 AS dummy)
);
```

Note that the `COLUMNS` clause needs to contain at least one expression, hence a dummy value is projected but it is not returned from the query.

The result is:

```
  COUNT(*)
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
----------
         6
```

Example 2

The following query counts the number of edges in the graph:

```
SELECT COUNT(*)
FROM GRAPH_TABLE ( students_graph
  MATCH -[e]->
  COLUMNS (1 AS dummy)
);
```

The result is:

```
  COUNT(*)
----------
         8
```

Example 3

The following query finds persons that are two friend hops away from `Mary`, following either incoming or outgoing friends edges:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (n IS person) -[IS friends]- () -[IS friends]- (m IS person)
  WHERE n.name = 'Mary' AND m.name <> n.name
  COLUMNS (m.name AS fof)
);
```

In the path pattern above:

- `(n IS person)` is a vertex pattern that has a variable `n` and a label expression `IS person`.
- `-[IS friends]-` is an any-directed edge pattern that has an implicit variable and a label expression `IS friends`.
- `()` is a vertex pattern that has an implicit variable and no label expression such that it matches vertices having any label(s).
- `-[IS friends]-` is again an any-directed edge pattern that has an implicit variable and a label expression `IS friends`.
- `(n IS person)` is a vertex pattern that has a variable `n` and a label expression `IS person`.

The result is:

```
FOF
----------
Bob
John
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Note that the query above can also be expressed as:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (n IS person) -[IS friends]- -[IS friends]- (m IS person)
  WHERE n.name = 'Mary' AND m.name <> n.name
  COLUMNS (m.name AS fof)
);
```

Here, the vertex pattern between the two edge patterns is implicit.

The same query can be expressed using a quantifier to avoid the repeated specification of the same edge pattern:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (n IS person) -[IS friends]-{2}(m IS person)
  WHERE n.name = 'Mary' AND m.name <> n.name
  COLUMNS (m.name AS fof)
);
```

Quantified path patterns may be parenthesized:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (n IS person) (-[IS friends]-){2}(m IS person)
  WHERE n.name = 'Mary' AND m.name <> n.name
  COLUMNS (m.name AS fof)
);
```

Note that each of the syntax variations above gives the same result:

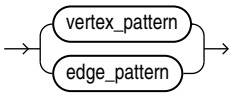
```
FOF
----------
Bob
John
```

Element Pattern

Purpose

An element pattern is either a vertex pattern or an edge pattern. The result of matching an element pattern is the binding of vertices or edges to the implicitly or explicitly declared variable of the element pattern.

This section comprises the following sections:



- Vertex Pattern
- Edge Pattern
- Element Pattern Filler

Copyright © 1996, 2026, Oracle and/or its affiliates.

- Element Variable
- Label Expression
- Element Pattern WHERE Clause

Syntax

***element_pattern*::=**

Vertex Pattern

Purpose

A vertex pattern is a pattern that matches vertices in a graph. The result of such matching is the binding of a set of vertices to the implicitly or explicitly declared variable of the vertex pattern.

Syntax

***vertex_pattern*::=**

Semantics

Visually, a vertex pattern has two parentheses ( ) to mimic a circle since vertices are typically represented by circles in visualizations of graphs.

Examples

Example 1

The following query counts the number of vertices in the graph:

```
SELECT COUNT(*)
FROM GRAPH_TABLE ( students_graph
  MATCH (v)
  COLUMNS (1 AS dummy)
);
```

Note that the `COLUMNS` clause needs to contain at least one expression, hence a dummy value is projected but it is not returned from the query.

The result is:

```
  COUNT(*)
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
----------
         6
```

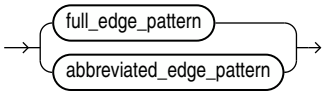
Example 2

The following query matches all persons with a date of birth greater than 1 January 1980:

```
SELECT name, birthday
FROM GRAPH_TABLE ( students_graph
  MATCH (p IS person WHERE p.dob > DATE '1980-01-01')
  COLUMNS (p.name, p.dob AS birthday)
)
ORDER BY birthday;
```

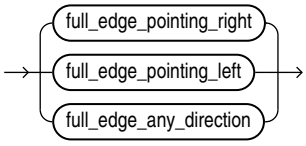
The result is:

```
NAME       BIRTHDAY
---------- ---------
Mary       9/25/1982, 12:00:00 AM
Alice      2/1/1987, 12:00:00 AM
```



Edge Pattern

Purpose



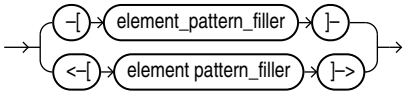
An edge pattern is a pattern that matches edges in a graph. The result of such matching is the binding of a set of edges to the implicitly or explicitly declared variable of the edge pattern.

Syntax

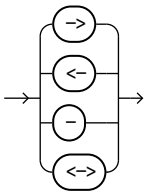
***edge_pattern*::=**

***full_edge_pattern*::=**

***full_edge_pointing_right*::=**



Copyright © 1996, 2026, Oracle and/or its affiliates.



***full_edge_pointing_left*::=**

***full_edge_any_direction*::=**

***abbreviated_edge_pattern*::=**

Semantics

Visually, an edge pattern mimics an arrow since edges are typically represented by arrows in visualizations of graphs. For example, <-[]- or <- are incoming edge patterns because they look like incoming arrows, while -[]-> or -> are outgoing edge patterns because they look like outgoing arrows.

An edge_pattern is either a full_edge_pattern or an abbreviated_edge_pattern. The full edge pattern has an element_pattern_filler with optional element pattern variable, label expression and element pattern WHERE clause, while the abbreviated edge pattern provides syntactic sugar in case none of the three optional filler parts are needed.

The following table summarizes the options:

Table 4-6 Summary of Edge Patterns

Directionality	Full Edge Pattern	Abbreviated Edge Pattern
Directed pointing to the right	-[ ] ->	->
Directed pointing to the left	<-[ ]-	<-
Any-Directed: pointing to the right or the left	-[ ]- or <-[ ]->	-

Note that since the abbreviated syntax does not allow for providing a variable name, a label expression, or an element pattern `WHERE` clause, abbreviated edge patterns match with all edges in the graph that have the specified direction.

Examples

Example 1

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following query counts the number of edges in the graph:

```
SELECT COUNT(*)
FROM GRAPH_TABLE ( students_graph
  MATCH ->
  COLUMNS (1 AS dummy)
);
```

The result is:

```
  COUNT(*)
----------
         8
```

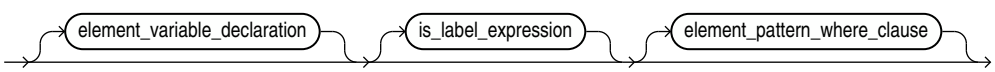
Example 2

The following query matches all `friends` edges that have a property `meeting_date` with a value greater than `DATE '2000-01-01'`:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH -[e IS friends WHERE e.meeting_date > DATE '2001-01-01']->
  COLUMNS (e.meeting_date)
);
```

The result is:

```
MEETING_DATE
----------------------
7/10/2001, 12:00:00 AM
```



Element Pattern Filler

Purpose

Vertex patterns and full edge patterns have a filler for providing an optional variable declaration, an optional label expression, and an optional `WHERE` clause.

Syntax

***element_pattern_filler*::=**

Semantics

Vertex patterns and full edge patterns and have a filler containing the following parts:

- An optional *`element_variable_declaration`* for providing a variable name for the element pattern so that the element can be referenced elsewhere, for example in `WHERE` and

Copyright © 1996, 2026, Oracle and/or its affiliates.

COLUMNS clauses. If no variable name is specified, a variable is implicit and cannot be referenced.

- An optional *is_label_expression* for defining a label expression. Vertices and edges only match if they satisfy the specified label expression.
- An optional *element_pattern_where_clause* for defining an in-lined search condition. Vertices and edges only match if they satisfy the specified search condition.

Examples

Example 1

The following query finds persons that are two friend hops away from Mary, following either incoming or outgoing friends edges:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (n IS person WHERE n.name = 'Mary')
          -[e IS friends WHERE e.meeting_date > DATE '2001-01-01']-
            () -[IS friends]- (m IS person)
  WHERE m.name <> n.name
  COLUMNS (m.name, e.meeting_date)
);
```

In the path pattern above:

- (n IS person WHERE n.name = 'Mary') is a vertex pattern that has a variable n, a label expression IS person and an element pattern WHERE clause WHERE n.name = 'Mary'.
- -[e IS friends WHERE e.meeting_date > DATE '2001-01-01']- is an any-directed edge pattern that has a variable e, a label expression IS friends and an element pattern WHERE clause WHERE e.meeting_date > DATE '2001-01-01'.
- () is a vertex pattern that has an implicit variable and neither has a label expression nor an element pattern WHERE clause.
- -[IS friends]- is an any-directed edge pattern that has an implicit variable, a label expression IS friends but no element pattern WHERE clause.
- (n IS person) is a vertex pattern that has a variable n, a label expression IS person but no element pattern WHERE clause.

The result is:

```
NAME       MEETING_DATE
---------- ---------------------
John       7/10/2001, 12:00:00 AM
```

Element Variable

Purpose

Element variables are either vertex or edge variables. During pattern matching, the variables will bind to sets of vertices or edges in the graph. Element variables can be referenced from other places in the query to access data of vertices and edges, such as their property values.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Syntax

***element_variable_declaration*::=**

***element_variable*::=**

Semantics

Syntactically, an *element_variable_declaration* is an identifier and can thus be either double quoted or unquoted. Declaring an element variable is optional and if no element variable is declared then the element pattern has an implicit variable with an (implicit) unique name. Implicit variables cannot be referenced elsewhere in the query.

Multiple vertex patterns may declare the same element variable and multiple edge patterns may also declare the same element variable. In such cases, there are not multiple variables but there is a single variable that is shared by the different vertex or edge patterns.

Declared variables are visible within the `GRAPH_TABLE` in which they are declared. They may be referenced in `WHERE` and `COLUMNS` clauses defined in the same `GRAPH_TABLE`.

If an element variable is declared in a quantified path pattern, then it may bind to more than one vertex or edge within a single solution to the pattern. References are interpreted contextually: if the reference occurs outside the quantified path pattern, then the reference is to the complete list of graph elements that are bound to the element variable. In this circumstance, the element variable is said to have group degree of reference. However, if the reference does not cross a quantifier, then the reference has singleton degree of reference.

For example, in `(X) -[E WHERE E.P > 1]->{1,10} (Y) WHERE SUM(E.P) < 100` the edge variable `E` is referenced twice: once in the edge pattern and once outside the edge pattern. Within the edge pattern, `E` has singleton degree of reference and the property reference `E.P` references a property of a single edge. On the other hand, the reference within the `SUM` aggregate has group degree of reference (because of the quantifier `{1,10}`) and references the list of edges that are bound to `E`.

Restrictions

- A vertex pattern may not declare a variable with the same name as an edge pattern.
- A quantified path pattern may not declare a variable with the same name as an element variable declared outside of the quantified path pattern.

Examples

Example 1

The following query finds friends of friends of John following incoming or outgoing edges that have a property `meeting_date` with a value greater than `DATE '2000-09-015'`:

```
SELECT DISTINCT name
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
FROM GRAPH_TABLE ( students_graph
  MATCH (a IS person) -[e IS friends WHERE e.meeting_date > DATE
'2000-09-15']-{2} ("b" IS person)
  WHERE a.name = 'John' AND a.name <> "b".name
  COLUMNS ("b".name)
);
```

In the query above, `a` and `"b"` are vertex variables, `e` is an edge variable and `e.meeting_date`, `a.name` and `"b".name` are property references that access a property value of the referenced vertex or edge.

The result shows that John has two such friends of friends:

```
NAME
----------
Alice
Bob
```

Example 2

The following query finds friends of Mary and the universities that Mary and her friends went to:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (p1 IS person) -[e1 IS friends]- (p2 IS person)
      , (p1) -[IS student_of]-> (u1 IS university)
      , (p2) -[IS student_of]-> (u2 IS university)
  WHERE p1.name = 'Mary'
  COLUMNS (p1.name, p2.name AS friend, e1.meeting_date, u1.name AS univ_1,
u2.name AS univ_2)
);
```

In the query above, `p1`, `p2`, `u1` and `u2` are vertex variables, while `e1` is an edge variable. The pattern `-[IS student_of]->` appears twice and implicitly declares two unique variables that cannot be referenced. Furthermore, there are two vertex patterns that share variable `p1` and there are two vertex patterns that share variable `p2`. Vertices will only bind to such variable if both vertex patterns match.

The result shows that Mary has three friends, one of which goes to the same university `XYZ`, while two other friends go to a different university `ABC`:

```
NAME       FRIEND     MEETING_D UNIV_1     UNIV_2
---------- ---------- --------- ---------- ----------
Mary       John       19-SEP-00 XYZ        ABC
Mary       Bob        10-JUL-01 XYZ        ABC
Mary       Alice      19-SEP-00 XYZ        XYZ
```

Example 3

The following query finds all paths that have a length between 2 and 5 edges (`{2,5}`), starting from a person named Alice and following both incoming and outgoing edges labeled `friends`. Edges along paths should not be traversed twice (`COUNT(e.friendship_id) = COUNT(DISTINCT`

Copyright © 1996, 2026, Oracle and/or its affiliates.

e.friendship_id)). The query returns all friendship IDs along paths as well as the length of each path.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (p IS person) -[e IS friends]-{2,5} (friend IS person)
       WHERE p.name = 'Alice' AND
             COUNT(e.friendship_id) = COUNT(DISTINCT e.friendship_id)
       COLUMNS (LISTAGG(e.friendship_id, ', ') AS friendship_ids,
                COUNT(e.friendship_id) AS path_length));
```

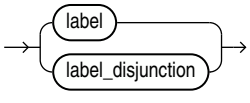
Note that in the element pattern `WHERE` clause of the query above, `p.name` references a property of a single edge, while `e.friendship_id` within the `COUNT` aggregate accesses a list of property values since the edge variable `e` is enclosed by the quantifier `{2,5}`. Similarly, the two property references in the `COLUMNS` clause both access a list of property values.

The result is:

```
FRIENDSHIP_IDS    PATH_LENGTH
----------------- -----------
2, 3              2
2, 4              2
2, 3, 1           3
2, 4, 1           3
2, 3, 1, 4        4
2, 4, 1, 3        4
```

Label Expression

Purpose



Label expressions are used to limit the search to only vertices or edges of a specific type.

Syntax

***is_label_declaration*::=**

***label_expression*::=**

***label_disjunction*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

***label*::=**

Semantics

Syntactically, an `is_label_declaration` starts with the keyword `IS` followed by a `label_expression`, which is either a `label` or a `label_disjunction` denoted by a vertical bar |. A label itself is an identifier and can thus be double quoted or unquoted.

An element pattern matches only vertices and edges that satisfy the label expression. If the label expression is omitted, then all vertices and edges are matched irrespective of their labels.

Examples

Example 1

The following query matches all vertices labeled person or university and retrieves their name and date of birth properties:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (x IS person|university)
  COLUMNS (x.name, x.dob)
)
ORDER BY name;
```

The result is:

```
NAME       DOB
---------- ---------
ABC
Alice      01-FEB-87
Bob        11-MAR-66
John       13-JUN-63
Mary       25-SEP-82
XYZ
```

Above, since universities do not have a date of birth, a null value is returned and shows up as empty string in the `DOB` column.

Example 2

The following query matches outgoing edges labeled `student_of` or `friends` from a person named Mary to a vertex `m` that is labeled `university` or `"PERSON"`:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (n IS person) -[e IS student_of|friends]-> (m IS university|"PERSON")
  WHERE n.name = 'Mary'
  COLUMNS (e.subject, e.meeting_date, m.name)
)
ORDER BY subject, meeting_date, name;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

The result is:

```
SUBJECT    MEETING_D NAME
---------- --------- ----------
Math                 XYZ
           19-SEP-00 Alice
           19-SEP-00 John
```

Element Pattern WHERE Clause

Purpose

The element pattern `WHERE` clause specifies a search condition that is syntactically placed inside a vertex or an edge pattern and that needs to be satisfied by the vertex or edge for the pattern to match.

Syntax

***element_pattern_where_clause*::=**

Semantics

Syntactically, the *`element_pattern_where_clause`* starts with the keyword `WHERE` and is followed by a *`search_condition`*, which is an arbitrary boolean value expression.

The element pattern `WHERE` clause may reference any graph element variable in the graph pattern. If the variable has group degree of reference, then the reference must be inside the arguments of an aggregate function. See Aggregation in GRAPH_TABLE. There is no requirement that the search condition must reference the variable of the element pattern itself, but for improved query readability it is generally recommended that it always does such that any search condition that does not reference the element variable is placed in the graph pattern `WHERE` clause instead.

Examples

Example 1

The following query finds all friends of John whom he met after `15 September 2000`:

```
SELECT Gt.name
FROM GRAPH_TABLE ( students_graph
  MATCH (a IS person WHERE a.name = 'John')
          -[e IS friends WHERE e.meeting_date > DATE '2000-09-15']-
            (b IS person)
  COLUMNS (b.name)
) GT;
```

The example above contains two element pattern `WHERE` clauses:

- `WHERE a.name = 'John'`
- `WHERE e.meeting_date > DATE '2000-09-15'.`

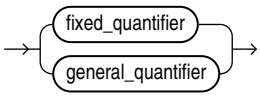
Copyright © 1996, 2026, Oracle and/or its affiliates.

The result is:

```
NAME
----------
Mary
```

Quantified Path Pattern

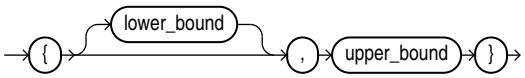
Purpose



Quantified path patterns allow for repeated matching of a path pattern, typically for the purpose of matching variable-length paths. The specified quantifier determines a minimum and maximum for the number of times to match the path pattern.

Syntax

***quantified_path_primary*::=**



***graph_pattern_quantifier*::=**

***fixed_quantifier*::=**

***general_quantifier*::=**

***lower_bound*::=**

***upper_bound*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

Semantics

A *quantified_path_primary* is a path_primary together with a quantifier. Here, the path primary must be either an edge pattern or a parenthesized path pattern.

A graph_pattern_quantifier is either:

- A *fixed_quantifier*, which is an unsigned integer placed between curly braces. The integer value specifies an exact number of times the pattern should be matched. In other words, the lower bound on the number of times to match the pattern is the same as the upper bound.
- A *general_quantifier*, which has an optional *lower_bound*, a comma (,) and a mandatory *upper_bound*, all of which are placed between curly braces. Lower and upper bound are unsigned integers and specify a minimum and a maximum number of times to match the path pattern. If no lower bound is specified, then the lower bound is zero (0).

The following table summarizes the options:

Table 4-7 Quantifier Table

Quantifier	Meaning
`{ n }`	Exactly `n`
`{ n, m }`	Between `n` and `m` (inclusive)
`{ , m }`	Between zero (0) and `m` (inclusive)

Restrictions

The following restrictions apply to quantified path patterns:

- The path primary that is quantified must be either an edge pattern or a parenthesized path pattern. For example, vertex patterns cannot be quantified unless they appear together with at least one edge pattern inside a parenthesized path pattern.
- The lower bound should be 0 or greater, while the upper bound should be 1 or greater and should also be greater than or equal to the lower bound.
- Nested quantifiers are not allowed.

Examples

Example 1

The following query finds friends of friends of John following incoming or outgoing edges that have a property `meeting_date` with a value greater than `DATE '2000-09-15'`:

```
SELECT DISTINCT name
FROM GRAPH_TABLE ( students_graph
  MATCH (a IS person)
          -[e IS friends WHERE e.meeting_date > DATE '2000-09-15']-{2}
            (b IS person)
  WHERE a.name = 'John' AND a.name <> b.name
  COLUMNS (b.name)
);
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

In the query above, the path pattern `-[e IS friends WHERE e.meeting_date > DATE '2000-09-15']-` is quantified with the fixed quantifier `{2}` to indicate that the edge pattern should match exactly twice.

The result is:

```
NAME
----------
Bob
Alice
```

The same query may be written using a parenthesized path pattern too. The following are all syntactic alternatives, the latter two use a parenthesized path pattern:

- `-[e IS friends WHERE e.meeting_date > DATE '2000-09-15']-{2}`
- `(-[e IS friends WHERE e.meeting_date > DATE '2000-09-15']-){2}`
- `(-[e IS friends]- WHERE e.meeting_date > DATE '2000-09-15'){2}`

Example 2

The following query finds persons that can be reached from Mary within three hops, following only persons that are taller than Mary.

```
SELECT DISTINCT name, height
FROM GRAPH_TABLE ( students_graph
  MATCH (a IS person|person_ht)
           (-[e IS friends]- (x IS person_ht) WHERE x.height > a.height) {,3}
             (b IS person|person_ht)
  WHERE a.name = 'Mary'
  COLUMNS (b.name, b.height)
)
ORDER BY height;
```

The result is:

```
NAME           HEIGHT
---------- ----------
Mary             1.65
Alice             1.7
Bob              1.75
John              1.8
```

Note that the reason Mary is included in the result is because the specified quantifier `{,3}` has a lower bound of zero such that the quantified pattern is allowed to match zero times in which case variables `a` and `b` bind to the same vertex corresponding to Mary.

Example 3

The following query finds all paths between university `ABC` and university `XYZ` such that paths have a length of up to 3 edges (`{,3}`). For each path, a JSON array is returned such that the array contains the `friendship_id` value for edges labeled `friends`, and the subject value for

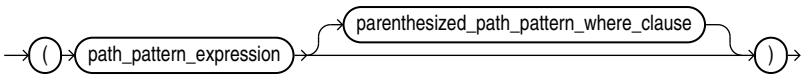
Copyright © 1996, 2026, Oracle and/or its affiliates.

edges labeled `student_of`. Note that the `friendship_id` property is cast to `VARCHAR(100)` to make it type-compatible with the subject property.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (u1 IS university) -[e]-{,3} (u2 IS university)
       WHERE u1.name = 'ABC' AND u2.name = 'XYZ'
       COLUMNS (JSON_ARRAYAGG(CASE WHEN e.subject IS NOT NULL THEN e.subject
                                   ELSE CAST(e.friendship_id AS VARCHAR(100)) END)
AS path));
```

The result is:

```
PATH
----------------------
["Arts","3","Math"]
["Music","4","Math"]
```



Parenthesized Path Pattern

Purpose

Parenthesized path patterns allow for defining more complex quantified path pattern expressions.

Syntax

***parenthesized_path_pattern_expression*::=**

***parenthesized_path_pattern_where_clause*::=**

Semantics

A *`parenthesized_path_pattern_expression`* is a *`path_pattern_expression`* together with an optional *`parenthesized_path_pattern_where_clause`*, placed in between parentheses.

Parenthesized path patterns allow for the quantification of any path pattern expression that contains at least one edge pattern. Without parentheses, only a single edge pattern can be quantified.

The parenthesized path pattern `WHERE` clause may reference vertex and edge variables declared in the parenthesized path pattern itself as well as vertex and edge variables declared outside of the parenthesized path pattern. If the variable has group degree of reference, then the reference must be inside the arguments of an aggregate function. See Aggregation in GRAPH_TABLE.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Restrictions

The following restrictions apply to parenthesized path pattern expressions:

- Each parenthesized path pattern needs to be quantified.
- There can only be a single level of parentheses. Nesting of parenthesized path patterns is not allowed.

Examples

Example 1

The following query finds persons that can be reached from Bob within one to three hops ({1,3}) such that for each consecutive pair of persons along the path, the first person has a date of birth that is smaller than the date of birth of the second person.

```
SELECT DISTINCT name, birthday
FROM GRAPH_TABLE ( students_graph
  MATCH
   (a IS person)
     ( (x) -[e IS friends]- (y IS person)
       WHERE x.dob < y.dob ){1,3}
         (b IS person)
  WHERE a.name = 'Bob'
  COLUMNS (b.name, b.dob AS birthday)
)
ORDER BY birthday;
```

The result is:

```
NAME       BIRTHDAY
---------- ---------
Mary       25-SEP-82
Alice      01-FEB-87
```

Example 2

The following query finds all paths that have a length between 2 and 3 edges ({2,3}), starting from a person named John and following only outgoing edges labeled friends and vertices labeled person. Vertices along paths should not have the same person_id as John (WHERE p.person_id <> friend.person_id).

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (p IS person) ( -[e IS friends]-> (friend IS person)
                             WHERE p.person_id <> friend.person_id){2,3}
       WHERE p.name = 'John'
       COLUMNS (COUNT(e.friendship_id) AS path_length,
                LISTAGG(friend.name, ', ') AS names,
                LISTAGG(e.meeting_date, ', ') AS meeting_dates ));
```

Above, the `COLUMNS` clause contains three aggregates, the first to compute the length of each path, the second to create a comma-separated list of person names along paths, and the third to create a comma-separate list of meeting dates along paths.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The result of the query is:

```
PATH_LENGTH NAMES
MEETING_DATES
----------- ------------------
-----------------------------------
          2 Bob, Mary           01-SEP-00, 10-
JUL-01
          3 Bob, Mary, Alice    01-SEP-00, 10-JUL-01, 19-SEP-00
```

Graph Pattern WHERE Clause

Purpose

The graph pattern `WHERE` clause specifies a search condition that is syntactically placed at the end of the graph pattern and that needs to be satisfied by the complete graph pattern in order for the graph pattern to match.

Syntax

***graph_pattern_where_clause*::=**

Semantics

Syntactically, the graph pattern `WHERE` clause starts with the keyword `WHERE` and is followed by a *`search_condition`*, which is an arbitrary boolean value expression.

The graph pattern `WHERE` clause may reference any element variables in the graph pattern. If the variable has group degree of reference, then the reference must be inside the arguments of an aggregate function. See Aggregation in GRAPH_TABLE .

Examples

Example 1

The following query finds all friends of John whom he met after 15 September 2000:

```
SELECT Gt.name
FROM GRAPH_TABLE ( students_graph
  MATCH (a IS person) -[e IS friends]- (b IS person)
  WHERE a.name = 'John' AND e.meeting_date > DATE '2000-09-15'
  COLUMNS (b.name)
) GT;
```

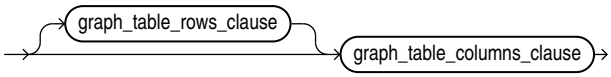
Note that the two conditions are placed together in the graph pattern `WHERE` clause to form a single search that needs to be satisfied by the pattern: `WHERE a.name = 'John' AND e.meeting_date > DATE '2000-09-15'`.

The result is:

```
NAME
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
----------
Mary
```



Graph Table Shape

Purpose

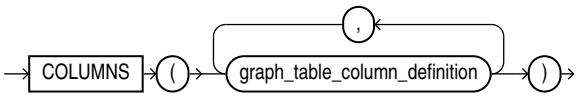
A graph table shape defines how the result of pattern matching should be transformed into tabular form. This is done through the *graph_table_rows_clause* and *graph_table_columns_clause* clauses.

Syntax

***graph_table_shape*::=**

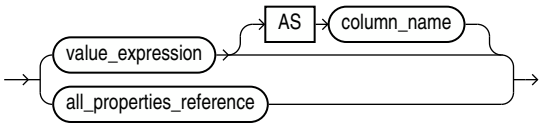
COLUMNS Clause

Rows Clause



COLUMNS Clause

Purpose



The `COLUMNS` clause allows for defining a projection that transforms the result of graph pattern matching into a regular table that no longer contains graph objects like vertices and edges but instead regular data values only.

Syntax

***graph_table_columns_clause*::=**

***graph_table_column_definition*::=**

***all_properties_reference*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

***element_reference*::=**

Semantics

Syntactically, the `COLUMNS` clause starts with the keyword `COLUMNS` and is followed by an opening parenthesis, a comma-separated list of one or more *`graph_table_column_definition`* and a closing parenthesis.

A *`graph_table_column_definition`* defines either:

- A single output column via an arbitrary value expression. The value expression may contain references to vertices and edges in the graph pattern, for example to access property values of vertices and edges. An optional alias, `AS` *`column_name`* provides a name for the column. The alias can only be omitted if the value expression is a property reference, in which case the alias defaults to the property name.
- An *`all_properties_reference`* that expands to the set of all valid properties based on the element type (vertex or edge) and any label expression specified for the element. The set of properties is the union of properties of the vertex (or edge) labels belonging to tables that have at least one label that satisfies the label expression. In case some of these matching tables define a property while other tables do not, then NULL values will be returned for those tables that do not define the property.

An optional alias, `AS` *`column_name`* provides a name for the column. The alias can only be omitted if the value expression is a property reference, in which case the alias defaults to the property name.

Examples

Example 1

The following example returns the name of each person as well as the height in feet by multiplying the height in meters by 3.281:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (n IS person|person_ht)
  COLUMNS (n.name, n.height * 3.281 AS height_in_feet)
)
ORDER BY name;
```

In the query above, the `COLUMNS` clause defines two columns. Note that `n.name` is short for `n.name AS name`.

The result is:

```
NAME       HEIGHT_IN_FEET
---------- --------------
Alice    5.578
Bob      5.742
John     5.906
Mary     5.414
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Example 2

The following query matches all FRIENDS edges between two persons P1 and P2 and uses all properties references P1.* and E.* to retrieve all the properties of vertex P1 as well as all properties of edge E:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (p1 IS person) -[e IS friends]-> (p2 IS person)
  COLUMNS ( p1.*, p2.name AS p2_name, e.* )
)
ORDER BY 1, 2, 3, 4, 5;
```

The result is:

```
PERSON_ID NAME DOB       HEIGHT P2_NAME FRIENDSHIP_ID MEETING_D
--------- ---- --------- ------ ------- ------------- ---------
        1 John 13-JUN-63   1.8   Bob               1 01-SEP-00
        2 Mary 25-SEP-82   1.65  Alice             2 19-SEP-00
        2 Mary 25-SEP-82   1.65  John              3 19-SEP-00
        3 Bob  11-MAR-66   1.75  Mary              4 10-JUL-01
```

Note that the result for P1.* includes properties PERSON_ID, NAME and DOB of label PERSON as well as property HEIGHT of label PERSON_HT. Furthermore, the result for E.* includes properties FRIENDSHIP_ID and MEETING_DATE of label FRIENDS.

Example 3

The following query matches all vertices in the graph and retrieves all their properties:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (v)
  COLUMNS ( v.* )
)
ORDER BY 1, 2, 3, 4, 5;
```

The result is:

```
 PERSON_ID NAME       DOB       HEIGHT     ID
---------- ---------- --------- ---------- ----------
         1 John       13-JUN-63        1.8
         2 Mary       25-SEP-82       1.65
         3 Bob        11-MAR-66       1.75
         4 Alice      01-FEB-87        1.7
           ABC                                      1
           XYZ                                      2
```

Note that since PERSON vertices do not have an ID property, NULL values (empty strings) are returned. Similarly, UNIVERSITY vertices do not have PERSON_ID, DOB and HEIGHT properties so again NULL values (empty strings) are returned.

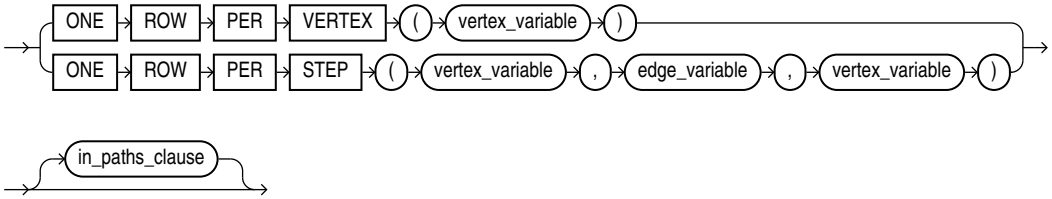
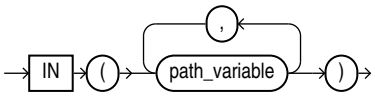
Rows Clause

Purpose



The GRAPH_TABLE rows clause is used to specify how many rows should be returned from GRAPH_TABLE, based on the number of matches to the graph pattern or the number of vertices or steps in such matches.

Syntax



***graph_table_rows_clause*::=**

***one_row_per_iteration*::=**

***in_paths_clause*::=**

graph_table_rows_clause

- ONE ROW PER MATCH, the default, specifies that one row is returned per match to the graph pattern.
- *one_row_per_iteration* declares one or more iterator variables and returns one row per iteration. In particular:
  - ONE ROW PER VERTEX declares a single iterator vertex variable. It iterates through the vertices in paths and binds the iterator variable to different vertices in different iterations. For each path, it creates as many rows as there are vertices in the path. For example, if a pattern matches two paths, one with 3 vertices and another with 5 vertices, then a total of 8 rows are returned.
  - ONE ROW PER STEP declares an iterator vertex variable, an iterator edge variable, and another iterator vertex variable. It iterates through the steps of the different paths. A step is a vertex-edge-vertex triple. If a path is non-empty and thus contains at least one edge and two vertices, then there are as many steps as there are edges and each iteration binds the iterator variables to the next edge and its source and destination in the path. However, if a path is empty and consists of a single vertex only, then the path

Copyright © 1996, 2026, Oracle and/or its affiliates.

has a single step and the first iterator vertex variable binds to that vertex, while the iterator edge variable and the second iterator vertex variable are not bound to any graph element.

- An optional `IN` paths clause specifies one or more path variables referencing the paths that should be iterated through. If no `IN` paths clause is specified then all paths are iterated through.

When an *`all_properties_reference`* contains a reference to an iterator variable, then depending on the type of the iterator variable, it expands to either all vertex properties or to all edge properties in the graph. Note that label expressions for elements in the graph pattern are not considered when expanding the properties of an iterator variable.

See *all_properties_reference*::= of `COLUMNS`.

Restrictions

The *`graph_table_rows_clause`* clause is subject to the following restrictions:

- Iterator element variables cannot be multiply declared. This means that an iterator variable may not be declared with the same name as a path variable or an element variable declared in the graph pattern, or as another iterator variable.
- Iterator variables may only be referenced in the `COLUMNS` clause but not in the graph pattern or in the graph pattern `WHERE` clause.
- The *`in_paths_clause`* may reference a path variable at most once.
- If the *`in_paths_clause`* is omitted, then either a single path pattern must be specified, or all the path patterns must have a path variable declaration.

Examples

Example 1

The following query finds all friends path with length between 0 and 3 starting from a person named John. It outputs one row per vertex.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (n IS person) -[e1 IS friends]->{0,3} (IS person)
       WHERE n.name = 'John'
       ONE ROW PER VERTEX (v)
       COLUMNS (
        LISTAGG(e1.friendship_id, ', ') AS friendship_ids,
        v.name)
     );
```

The results are:

```
FRIENDSHIP_IDS       NAME
-------------------- ---------------
                     John
1                    John
1                    Bob
1, 4                 John
1, 4                 Bob
1, 4                 Mary
1, 4, 3              John
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
1, 4, 3             Bob
1, 4, 3             Mary
1, 4, 3             John
1, 4, 2             John
1, 4, 2             Bob
1, 4, 2             Mary
1, 4, 2             Alice
```

The results above show data from five paths that were matched:

- The empty path (zero *friendship_ids*) contains a single person named John.
- The path with *friendship_ids* 1 contains two persons named John and Bob.
- The path with *friendship_ids* 1, 4 contains three persons named John, Bob and Mary.
- The path with *friendship_ids* 1, 4, 3 contains four persons named John, Bob, Mary and John (this is a cycle).
- The path with *friendship_ids* 1, 4, 2 contains four persons named John, Bob, Mary and Alice.

Example 2

The following query again finds all friends path with length between 0 and 3 starting from a person named John. This time it outputs one row per step.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (n IS person) -[e1 IS friends]->{0,3} (IS person)
       WHERE n.name = 'John'
       ONE ROW PER STEP (src, e2, dst)
       COLUMNS (
         LISTAGG(e1.friendship_id, ', ') AS friendship_ids,
         src.name AS src_name,
         e2.friendship_id,
         dst.name AS dst_name)
     );
```

The results are:

```
FRIENDSHIP_IDS       SRC_NAME   FRIENDSHIP_ID DST_NAME
-------------------- ---------- ------------- ----------
                     John
1                    John       1             Bob
1, 4                 John       1             Bob
1, 4                 Bob        4             Mary
1, 4, 3              John       1             Bob
1, 4, 3              Bob        4             Mary
1, 4, 3              Mary       3             John
1, 4, 2              John       1             Bob
1, 4, 2              Bob        4             Mary
1, 4, 2              Mary       2             Alice
```

The results above show data from five paths that were matched:

- The empty path (no *friendship_ids*) has a single step in which iterator vertex variable `src` is bound to the vertex corresponding to the person named John, while iterator edge

Copyright © 1996, 2026, Oracle and/or its affiliates.

variable e2 and iterator vertex variable dst are not bound, resulting in NULL values for FRIENDSHIP_ID and DST_NAME.

- The path with *friendship_ids* 1 has a single step since it has a single edge. In this step, iterator vertex variable src is bound to the vertex corresponding to John, iterator edge variable e2 is bound to the edge with *friendship_ids* 1, and iterator vertex variable dst is bound to the vertex corresponding to Bob.
- The path with *friendship_ids* 1, 4 has two steps since it has two edges.
- The path with *friendship_ids* 1, 4, 3 has three steps since it has three edges.
- The path with *friendship_ids* 1, 4, 2 again has three steps since it has three edges.

Example 3

The following query matches paths between universities ABC and XYZ such that paths consist of an incoming student_of edge, followed by one or two friends edges, followed by an outgoing student_of edge. The query returns one row per vertex and for each row it returns the match number, the element number, the type of the vertex (either person or university), as well as the name of the university or the person.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (u1 IS university)
              <-[IS student_of]- (p1 IS person)
              -[IS friends]-{1,2} (p2 IS person)
              -[IS student_of]-> (u2 IS university)
       WHERE u1.name = 'ABC' AND u2.name = 'XYZ'
       ONE ROW PER VERTEX (v)
       COLUMNS (MATCHNUM() AS matchnum,
                ELEMENT_NUMBER(v) AS element_number,
                CASE WHEN v.person_id IS NOT NULL
                  THEN 'person'
                  ELSE 'university'
                  END AS label,
                v.name))
ORDER BY matchnum, element_number;
```

The results are:

```
MATCHNUM ELEMENT_NUMBER        LABEL       NAME
---------- -------------- ---------- ----------
         1              1 university         ABC
         1              3 person             John
         1              5 person             Mary
         1              7 university         XYZ
         2              1 university         ABC
         2              3 person             Bob
         2              5 person             John
         2              7 person             Mary
         2              9 university         XYZ
         3              1 university         ABC
         3              3 person             Bob
         3              5 person             Mary
         3              7 university         XYZ
         4              1 university         ABC
         4              3 person             John
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
         4             5 person            Mary
         4             7 person            Alice
         4             9 university        XYZ
         6             1 university        ABC
         6             3 person            John
         6             5 person            Bob
         6             7 person            Mary
         6             9 university        XYZ
         8             1 university        ABC
         8             3 person            Bob
         8             5 person            Mary
         8             7 person            Alice
         8             9 university        XYZ
```

Note that a total of 6 paths were matched with match numbers 1, 2, 3, 4, 6 and 8. Each path has university ABC as the first vertex and university XYZ as the last vertex. Furthermore, paths with match numbers 1 and 3 contain two person vertices while the other paths (match numbers 2, 4, 6 and 8) contain three person vertices.

Example 4

Like in Example 3, the following query matches paths between universities ABC and XYZ. In Example 4, the graph pattern is split into three path patterns. The first path pattern matches an incoming student_of edge, the second path pattern matches one or two friends' edges, and the third path pattern matches again a student_of edge. The query returns one row per vertex in the second path. This path contains only person vertices. For each vertex, the query returns the match number, the path name, the element number, and all the vertex properties.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH path1 = (u1 IS university) <-[IS student_of]- (p1 IS person),
             path2 = (p1) -[IS friends]-{1,2} (p2 IS person),
             path3 = (p2) -[IS student_of]-> (u2 IS university)
       WHERE u1.name = 'ABC' AND u2.name = 'XYZ'
       ONE ROW PER VERTEX (v) IN (path2)
       COLUMNS (MATCHNUM() AS matchnum,
                PATH_NAME() AS path_name,
                ELEMENT_NUMBER(v) AS element_number,
                v.*))
ORDER BY matchnum, element_number;
The results are:
MATCHNUM PATH_NAME ELEMENT_NUMBER PERSON_ID NAME  DOB       HEIGHT    ID
-------- --------- -------------- --------- ----- --------- --------- --
       1 PATH2                  1         1 John  13-JUN-63       1.8
       1 PATH2                  3         2 Mary  25-SEP-82      1.65
       2 PATH2                  1         3 Bob   11-MAR-66      1.75
       2 PATH2                  3         1 John  13-JUN-63       1.8
       2 PATH2                  5         2 Mary  25-SEP-82      1.65
       3 PATH2                  1         3 Bob   11-MAR-66      1.75
       3 PATH2                  3         2 Mary  25-SEP-82      1.65
       4 PATH2                  1         1 John  13-JUN-63       1.8
       4 PATH2                  3         2 Mary  25-SEP-82      1.65
       4 PATH2                  5         4 Alice 01-FEB-87       1.7
       6 PATH2                  1         1 John  13-JUN-63       1.8
       6 PATH2                  3         3 Bob   11-MAR-66      1.75
       6 PATH2                  5         2 Mary  25-SEP-82      1.65
       8 PATH2                  1         3 Bob   11-MAR-66      1.75
       8 PATH2                  3         2 Mary  25-SEP-82      1.65
       8 PATH2                  5         4 Alice 01-FEB-87       1.7
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Like in Example 3, a total of 6 paths were matched with match numbers 1, 2, 3, 4, 6 and 8. Paths with match numbers 1 and 3 contain two person vertices while the other paths (match numbers 2, 4, 6 and 8) contain three person vertices. The all properties reference v.* expands to properties PERSON_ID, NAME, DOB, HEIGHT and ID. Thus, even though person vertices do not have property ID (only university vertices do), the expansion still includes property ID because an all properties reference with an iterator variable always expands to either all vertex properties or all edge properties in the graph based on the iterator variable type.

Value Expressions for GRAPH_TABLE

Purpose

Value expressions in WHERE and COLUMNS clauses inside GRAPH_TABLE inherit all the functionality supported in value expressions outside of GRAPH_TABLE. Additionally, inside GRAPH_TABLE, the following value expressions are available:

- Property Reference
- Vertex and Edge ID Functions
- Vertex and Edge Equal Predicates
- SOURCE and DESTINATION Predicates
- Aggregation in GRAPH_TABLE
- JSON Object Access Expressions for Property Graphs

Property Reference

Purpose

Property references allow for accessing property values of vertices and edges.

Syntax

***property_reference*::=**

***property_name*::=**

Semantics

Syntactically, a property access is an element variable followed by a dot (.) and the name of the property. A property name is an identifier and may thus be either double quoted or unquoted.

The label expression specified for an element pattern determines which properties can be referenced:

- If no label expression is specified, then depending on the type of element variable, either all vertex properties or all edge properties in the graph can be referenced.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- Otherwise, if a label expression is specified, then the set of properties that can be referenced is the union of the properties of labels belonging to vertex (or edge) tables that have at least one label that satisfies the label expression.

If multiple labels satisfy the label expression but they define the same property but of a different data type, then such properties may only be referenced if the data types are union compatible. The resulting value will then have the union compatible data type.

If multiple labels satisfy the label expression while some labels have a particular property that other labels do not, then such properties can still be referenced. The property reference will result in null values for any vertex or edge that does not have the property.

Furthermore, if the element variable is not bound to a graph element, then the result is the null value. Note that the only way an element variable is optionally bound is when the element variable is an iterator variable declared in `ONE ROW PER STEP`. Specifically, the edge variable and the second vertex variable declared in `ONE ROW PER STEP` will not be bound to a graph element when the path pattern matches an empty path, for example because a quantifier iterated zero times.

Examples

Example 1

The following query lists the date of birth of all persons and universities in the graph:

```
SELECT GT.name, GT.birthday
FROM GRAPH_TABLE ( students_graph
  MATCH (p IS person|university)
  COLUMNS (p.name, p.dob AS birthday)
) GT
ORDER BY GT.birthday, GT.name;
```

Note that since only persons `John`, `Bob`, `Mary`, `Alice` have dates of birth while universities (`ABC` and `XYZ`) do not, null values are returned for universities. These appear as empty strings in the output:

```
NAME       BIRTHDAY
---------- ---------
John       13-JUN-63
Bob        11-MAR-66
Mary       25-SEP-82
Alice      01-FEB-87
ABC
XYZ
```

Example 2

The following query matches all `PERSON` vertices and returns their `NAME` and `HEIGHT`:

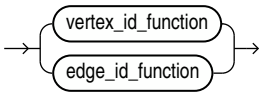
```
SELECT *
FROM GRAPH_TABLE ( students_graph
  MATCH (n IS person)
  COLUMNS ( n.name, n.height )
)
ORDER BY height;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

The result is:

```
NAME       HEIGHT
---------- -------
Mary          1.65
Alice         1.7
Bob           1.75
John          1.8
```

Here, even though label `PERSON` does not have property `HEIGHT`, the property can still be referenced because vertex table `PERSONS` has labels `PERSON` and `PERSON_HT` and since label `PERSON` matches the label expression, the set of properties that can be referenced is the union of the properties of labels `PERSON` and `PERSON_HT`, which includes the property `HEIGHT` of label `PERSON_HT`.



Vertex and Edge ID Functions

Purpose

Vertex and edge ID functions allow for obtaining unique identifiers for graph elements.

Syntax

***element_id_function*::=**

***vertex_id_function*::=**

***edge_id_function*::=**

***element_reference*::=**

Semantics

Syntactically, the `VERTEX_ID` and `EDGE_ID` functions take an element reference, which should be a vertex reference in case of `VERTEX_ID` and an edge reference in case of `EDGE_ID`. The two functions generate identifiers for graph elements that are globally unique within a database.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Content-wise, vertex and edge identifiers are JSON object that contains the following information:

- Owner of the graph that the vertex or edge is part of.
- Name of the graph that the vertex or edge is part of.
- Element table that the vertex or edge is defined in.
- Key value of the vertex or edge.

If the referenced element variable is not bound to a graph element, then the functions return the null value.

Examples

Example 1

The following query lists the vertex identifiers of friends of Mary:

```
SELECT CAST(p2_id AS VARCHAR2(200)) AS p2_id
FROM GRAPH_TABLE ( students_graph
  MATCH (p1 IS person) -[e1 IS friends]- (p2 IS person)
  WHERE p1.name = 'Mary'
  COLUMNS (vertex_id(p2) AS p2_id)
)
ORDER BY p2_id;
```

The result is:

```
P2_ID
--------------------------------------------------------------------------------
--------------
{"GRAPH_OWNER":"SCOTT","GRAPH_NAME":"STUDENTS_GRAPH","ELEM_TABLE":"PERSONS","KEY_VALUE":
{"PERSON_ID":1}}
{"GRAPH_OWNER":"SCOTT","GRAPH_NAME":"STUDENTS_GRAPH","ELEM_TABLE":"PERSONS","KEY_VALUE":
{"PERSON_ID":3}}
{"GRAPH_OWNER":"SCOTT","GRAPH_NAME":"STUDENTS_GRAPH","ELEM_TABLE":"PERSONS","KEY_VALUE":
{"PERSON_ID":4}}
```

Example 2

The following query uses JSON dot-notation syntax to obtain a set of JSON objects representing the vertex keys of vertices corresponding to friends of Mary:

```
SELECT GT.p2_id.KEY_VALUE
FROM GRAPH_TABLE ( students_graph
  MATCH (p1 IS person) -[e1 IS friends]- (p2 IS person)
  WHERE p1.name = 'Mary'
  COLUMNS (vertex_id(p2) AS p2_id)
) GT
ORDER BY key_value;
```

The result is:

```
KEY_VALUE
----------------------------------------
{"PERSON_ID":1}
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
{"PERSON_ID":3}
{"PERSON_ID":4}
```

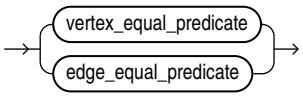
Example 3

The following query uses the `JSON_VALUE` function to obtain all the element table names of edges in the graph:

```
SELECT DISTINCT json_value(e_id, '$.ELEM_TABLE') AS elem_table
FROM GRAPH_TABLE ( students_graph
  MATCH -[e]-
  COLUMNS (edge_id(e) AS e_id)
)
ORDER BY elem_table;
```

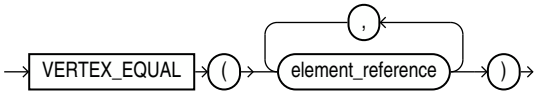
The result is:

```
ELEM_TABLE
--------------------------------------
FRIENDS
STUDENT_OF
```



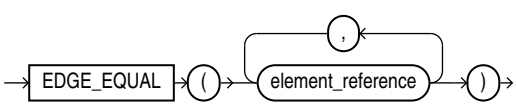
Vertex and Edge Equal Predicates

Purpose



The vertex and edge equal predicates allow for specifying that two vertex variables (or two edge variables) should or should not bind to the same vertex (or edge).

Syntax



***element_equal_predicate*::=**

***vertex_equal_predicate*::=**

***edge_equal_predicate*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

Semantics

If at least one of the referenced element variables is not bound to a graph element, then the predicates evaluate to the null value. Otherwise, they evaluate to `TRUE` or `FALSE`.

Examples

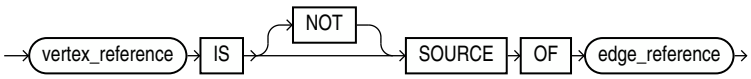
Example 1

The following query finds friends of friends of Mary. Here, the *`vertex_equal predicate`* is used to make sure Mary herself is not included in the result.

```
SELECT name
FROM GRAPH_TABLE ( students_graph
  MATCH (p IS person)
          -[IS friends]- (friend IS person)
            -[IS friends]- (friend_of_friend IS person)
  WHERE p.name = 'Mary' AND NOT vertex_equal(p, friend_of_friend)
  COLUMNS (friend_of_friend.name)
)
ORDER BY name;
```

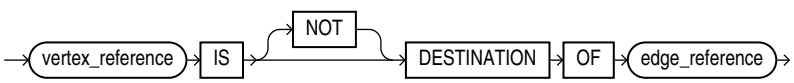
The result is:

```
NAME
----------
Bob
John
```



SOURCE and DESTINATION Predicates

Purpose



The `SOURCE` and `DESTINATION` predicates allow for testing if a vertex is the source or the destination of an edge. They are useful, for example, for determining the direction of edges that are matched via any-directed edge patterns.

Syntax

***source_predicate*::=**

***destination_predicate*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

Semantics

The SOURCE predicate takes a vertex and an edge as input and returns TRUE or FALSE depending on whether the vertex is (not) the source of the edge.

The DESTINATION predicate also takes a vertex and an edge as input and returns TRUE or FALSE depending on whether the vertex is (not) the destination of the edge.

If at least one of the referenced element variables is not bound to a graph element, then the predicates evaluate to the null value. Otherwise, they evaluate to TRUE or FALSE.

Examples

Example 1

The following query matches FRIENDS edges that are either incoming or outgoing from Mary. For each edge, it return the NAME property for the source of the edge as well as the NAME property of the destination of the edge.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (p1 IS person) -[e IS friends]- (p2 IS person)
       WHERE p1.name = 'Mary'
       COLUMNS (e.friendship_id,
                e.meeting_date,
                CASE WHEN p1 IS SOURCE OF e THEN p1.name ELSE p2.name END AS
from_person,
                CASE WHEN p1 IS DESTINATION OF e THEN p1.name ELSE p2.name
END AS to_person))
ORDER BY friendship_id;
```

The result is:

```
FRIENDSHIP_ID MEETING_DATE FROM_PERSON TO_PERSON
------------- ------------ ----------- ---------
            2 19-SEP-00    Mary        Alice
            3 19-SEP-00    Mary        John
            4 10-JUL-01    Bob         Mary
```

Example 2

The following query find friends of friends of John such that the two FRIENDS edges are either both incoming or outgoing.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (p1 IS person) -[e1 IS friends]- (p2 IS person)
               -[e2 IS friends]- (p3 IS person)
       WHERE p1.name = 'John'
         AND ((p1 IS SOURCE OF e1 AND p2 IS SOURCE OF e2) OR
              (p1 IS DESTINATION OF e1 AND p2 IS DESTINATION OF e2))
       COLUMNS (p1.name AS person_1,
                CASE WHEN p1 IS SOURCE OF e1
                  THEN 'Outgoing' ELSE 'Incoming'
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
                  END AS e1_direction,
                p2.name AS person_2,
                CASE WHEN p2 IS SOURCE OF e2
                  THEN 'Outgoing' ELSE 'Incoming'
                  END AS e2_direction,
                p3.name AS person_3))
ORDER BY 1, 2, 3;
```

The result is:

```
PERSON_1   E1_DIRECTION PERSON_2   E2_DIRECTION PERSON_3
---------- ------------ ---------- ------------ ----------
John       Incoming     Mary       Incoming     Bob
John       Outgoing     Bob        Outgoing     Mary
```

Notice how the path from John via Mary to Alice is not part of the result since it has an incoming edge followed by an outgoing edge and thus not two edges in the same direction.

Aggregation in GRAPH_TABLE

Purpose

Aggregations in `GRAPH_TABLE` are used to compute one or more values for a set of vertices or edges in a variable-length path. This is done using the same Aggregate Functions that are also available for non-graph queries.

Syntax

All the aggregate functions that are available for non-graph queries are also available for graph queries. See Aggregate Functions for the syntax of these functions.

Aggregate functions can be used in `WHERE` and `COLUMNS` clauses in `GRAPH_TABLE`, with the restriction that `WHERE` clauses within quantified patterns may not contain aggregate functions.

Syntactically, the value expressions in the aggregations must contain references to vertices and edges in the graph pattern, rather than to columns of tables like in case of regular (non-graph) SQL queries.

Semantics

See Aggregate Functions for the semantics of aggregate functions.

The arguments of the aggregate function together must reference exactly one group variable. In addition, they can reference any number of singleton variables. Note that an element variable is said to have group degree of reference when the variable is declared in a quantified path pattern while the reference occurs outside the quantified path pattern. On the other hand, if the reference does not cross a quantifier then the reference has singleton degree of reference. Singleton variables may be element pattern variables declared in the graph pattern or iterator variables declared in the Rows Clause. Also see Element Variable for more details on the contextual interpretation of graph element references.

The order in which values are aggregated in case of `LISTAGG`, `JSON_ARRAYAGG` and `XMLAGG` is non-deterministic unless an `ORDER BY` clause is specified. For example: `LISTAGG(edge1.property1 ORDER BY edge1.property1))`. There is currently no way to explicitly order by path order in such a way that elements are ordered in the same order as the vertices or edges in the path. However, when omitting the `ORDER BY` clause, the current

Copyright © 1996, 2026, Oracle and/or its affiliates.

implementation nevertheless implicitly orders by path order, but it should not be relied upon as this behavior may change over time.

Restrictions

- Only `WHERE` clauses that are not within a quantified pattern may contain aggregations. For example, the graph pattern `WHERE` clause as well as non-quantified element pattern `WHERE` clauses may contain aggregations, while parenthesized path pattern `WHERE` clauses may not contain aggregations since parenthesized path patterns currently have a restriction that they must always be quantified.
- The arguments of an aggregate function in `GRAPH_TABLE` together must reference exactly one group variable. In addition, they may reference any number of singleton variables. For example, `MATCH -[e1]-> WHERE SUM(e1.prop) > 10` is not allowed since variable `e1` has singleton degree of reference within the `SUM` aggregate, while `MATCH -[e2]->{1,10} WHERE SUM(e2.prop) > 10` and `MATCH -[e3]->{1,1} WHERE SUM(e3.prop) > 10` are allowed since variables `e2` and `e3` have group degree of reference within the `SUM` aggregates.
- Variable references must be inside property references, vertex or edge ID functions, or JSON dot-notation expressions. For example, `vertex_equal`, `edge_equal`, `IS SOURCE OF` and `IS DESTINATION OF` cannot be used in aggregate functions. For example, `COUNT(edge1)` is not allowed but `COUNT(edge_id(edge1))` and `COUNT(edge1.some_property))` are allowed.
- The arguments of an aggregate function in `GRAPH_TABLE` cannot reference anything other than a vertex or edge declared within the graph pattern of the `GRAPH_TABLE`. For example, it is not possible to reference a column that is passed from an outer query.
- In case of `LISTAGG`, `JSON_ARRAYAGG` and `XMLAGG` there is no way to specify that the order of elements in the result should be in the order of the vertices or edges in the path, although the current implement nevertheless implicitly orders by path order.

Examples

Example 1

The following query finds all paths that have a length between 2 and 5 edges (`{2,5}`), starting from a person named Alice and following both incoming and outgoing edges labeled friends. Edges along paths should not be traversed twice (`COUNT(edge_id(e) = COUNT(DISTINCT edge_id(e))`). The query returns all friendship IDs along paths as well as the length of each path.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (p IS person) -[e IS friends]-{2,5} (friend IS person)
       WHERE p.name = 'Alice' AND
             COUNT(edge_id(e)) = COUNT(DISTINCT edge_id(e))
       COLUMNS (LISTAGG(e.friendship_id, ', ') AS friendship_ids,
                COUNT(edge_id(e)) AS path_length))
ORDER BY path_length, friendship_ids;
```

Note that in the element pattern `WHERE` clause of the query above, p.name references a property of a single edge, while `edge_id(e)` within the `COUNT` aggregates accesses a list of element IDs since the edge variable e is enclosed by the quantifier `{2,5}`. Similarly, the two property references in the `COLUMNS` clause access a list of property values and edge ID values.

The result is:

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
FRIENDSHIP_IDS    PATH_LENGTH
----------------- -----------
2, 3              2
2, 4              2
2, 3, 1           3
2, 4, 1           3
2, 3, 1, 4        4
2, 4, 1, 3        4
```

Example 2

The following query finds all paths between university `ABC` and university `XYZ` such that paths have a length of up to 3 edges (`{,3}`). For each path, a JSON array is returned such that the array contains the `friendship_id` value for edges labeled friends, and the subject value for edges labeled `student_of`. Note that the `friendship_id` property is cast to `VARCHAR(100)` to make it type-compatible with the subject property.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (u1 IS university) -[e]-{,3} (u2 IS university)
       WHERE u1.name = 'ABC' AND u2.name = 'XYZ'
       COLUMNS (JSON_ARRAYAGG(CASE WHEN e.subject IS NOT NULL THEN e.subject
                              ELSE CAST(e.friendship_id AS VARCHAR(100)) END)
AS path))
ORDER BY path;
```

The result is:

```
PATH
----------------------
["Arts","3","Math"]
["Music","4","Math"]
```

Example 3

Example 3 The following query finds all paths that have a length between 2 and 3 edges (`{2,3}`), starting from a person named John and following only outgoing edges labeled friends and vertices labeled person. Vertices along paths should not have the same person_id as John (`WHERE p.person_id <> friend.person_id`).

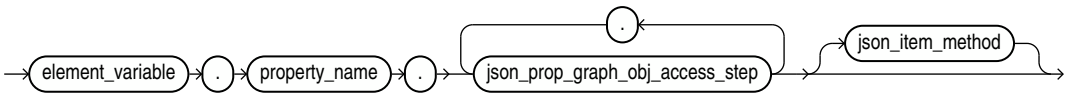
```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (p IS person) ( -[e IS friends]-> (friend IS person)
                             WHERE p.person_id <> friend.person_id){2,3}
       WHERE p.name = 'John'
       COLUMNS (COUNT(edge_id(e)) AS path_length,
                LISTAGG(friend.name, ', ') AS names,
                LISTAGG(e.meeting_date, ', ') AS meeting_dates ))
ORDER BY path_length;
```

Above, the `COLUMNS` clause contains three aggregates, the first to compute the length of each path, the second to create a comma-separated list of person names along paths, and the third to create a comma-separate list of meeting dates along paths.

Copyright © 1996, 2026, Oracle and/or its affiliates.

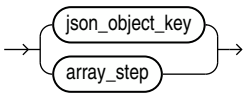
The result of the query is:

```
PATH_LENGTH NAMES
MEETING_DATES
----------- ------------------
-----------------------------------
          2 Bob, Mary           01-SEP-00, 10-
JUL-01
          3 Bob, Mary, Alice    01-SEP-00, 10-JUL-01, 19-SEP-00
```



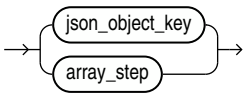
JSON Object Access Expressions for Property Graphs

Purpose



JSON dot notation for property graphs allows for easy access to JSON data exposed as vertex or edge property values. It provides a simple syntax for common use cases, while SQL/JSON functions json_value and json_query can be used for more complex queries against property graphs containing JSON data.

Syntax



***json_property_graph_object_access_expr*::=**

***json_prop_graph_obj_access_step*::=**

***array_step*::=**

Semantics

JSON dot notation for property graphs supports the same functionality as JSON Dot Notation for columns of JSON data. Please refer to JSON Object Access Expressions.

Examples

The following example creates a new graph on top of the `persons` table from the sample data. This graph will have a vertex property `person_data` of type JSON since the persons table has

Copyright © 1996, 2026, Oracle and/or its affiliates.

person_data column of type JSON. Then, a GRAPH_TABLE query that uses JSON dot notation is issued against this graph to obtain the role of all persons in the HR department.

```
CREATE PROPERTY GRAPH IF NOT EXISTS persons_graph VERTEX TABLES ( persons );
```

```
SELECT *
FROM GRAPH_TABLE ( persons_graph
       MATCH (n)
       WHERE n.person_data.department = 'HR'
       COLUMNS (n.name, n.person_data.role.string() AS role)
     );
```

The result is:

```
NAME            ROLE
--------------- ---------------
Mary            HR Manager
Alice           HR Assistant
```

Note how item method string() is used in the COLUMNS clause to return a VARCHAR2(4000). Without the item method it would have returned a JSON string and the result would have been double quoted.

> **See Also**
>
> *Simple Dot Notation Access JSON Data* of the *JSON Developer's Guide*.

MATCHNUM

Purpose

The MATCHNUM function returns a number that uniquely identifies a match in a set of matches.

Syntax

Semantics

The MATCHNUM function returns a number that uniquely identifies a match in a set of matches. The numbers are not necessarily consecutive, and gaps may appear for example when matches were filtered out. Rows returned from GRAPH_TABLE have unique match numbers unless ONE ROW PER VERTEX or ONE ROW PER STEP is specified, in which case the same match number is returned for different iterations within a match.

Restricitons

MATCHNUM can only be used in the COLUMNS clause.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

Example 1

The following query matches all person vertices and for each match returns a unique match number as well as the name of the person.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (p IS person)
       COLUMNS (MATCHNUM() AS matchnum,
                p.name))
ORDER BY matchnum;
```

The results are:

```
  MATCHNUM NAME
---------- -------
         1 John
         2 Mary
         3 Bob
         4 Alice
```

Example 2

The following query finds paths connecting John and Mary either directly or indirectly via a common friend. For each match, the query returns one row per vertex, which means one row per person along the friendship path. Each result contains a match number, the element number of the person vertex, and the name of the person.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (p1 IS person) -[IS friends]-{1,2} (p2 IS person)
       WHERE p1.name = 'John' AND p2.name = 'Mary'
       ONE ROW PER VERTEX (v)
       COLUMNS (MATCHNUM() AS matchnum,
                ELEMENT_NUMBER(v) AS element_number,
                v.name))
ORDER BY matchnum, element_number;
```

The results are:

```
MATCHNUM   ELEMENT_NUMBER NAME
---------  -------------- ----------
       1              1  John
       1              3  Mary
       2              1  John
       2              3  Bob
       2              5  Mary
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

ELEMENT_NUMBER

Purpose

The `ELEMENT_NUMBER` function returns the sequential element number of the graph element that an iterator variable currently binds to.

Syntax

Semantics

The `ELEMENT_NUMBER` function can be used in a `COLUMNS` clause if `ONE ROW PER VERTEX` or `ONE ROW PER STEP` is specified. The function references an iterator variable and returns the sequential element number that the iterator variable currently binds to. Since paths always start with a vertex and alternate between vertices and edges, the first element is a vertex with element number 1, the second element is an edge with element number 2, the third element is a vertex with element number 3, etc. Vertices thus always have odd element numbers while edges have even element numbers. If a path is empty and thus only has a single vertex and no edges, and `ONE ROW PER STEP` is specified, then `ELEMENT_NUMBER` returns NULL when the iterator edge variable or the second iterator vertex variable is referenced. Note that empty paths result in single steps in which only the first iterator (vertex) variable is bound.

Restricitons

- `ELEMENT_NUMBER` can only be used in the `COLUMNS` clause.
- `ELEMENT_NUMBER` can only be used if `ONE ROW PER VERTEX` or `ONE ROW PER STEP` is specified.
- `ELEMENT_NUMBER` cannot reference any other type of variable than an iterator variable.

Examples

Example 1

The following query finds paths connecting John and Mary either directly or indirectly via a common friend. For each match, the query returns one row per step. Each result contains a match number, the element number of the friends edge in the step, the `friendship_id` and the names of the two persons in the step.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (p1 IS person) -[IS friends]-{1,2} (p2 IS person)
       WHERE p1.name = 'John' AND p2.name = 'Mary'
       ONE ROW PER STEP (v1, e, v2)
       COLUMNS (MATCHNUM() AS matchnum,
                ELEMENT_NUMBER(e) AS element_number,
                v1.name AS name1,
                e.friendship_id,
                v2.name AS name2))
ORDER BY matchnum, element_number;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

The results are:

```
The results are:
  MATCHNUM ELEMENT_NUMBER NAME1      FRIENDSHIP_ID NAME2
---------- -------------- ---------- ------------- ----------
         1              2 John                   3 Mary
         2              2 John                   1 Bob
         2              4 Bob                    4 Mary
```

Example 2

The following query finds all people connected to John via 0 or 1 friends edges. For each match, the query returns one row per step. Each result contains a match number, the element number of the friends edge in the step, the `friendship_id` and the names of the two persons in the step.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (p1 IS person) -[IS friends]-{0,1} (p2 IS person)
       WHERE p1.name = 'John'
       ONE ROW PER STEP (v1, e, v2)
       COLUMNS (MATCHNUM() AS matchnum,
                ELEMENT_NUMBER(e) AS element_number,
                v1.name AS name1,
                e.friendship_id,
                v2.name AS name2))
ORDER BY matchnum, element_number;
```

The results are:

```
The results are:
  MATCHNUM ELEMENT_NUMBER   NAME1      FRIENDSHIP_ID   NAME2
---------- --------------   ---------- -------------   ---------
         1                       John
         2              2         John             3        Mary
         4              2         John             1        Bob
```

Here, three paths were matched. The path with match number 1 has one vertex and zero edges. Thus, there is a single step in which iterator vertex variable `v1` is bound but iterator edge variable `e` and iterator vertex variable `v2` are not bound, leading to the NULL values in the `ELEMENT_NUMBER`, `FRIENDSHIP_ID` and `NAME2` columns. The other two paths (with match numbers 2 and 4) also have a single step but since these paths do contain an edge as well as a second vertex, all three iterator variables are bound, and no NULL values are returned.

PATH_NAME

Purpose

The `PATH_NAME` function returns the name of the path that the iterator variables are currently iterating over.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Syntax

Semantics

You can use `PATH_NAME` in combination with `ONE ROW PER VERTEX` or `ONE ROW PER STEP` to return the name of the path that the iterator variables are currently iterating over.

For example, in case of `MATCH p1 = (x)->(y), p2 = (y) -> (z) ONE ROW PER VERTEX (v) COLUMNS (PATH_NAME() AS path_name)`, return values of `PATH_NAME()` are `P1` and `P2`. The return type of `PATH_NAME` is `CHAR`.

In case there is a single path pattern without a path variable declaration, then `PATH_NAME` will return `NULL`.

Note that `ONE ROW PER VERTEX` and `ONE ROW PER STEP` have the following restriction: If there are multiple path patterns, all the path patterns must have a path variable declaration. It thus follows that `PATH_NAME` can only return `NULL` when there is a single path pattern.

Restrictions

- `PATH_NAME` can only be used in the `COLUMNS` clause.
- `PATH_NAME` can only be used if `ONE ROW PER VERTEX` or `ONE ROW PER STEP` is specified.

Examples

Example 1

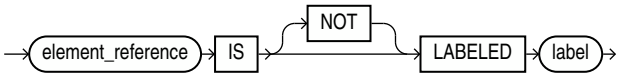
The following query finds friends of Bob's friends and the universities they attend. The graph pattern is split into two path patterns named `PATH1` and `PATH2`. For each match, `PATH1` always matches 3 vertices while `PATH2` always matches 2 vertices. Therefore, since the query specifies `ONE ROW PER VERTEX`, a total of 5 rows are returned for each match. Each row includes the match number, the path name, the element number and the `NAME` property of the vertices.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH path1 = (p1 IS person) -[IS friends]-{2} (p2 IS person),
             path2 = (p2) -[IS student_of]-> (u2 IS university)
       WHERE p1.name = 'Bob'
       ONE ROW PER VERTEX (v)
       COLUMNS (MATCHNUM() AS matchnum,
                PATH_NAME() AS path_name,
                ELEMENT_NUMBER(v) AS element_number,
                v.name))
ORDER BY matchnum, path_name, element_number;
```

The result is:

```
 MATCHNUM PATH_NAME ELEMENT_NUMBER NAME
---------- --------- -------------- ----------
         1 PATH1                  1 Bob
         1 PATH1                  3 John
         1 PATH1                  5 Mary
         1 PATH2                  1 Mary
```

Copyright © 1996, 2026, Oracle and/or its affiliates.



```
1 PATH2                3 XYZ
2 PATH1                1 Bob
2 PATH1                3 John
2 PATH1                5 Bob
2 PATH2                1 Bob
2 PATH2                3 ABC
3 PATH1                1 Bob
3 PATH1                3 Mary
3 PATH1                5 Bob
3 PATH2                1 Bob
3 PATH2                3 ABC
4 PATH1                1 Bob
4 PATH1                3 Mary
4 PATH1                5 John
4 PATH2                1 John
4 PATH2                3 ABC
5 PATH1                1 Bob
5 PATH1                3 Mary
5 PATH1                5 Alice
5 PATH2                1 Alice
5 PATH2                3 XYZ
```

IS LABELED

Purpose

The `IS LABELED` predicate determines whether a graph element satisfies a label expression.

Syntax

Semantics

The `IS LABELED` predicate determines whether a graph element has a particular label. It returns a `BOOLEAN`.

In case the referenced element is not bound then the `IS LABELED` predicate returns `NULL`. This may happen for iterator variables when empty paths are matched.

Restrictions

Label disjunction within a single labeled predicate is not supported. Instead, use multiple labeled predicates together with the logical `OR` operator.

Examples

Example 1

The following query finds all outgoing `FRIENDS` and `STUDENT_OF` edges from a person named Bob. It returns the label of the destination vertex as well as person and university IDs and names. The `IS LABELED` predicate is used to construct the output label as well as to combine the person's id property and the university's id property into a single ID column.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
       MATCH (p1 IS person) -[IS friends|student_of]-> (x IS person|
university)
       WHERE p1.name = 'Bob'
       COLUMNS (CASE
                  WHEN x IS LABELED person THEN 'PERSON'
                  ELSE 'UNIVERSITY'
                END AS label,
                CASE
                  WHEN x IS LABELED person THEN x.person_id
                  ELSE x.id
                END AS id,
                x.name))
ORDER BY label, id;
```

The query returns:

```
LABEL      ID         NAME
---------- ---------- ----------
PERSON              2 Mary
UNIVERSITY          1 ABC
```

PROPERTY_EXISTS

Purpose

The `PROPERTY_EXISTS` predicate determines if the graph element bound to a singleton element reference has a property.

Syntax

Semantics

The `PROPERTY_EXISTS` predicate determines if the graph element bound to a singleton element reference has a property. It returns a `BOOLEAN`.

In case the referenced element is not bound then the `PROPERTY_EXISTS` predicate returns NULL. This may happen for iterator variables when empty paths are matched.

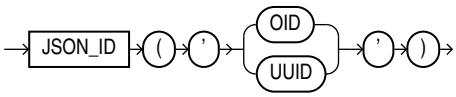
Examples

Example 1

The following example matches vertices labeled `PERSON` or `UNIVERSITY` and for each type of vertex returns whether it has properties `DOB`, `HEIGHT`, `NAME` and `ID`.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
       MATCH (x IS person|university)
       COLUMNS (CASE
                  WHEN x IS LABELED person THEN 'PERSON'
                  ELSE 'UNIVERSITY'
```

Copyright © 1996, 2026, Oracle and/or its affiliates.



```
                END AS label,
                PROPERTY_EXISTS(x, dob) AS has_dob,
                PROPERTY_EXISTS(x, height) AS has_height,
                PROPERTY_EXISTS(x, name) AS has_name,
                PROPERTY_EXISTS(x, id) AS has_id))
GROUP BY label, has_dob, has_height, has_name, has_id
ORDER BY label;
```

The query returns:

```
LABEL      HAS_DOB     HAS_HEIGHT  HAS_NAME    HAS_ID
---------- ----------- ----------- ----------- -----------
PERSON     TRUE        TRUE        TRUE        FALSE
UNIVERSITY FALSE       FALSE       TRUE        TRUE
```

JSON_ID Operator

Syntax

Purpose

`JSON_ID` takes a single argument, one of `'OID'` or `'UUID'` to create a value for a document-identifier field that you provide.

`JSON_ID` returns a value of SQL type `RAW` that is globally unique. The value returned is determined by the argument that you provide. With string `'OID'`, a 12-byte `RAW` value is returned; with string `'UUID'`, a 16-byte `RAW` value is returned.

5
Expressions

This chapter describes how to combine values, operators, and functions into **expressions**.

This chapter includes these sections:

- About SQL Expressions
- Simple Expressions
- Analytic View Expressions
- Compound Expressions
- CASE Expressions
- Column Expressions
- CURSOR Expressions
- Datetime Expressions
- Function Expressions
- Interval Expressions
- JSON Object Access Expressions
- Model Expressions
- Object Access Expressions
- Placeholder Expressions
- Scalar Subquery Expressions
- Type Constructor Expressions
- Expression Lists

About SQL Expressions

An **expression** is a combination of one or more values, operators, and SQL functions that evaluates to a value. An expression generally assumes the data type of its components.

This simple expression evaluates to 4 and has data type `NUMBER` (the same data type as its components):

```
2*2
```

The following expression is an example of a more complex expression that uses both functions and operators. The expression adds seven days to the current date, removes the time component from the sum, and converts the result to `CHAR` data type:

```
TO_CHAR(TRUNC(SYSDATE+7))
```

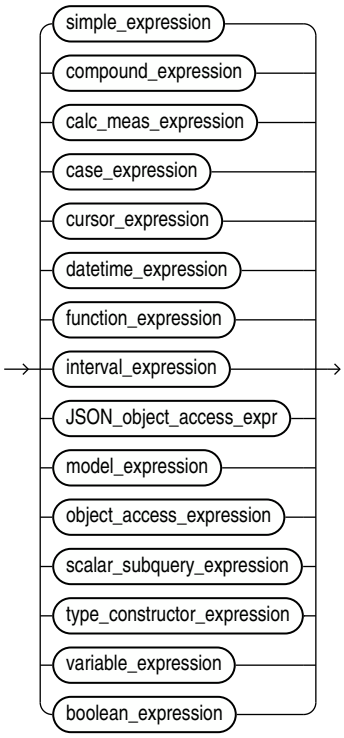
You can use expressions in:

- The select list of the `SELECT` statement
- A condition of the `WHERE` clause and `HAVING` clause

Copyright © 1996, 2026, Oracle and/or its affiliates.

- The `CONNECT BY`, `START WITH`, and `ORDER BY` clauses
- The `VALUES` clause of the `INSERT` statement
- The `SET` clause of the `UPDATE` statement

For example, you could use an expression in place of the quoted string `'Smith'` in this `UPDATE` statement `SET` clause:



```
SET last_name = 'Smith';
```

This `SET` clause has the expression `INITCAP(last_name)` instead of the quoted string `'Smith'`:

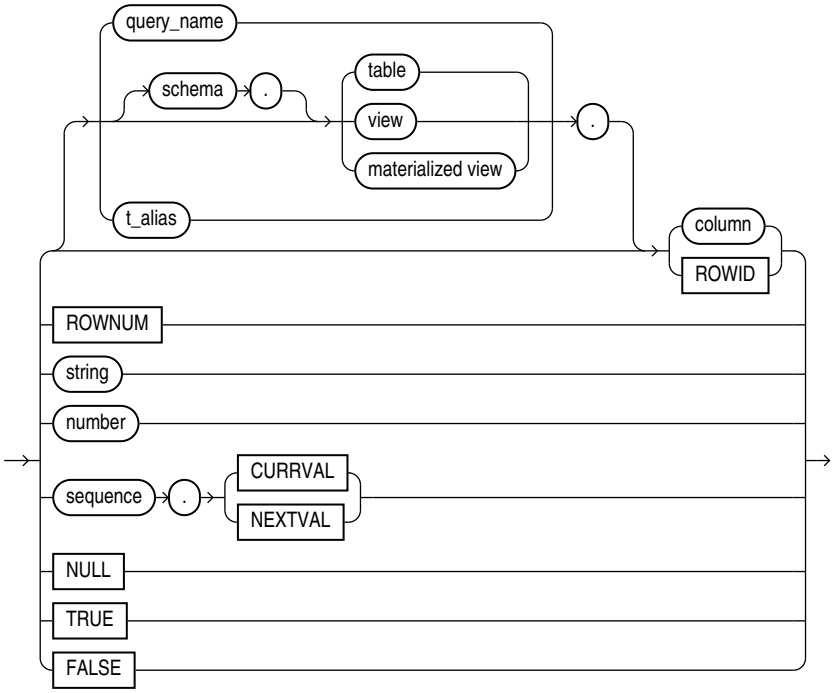
```
SET last_name = INITCAP(last_name);
```

Expressions have several forms, as shown in the following syntax:

***expr*::=**

simple_expression::=,,,,,,,boolean_expression::=

Oracle Database does not accept all forms of expressions in all parts of all SQL statements. Refer to the section devoted to a particular SQL statement in this book for information on restrictions on the expressions in that statement.



You must use appropriate expression notation whenever *expr* appears in conditions, SQL functions, or SQL statements in other parts of this reference. The sections that follow describe and provide examples of the various forms of expressions.

Simple Expressions

A simple expression specifies a column, pseudocolumn, constant, sequence number, or null.

Copyright © 1996, 2026, Oracle and/or its affiliates.

***simple_expression*::=**

In addition to the schema of a user, *schema* can also be "PUBLIC" (double quotation marks required), in which case it must qualify a public synonym for a table, view, or materialized view. Qualifying a public synonym with "PUBLIC" is supported only in data manipulation language (DML) statements, not data definition language (DDL) statements.

You can specify ROWID only with a table, not with a view or materialized view. NCHAR and NVARCHAR2 are not valid pseudocolumn data types.

> **See Also**
>
> Pseudocolumns for more information on pseudocolumns and subquery_factoring_clause for information on *query_name*

Some valid simple expressions are:

```
employees.last_name
'this is a text string'
10
N'this is an NCHAR string'
```

Analytic View Expressions

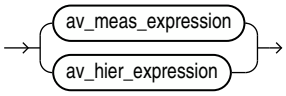
You can use analytic view expressions to create calculated measures within the definition of an analytic view or in a query that selects from an analytic view.

Analytic view expressions differ from other types of expressions in that they reference elements of hierarchies and analytic views rather than tables and columns.

Copyright © 1996, 2026, Oracle and/or its affiliates.

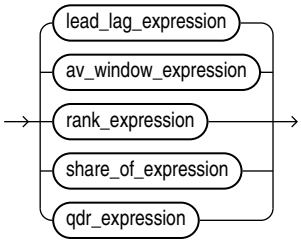
An analytic view expression is one of the following:

- An *av_meas_expression*, which is based on a measure in an analytic view
- An *av_hier_expression*, which returns an attribute value of the related member



You use an analytic view expression as the *calc_meas_expression* parameter in a *calc_measure_clause* in a `CREATE ANALYTIC VIEW` statement and in the `WITH` or `FROM` clauses of a `SELECT` statement.

In defining a calculated measure, you may also use the following types of expression:



- Simple
- Case
- Compound
- Datetime
- Interval

Semantics

av_meas_expression

An expression that performs hierarchical navigation to locate related measure values.

lead_lag_expression

An expression that specifies a lead or lag operation that locates a related measure value by navigating forward or backward by some number of members within a hierarchy.

The *calc_meas_expression* parameter is evaluated in the new context created by the *lead_lag_expression*. This context has the same members as the outer context, except that the member of the specified hierarchy is changed to the related member specified by the lead or lag operation. The lead or lag function is run over the hierarchy members specified by the *lead_lag_clause* parameter.

lead_lag_function_name

The lead or lag function may be one of the following:

- LAG returns the measure value of an earlier member.
- LAG_DIFF returns the difference between the measure value of the current member and the measure value of an earlier member.
- LAG_DIFF_PERCENT returns the percent difference between the measure value of the current member and the measure value of an earlier member.
- LEAD returns the measure value of a later member.
- LEAD_DIFF returns the difference between the measure value of the current member and the measure value of a later member.
- LEAD_DIFF_PERCENT returns the percent difference between the measure value of the current member and the measure value of a later member.

lead_lag_clause

Specifies the hierarchy to evaluate and an offset value. The parameters of the *lead_lag_clause* are the following:

- HIERARCHY *hierarchy_ref* specifies the alias of a hierarchy as defined in the analytic view.
- OFFSET *offset_expr* specifies a *calc_meas_expression* that resolves to a number. The number specifies how many members to move either forward or backward from the current member. The ordering of members within a level is determined by the definition of the attribute dimension used by the hierarchy.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- `WITHIN LEVEL` specifies locating the related member by moving forward or backward by the offset number of members within the members that have the same level depth as the current member. The ordering of members within the level is determined by the definition of the attribute dimension used by the hierarchy.

  The `WITHIN LEVEL` operation is the default if neither the `WITHIN LEVEL` nor the `ACROSS ANCESTOR AT LEVEL` keywords are specified.

- `WITHIN PARENT` specifies locating the related member by moving forward or backward by the offset number of members within the members that have the same parent as the current member.

- `ACROSS ANCESTOR AT LEVEL` *`level_ref`* specifies locating the related member by navigating up to the ancestor (or to the member itself if no ancestor exists) of the current member at the level specified by *`level_ref`*, and noting the position of each ancestor member (including the member itself) within its parent. The *`level_ref`* parameter is the name of a level in the specified hierarchy.

  Once the ancestor member is found, navigation moves either forward or backward the offset number of members within the members that have the same depth as the ancestor member. After locating the related ancestor, navigation proceeds back down the hierarchy from this member, matching the position within the parent as recorded on the way up (in reverse order). The position within the parent is either an offset from the first child or the last child depending on whether `POSITION FROM BEGINNING` or `POSITION FROM END` is specified. The default value is `POSITION FROM BEGINNING`. The ordering of members within the level is determined by the definition of the attribute dimension used by the hierarchy.

av_window_expression

An *`av_window_expression`* selects the set of members that are in the specified range starting from the current member and that are at the same depth as the current member. You can further restrict the selection of members by specifying a hierarchical relationship using a WITHIN phrase. Aggregation is then performed over the selected measure values to produce a single result for the expression.

The parameters for an *`av_window_expression`* are the following:

- *`aggregate_function`* is any existing SQL aggregate function except `COLLECT`, `GROUP_ID`, `GROUPING`, `GROUPING_ID`, `SYS_XMLAGG`, `XMLAGG`, and any multi-argument function. A user defined aggregate function is also allowed. The arguments to the aggregate function are *`calc_meas_expression`* expressions. These expressions are evaluated using the outer context, with the member of the specified hierarchy changed to each member in the related range. Therefore, each expression argument is evaluated once per related member. The results are then aggregated using the *`aggregate_function`*.

- `OVER (`*`av_window_clause`*`)` specifies the hierarchy to use and the boundaries of the window to consider.

> **See Also**
>
> Aggregate Functions

av_window_clause

The *`av_window_clause`* parameter selects a range of members related to the current member. The range is between the members specified by the *`preceding_boundary`* or

Copyright © 1996, 2026, Oracle and/or its affiliates.

following_boundary parameters. The range is always computed over members at the same level as the current member.

Use `IN member_set` to specify an arbitrary member set to be used as the window for the window expression.

The parameters for a *av_window_clause* are the following:

- `HIERARCHY` *hierarchy_ref* specifies the alias of the hierarchy as defined in the analytic view.
- `BETWEEN` *preceding_boundary* or *following_boundary* defines the set of members to relate to the current member.
- `WITHIN LEVEL` selects the related members by applying the boundary clause to all members of the current level. This is the default when the `WITHIN` keyword is not specified.
- `WITHIN PARENT` selects the related members by applying the boundary clause to all members that share a parent with the current member.
- `WITHIN ANCESTOR AT LEVEL` selects the related members by applying the boundary clause to all members at the current depth that share an ancestor (or is the member itself) at the specified level with the current member. The value of the window expression is `NULL` if the current member is above the specified level. If the level is not in the specified hierarchy, then an error occurs.

preceding_boundary

The *preceding_boundary* parameter defines a range of members from the specified number of members backward in the level from the current member and forward to the specified end of the boundary. The following parameters specify the range:

- `UNBOUNDED PRECEDING` begins the range at the first member in the level.
- *offset_expr* `PRECEDING` begins the range at the *offset_expr* number of members backward from the current member. The *offset_expr* expression is a *calc_meas_expression* that resolves to a number. If the offset number is greater than the number of members from the current member to the first member in the level, than the first member is used as the start of the range.
- `CURRENT MEMBER` ends the range at the current member.
- *offset_expr* `PRECEDING` ends the range at the member that is *offset_expr* backward from the current member.
- *offset_expr* `FOLLOWING` ends the range at the member that is *offset_expr* forward from the current member.
- `UNBOUNDED FOLLOWING` ends the range at the last member in the level.

following_boundary

The *following_boundary* parameter defines a range of members from the specified number of members from the current member forward to the specified end of the range. The following parameters specify the range:

- `CURRENT MEMBER` begins the range at the current member.
- *offset_expr* `FOLLOWING` begins the range at the member that is *offset_expr* forward from the current member.
- *offset_expr* `FOLLOWING` ends the range at the member that is *offset_expr* forward from the current member.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- `UNBOUNDED FOLLOWING` ends the range at the last member in the level.

hierarchy_ref

A reference to a hierarchy of an analytic view. The *hier_alias* parameter specifies the alias of a hierarchy in the definition of the analytic view. You may use double quotes to escape special characters or preserve case, or both.

The optional *attr_dim_alias* parameter specifies the alias of an attribute dimension in the definition of the analytic view. You may use the *attr_dim_alias* parameter to resolve the ambiguity if the specified hierarchy alias conflicts with another hierarchy alias in the analytic view or if an attribute dimension is used more than once in the analytic view definition. You may use the *attr_dim_alias* parameter even when a name conflict does not exist.

rank_expression

Hierarchical rank calculations rank the related members of the specified hierarchy based on the order of the specified measure values and return the rank of the current member within those results.

Hierarchical rank calculations locate a set of related members in the specified hierarchy, rank all the related members based on the order of the specified measure values, and then return the rank of the current member within those results. The related members are a set of members at the same level as the current member. You may optionally restrict the set by some hierarchical relationship, but the set always includes the current member. The ordering of the measure values is determined by the *calc_meas_order_by_clause* of the *rank_clause*.

rank_function_name

Each hierarchical ranking function assigns an order number to each related member based on the *calc_meas_order_by_clause*, starting at 1. The functions differ in the way they treat measure values that are the same.

The functions and the differences between them are the following:

- `RANK`, which assigns the same rank to identical measure values. The rank after a set of tied values is the number of tied values plus the tied order value; therefore, the ordering may not be consecutive numbers.
- `DENSE_RANK`, which assigns the same minimum rank to identical measure values. The rank after a set of tied values is always one more than the tied value; therefore, the ordering always has consecutive numbers.
- `AVERAGE_RANK`, assigns the same average rank to identical values. The next value after the average rank value is the number of identical values plus 1, that sum divided by 2, plus the average rank value. For example, for the series of five values 4, 5, 10, 5, 7, `AVERAGE_RANK` returns 1, 1.5, 1.5, 3, 4. For the series 2, 12, 10, 12, 17, 12, the returned ranks are 1, 2, 3, 3, 3, 5.
- `ROW_NUMBER`, which assigns values that are unique and consecutive across the hierarchy members. If the *calc_meas_order_by_clause* results in equal values then the results are non-deterministic.

rank_clause

The `rank_clause` locates a range of hierarchy members related to the current member. The range is some subset of the members in the same level as the current member. The subset is determined from the `WITHIN` clause.

Valid values for the `WITHIN` clause are:

Copyright © 1996, 2026, Oracle and/or its affiliates.

- `WITHIN LEVEL`, which specifies that the related members are all the members of the current level. This is the default subset if the `WITHIN` keyword is not specified.
- `WITHIN PARENT`, which specifies that the related members all share a parent with the current member
- `WITHIN ANCESTOR AT LEVEL`, which specifies that the related members are all of the members of the current level that share an ancestor (or self) at the specified level with the current member.

share_of_expression

A *share_of_expression* expression calculates the ratio of an expression's value for the current context over the expression's value at a related context. The expression is a *calc_meas_expression* that is evaluated at the current context and the related context. The *share_clause* specification determines the related context to use.

share_clause

A *share_clause* modifies the outer context by setting the member for the specified hierarchy to a related member.

The parameters of the share clause are the following:

- `HIERARCHY` *hierarchy_ref* specifies the name of the hierarchy that is the outer context for the *share_of_expression* calculations.
- `PARENT` specifies that the related member is the parent of the current member.
- `LEVEL` *level_ref* specifies that the related member is the ancestor (or is the member itself) of the current member at the specified level in the hierarchy. If the current member is above the specified level, then `NULL` is returned for the share expression. If the level is not in the hierarchy, then an error occurs.
- `MEMBER` *member_expression* specifies that the related member is the member returned after evaluating the *member_expression* in the current context. If the value of the specified member is `NULL`, then `NULL` is returned for the share expression.

member_expression

A *member_expression* a member expression is an expression that returns a single member in a hierarchy. A member set contains multiple members (possibly including duplicates), and may be empty. A multiple member expression is an expression that returns a member set.

The hierarchy can be determined from the outer expression (enforced by the syntax).

A *member_expression* can be one of the following:

- *level_member_literal* expression specifies a particular member contained within a particular level. The member is identified by specifying a key value.
- *hier_navigation_expr* is an expression that relates one member of the hierarchy to another member.
- `CURRENT MEMBER` indicates that the function should operate on the current member of the hierarchy, typically the starting point of a function, used in the innermost function when nesting. For example, `HIER_PARENT(HIER_PARENT(CURRENT MEMBER))` returns the grandparent of the current member.

  When used within a hierarchical window expression, for example, the current member is the one in which the window is currently operating. The current member can also be provided by some member set functions as well as in `QUALIFY`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- The NULL keyword is simply a placeholder for a member that is not in the hierarchy, called an empty member. This can be specified explicitly, but can also be the result of a function. For example, HIER_PARENT on the ALL member of a hierarchy will result in the empty member. The empty member should not be confused with NULL members that are true hierarchy members of SKIP WHEN NULL levels.
- The ALL keyword specifies the ALL member, the ultimate ancestor of every other member in the hierarchy. Every hierarchy has an implicit ALL member contained within an implicit ALL level.

level_member_literal

A level member expression specifies a particular member contained within a particular level. The member is identified by specifying a key value. If the attribute name is not specified, it is assumed to be the primary key attribute. Typically, just a single attribute needs qualification.

In the case of a level with either a multi-column key or a SKIP WHEN NULL level, multiple attributes need to be qualified in order to uniquely identify a member. If the key attribute is specified, ordering is not important. If not specified, the ordering is assumed to be the ordering as defined in the xxx_HIER_LEVEL_ID_ATTRS data dictionary view.

pos_member_keys

The *member_key_expr* expression resolves to the key value for the member. When specified by position, all components of the key must be given in the order found in the ALL_HIER_LEVEL_ID_ATTRS dictionary view. For a hierarchy in which the specified level is not determined by the child level, then all member key values of all such child levels must be provided preceding the current level's member key or keys. Duplicate key components are only specified the first time they appear.

The primary key is used when *level_member_literal* is specified using the *pos_member_keys* phrase. You can reference an alternate key by using the *named_member_keys* phrase.

named_member_keys

The *member_key_expr* expression resolves to the key value for the member. The *attr_name* parameter is an identifier for the name of the attribute. If all of the attribute names do not make up a key or alternate key of the specified level, then an error occurs.

When specified by name, all components of the key must be given and all must use the attribute *name* = *value* form, in any order. For a hierarchy in which the specified level is not determined by the child level, then all member key values of all such child levels must be provided, also using the named form. Duplicate key components are only specified once.

hier_navigation_expression

A *hier_navigation_expression* expression navigates from the specified member to a different member in the hierarchy.

hier_ancestor_expression

Returns the ancestor of the specified member at the given level. The level can either be specified by name or depth. If the member has no ancestor at the specified level, the empty member is returned.

The depth is specified as an expression that must resolve to a number. If the member is at a level or depth above the specified member, or the member is NULL, then NULL is returned for the expression value. If the specified level is not in the context hierarchy, then an error occurs.

Copyright © 1996, 2026, Oracle and/or its affiliates.

hier_parent_expression

Returns the parent of the specified member, or the empty member if it has no parent (i.e. is the `ALL` member).

hier_first_expression

Returns the first element in the specified member set. If the member set is empty, the empty member is returned.

hier_last_expression

Returns the last element in the specified member set. If the member set is empty, the empty member is returned.

hier_member_at_expression

Returns the member in the specified member set at the position identified by the given expression representing the position, where positions are 1-based. If the specified position is greater than the number of elements in the member set, the empty member is returned. The expression must be coercible to a numeric type, and will be rounded to the nearest integer. If the expression resolves to an integer less than 1, the empty member is returned.

hier_lead_lag_expression

Navigates from the specified member to a related member by moving forward or backward some number of members within the context hierarchy. The `HIER_LEAD` keyword returns a later member. The `HIER_LAG` keyword returns an earlier member.

hier_lead_lag_clause

Navigates the *`offset_expr`* number of members forward or backward from the specified member. The ordering of members within a level is specified in the definition of the attribute dimension.

The optional parameters of *`hier_lead_lag_clause`* are the following:

- `WITHIN LEVEL` locates the related member by moving forward or backward *`offset_expr`* members within the members that have the same depth as the current member. The ordering of members within the level is determined by the definition of the attribute dimension. The `WITHIN LEVEL` operation is the default if neither the `WITHIN` nor the `ACROSS` keywords are used.
- `WITHIN PARENT` locates the related member by moving forward or backward *`offset_expr`* members within the members that have the same depth as the current member, but only considers members that share a parent with the current member. The ordering of members within the level is determined by the definition of the attribute dimension.
- `WITHIN ACROSS ANCESTOR AT LEVEL` locates the related member by navigating up to the ancestor of the current member (or to the member itself) at the specified level, noting the position of each ancestor member (including the member itself) within its parent. Once the ancestor member is found, navigation moves forward or backward *`offset_expr`* members within the members that have the same depth as the ancestor member.

  After locating the related ancestor, navigation moves back down the hierarchy from that member, matching the position within the parent as recorded on the way up (in reverse order). The position within the parent is either an offset from the first child or the last child depending on whether `POSITION FROM BEGINNING` or `POSITION FROM END` is specified,

Copyright © 1996, 2026, Oracle and/or its affiliates.

defaulting to `POSITION FROM BEGINNING`. The ordering of members within the level is determined by the definition of the attribute dimension.

qdr_expression

A *`qdr_expression`* is a qualified data reference that evaluates the specified *`calc_meas_expression`* in a new context and sets the hierarchy member to the new value.

qualifier

A qualifier modifies the outer context by setting the member for the specified hierarchy to the member resulting from evaluating *`member_expression`*. If *`member_expression`* is `NULL`, then the result of the *`qdr_expression`* selection is `NULL`.

av_hier_expression

An *`av_hier_expression`* performs hierarchy navigation to locate an attribute value of the related member. An *`av_hier_expression`* may be a top-level expression, whereas a *`hier_navigation_expression`* may only be used as a *`member_expression`* argument.

For example, in the following query `HIER_MEMBER__NAME` is an *`av_hier_expression`* and `HIER_PARENT` is a *`hier_navigation_expression`*.

```
HIER_MEMBER_NAME(HIER_PARENT(CURRENT MEMBER) WITHIN HIERARCHY product_hier))
```

hier_function_name

The *`hier_function_name`* values are the following:

- `HIER_CAPTION`, which returns the caption of the related member in the hierarchy.
- `HIER_DEPTH`, which returns one less than the number of ancestors between the related member and the ALL member in the hierarchy. The depth of the ALL member is 0.
- `HIER_DESCRIPTION`, which returns the description of the related member in the hierarchy.
- `HIER_LEVEL`, which returns as a string value the name of the level to which the related member belongs in the hierarchy.
- `HIER_MEMBER_NAME`, which returns the member name of the related member in the hierarchy.
- `HIER_MEMBER_UNIQUE_NAME`, which returns the member unique name of the related member in the hierarchy.

member_set

The primary purpose of member sets is to allow them to be used within hierarchical functions. A member set is the result of either a member to set function or a set to set function.

member_to_set_func

All member to set functions take a member expression as input and produce a member set in hierarchy order. The variants that have a self_clause can specify whether or not the member specified in the given member expression itself should be included in the resulting member set, with the default being that it is excluded. If the given member is the empty member, all functions return an empty set even when `INCLUDE SELF` is specified.

Copyright © 1996, 2026, Oracle and/or its affiliates.

hier_ancestors

Returns a member set consisting of all ancestors of the specified member, optionally including the member itself. If the member has no ancestors (i.e. is the `ALL` member) and self is excluded, an empty set is returned.

hier_descendants

Returns a member set consisting of all descendants of the specified member, optionally including the member itself. If the `AT` clause is specified, the set of descendants are filtered to only include members at the specified level or depth. If the member has no descendants (i.e. is a leaf) optionally filtered to the given level and self is excluded, an empty set is returned.

hier_siblings

Returns a member set consisting of all siblings of the specified member, optionally including the member itself. A sibling is defined as any member whose parent is equal to the parent of the given member. If the member has no siblings and self is excluded, an empty set is returned.

hier_children

Returns a member set consisting of all children of the specified member. If the member has no children, an empty set is returned.

hier_level_members

Returns a member set consisting of members at the same level as the given member that have a common ancestor as defined by the `WITHIN` clause. This function always includes self. `WITHIN PARENT` returns all members that are children of the given member's parent. `WITHIN ANCESTOR AT` returns all members at the same level as the given member that have the same ancestor at the specified level. `WITHIN LEVEL` returns all members at the same level as the given member. If the `WITHIN` clause is omitted, the default is `WITHIN LEVEL`.

hier_member_set

Returns a member set consisting of explicitly specified members, in the order specified. This function is in its own category as it is not really performing a navigation, but simply building a set from some number of given members. Duplicate members are allowed. Any empty members in the given set are ignored, as a member set will never include the empty member.

set_to_set_func

The functions in this section all operate on a member set. They perform standard set operations and further hierarchical navigation.

hier_union

Returns the distinct union of members among the two given sets by taking all distinct members of the first set followed by all members in the second set that are not in the first set.

hier_union_all

Returns all members in the first set followed by all members in the second set, retaining duplicates.

Copyright © 1996, 2026, Oracle and/or its affiliates.

hier_intersect

Returns all distinct members in order from the first set that also appear in the second set.

hier_minus

Returns all distinct members in order from the first set that do not appear in the second set.

hier_distinct

Returns the distinct members in order from the given set.

hier_range

Returns members in order from the set that fall within the specified range. In all cases, *number* is an expression that is coercible to a number. When PERCENT is not specified, the expression must evaluate to a positive integer. FIRST will return the first Nmembers in the set. If N is greater than the number of elements in the set, all elements are returned. LAST will return the last N members in the set. If N is greater than the number of elements in the set, all elements are returned. BETWEEN will return all elements whose position in the set is >= the start position and <= the given end position, with positions being 1-based. If the PERCENT keyword is specified, the *number* arguments all represent percentages and must evaluate to a number between 0 and 100.

hier_window

Returns all members in order from the given set which fall within the specified boundary relative to the given member. If the given member is not in the given set, an empty set is returned.

hier_expand

For each member in the given set, applies the specified member to set function. References to CURRENT MEMBER in the member to set function refer to the current member in the set to which it is being applied. The member sets produced for the members are combined using the semantics of HIER_UNION_ALL (i.e. retaining duplicates).

hier_cond

Use IN member_set to specify an arbitrary member set to use for the comparison.

hier_position

Returns the numeric 1-based position of the first occurrence of the member identified by mbr_expr in the specified member set, with references to CURRENT MEMBER referring to the current member in the set to which it is being applied. If the member does not appear in the set, NULL is returned. This could be useful if a user wanted to order the output of a query based on the set order.

hier_count

Returns the number of members in the member set. If the DISTINCT keyword is included, returns the number of distinct members in the member set.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples of Analytic View Expressions

This topic contains examples that show calculated measures defined in the `MEASURES` clause of an analytic view and in the `ADD MEASURES` clause of a `SELECT` statement.

The examples are the following:

- Examples of LAG Expressions
- Example of a Window Expression
- Examples of SHARE OF Expressions
- Examples of QDR Expressions
- Example of an Added Measure Using the RANK Function

For more examples, see the tutorials on analytic views at the SQL Live website at https://livesql.oracle.com/apex/livesql/file/index.html.

Examples of LAG Expressions

These calculated measures different `LAG` operations.

```
-- These calculated measures are from the measures_clause of the
-- sales_av analytic view.
MEASURES
 (sales FACT sales,                       -- A base measure
  units FACT units,                       -- A base measure
  sales_prior_period AS                   -- Calculated measures
    (LAG(sales) OVER (HIERARCHY time_hier OFFSET 1)),
  sales_year_ago AS
    (LAG(sales) OVER (HIERARCHY time_hier OFFSET 1
     ACROSS ANCESTOR AT LEVEL year)),
  chg_sales_year_ago AS
    (LAG_DIFF(sales) OVER (HIERARCHY time_hier OFFSET 1
     ACROSS ANCESTOR AT LEVEL year)),
  pct_chg_sales_year_ago AS
    (LAG_DIFF_PERCENT(sales) OVER (HIERARCHY time_hier OFFSET 1
     ACROSS ANCESTOR AT LEVEL year)),
  sales_qtr_ago AS
    (LAG(sales) OVER (HIERARCHY time_hier OFFSET 1
     ACROSS ANCESTOR AT LEVEL quarter)),
  chg_sales_qtr_ago AS
    (LAG_DIFF(sales) OVER (HIERARCHY time_hier OFFSET 1
     ACROSS ANCESTOR AT LEVEL quarter)),
  pct_chg_sales_qtr_ago AS
    (LAG_DIFF_PERCENT(sales) OVER (HIERARCHY time_hier OFFSET 1
     ACROSS ANCESTOR AT LEVEL quarter))
 )
```

Example of a Window Expression

This calculated measure uses a window operation.

```
MEASURES
 (sales FACT sales,
  units FACT units,
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
  sales_qtd AS
    (SUM(sales) OVER (HIERARCHY time_hier
     BETWEEN UNBOUNDED PRECEDING AND CURRENT MEMBER
     WITHIN ANCESTOR AT LEVEL QUARTER)),
  sales_ytd AS
    (SUM(sales) OVER (HIERARCHY time_hier
     BETWEEN UNBOUNDED PRECEDING AND CURRENT MEMBER
     WITHIN ANCESTOR AT LEVEL YEAR))
 )
```

Examples of SHARE OF Expressions

These calculated measures use `SHARE OF` expressions.

```
MEASURES
 (sales FACT sales,
  units FACT units,
 sales_shr_parent_prod AS
   (SHARE_OF(sales HIERARCHY product_hier PARENT)),
 sales_shr_parent_geog AS
   (SHARE_OF(sales HIERARCHY geography_hier PARENT)),
 sales_shr_region AS
   (SHARE_OF(sales HIERARCHY geography_hier LEVEL REGION))
 )
```

Examples of QDR Expressions

These calculated measures use the `QUALIFY` keyword to specify qualified data reference expressions.

```
MEASURES
 (sales FACT sales,
  units FACT units,
  sales_2011 AS
    (QUALIFY (sales, time_hier = year['11'])),
  sales_pct_chg_2011 AS
    ((sales - (QUALIFY (sales, time_hier = year['11']))) /
    (QUALIFY (sales, time_hier = year['11'])))
 )
```

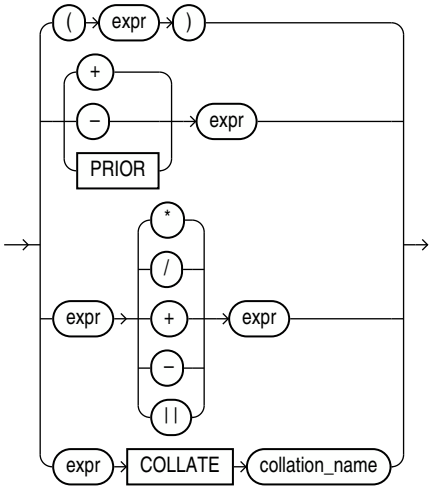
Example of an Added Measure Using the RANK Function

In this example, the units_geog_rank_level measure uses the `RANK` function to rank geography hierarchy members within a level based on units.

```
SELECT geography_hier.member_name AS "Region",
       units AS "Units",
       units_geog_rank_level AS "Rank"
  FROM ANALYTIC VIEW (
    USING sales_av HIERARCHIES (geography_hier)
    ADD MEASURES (
      units_geog_rank_level AS (
        RANK() OVER (
          HIERARCHY geography_hier
          ORDER BY units desc nulls last
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
        WITHIN LEVEL))
    )
  )
  WHERE geography_hier.level_name IN ('REGION')
  ORDER BY units_geog_rank_level;
```



The following is the result of the query.

```
Regions            Units  Rank
-------------  ---------  ----
Asia            56017849     1
South America   23904155     2
North America   20523698     3
Africa          12608308     4
Europe           8666520     5
Oceania           427664     6
```

Compound Expressions

A compound expression specifies a combination of other expressions.

***compound_expression*::=**

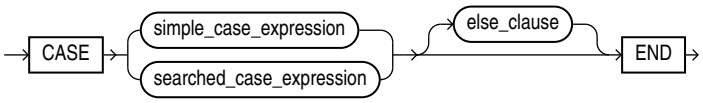
You can use any built-in function as an expression (Function Expressions). However, in a compound expression, some combinations of functions are inappropriate and are rejected. For example, the `LENGTH` function is inappropriate within an aggregate function.

The `PRIOR` operator is used in `CONNECT BY` clauses of hierarchical queries.

The `COLLATE` operator determines the collation for an expression. This operator overrides the collation that the database would have derived for the expression using standard collation derivation rules.

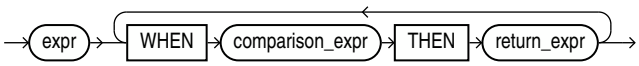
Copyright © 1996, 2026, Oracle and/or its affiliates.

See Also



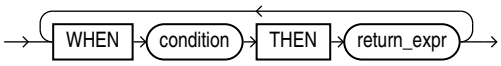
- Operator Precedence
- Hierarchical Queries
- COLLATE Operator

Some valid compound expressions are:



```
('CLARK' || 'SMITH')
LENGTH('MOOSE') * 57
SQRT(144) + 72
my_fun(TO_CHAR(sysdate,'DD-MMM-YY'))
name COLLATE BINARY_CI
```

CASE Expressions



CASE expressions let you use IF ... THEN ... ELSE logic in SQL statements without having to invoke procedures. The syntax is:

***simple_case_expression*::=**

***searched_case_expression*::=**

***else_clause*::=**

In a simple CASE expression, Oracle Database searches for the first WHEN ... THEN pair for which *expr* is equal to *comparison_expr* and returns *return_expr*. If none of the WHEN ... THEN pairs meet this condition, and an ELSE clause exists, then Oracle returns *else_expr*. Otherwise, Oracle returns null.

In a searched CASE expression, Oracle searches from left to right until it finds an occurrence of *condition* that is true, and then returns *return_expr*. If no *condition* is found to be true, and an ELSE clause exists, then Oracle returns *else_expr*. Otherwise, Oracle returns null.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Oracle Database uses **short-circuit evaluation**. For a simple CASE expression, the database evaluates each *comparison_expr* value only before comparing it to *expr*, rather than evaluating all *comparison_expr* values before comparing any of them with *expr*. Consequently, Oracle never evaluates a *comparison_expr* if a previous *comparison_expr* is equal to *expr*. For a searched CASE expression, the database evaluates each *condition* to determine whether it is true, and never evaluates a *condition* if the previous *condition* was true.

For a simple CASE expression, the *expr* and all *comparison_expr* values must either have the same data type (CHAR, VARCHAR2, NCHAR, or NVARCHAR2, NUMBER, BINARY_FLOAT, or BINARY_DOUBLE) or must all have a numeric data type. If all expressions have a numeric data type, then Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

For both simple and searched CASE expressions, all of the *return_expr*s must either have the same data type (CHAR, VARCHAR2, NCHAR, or NVARCHAR2, NUMBER, BINARY_FLOAT, or BINARY_DOUBLE) or must all have a numeric data type. If all return expressions have a numeric data type, then Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

The maximum number of arguments in a CASE expression is 65535. All expressions count toward this limit, including the initial expression of a simple CASE expression and the optional ELSE expression. Each WHEN ... THEN pair counts as two arguments. To avoid exceeding this limit, you can nest CASE expressions so that the *return_expr* itself is a CASE expression.

The comparison performed by the simple CASE expression is collation-sensitive if the compared arguments have a character data type (CHAR, VARCHAR2, NCHAR, or NVARCHAR2). The collation determination rules determine the collation to use.

See Also

- Table 2-9 for more information on implicit conversion
- Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation and determination rules for the CASE expression
- Numeric Precedence for information on numeric precedence
- COALESCE and NULLIF for alternative forms of CASE logic
- *Oracle AI Database Data Warehousing Guide* for examples using various forms of the CASE expression

Simple CASE Example

For each customer in the sample oe.customers table, the following statement lists the credit limit as "Low" if it equals $100, "High" if it equals $5000, and "Medium" if it equals anything else.

```
SELECT cust_last_name,
   CASE credit_limit WHEN 100 THEN 'Low'
   WHEN 5000 THEN 'High'
   ELSE 'Medium' END AS credit
   FROM customers
   ORDER BY cust_last_name, credit;

CUST_LAST_NAME       CREDIT
-------------------- ------
Adjani               Medium
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
Adjani               Medium
Alexander            Medium
Alexander            Medium
Altman               High
Altman               Medium
. . .
```

Searched CASE Example

The following statement finds the average salary of the employees in the sample table `oe.employees`, using $2000 as the lowest salary possible:

```
SELECT AVG(CASE WHEN e.salary > 2000 THEN e.salary
   ELSE 2000 END) "Average Salary" FROM employees e;

Average Salary
--------------
    6461.68224
```

Column Expressions

A column expression, which is designated as *column_expression* in subsequent syntax diagrams, is a limited form of *expr*. A column expression can be a simple expression, compound expression, function expression, boolean expression, or expression list, but it can contain only the following forms of expression:

- Columns of the subject table — the table being created, altered, or indexed
- Constants (strings or numbers)
- Deterministic functions — either SQL built-in functions or user-defined functions

No other expression forms described in this chapter are valid. In addition, compound expressions using the `PRIOR` keyword are not supported, nor are aggregate functions.

You can use a column expression for these purposes:

- To create a function-based index.
- To explicitly or implicitly define a virtual column. When you define a virtual column, the defining *column_expression* must refer only to columns of the subject table that have already been defined, in the current statement or in a prior statement.

  You cannot specify a call to a PL/SQL function in the defining expression for a virtual column that you want to use as a partitioning column.
- You can use *column_expression* directly as a partitioning key.

The combined components of a column expression must be deterministic. That is, the same set of input values must return the same set of output values.

> **See Also**
>
> Simple Expressions , Compound Expressions , Function Expressions , and Expression Lists for information on these forms of *expr*

Copyright © 1996, 2026, Oracle and/or its affiliates.

CURSOR Expressions

A CURSOR expression returns a nested cursor. This form of expression is equivalent to the PL/SQL REF CURSOR and can be passed as a REF CURSOR argument to a function.

A nested cursor is implicitly opened when the cursor expression is evaluated. For example, if the cursor expression appears in a select list, a nested cursor will be opened for each row fetched by the query. The nested cursor is closed only when:

- The nested cursor is explicitly closed by the user
- The parent cursor is reexecuted
- The parent cursor is closed
- The parent cursor is cancelled
- An error arises during fetch on one of its parent cursors (it is closed as part of the clean-up)

Restrictions on CURSOR Expressions

The following restrictions apply to CURSOR expressions:

- If the enclosing statement is not a SELECT statement, then nested cursors can appear only as REF CURSOR arguments of a procedure.
- If the enclosing statement is a SELECT statement, then nested cursors can also appear in the outermost select list of the query specification or in the outermost select list of another nested cursor.
- Nested cursors cannot appear in views.
- You cannot perform BIND and EXECUTE operations on nested cursors.

Examples

The following example shows the use of a CURSOR expression in the select list of a query:

```
SELECT department_name, CURSOR(SELECT salary, commission_pct
   FROM employees e
   WHERE e.department_id = d.department_id)
   FROM departments d
   ORDER BY department_name;
```

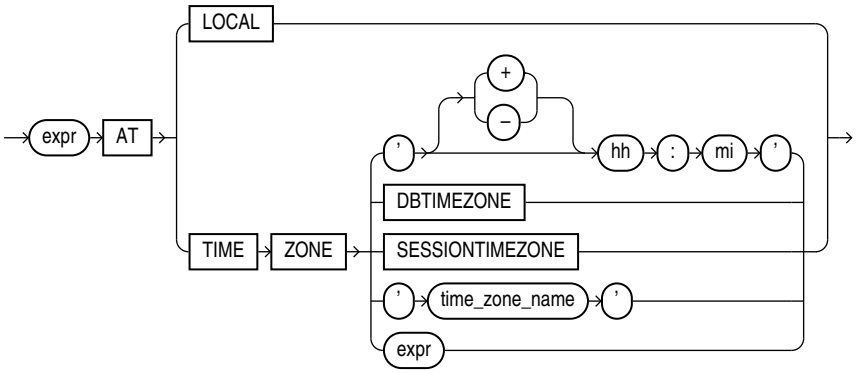
The next example shows the use of a CURSOR expression as a function argument. The example begins by creating a function in the sample OE schema that can accept the REF CURSOR argument. (The PL/SQL function body is shown in italics.)

```
CREATE FUNCTION f(cur SYS_REFCURSOR, mgr_hiredate DATE)
   RETURN NUMBER IS
   emp_hiredate DATE;
   before number :=0;
   after number:=0;
begin
  loop
    fetch cur into emp_hiredate;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
    exit when cur%NOTFOUND;
    if emp_hiredate > mgr_hiredate then
      after:=after+1;
    else
      before:=before+1;
    end if;
  end loop;
  close cur;
  if before > after then
    return 1;
  else
    return 0;
  end if;
end;
/
```

The function accepts a cursor and a date. The function expects the cursor to be a query returning a set of dates. The following query uses the function to find those managers in the sample `employees` table, most of whose employees were hired before the manager.



```
SELECT e1.last_name FROM employees e1
   WHERE f(
   CURSOR(SELECT e2.hire_date FROM employees e2
   WHERE e1.employee_id = e2.manager_id),
   e1.hire_date) = 1
   ORDER BY last_name;

LAST_NAME
-------------------------
Cambrault
Higgins
Hunold
Kochhar
Mourgos
Zlotkey
```

Datetime Expressions

A datetime expression yields a value of one of the datetime data types.

***datetime_expression*::=**

The initial *expr* is any expression, except a scalar subquery expression, that evaluates to a value of data type `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, or `TIMESTAMP WITH LOCAL TIME ZONE`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The DATE data type is not supported. If this *expr* is itself a *datetime_expression*, then it must be enclosed in parentheses.

Datetimes and intervals can be combined according to the rules defined in Table 2-5. The three combinations that yield datetime values are valid in a datetime expression.

If you specify AT LOCAL, then Oracle uses the current session time zone.

The settings for AT TIME ZONE are interpreted as follows:

- The string '[+|-]*hh*:*mi*' specifies a time zone as an offset from UTC. For *hh*, specify the number of hours. For *mi*, specify the number of minutes.
- DBTIMEZONE: Oracle uses the database time zone established (explicitly or by default) during database creation.
- SESSIONTIMEZONE: Oracle uses the session time zone established by default or in the most recent ALTER SESSION statement.
- *time_zone_name*: Oracle returns the *datetime_value_expr* in the time zone indicated by *time_zone_name*. For a listing of valid time zone region names, query the V$TIMEZONE_NAMES dynamic performance view.

> **Note**
>
> Time zone region names are needed by the daylight saving feature. These names are stored in two types of time zone files: one large and one small. One of these files is the default file, depending on your environment and the release of Oracle Database you are using. For more information regarding time zone files and names, see *Oracle AI Database Globalization Support Guide*.

> **See Also**
>
> - *Oracle AI Database Globalization Support Guide* for a complete listing of the time zone region names in both files
> - *Oracle AI Database Reference* for information on the dynamic performance views

- *expr*: If *expr* returns a character string with a valid time zone format, then Oracle returns the input in that time zone. Otherwise, Oracle returns an error.

Example

The following example converts the datetime value of one time zone to another time zone:

```
SELECT FROM_TZ(CAST(TO_DATE('1999-12-01 11:00:00',
      'YYYY-MM-DD HH:MI:SS') AS TIMESTAMP), 'America/New_York')
   AT TIME ZONE 'America/Los_Angeles' "West Coast Time"
   FROM DUAL;

West Coast Time
---------------------------------------------
01-DEC-99 08.00.00.000000 AM AMERICA/LOS_ANGELES
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Function Expressions

You can use any built-in SQL function or user-defined function as an expression. Some valid built-in function expressions are:

```
LENGTH('BLAKE')
ROUND(1234.567*43)
SYSDATE
```

> **See Also**
>
> About SQL Functions ' and Aggregate Functions for information on built-in functions

A user-defined function expression specifies a call to:

- A function in an Oracle-supplied package (see *Oracle AI Database PL/SQL Packages and Types Reference*)
- A function in a user-defined package or type or in a standalone user-defined function (see About User-Defined Functions)
- A user-defined function or operator (see CREATE OPERATOR , CREATE FUNCTION , and *Oracle AI Database Data Cartridge Developer's Guide*)

Some valid user-defined function expressions are:

```
circle_area(radius)
payroll.tax_rate(empno)
hr.employees.comm_pct@remote(dependents, empno)
DBMS_LOB.getlength(column_name)
my_function(a_column)
```

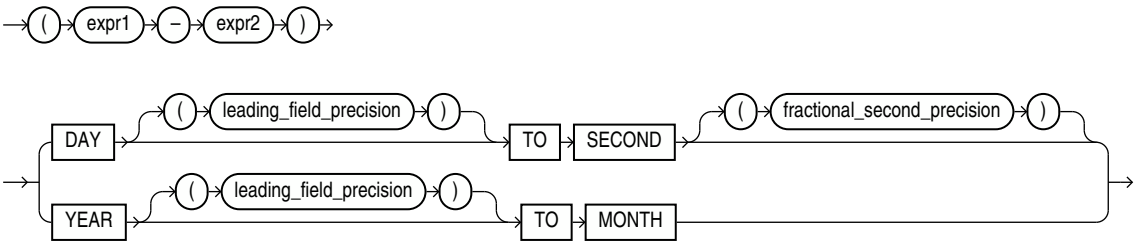
In a user-defined function being used as an expression, positional, named, and mixed notation are supported. For example, all of the following notations are correct:

```
CALL my_function(arg1 => 3, arg2 => 4) ...

CALL my_function(3, 4) ...

CALL my_function(3, arg2 => 4) ...
```

Restriction on User-Defined Function Expressions



You cannot pass arguments of object type or `XMLType` to remote functions and procedures.

Interval Expressions

An interval expression yields a value of `INTERVAL YEAR TO MONTH` or `INTERVAL DAY TO SECOND`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

***interval_expression*::=**

The expressions *expr1* and *expr2* can be any expressions that evaluate to values of data type `DATE`, `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, or `TIMESTAMP WITH LOCAL TIME ZONE`.

Datetimes and intervals can be combined according to the rules defined in Table 2-5. The six combinations that yield interval values are valid in an interval expression.

Both *leading_field_precision* and *fractional_second_precision* can be any integer from 0 to 9. If you omit the *leading_field_precision* for either `DAY` or `YEAR`, then Oracle Database uses the default value of 2. If you omit the *fractional_second_precision* for second, then the database uses the default value of 6. If the value returned by a query contains more digits that the default precision, then Oracle Database returns an error. Therefore, it is good practice to specify a precision that you know will be at least as large as any value returned by the query.

For example, the following statement subtracts the value of the `order_date` column in the sample table `orders` (a datetime value) from the system timestamp (another datetime value) to yield an interval value expression. It is not known how many days ago the oldest order was placed, so the maximum value of 9 for the `DAY` leading field precision is specified:

```
SELECT (SYSTIMESTAMP - order_date) DAY(9) TO SECOND FROM orders
   WHERE order_id = 2458;
```

JSON Object Access Expressions

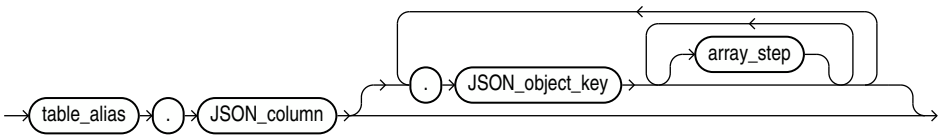
A JSON object access expression is used only when querying a column of JSON data. It yields a character string that contains one or more JSON values found in that data. The syntax for this type of expression is called dot-notation syntax.

Just as for SQL/JSON query functions, the JSON column that you query must be known to contain only well-formed JSON data. That is, it must be of data type `JSON`, `VARCHAR2`, `CLOB`, or `BLOB`. If the type is not `JSON` then the column must have an `IS JSON` check constraint.

If you do not use an item method in your dot-notation query, then a SQL value representing JSON data is returned as follows:

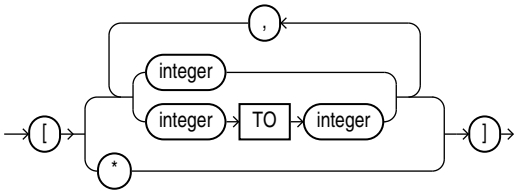
- If the queried data is of type `JSON`, then the returned value is also of type `JSON` .
- If the queried data is textual of type `VARCHAR2`, `CLOB`, or `BLOB`, then the returned data is of type `VARCHAR2(4000)`.

If a dot-notation query does not use an item method then the returned JSON data depends on the targeted JSON data, as follows:



- If a *single* JSON value is targeted, then that value is returned, whether it is a JSON scalar, object, or array.

Copyright © 1996, 2026, Oracle and/or its affiliates.



- If *multiple* JSON values are targeted, then a JSON array, whose elements are those values, is returned. (The order of the array elements is undefined.)

For details on querying JSON data using simple dot notation see Simple Dot-Notation Access to JSON Data of the *JSON Developer's Guide* .

***json_object_access_expr*::=**

***array_step*::=**

The dot-notation syntax is a table alias (mandatory) followed by a dot, that is, a period (.), the name of a JSON column, and one or more pairs of the form `. json_field` or `. json_field` followed by `array_step`, where `json_field` is a JSON field name and `array_step` is an array step expression as described in Basic SQL/JSON Path Expression Syntax of the *JSON Developer's Guide*.

- For *`table_alias`*, specify the alias for the table that contains the column of JSON data. This table alias is required and must be assigned to the table elsewhere in the SQL statement.
- For *`JSON_column`*, specify the name of the column of JSON data. The column must be of data type `VARCHAR2`, `CLOB`, `BLOB`, or `JSON`.

  Columns can have data of `JSON` data type if they are the result of JSON generation functions, of `JSON_QUERY`, or `TREAT` .

  To identify non `JSON` type data types you can define the `IS JSON` check constraint on the column .
- You can optionally specify one or more JSON object keys. The object keys allow you to target specific JSON values in the JSON data. The first *`JSON_object_key`* must be a case-sensitive match to the key (property) name of an object member in the top level of the JSON data. If the value of that object member is another JSON object, then you can specify a second *`JSON_object_key`* that matches the key name of a member of that object, and so on. If a JSON array is encountered during any of these iterations, and you do not specify an *`array_step`*, then the array is implicitly unwrapped and the elements of the array are evaluated using the *`JSON_object_key`*.
- If the JSON value is an array, then you can optionally specify one or more *`array_step`* clauses. This allows you to access specific elements of the JSON array.
  - Use *`integer`* to specify the element at index *`integer`* in a JSON array. Use *`integer`* `TO` *`integer`* to specify the range of elements between the two index *`integer`* values, inclusive. If the specified elements exist in the JSON array being evaluated, then the

Copyright © 1996, 2026, Oracle and/or its affiliates.

array step results in a match to those elements. Otherwise, the array step does not result in a match. The first element in a JSON array has index 0.

- Use the asterisk wildcard symbol (*) to specify all elements in a JSON array. If the JSON array being evaluated contains at least one element, then the array step results in a match to all elements in the JSON array. Otherwise, the array step does not result in a match.

If you omit *JSON_object_key*, then the expression yields a character string that contains the JSON data in its entirety. In this case, the character string is of the same data type as the column of JSON data being queried.

A JSON object access expression cannot return a value larger than 4K bytes. If the value surpasses this limit, then the expression returns null. To obtain the actual value, instead use the JSON_QUERY function or the JSON_VALUE function and specify an appropriate return type with the RETURNING clause.

The collation derivation rules for the JSON object access expression are the same as for the JSON_QUERY function.

> **See Also**
>
> Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules for the JSON_QUERY function

Examples

The following examples use the j_purchaseorder table, which is created in Create a Table That Contains a JSON Document. This table contains a column of JSON data called po_document. These examples return JSON values from column po_document.

The following statement returns the value of the property with key name PONumber. The value returned, 1600, is a SQL number.

```
SELECT po.po_document.PONumber.number()
  FROM j_purchaseorder po;

PONumber
--------
1600
```

The following statement first targets the property with key name ShippingInstructions, whose value is a JSON object. The statement then targets the property with key name Phone within that object. The statement returns the value of Phone, which is a JSON array.

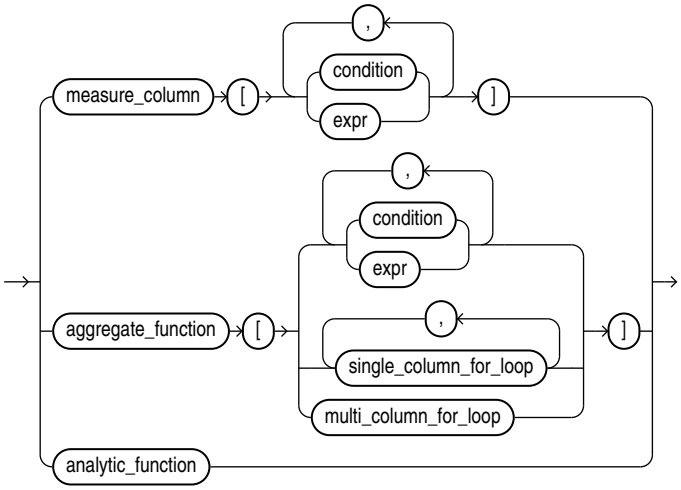
```
SELECT po.po_document.ShippingInstructions.Phone
  FROM j_purchaseorder po;

SHIPPINGINSTRUCTIONS
--------------------------------------------------------------------------------
[{"type":"Office","number":"909-555-7307"},{"type":"Mobile","number":"415-555-1234"}]
```

The following statement first targets the property with key name LineItems, whose value is a JSON array. The expression implicitly unwraps the array and evaluates its elements, which are JSON objects. Next, the statement targets the properties with key name Part, within the unwrapped objects, and finds two objects. The statement then targets the properties with key name Description within those two objects and finds string values. Because more than one value is returned, the values are returned as elements of a JSON array.

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT po.po_document.LineItems.Part.Description
  FROM j_purchaseorder po;



LINEITEMS
---------------------------------
[One Magic Christmas,Lethal Weapon]
```

> **See Also**
>
> *Oracle AI Database JSON Developer's Guide* for more information on querying JSON data using dot-notation syntax

Model Expressions

A model expression is used only in the *model_clause* of a SELECT statement and then only on the right-hand side of a model rule. It yields a value for a cell in a measure column previously defined in the *model_clause*. For additional information, refer to *model_clause*.

***model_expression*::=**

When you specify a measure column in a model expression, any conditions and expressions you specify must resolve to single values.

When you specify an aggregate function in a model expression, the argument to the function is a measure column that has been previously defined in the *model_clause*. An aggregate function can be used only on the right-hand side of a model rule.

Specifying an analytic function on the right-hand side of the model rule lets you express complex calculations directly in the *model_clause*. The following restrictions apply when using an analytic function in a model expression:

- Analytic functions can be used only in an UPDATE rule.
- You cannot specify an analytic function on the right-hand side of the model rule if the left-hand side of the rule contains a FOR loop or an ORDER BY clause.
- The arguments in the OVER clause of the analytic function cannot contain an aggregate.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- The arguments before the `OVER` clause of the analytic function cannot contain a cell reference.

> **See Also**
>
> The MODEL clause: Examples for an example of using an analytic function on the right-hand side of a model rule

When *expr* is itself a model expression, it is referred to as a **nested cell reference**. The following restrictions apply to nested cell references:

- Only one level of nesting is allowed.
- A nested cell reference must be a single-cell reference.
- When `AUTOMATIC ORDER` is specified in the *model_rules_clause*, a nested cell reference can be used on the left-hand side of a model rule only if the measures used in the nested cell reference remain static.

The model expressions shown below are based on the *model_clause* of the following `SELECT` statement:

```
SELECT country,prod,year,s
  FROM sales_view_ref
  MODEL
    PARTITION BY (country)
    DIMENSION BY (prod, year)
    MEASURES (sale s)
    IGNORE NAV
    UNIQUE DIMENSION
    RULES UPSERT SEQUENTIAL ORDER
    (
      s[prod='Mouse Pad', year=2000] =
        s['Mouse Pad', 1998] + s['Mouse Pad', 1999],
      s['Standard Mouse', 2001] = s['Standard Mouse', 2000]
    )
  ORDER BY country, prod, year;
```

The following model expression represents a single cell reference using symbolic notation. It represents the sales of the Mouse Pad for the year 2000.

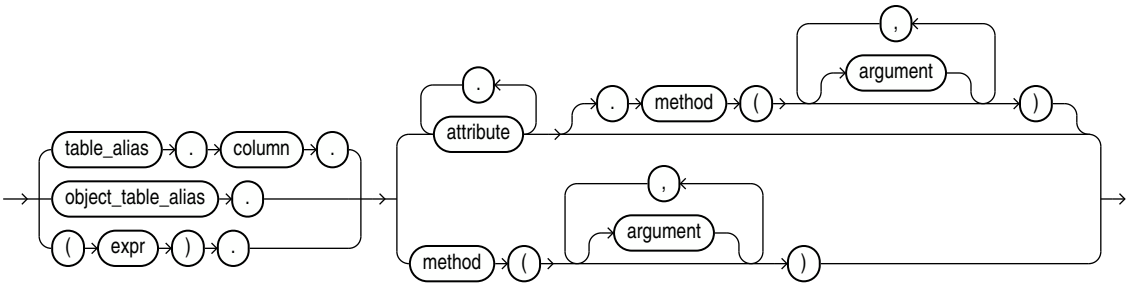
```
s[prod='Mouse Pad',year=2000]
```

The following model expression represents a multiple cell reference using positional notation, using the `CV` function. It represents the sales of the current value of the dimension column `prod` for the year 2001.

```
s[CV(prod), 2001]
```

The following model expression represents an aggregate function. It represents the sum of sales of the Mouse Pad for the years between the current value of the dimension column `year` less two and the current value of the dimension column `year` less one.

```
SUM(s)['Mouse Pad',year BETWEEN CV()-2 AND CV()-1]
```



Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> CV and *model_clause*

Object Access Expressions

An object access expression specifies attribute reference and method invocation.

***object_access_expression*::=**

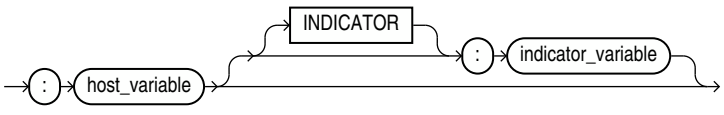
The column parameter can be an object or `REF` column. If you specify *expr*, then it must resolve to an object type.

When a type's member function is invoked in the context of a SQL statement, if the `SELF` argument is null, Oracle returns null and the function is not invoked.

Examples

The following example creates a table based on the sample `oe.order_item_typ` object type, and then shows how you would update and select from the object column attributes.

```
CREATE TABLE short_orders (
   sales_rep VARCHAR2(25), item order_item_typ);



UPDATE short_orders s SET sales_rep = 'Unassigned';

SELECT o.item.line_item_id, o.item.quantity FROM short_orders o;
```

Placeholder Expressions

A placeholder expression provides a location in a SQL statement for which a third-generation language bind variable will provide a value. You can specify the placeholder expression with an optional indicator variable. This form of expression can appear only in embedded SQL statements or SQL statements processed in an Oracle Call Interface (OCI) program.

***placeholder_expression*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

Some valid placeholder expressions are:

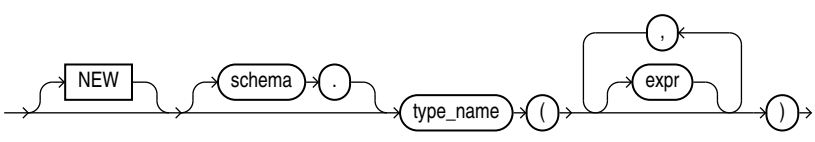
```
:employee_name INDICATOR :employee_name_indicator_var
:department_location
```

> **See Also**
>
> Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules for the placeholder expression with a character data type

Scalar Subquery Expressions

A scalar subquery expression is a subquery that returns exactly one column value from one row. The value of the scalar subquery expression is the value of the select list item of the subquery. If the subquery returns 0 rows, then the value of the scalar subquery expression is `NULL`. If the subquery returns more than one row, then Oracle returns an error.

You can use a scalar subquery expression in most syntax that calls for an expression (*expr*). In all cases, a scalar subquery must be enclosed in its own parentheses, even if its syntactic location already positions it within parentheses (for example, when the scalar subquery is used as the argument to a built-in function).



Scalar subqueries are not valid expressions in the following places:

- As default values for columns
- As hash expressions for clusters
- In the `RETURNING` clause of DML statements
- As the basis of a function-based index
- In `CHECK` constraints
- In `GROUP BY` clauses
- In statements that are unrelated to queries, such as `CREATE PROFILE`

Type Constructor Expressions

A type constructor expression specifies a call to a constructor method. The argument to the type constructor is any expression. Type constructors can be invoked anywhere functions are invoked.

***type_constructor_expression*::=**

The `NEW` keyword applies to constructors for object types but not for collection types. It instructs Oracle to construct a new object by invoking an appropriate constructor. The use of the `NEW` keyword is optional, but it is good practice to specify it.

Copyright © 1996, 2026, Oracle and/or its affiliates.

If *type_name* is an **object type**, then the expressions must be an ordered list, where the first argument is a value whose type matches the first attribute of the object type, the second argument is a value whose type matches the second attribute of the object type, and so on. The total number of arguments to the constructor must match the total number of attributes of the object type.

If *type_name* is a **varray** or **nested table type**, then the expression list can contain zero or more arguments. Zero arguments implies construction of an empty collection. Otherwise, each argument corresponds to an element value whose type is the element type of the collection type.

Restriction on Type Constructor Invocation

In an invocation of a type constructor method, the number of parameters (*expr*) specified cannot exceed 999, even if the object type has more than 999 attributes. This limitation applies only when the constructor is called from SQL. For calls from PL/SQL, the PL/SQL limitations apply.

> **See Also**
>
> *Oracle AI Database Object-Relational Developer's Guide* for additional information on constructor methods and *Oracle AI Database PL/SQL Language Reference* for information on PL/SQL limitations on calls to type constructors

Expression Example

This example uses the `cust_address_typ` type in the sample `oe` schema to show the use of an expression in the call to a constructor method (the PL/SQL is shown in italics):

```
CREATE TYPE address_book_t AS TABLE OF cust_address_typ;
DECLARE
   myaddr cust_address_typ := cust_address_typ(
     '500 Oracle Parkway', 94065, 'Redwood Shores', 'CA','USA');
   alladdr address_book_t := address_book_t();
BEGIN
   INSERT INTO customers VALUES (
      666999, 'Joe', 'Smith', myaddr, NULL, NULL, NULL, NULL,
      NULL, NULL, NULL, NULL, NULL, NULL, NULL);
END;
/
```

Subquery Example

This example uses the `warehouse_typ` type in the sample schema `oe` to illustrate the use of a subquery in the call to the constructor method.

```
CREATE TABLE warehouse_tab OF warehouse_typ;

INSERT INTO warehouse_tab
   VALUES (warehouse_typ(101, 'new_wh', 201));

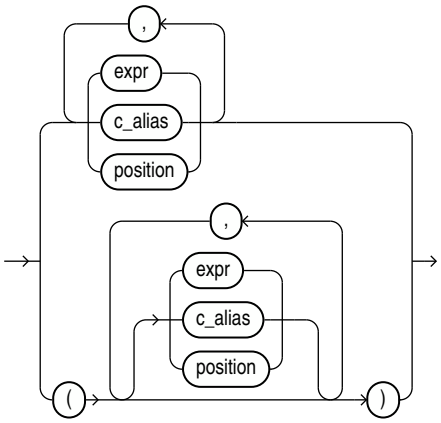
CREATE TYPE facility_typ AS OBJECT (
   facility_id NUMBER,
   warehouse_ref REF warehouse_typ);

CREATE TABLE buildings (b_id NUMBER, building facility_typ);

INSERT INTO buildings VALUES (10, facility_typ(102,
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
   (SELECT REF(w) FROM warehouse_tab w
      WHERE warehouse_name = 'new_wh')));



SELECT b.b_id, b.building.facility_id "FAC_ID",
   DEREF(b.building.warehouse_ref) "WH" FROM buildings b;

      B_ID     FAC_ID WH(WAREHOUSE_ID, WAREHOUSE_NAME, LOCATION_ID)
---------- ---------- -------------------------------------------
        10        102 WAREHOUSE_TYP(101, 'new_wh', 201)
```

Expression Lists

An expression list is a combination of other expressions.

***expression_list*::=**

Expression lists can appear in comparison and membership conditions and in `GROUP BY` clauses of queries and subqueries. An expression lists in a comparision or membership condition is sometimes referred to as a **row value constructor** or **row constructor**.

Comparison and membership conditions appear in the conditions of `WHERE` clauses. They can contain either one or more comma-delimited expressions or one or more sets of expressions where each set contains one or more comma-delimited expressions. In the latter case (multiple sets of expressions):

- Each set is bounded by parentheses
- Each set must contain the same number of expressions
- The number of expressions in each set must match the number of expressions before the operator in the comparison condition or before the `IN` keyword in the membership condition.

A comma-delimited list of expressions can contain no more than 65,535 expressions. A comma-delimited list of sets of expressions can contain any number of sets, but each set can contain no more than 1000 expressions.

The following are some valid expression lists in conditions:

```
(10, 20, 40)
('SCOTT', 'BLAKE', 'TAYLOR')
( ('Guy', 'Himuro', 'GHIMURO'),('Karen', 'Colmenares', 'KCOLMENA') )
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

In the third example, the number of expressions in each set must equal the number of expressions in the first part of the condition. For example:

```
SELECT * FROM employees
  WHERE (first_name, last_name, email) IN
  (('Guy', 'Himuro', 'GHIMURO'),('Karen', 'Colmenares', 'KCOLMENA'))
```

> **See Also**
>
> Comparison Conditions and IN Condition conditions

In a simple `GROUP BY` clause, you can use either the upper or lower form of expression list:

```
SELECT department_id, MIN(salary) min, MAX(salary) max FROM employees
   GROUP BY department_id, salary
   ORDER BY department_id, min, max;

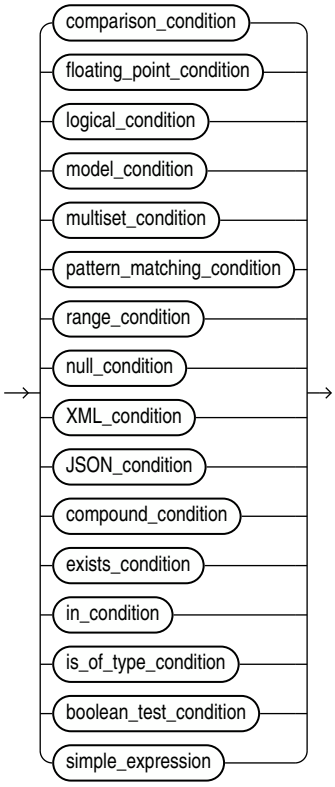
SELECT department_id, MIN(salary) min, MAX(salary) max FROM employees
   GROUP BY (department_id, salary)
   ORDER BY department_id, min, max;
```

In `ROLLUP`, `CUBE`, and `GROUPING SETS` clauses of `GROUP BY` clauses, you can combine individual expressions with sets of expressions in the same expression list. The following example shows several valid grouping sets expression lists in one SQL statement:

```
SELECT
prod_category, prod_subcategory, country_id, cust_city, count(*)
   FROM  products, sales, customers
   WHERE sales.prod_id = products.prod_id
   AND sales.cust_id=customers.cust_id
   AND sales.time_id = '01-oct-00'
   AND customers.cust_year_of_birth BETWEEN 1960 and 1970
GROUP BY GROUPING SETS
  (
   (prod_category, prod_subcategory, country_id, cust_city),
   (prod_category, prod_subcategory, country_id),
   (prod_category, prod_subcategory),
    country_id
  )
ORDER BY prod_category, prod_subcategory, country_id, cust_city;
```

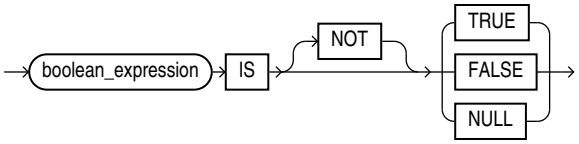
> **See Also**
>
> SELECT

BOOLEAN Expressions



You can now use boolean value expressions within SQL expressions wherever an expression appears in SQL syntax.

***boolean_expression*::=**



Copyright © 1996, 2026, Oracle and/or its affiliates.

***condition*::=**

***boolean_test_condition*::=**

Use *boolean_expression* to evalute the input and return one of the following boolean values :

- `IS TRUE`
- `IS NOT TRUE`
- `IS FALSE`
- `IS NOT FALSE`
- `IS NULL`
- `IS NOT NULL`

Copyright © 1996, 2026, Oracle and/or its affiliates.

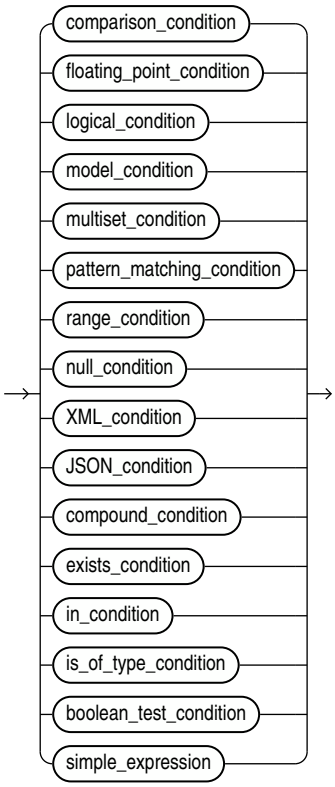
About SQL Expressions

Copyright © 1996, 2026, Oracle and/or its affiliates.

6
Conditions

A **condition** specifies a combination of one or more expressions and logical (Boolean) operators and returns a value of `TRUE`, `FALSE`, or `UNKNOWN`.

This chapter contains the following sections:



- About SQL Conditions
- Comparison Conditions
- Floating-Point Conditions
- Logical Conditions
- Model Conditions
- Multiset Conditions
- Pattern-matching Conditions
- Null Conditions
- XML Conditions
- SQL For JSON Conditions
- Compound Conditions
- BETWEEN Condition
- EXISTS Condition
- IN Condition
- IS OF *type* Condition
- BOOLEAN Test Condition

About SQL Conditions

Conditions can have several forms, as shown in the following syntax.

Copyright © 1996, 2026, Oracle and/or its affiliates.

***condition*::=**

If you have installed Oracle Text, then you can create conditions with the built-in operators that are part of that product, including `CONTAINS`, `CATSEARCH`, and `MATCHES`. For more information on these Oracle Text elements, refer to *Oracle Text Reference*.

The sections that follow describe the various forms of conditions. You must use appropriate condition syntax whenever *`condition`* appears in SQL statements.

You can use a condition in the `WHERE` clause of these statements:

- `DELETE`
- `SELECT`
- `UPDATE`

You can use a condition in any of these clauses of the `SELECT` statement:

- `WHERE`
- `START WITH`
- `CONNECT BY`
- `HAVING`

A condition could be said to be of a logical data type, although Oracle Database does not formally support such a data type.

The following simple condition always evaluates to `TRUE`:

```
1 = 1
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following more complex condition adds the `salary` value to the `commission_pct` value (substituting the value 0 for null) and determines whether the sum is greater than the number constant 25000:

```
NVL(salary, 0) + NVL(salary + (salary*commission_pct, 0) > 25000)
```

Logical conditions can combine multiple conditions into a single condition. For example, you can use the `AND` condition to combine two conditions:

```
(1 = 1) AND (5 < 7)
```

Here are some valid conditions:

```
name = 'SMITH'
employees.department_id = departments.department_id
hire_date > '01-JAN-08'
job_id IN ('SA_MAN', 'SA_REP')
salary BETWEEN 5000 AND 10000
commission_pct IS NULL AND salary = 2100
```

Oracle Database does not accept all conditions in all parts of all SQL statements. Refer to the section devoted to a particular SQL statement in this book for information on restrictions on the conditions in that statement.

Condition Precedence

Precedence is the order in which Oracle Database evaluates different conditions in the same expression. When evaluating an expression containing multiple conditions, Oracle evaluates conditions with higher precedence before evaluating those with lower precedence. Oracle evaluates conditions with equal precedence from left to right within an expression, with the following exceptions:

- Left to right evaluation is not guaranteed for multiple conditions connected using `AND`
- Left to right evaluation is not guaranteed for multiple conditions connected using `OR`

Table 6-1 lists the levels of precedence among SQL condition from high to low. Conditions listed on the same line have the same precedence. As the table indicates, Oracle evaluates operators before conditions.

Table 6-1 SQL Condition Precedence

Type of Condition	Purpose
SQL operators are evaluated before SQL conditions	See Operator Precedence
`=, !=, <, >, <=, >=,`	comparison
`IS [NOT] NULL| TRUE|FALSE , LIKE, [NOT] BETWEEN, [NOT] IN, EXISTS, IS OF` *type*	comparison
`NOT`	exponentiation, logical negation
`AND`	conjunction
`OR`	disjunction

Comparison Conditions

Comparison conditions compare one expression with another. The result of such a comparison can be `TRUE`, `FALSE`, or `UNKNOWN`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Large objects (LOBs) are not supported in comparison conditions. However, you can use PL/SQL programs for comparisons on `CLOB` data.

When comparing numeric expressions, Oracle uses numeric precedence to determine whether the condition compares `NUMBER`, `BINARY_FLOAT`, or `BINARY_DOUBLE` values. Refer to Numeric Precedence for information on numeric precedence.

When comparing character expressions, Oracle uses the rules described in Data Type Comparison Rules. The rules define how the character sets of the expressions are aligned before the comparison, the use of binary or linguistic comparison (collation), the use of blank-padded comparison semantics, and the restrictions resulting from limits imposed on collation keys, including reporting of the error `ORA-12742: unable to create the collation key`.

Two objects of nonscalar type are comparable if they are of the same named type and there is a one-to-one correspondence between their elements. In addition, nested tables of user-defined object types, even if their elements are comparable, must have `MAP` methods defined on them to be used in equality or `IN` conditions.

> **See Also**
>
> *Oracle AI Database Object-Relational Developer's Guide* for information on using `MAP` methods to compare objects

Table 6-2 lists comparison conditions.

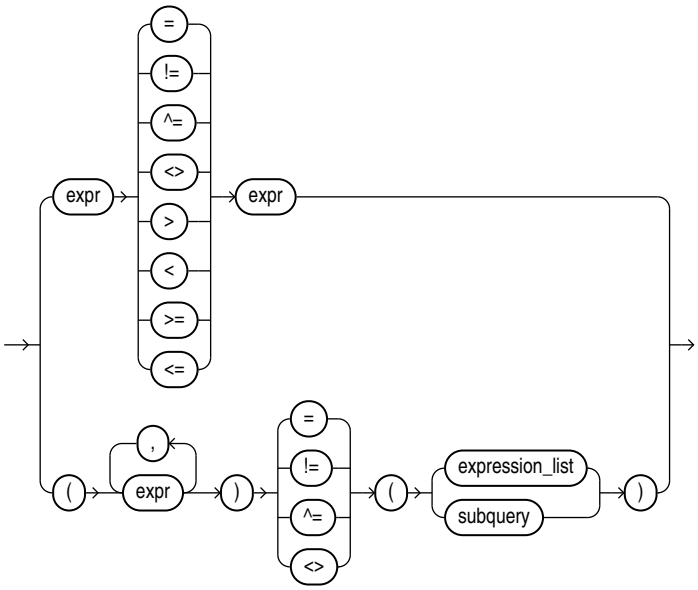
Table 6-2 Comparison Conditions

Type of Condition	Purpose	Example
=	Equality test.	`SELECT * FROM employees WHERE salary = 2500 ORDER BY employee_id;`
!= ^= <>	Inequality test.	`SELECT * FROM employees WHERE salary != 2500 ORDER BY employee_id;`
> <	Greater-than and less-than tests.	`SELECT * FROM employees WHERE salary > 2500 ORDER BY employee_id;` `SELECT * FROM employees WHERE salary < 2500 ORDER BY employee_id;`
>= <=	Greater-than-or-equal-to and less-than-or-equal-to tests.	`SELECT * FROM employees WHERE salary >= 2500 ORDER BY employee_id;` `SELECT * FROM employees WHERE salary <= 2500 ORDER BY employee_id;`

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 6-2 (Cont.) Comparison Conditions

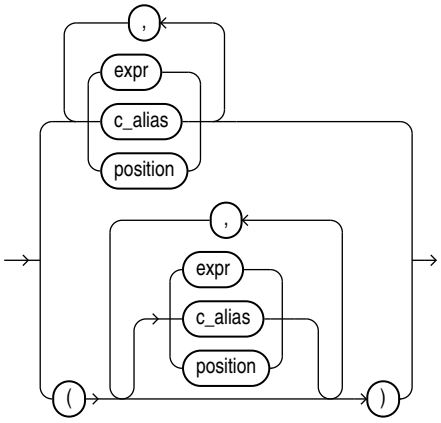
Type of Condition	Purpose	Example



`op ANY`
`op SOME`
	"op" must be one of =, !=, >, <, <=, or >=.
	`op ANY` compares a value on the left side either to each value in a list, or to each value returned by a query, whichever is specified on the right side, using the condition `op`.
	If any of these comparisons returns `TRUE`, `op ANY` returns `TRUE`.
	If all of these comparisons return `FALSE`, or the subquery on the right side returns no rows, `op ANY` returns `FALSE`. Otherwise, the return value is `UNKNOWN`.
	`op ANY` and `op SOME` are synonymous.
		`SELECT * FROM employees`
		`WHERE salary = ANY`
		`(SELECT salary`
		`FROM employees`
		`WHERE department_id = 30)`
		`ORDER BY employee_id;`

`op ALL`	"op" must be one of =, !=, >, <, <=, or >=.
	`op ALL` compares a value on the left side either to each value in a list, or to each value returned by a subquery, whichever is specified on the right side, using the condition `op`.
	If any of these comparisons returns `FALSE`, `op ALL` returns `FALSE`.
	If all of these comparisons return `TRUE`, or the subquery on the right side returns no rows, `op ALL` returns `TRUE` . Otherwise, the return value is `UNKNOWN`.
		`SELECT * FROM employees`
		`WHERE salary >=`
		`ALL (1400, 3000)`
		`ORDER BY employee_id;`

Simple Comparison Conditions



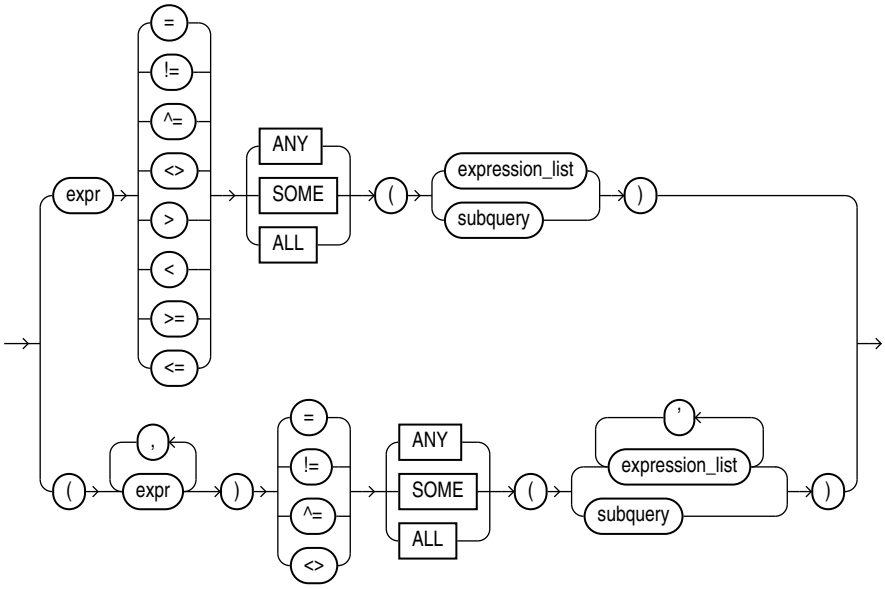
A simple comparison condition specifies a comparison with expressions or subquery results.

***simple_comparison_condition*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

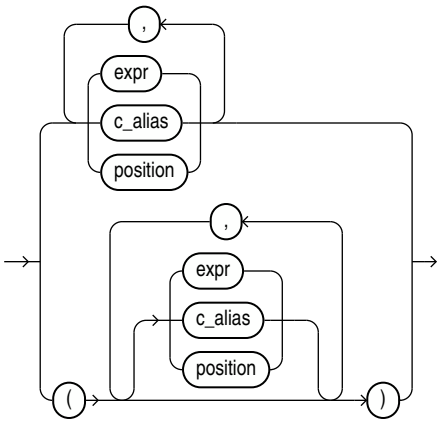
***expression_list*::=**

If you use the lower form of this condition with a single expression to the left of the operator, then you can use the upper or lower form of *expression_list*. If you use the lower form of this condition with multiple expressions to the left of the operator, then you must use the lower form of *expression_list*. In either case, the expressions in *expression_list* must match in number and data type the expressions to the left of the operator. If you specify *subquery*, then the values returned by the subquery must match in number and data type the expressions to the left of the operator.



> **See Also**
>
> Expression Lists for more information about combining expressions and SELECT for information about subqueries

Group Comparison Conditions



A group comparison condition specifies a comparison with any or all members in a list or subquery.

Copyright © 1996, 2026, Oracle and/or its affiliates.

***group_comparison_condition*::=**

***expression_list*::=**

If you use the upper form of this condition (with a single expression to the left of the operator), then you must use the upper form of *expression_list*. If you use the lower form of this condition (with multiple expressions to the left of the operator), then you must use the lower form of *expression_list*, and the expressions in each *expression_list* must match in number and data type the expressions to the left of the operator. If you specify *subquery*, then the values returned by the subquery must match in number and data type the expressions to the left of the operator.

Floating-Point Conditions

The floating-point conditions let you determine whether an expression is infinite or is the undefined result of an operation (is not a number or `NaN`).

***floating_point_condition*::=**

In both forms of floating-point condition, *expr* must resolve to a numeric data type or to any data type that can be implicitly converted to a numeric data type. Table 6-3 describes the floating-point conditions.

Table 6-3 Floating-Point Conditions

Type of Condition	Operation	Example
`IS [NOT] NAN`	Returns TRUE if *expr* is the special value `NaN` when `NOT` is not specified. Returns TRUE if *expr* is not the special value `NaN` when `NOT` is specified.	`SELECT COUNT(*) FROM employees WHERE commission_pct IS NOT NAN;`
`IS [NOT] INFINITE`	Returns TRUE if *expr* is the special value `+INF` or `-INF` when `NOT` is not specified. Returns TRUE if *expr* is neither `+INF` nor `-INF` when `NOT` is specified.	`SELECT last_name FROM employees WHERE salary IS NOT INFINITE;`

Copyright © 1996, 2026, Oracle and/or its affiliates.

Logical Conditions

A logical condition combines the results of two component conditions to produce a single result based on them or to invert the result of a single condition. Table 6-4 lists logical conditions.

Table 6-4 Logical Conditions

Type of Condition	Operation	Examples
NOT	Returns TRUE if the following condition is FALSE. Returns FALSE if it is TRUE. If it is UNKNOWN, then it remains UNKNOWN.	`SELECT * FROM employees WHERE NOT (job_id IS NULL) ORDER BY employee_id;` `SELECT * FROM employees WHERE NOT (salary BETWEEN 1000 AND 2000) ORDER BY employee_id;`
AND	Returns TRUE if both component conditions are TRUE. Returns FALSE if either is FALSE. Otherwise returns UNKNOWN.	`SELECT * FROM employees WHERE job_id = 'PU_CLERK' AND department_id = 30 ORDER BY employee_id;`
OR	Returns TRUE if either component condition is TRUE. Returns FALSE if both are FALSE. Otherwise returns UNKNOWN.	`SELECT * FROM employees WHERE job_id = 'PU_CLERK' OR department_id = 10 ORDER BY employee_id;`

Table 6-5 shows the result of applying the NOT condition to an expression.

Table 6-5 NOT Truth Table

--	TRUE	FALSE	UNKNOWN
NOT	FALSE	TRUE	UNKNOWN

Table 6-6 shows the results of combining the AND condition to two expressions.

Table 6-6 AND Truth Table

AND	TRUE	FALSE	UNKNOWN
TRUE	TRUE	FALSE	UNKNOWN
FALSE	FALSE	FALSE	FALSE
UNKNOWN	UNKNOWN	FALSE	UNKNOWN

For example, in the WHERE clause of the following SELECT statement, the AND logical condition is used to ensure that only those hired before 2004 and earning more than $2500 a month are returned:

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT * FROM employees
WHERE hire_date < TO_DATE('01-JAN-2004', 'DD-MON-YYYY')
  AND salary > 2500
  ORDER BY employee_id;
```

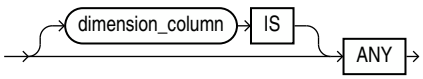
Table 6-7 shows the results of applying OR to two expressions.

Table 6-7 OR Truth Table

OR	TRUE	FALSE	UNKNOWN
TRUE	TRUE	TRUE	TRUE
FALSE	TRUE	FALSE	UNKNOWN
UNKNOWN	TRUE	UNKNOWN	UNKNOWN

For example, the following query returns employees who have a 40% commission rate or a salary greater than $20,000:

```
SELECT employee_id FROM employees
   WHERE commission_pct = .4 OR salary > 20000
   ORDER BY employee_id;
```



Model Conditions

Model conditions can be used only in the MODEL clause of a SELECT statement.

IS ANY Condition

The IS ANY condition can be used only in the *model_clause* of a SELECT statement. Use this condition to qualify all values of a dimension column, including NULL.

***is_any_condition*::=**

The condition always returns a Boolean value of TRUE in order to qualify all values of the column.

Germany       Standard Mouse                             2001     6456.13

16 rows selected.
```

The preceding example requires the view `sales_view_ref`. Refer to The MODEL clause: Examples to create this view.

IS PRESENT Condition

***is_present_condition*::=**

The `IS PRESENT` condition can be used only in the *`model_clause`* of a `SELECT` statement. Use this condition to test whether the cell referenced is present prior to the execution of the *`model_clause`*.

The condition returns `TRUE` if the cell exists prior to the execution of the *`model_clause`* and `FALSE` if it does not.

> **See Also**
>
> *model_clause* and Model Expressions for information

Example

In the following example, if sales of the Mouse Pad for year 1999 exist, then sales of the Mouse Pad for year 2000 is set to sales of the Mouse Pad for year 1999. Otherwise, sales of the Mouse Pad for year 2000 is set to 0.

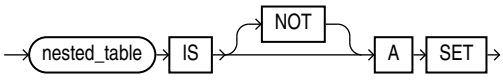
16 rows selected.
```

The preceding example requires the view `sales_view_ref`. Refer to The MODEL clause: Examples to create this view.



Multiset Conditions

Multiset conditions test various aspects of nested tables.

IS A SET Condition

Use `IS A SET` conditions to test whether a specified nested table is composed of unique elements. The condition returns `UNKNOWN` if the nested table is `NULL`. Otherwise, it returns `TRUE` if the nested table is a set, even if it is a nested table of length zero, and `FALSE` otherwise.

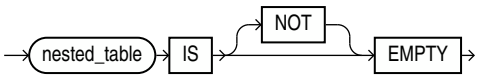
***is_a_set_condition*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

Example

The following example selects from the table `customers_demo` those rows in which the `cust_address_ntab` nested table column contains unique elements:

```
SELECT customer_id, cust_address_ntab
  FROM customers_demo
  WHERE cust_address_ntab IS A SET
  ORDER BY customer_id;



CUSTOMER_ID CUST_ADDRESS_NTAB(STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID)
-----------------------------------------------------------------------------------------
        101 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('514 W Superior St', '46901', 'Kokomo', 'IN', 'US'))
        102 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('2515 Bloyd Ave', '46218', 'Indianapolis', 'IN', 'US'))
        103 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('8768 N State Rd 37', '47404', 'Bloomington', 'IN', 'US'))
        104 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('6445 Bay Harbor Ln', '46254', 'Indianapolis', 'IN', 'US'))
        105 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('4019 W 3Rd St', '47404', 'Bloomington', 'IN', 'US'))
```

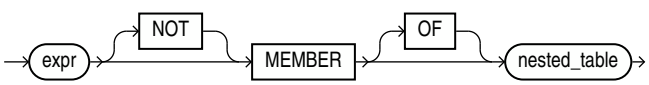
The preceding example requires the table `customers_demo` and a nested table column containing data. Refer to "Multiset Operators " to create this table and nested table column.

IS EMPTY Condition

Use the `IS [NOT] EMPTY` conditions to test whether a specified nested table is empty. A nested table that consists of a single value, a `NULL`, is not considered an empty nested table.

***is_empty_condition*::=**

The condition returns a Boolean value: `TRUE` for an `IS EMPTY` condition if the collection is empty, and `TRUE` for an `IS NOT EMPTY` condition if the collection is not empty. If you specify `NULL` for the nested table or varray, then the result is `NULL`.



Example

The following example selects from the sample table `pm.print_media` those rows in which the `ad_textdocs_ntab` nested table column is not empty:

```
SELECT product_id, TO_CHAR(ad_finaltext) AS text
   FROM print_media
   WHERE ad_textdocs_ntab IS NOT EMPTY
   ORDER BY product_id, text;
```

MEMBER Condition

***member_condition*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

A *member_condition* is a membership condition that tests whether an element is a member of a nested table. The return value is TRUE if *expr* is equal to a member of the specified nested table or varray. The return value is NULL if *expr* is null or if the nested table is empty.

- *expr* must be of the same type as the element type of the nested table.
- The OF keyword is optional and does not change the behavior of the condition.
- The NOT keyword reverses the Boolean output: Oracle returns FALSE if *expr* is a member of the specified nested table.
- The element types of the nested table must be comparable. Refer to Comparison Conditions for information on the comparability of nonscalar types.

Example

The following example selects from the table customers_demo those rows in which the cust_address_ntab nested table column contains the values specified in the WHERE clause:

```
SELECT customer_id, cust_address_ntab
  FROM customers_demo
  WHERE cust_address_typ('8768 N State Rd 37', 47404,
                         'Bloomington', 'IN', 'US')
  MEMBER OF cust_address_ntab
  ORDER BY customer_id;

CUSTOMER_ID CUST_ADDRESS_NTAB(STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID)
----------- --------------------------------------------------------------------------------
        103 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('8768 N State Rd 37', '47404', 'Bloomington', 'IN', 'US'))
```

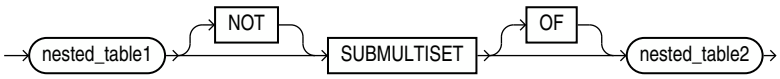
The preceding example requires the table customers_demo and a nested table column containing data. Refer to Multiset Operators to create this table and nested table column.

SUBMULTISET Condition

The SUBMULTISET condition tests whether a specified nested table is a submultiset of another specified nested table.

The operator returns a Boolean value. TRUE is returned when *nested_table1* is a submultiset of *nested_table2*. *nested_table1* is a submultiset of *nested_table2* when one of the following conditions occur:

- *nested_table1* is not null and contains no rows. TRUE is returned even if *nested_table2* is null since an empty multiset is a submultiset of any non-null replacement for *nested_table2*.
- *nested_table1* and *nested_table2* are not null, *nested_table1* does not contain a null element, and there is a one-to-one mapping of each element in *nested_table1* to an equal element in *nested_table2*.



NULL is returned when one of the following conditions occurs:

- *nested_table1* is null.
- *nested_table2* is null, and *nested_table1* is not null and not empty.
- *nested_table1* is a submultiset of *nested_table2* after modifying each null element of *nested_table1* and *nested_table2* to some non-null value, enabling a one-to-one mapping of each element in *nested_table1* to an equal element in *nested_table2*.

If none of the above conditions occur, then FALSE is returned.

Copyright © 1996, 2026, Oracle and/or its affiliates.

***submultiset_condition*::=**

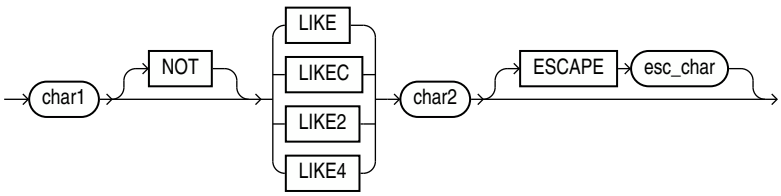
- The `OF` keyword is optional and does not change the behavior of the operator.
- The `NOT` keyword reverses the Boolean output: Oracle returns `FALSE` if *`nested_table1`* is a subset of *`nested_table2`*.
- The element types of the nested table must be comparable. Refer to Comparison Conditions for information on the comparability of nonscalar types.

Example

The following example selects from the `customers_demo` table those rows in which the `cust_address_ntab` nested table is a submultiset of the `cust_address2_ntab` nested table:

```
SELECT customer_id, cust_address_ntab
  FROM customers_demo
  WHERE cust_address_ntab SUBMULTISET OF cust_address2_ntab
  ORDER BY customer_id;
```

The preceding example requires the table `customers_demo` and two nested table columns containing data. Refer to Multiset Operators to create this table and nested table columns.



Pattern-matching Conditions

The pattern-matching conditions compare character data.

LIKE Condition

The `LIKE` conditions specify a test involving pattern matching. Whereas the equality operator (=) exactly matches one character value to another, the `LIKE` conditions match a portion of one character value to another by searching the first value for the pattern specified by the second. `LIKE` calculates strings using characters as defined by the input character set. `LIKEC` uses Unicode complete characters. `LIKE2` uses UCS2 code points. `LIKE4` uses UCS4 code points.

***like_condition*::=**

In this syntax:

- *`char1`* is a character expression, such as a character column, called the **search value**.
- *`char2`* is a character expression, usually a literal, called the **pattern**.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- *esc_char* is a character expression, usually a literal, called the **escape character**.

The LIKE condition is the best choice in almost all situations. Use the following guidelines to determine whether any of the variations would be helpful in your environment:

- Use LIKE2 to process strings using UCS-2 semantics. LIKE2 treats a Unicode supplementary character as two characters.
- Use LIKE4 to process strings using UCS-4 semantics. LIKE4 treats a Unicode supplementary character as one character.
- Use LIKEC to process strings using Unicode complete character semantics. LIKEC treats a composite character as one character.

For more on character length see the following:

- *Oracle Database Globalization Support Guide*
- *Oracle Database SecureFiles and Large Objects Developer's Guide*

If *esc_char* is not specified, then there is no default escape character. If any of *char1*, *char2*, or *esc_char* is null, then the result is unknown. Otherwise, the escape character, if specified, must be a character string of length 1.

All of the character expressions (*char1*, *char2*, and *esc_char*) can be of any of the data types CHAR, VARCHAR2, NCHAR, or NVARCHAR2. If they differ, then Oracle converts all of them to the data type of *char1*.

The pattern can contain special pattern-matching characters:

- An underscore (_) in the pattern matches exactly one character (as opposed to one byte in a multibyte character set) in the value.
- A percent sign (%) in the pattern can match zero or more characters (as opposed to bytes in a multibyte character set) in the value. The pattern '%' cannot match a null.

You can include the actual characters % or _ in the pattern by using the ESCAPE clause, which identifies the escape character. If the escape character precedes the character % or _ in the pattern, then Oracle interprets this character literally in the pattern rather than as a special pattern-matching character. You can also search for the escape character itself by repeating it. For example, if @ is the escape character, then you can use @@ to search for @.

> **Note**
>
> Only ASCII-equivalent underscore (_) and percent (%) characters are recognized as pattern-matching characters. Their full-width variants, present in East Asian character sets and in Unicode, are treated as normal characters.

Table 6-8 describes the LIKE conditions.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 6-8 LIKE Condition

Type of Condition	Operation	Example
`x [NOT] LIKE y [ESCAPE 'z']`	TRUE if *x* does [not] match the pattern *y*. Within *y*, the character % matches any string of zero or more characters except null. The character _ matches any single character. Any character can follow ESCAPE except percent (%) and underbar (_). A wildcard character is treated as a literal if preceded by the escape character.	`SELECT last_name FROM employees WHERE last_name LIKE '%A\_B%' ESCAPE '\' ORDER BY last_name;`

To process the `LIKE` conditions, Oracle divides the pattern into subpatterns consisting of one or two characters each. The two-character subpatterns begin with the escape character and the other character is %, or _, or the escape character.

Let P_1, P_2, ..., P_n be these subpatterns. The like condition is true if there is a way to partition the search value into substrings S_1, S_2, ..., S_n so that for all *i* between 1 and *n*:

- If P_i is _, then S_i is a single character.
- If P_i is %, then S_i is any string.
- If P_i is two characters beginning with an escape character, then S_i is the second character of P_i.
- Otherwise, $P_i = S_i$.

With the `LIKE` conditions, you can compare a value to a pattern rather than to a constant. The pattern must appear after the `LIKE` keyword. For example, you can issue the following query to find the salaries of all employees with names beginning with `R`:

```
SELECT salary
    FROM employees
    WHERE last_name LIKE 'R%'
    ORDER BY salary;
```

The following query uses the = operator, rather than the `LIKE` condition, to find the salaries of all employees with the name 'R%':

```
SELECT salary
    FROM employees
    WHERE last_name = 'R%'
    ORDER BY salary;
```

The following query finds the salaries of all employees with the name 'SM%'. Oracle interprets 'SM%' as a text literal, rather than as a pattern, because it precedes the `LIKE` keyword:

```
SELECT salary
    FROM employees
    WHERE 'SM%' LIKE last_name
    ORDER BY salary;
```

Collation and Case Sensitivity

The `LIKE` condition is collation-sensitive. Oracle Database compares the subpattern Pi to the substring Si in the processing algorithm above using the collation determined from the derived collations of *char1* and *char2*. If this collation is case-insensitive, the pattern-matching is case-insensitive as well.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> *Oracle AI Database Globalization Support Guide* for more information on case- and accent-insensitive collations and on collation determination rules for the `LIKE` condition

Pattern Matching on Indexed Columns

When you use `LIKE` to search an indexed column for a pattern, Oracle can use the index to improve performance of a query if the leading character in the pattern is not `%` or _. In this case, Oracle can scan the index by this leading character. If the first character in the pattern is `%` or _, then the index cannot improve performance because Oracle cannot scan the index.

LIKE Condition: General Examples

This condition is true for all `last_name` values beginning with `Ma`:

```
last_name LIKE 'Ma%'
```

All of these `last_name` values make the condition true:

```
Mallin, Markle, Marlow, Marvins, Mavris, Matos
```

Case is significant, so `last_name` values beginning with `MA`, `ma`, and `mA` make the condition false.

Consider this condition:

```
last_name LIKE 'SMITH_'
```

This condition is true for these `last_name` values:

```
SMITHE, SMITHY, SMITHS
```

This condition is false for `SMITH` because the special underscore character (_) must match exactly one character of the `last_name` value.

ESCAPE Clause Example

The following example searches for employees with the pattern `A_B` in their name:

```
SELECT last_name
    FROM employees
    WHERE last_name LIKE '%A\_B%' ESCAPE '\'
    ORDER BY last_name;
```

The `ESCAPE` clause identifies the backslash (\) as the escape character. In the pattern, the escape character precedes the underscore (_). This causes Oracle to interpret the underscore literally, rather than as a special pattern matching character.

Patterns Without % Example

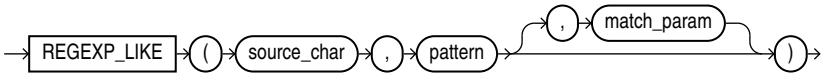
If a pattern does not contain the `%` character, then the condition can be true only if both operands have the same length. Consider the definition of this table and the values inserted into it:

```
CREATE TABLE ducks (f CHAR(6), v VARCHAR2(6));
INSERT INTO ducks VALUES ('DUCK', 'DUCK');
SELECT '*'||f||'*' "char",
   '*'||v||'*' "varchar"
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
   FROM ducks;

char     varchar
-------- --------
*DUCK  * *DUCK*
```



Because Oracle blank-pads `CHAR` values, the value of `f` is blank-padded to 6 bytes. `v` is not blank-padded and has length 4.

REGEXP_LIKE Condition

`REGEXP_LIKE` is similar to the `LIKE` condition, except `REGEXP_LIKE` performs regular expression matching instead of the simple pattern matching performed by `LIKE`. This condition evaluates strings using characters as defined by the input character set.

This condition complies with the POSIX regular expression standard and the Unicode Regular Expression Guidelines. For more information, refer to Oracle Regular Expression Support.

***regexp_like_condition*::=**

- *source_char* is a character expression that serves as the search value. It is commonly a character column and can be of any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`.
- *pattern* is the **regular expression**. It is usually a text literal and can be of any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. It can contain up to 512 bytes. If the data type of *pattern* is different from the data type of *source_char*, Oracle converts *pattern* to the data type of *source_char*. For a listing of the operators you can specify in *pattern*, refer to Oracle Regular Expression Support.
- *match_param* is a character expression of the data type `VARCHAR2` or `CHAR` that lets you change the default matching behavior of the condition.

  The value of *match_param* can include one or more of the following characters:

  - `'i'` specifies case-insensitive matching, even if the determined collation of the condition is case-sensitive.
  - `'c'` specifies case-sensitive and accent-sensitive matching, even if the determined collation of the condition is case-insensitive or accent-insensitive.
  - `'n'` allows the period (.), which is the match-any-character wildcard character, to match the newline character. If you omit this parameter, then the period does not match the newline character.
  - `'m'` treats the source string as multiple lines. Oracle interprets `^` and `$` as the start and end, respectively, of any line anywhere in the source string, rather than only at the start or end of the entire source string. If you omit this parameter, then Oracle treats the source string as a single line.
  - `'x'` ignores whitespace characters. By default, whitespace characters match themselves.

  If the value of *match_param* contains multiple contradictory characters, then Oracle uses the last character. For example, if you specify `'ic'`, then Oracle uses case-sensitive and

Copyright © 1996, 2026, Oracle and/or its affiliates.

accent-sensitive matching. If the value contains a character other than those shown above, then Oracle returns an error.

If you omit *match_param*, then:

- The default case and accent sensitivity are determined by the determined collation of the REGEXP_LIKE condition.
- A period (.) does not match the newline character.
- The source string is treated as a single line.

Similar to the LIKE condition, the REGEXP_LIKE condition is collation-sensitive.

- Appendix C in *Oracle AI Database Globalization Support Guide* for the collation determination rules for the REGEXP_LIKE condition

Examples

The following query returns the first and last names for those employees with a first name of Steven or Stephen (where first_name begins with Ste and ends with en and in between is either v or ph):

```
SELECT first_name, last_name
FROM employees
WHERE REGEXP_LIKE (first_name, '^Ste(v|ph)en$')
ORDER BY first_name, last_name;

FIRST_NAME           LAST_NAME
-------------------- -------------------------
Steven               King
Steven               Markle
Stephen              Stiles
```

The following query returns the last name for those employees with a double vowel in their last name (where last_name contains two adjacent occurrences of either a, e, i, o, or u, regardless of case):

```
SELECT last_name
FROM employees
WHERE REGEXP_LIKE (last_name, '([aeiou])\1', 'i')
ORDER BY last_name;

LAST_NAME
-------------------------
De Haan
Greenberg
Khoo
Gee
Greene
Lee
Bloom
Feeney
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Null Conditions

A `NULL` condition tests for nulls. This is the only condition that you should use to test for nulls.

***null_condition*::=**

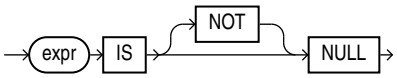

Table 6-9 lists the null conditions.

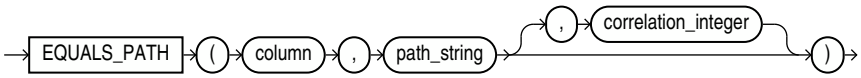
Table 6-9 Null Condition

Type of Condition	Operation	Example

`IS [NOT] NULL`	Tests for nulls.
	See Also: Nulls
		`SELECT last_name`
		`  FROM employees`
		`  WHERE commission_pct`
		`  IS NULL`
		`  ORDER BY last_name;`

XML Conditions



XML conditions determine whether a specified XML resource can be found in a specified path.

EQUALS_PATH Condition

The `EQUALS_PATH` condition determines whether a resource in the Oracle XML database can be found in the database at a specified path.

Use this condition in queries to `RESOURCE_VIEW` and `PATH_VIEW`. These public views provide a mechanism for SQL access to data stored in the XML database repository. `RESOURCE_VIEW` contains one row for each resource in the repository, and `PATH_VIEW` contains one row for each unique path in the repository.

***equals_path_condition*::=**

This condition applies only to the path as specified. It is similar to but more restrictive than `UNDER_PATH`.

For *`path_string`*, specify the (absolute) path name to resolve. This can contain components that are hard or weak resource links.

The optional *`correlation_integer`* argument correlates the `EQUALS_PATH` condition with its ancillary functions `DEPTH` and `PATH`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

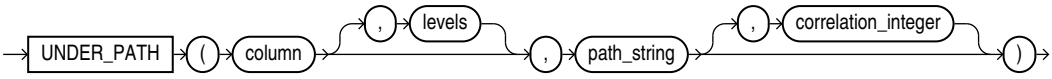
> **See Also**
>
> UNDER_PATH Condition , DEPTH , and PATH

Example

The view RESOURCE_VIEW computes the paths (in the any_path column) that lead to all XML resources (in the res column) in the database repository. The following example queries the RESOURCE_VIEW view to find the paths to the resources in the sample schema oe. The EQUALS_PATH condition causes the query to return only the specified path:

```
SELECT ANY_PATH FROM RESOURCE_VIEW
   WHERE EQUALS_PATH(res, '/sys/schemas/OE/www.example.com')=1;

ANY_PATH
--------------------------------------------
/sys/schemas/OE/www.example.com
```



Compare this example with that for UNDER_PATH Condition .

UNDER_PATH Condition

The UNDER_PATH condition determines whether resources specified in a column can be found under a particular path specified by *path_string* in the Oracle XML database repository. The path information is computed by the RESOURCE_VIEW view, which you query to use this condition.

Use this condition in queries to RESOURCE_VIEW and PATH_VIEW. These public views provide a mechanism for SQL access to data stored in the XML database repository. RESOURCE_VIEW contains one row for each resource in the repository, and PATH_VIEW contains one row for each unique path in the repository.

***under_path_condition*::=**

The optional *levels* argument indicates the number of levels down from *path_string* Oracle should search. For *levels*, specify any nonnegative integer.

The optional *correlation_integer* argument correlates the UNDER_PATH condition with its ancillary functions PATH and DEPTH.

> **See Also**
>
> The related condition EQUALS_PATH Condition and the ancillary functions DEPTH and PATH

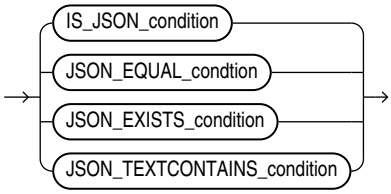
Example

The view RESOURCE_VIEW computes the paths (in the any_path column) that lead to all XML resources (in the res column) in the database repository. The following example queries the

Copyright © 1996, 2026, Oracle and/or its affiliates.

RESOURCE_VIEW view to find the paths to the resources in the sample schema oe. The query returns the path of the XML schema that was created in XMLType Table Examples:

```
SELECT ANY_PATH FROM RESOURCE_VIEW
   WHERE UNDER_PATH(res, '/sys/schemas/OE/www.example.com')=1;



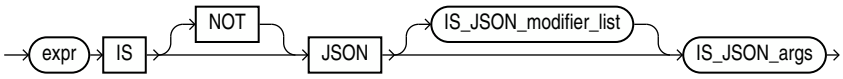
ANY_PATH
--------------------------------------------
/sys/schemas/OE/www.example.com/xwarehouses.xsd
```

SQL For JSON Conditions

SQL for JSON conditions allow you to test JavaScript Object Notation (JSON) data as follows:

- IS JSON Condition lets you test whether an expression is syntactically correct JSON data.
- JSON_EQUAL Condition tests whether two JSON values are the same.
- JSON_EXISTS Condition lets you test whether a specified JSON value exists in JSON data.
- JSON_TEXTCONTAINS Condition lets you test whether a specified character string exists in JSON property values.

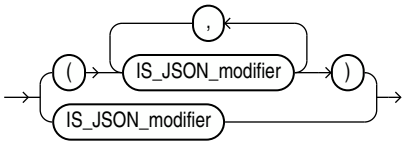
***JSON_condition*::=**



IS JSON Condition

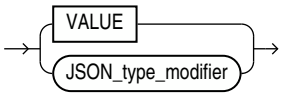
SQL/JSON conditions is json and is not json are complementary. They test whether their argument is syntactically correct, that is, well-formed, JSON data. With optional keyword VALIDATE they test whether the data is also valid with respect to a given JSON schema.

- If the data tested is syntactically correct and keyword VALIDATE is not present, then IS JSON returns true, and IS NOT JSON returns false.
- If keyword VALIDATE is present, then the data is tested to ensure that it is both well-formed and valid with respect to the specified JSON schema. Keyword VALIDATE (optionally followed by keyword USING) must be followed by a SQL string literal that is the JSON schema to validate against.
- If an error occurs during parsing or validating, and the data is considered to not be well-formed or not valid, then IS JSON returns false and IS NOT JSON returns true. Parsing and validation errors are handled by the condition itself returning true or false. Other errors that are neither from parsing or validation, these errors are raised.
- You can use IS JSON and IS NOT JSON in a CASE expression or the WHERE clause of a SELECT statement. You can use IS JSON in a check constraint.

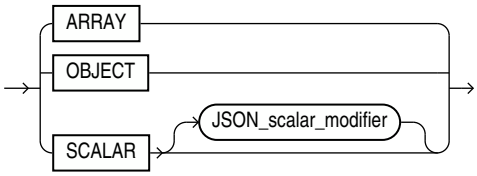


Copyright © 1996, 2026, Oracle and/or its affiliates.

***IS_JSON_condition*::=**

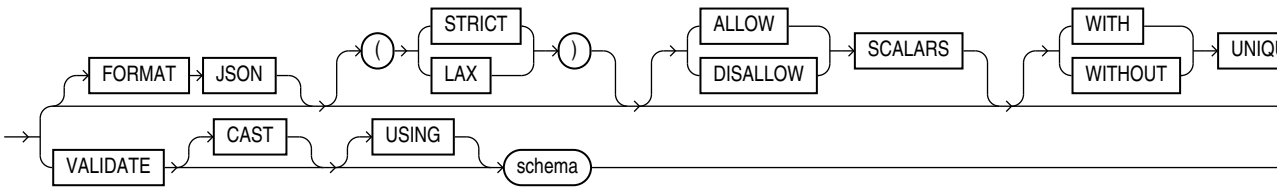


(*IS_JSON_modifier_list*::=, *IS_JSON_args*::=)



***IS_JSON_modifier_list*::=**

***IS_JSON_modifier*::=**



***JSON_type_modifier*::=**

JSON_scalar_modifier::=

***IS_JSON_args*::=**

- Use *expr* to specify the JSON data to be evaluated. Specify an expression that evaluates to a text literal. If *expr* is a column, then the column must be of data type `VARCHAR2`, `CLOB`, or `BLOB`. If *expr* evaluates to null or a text literal of length zero, then this condition returns `UNKNOWN`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- `LIMIT` in *`json_modifier_spec`* applies to the entire JSON modifier specification.
- Specify `ALLOW NULL` in *`json_array_spec`* to allow a JSON single type scalar value of NULL.
- Specify `DISALLOW NULL` in *`json_array_spec`* to disallow a JSON single type scalar value of NULL. This is the default.
- Specify `SORT` in *`json_array_spec`* to sort the JSON array elements in ascending order.

  For more information see SQL/JSON Conditions IS JSON and IS NOT JSON of the *JSON Developer's Guide*.

IS_JSON_Modifier

For JSON-type data, as an alternative to using `VALIDATE` with a simple JSON schema you can use the `IS JSON` modifers `OBJECT`, `ARRAY`, or `SCALAR`, respectively.

For more see SQL JSON Condtions IS JSON and IS NOT JSON of the *JSON Developers's Guide*.

is_json_args

- You must specify `FORMAT JSON` if *`expr`* is a column of data type `BLOB`.
- If you specify `STRICT`, then this condition considers only strict JSON syntax to be well-formed JSON data. If you specify `LAX`, then this condition also considers lax JSON syntax to be well-formed JSON data. The default is `LAX`.

  For a full discussion of `STRICT` and `LAX` syntax see *About Strict and Lax JSON Syntax*, and *TYPE Clause for SQL Functions and Conditions*
- If you specify `WITH UNIQUE KEYS`, then this condition considers JSON data to be well-formed only if key names are unique within each object. If you specify `WITHOUT UNIQUE KEYS`, then this condition considers JSON data to be well-formed even if duplicate key names occur within an object. A `WITHOUT UNIQUE KEYS` test performs faster than a `WITH UNIQUE KEYS` test. The default is `WITHOUT UNIQUE KEYS`.
- Specify the optional keyword `VALIDATE` to test that the data is also valid with respect to a given JSON schema.
- To enforce that a JSON type value is a certain type, you can use JSON type modifiers. See SQL/JSON Conditions IS JSON and IS NOT JSON *of the JSON Developer's Guide.*

JSON Schema Validation

A JSON schema typically specifies the allowed structure and data typing of other JSON documents. You can therefore use a JSON schema to validate JSON data. You can validate JSON data against a JSON schema in the following ways:

- Use condition `IS JSON` (or `IS NOT JSON`) with keyword `VALIDATE` and the name of a JSON schema, to test whether targeted data is valid (or invalid) against that schema. The schema can be provided as a literal string or a usage domain. (Keyword `VALIDATE` can optionally be followed by keyword `USING`.)

  You can use `VALIDATE` with condition is json anywhere you can use that condition. This includes use in a `WHERE` clause, or as a check constraint to ensure that only valid data is inserted in a column.

  When used as a check constraint for a JSON-type column, you can alternatively omit is json, and just use keyword `VALIDATE` directly. These two table creations are equivalent, for a JSON-type column:

  ```
  CREATE TABLE tab (jcol JSON VALIDATE '{"type" : "object"}');
  ```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
CREATE TABLE tab (jcol JSON CONSTRAINT jchk
  CHECK (jcol IS JSON VALIDATE '{"type" : "object"}'));
```

- Use a usage domain as a check constraint for JSON type data. For example:

  ```
  CREATE DOMAIN jd AS JSON CONSTRAINT jchkd CHECK (jd IS JSON VALIDATE '{"type" :
  "object"});

  CREATE TABLE jtab(jcol JSON DOMAIN jd);
  ```

  When creating a domain from a schema, you can alternatively omit the constraint and is json, and just use keyword `VALIDATE` directly. This domain creation is equivalent to the previous one:

  ```
  CREATE DOMAIN jd AS JSON VALIDATE '{"type" : "object"};
  ```

- For databases that support a binary JSON format, data can be encoded on the client. In such cases, the database does not have to convert textual JSON to its binary representation and hence validation using an extended data type can be performed.

  If textual JSON is sent to the database, it is followed by an encoding process to a binary representation (server-side encoding). In such circumstances, the schema validator can operate in `CAST` mode. That is, the binary encoder can use the value specified for the extended data type keyword in the JSON schema and encode the scalar field to its binary representation. Only scaler types are eligible for casting.

  ```
  CREATE TABLE jtab (
    id    NUMBER(9) PRIMARY KEY,
    jcol  JSON CHECK(jcol IS JSON VALIDATE CAST USING '{
                    "type": "object",
                    "properties": {
                         "firstName": {
                          "extendedType": "string",
                          "maxLength": 50
                        },
                        "birthDate" : {
                          "extendedType": "date"
                        }
                      },
                      "required": ["firstName", "birthDate"]
                    }'
    )
  );
  ```

  The following textual JSON is a valid document per the above schema:

  ```
  {
    "firstName": "Scott",
    "birthDate": "1990-04-02"
  }
  ```

- Use PL/SQL functions explained fully in *JSON Schema* of the *JSON Developer's Guide*.

Static dictionary views `DBA_JSON_SCHEMA_COLUMNS`, `ALL_JSON_SCHEMA_COLUMNS`, and `USER_JSON_SCHEMA_COLUMNS` describe a JSON schema that you is used as a check constraint.

Each row of these views contains the name of the table, the JSON column, and the constraint defined by the JSON schema, as well as the JSON schema itself and an indication of whether the cast mode is specified for the JSON schema. Views `DBA_JSON_SCHEMA_COLUMNS` and `ALL_JSON_SCHEMA_COLUMNS` also contain the name of the table owner.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

IS JSON VALIDATE

The following exampe creates a schema `jsontab1` with a JSON constraint `jtlisj` that has a JSON validate check:

```
CREATE TABLE jsontab1(
    id NUMBER(4),
    j  JSON CONSTRAINT jt1isj CHECK (j IS JSON VALIDATE USING
     '{
       "type":"object",
       "minProperties": 2
      }')
    );
```

The following example shows the error when you try to insert values other than a JSON object:

```
INSERT INTO jsontab1(j) VALUES ('["a", "b"]');
INSERT INTO jsontab1(j) VALUES ('["a", "b"]')
*
ERROR at line 1:
ORA-02290: check constraint (SYS.JT1ISJ) violated
```

The following two examples shows a row added with valid input :

```
INSERT INTO jsontab1(j) VALUES ('{"a": "a", "b": "b"}');

   1 row created.

INSERT INTO jsontab1(jschd) VALUES (json('"a json string"'));

1 row created.
```

The following example adds another constraint `jschdsv` to table `jsontab1`:

```
ALTER TABLE jsontab1
ADD jschd JSON CONSTRAINT jschdsv
                  CHECK (jschd IS JSON VALIDATE USING '{"type":"string"}');

Table altered.

SQL> INSERT INTO jsontab1(jschd) VALUES (json('3.1415'));
INSERT INTO jsontab1(jschd) VALUES (json('3.1415'))
*
ERROR at line 1:
ORA-02290: check constraint (SYS.JSCHDSV) violated
```

IS JSON VALIDATE in WHERE Clause

```
SELECT COUNT(1) FROM jsontab1 WHERE j IS JSON
VALIDATE
         '{"type" : "object",
              "properties" : {
                 "id" : {
                     "type" : "number"
                  }
               }
           }';
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Testing for STRICT or LAX JSON Syntax: Example

The following statement creates table `t` with column `col1`:

```
CREATE TABLE t (col1 VARCHAR2(100));
```

The following statements insert values into column `col1` of table `t`:

```
INSERT INTO t VALUES ( '[ "LIT192", "CS141", "HIS160" ]' );
INSERT INTO t VALUES ( '{ "Name": "John" }' );
INSERT INTO t VALUES ( '{ "Grade Values" : { A : 4.0, B : 3.0, C : 2.0 } }');
INSERT INTO t VALUES ( '{ "isEnrolled" : true }' );
INSERT INTO t VALUES ( '{ "isMatriculated" : False }' );
INSERT INTO t VALUES (NULL);
INSERT INTO t VALUES ('This is not well-formed JSON data');
```

The following statement queries table `t` and returns `col1` values that are well-formed JSON data. Because neither the `STRICT` nor `LAX` keyword is specified, this example uses the default `LAX` setting. Therefore, this query returns values that use strict or lax JSON syntax.

```
SELECT col1
  FROM t
  WHERE col1 IS JSON;

COL1
--------------------------------------------------
[ "LIT192", "CS141", "HIS160" ]
{ "Name": "John" }
{ "Grade Values" : { A : 4.0, B : 3.0, C : 2.0 } }
{ "isEnrolled" : true }
{ "isMatriculated" : False }
```

The following statement queries table `t` and returns `col1` values that are well-formed JSON data. This example specifies the `STRICT` setting. Therefore, this query returns only values that use strict JSON syntax.

```
SELECT col1
  FROM t
  WHERE col1 IS JSON STRICT;

COL1
--------------------------------------------------
[ "LIT192", "CS141", "HIS160" ]
{ "Name": "John" }
{ "isEnrolled" : true }
```

The following statement queries table `t` and returns `col1` values that use lax JSON syntax, but omits `col1` values that use strict JSON syntax. Therefore, this query returns only values that contain the exceptions allowed in lax JSON syntax.

```
SELECT col1
  FROM t
  WHERE col1 IS NOT JSON STRICT AND col1 IS JSON LAX;

COL1
--------------------------------------------------
{ "Grade Values" : { A : 4.0, B : 3.0, C : 2.0 } }
{ "isMatriculated" : False }
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Testing for Unique Keys: Example

The following statement creates table `t` with column `col1`:

```
CREATE TABLE t (col1 VARCHAR2(100));
```

The following statements insert values into column `col1` of table `t`:

```
INSERT INTO t VALUES ('{a:100, b:200, c:300}');
INSERT INTO t VALUES ('{a:100, a:200, b:300}');
INSERT INTO t VALUES ('{a:100, b : {a:100, c:300}}');
```

The following statement queries table t and returns `col1` values that are well-formed JSON data with unique key names within each object:

```
SELECT col1 FROM t
  WHERE col1 IS JSON WITH UNIQUE KEYS;

COL1
---------------------------
{a:100, b:200, c:300}
{a:100, b : {a:100, c:300}}
```

The second row is returned because, while the key name a appears twice, it is in two different objects.

The following statement queries table `t` and returns `col1` values that are well-formed JSON data, regardless of whether there are unique key names within each object:

```
SELECT col1 FROM t
  WHERE col1 IS JSON WITHOUT UNIQUE KEYS;

COL1
---------------------------
{a:100, b:200, c:300}
{a:100, a:200, b:300}
{a:100, b : {a:100, c:300}}
```

Using IS JSON as a Check Constraint: Example

The following statement creates table `j_purchaseorder`, which will store JSON data in column `po_document`. The statement uses the `IS JSON` condition as a check constraint to ensure that only well-formed JSON is stored in column `po_document`.

```
CREATE TABLE j_purchaseorder
  (id RAW (16) NOT NULL,
   date_loaded TIMESTAMP(6) WITH TIME ZONE,
   po_document CLOB CONSTRAINT ensure_json CHECK (po_document IS JSON));
```

> **See Also**
>
> *Conditions IS JSON and IS NOT JSON* of the *JSON Developer's Guide*.

JSON_EQUAL Condition

Syntax

Purpose

The Oracle SQL condition `JSON_EQUAL` compares two `JSON` values and returns true if they are equal. It returns false if the two values are not equal. The input values must be valid `JSON` data.

The comparison ignores insignificant whitespace and insignificant object member order. For example, `JSON` objects are equal, if they have the same members, regardless of their order.

If either of the two compared inputs has one or more duplicate fields, then the value returned by `JSON_EQUAL` is unspecified.

`JSON_EQUAL` supports `ERROR ON ERROR`, `FALSE ON ERROR`, and `TRUE ON ERROR`. The default is `FALSE ON ERROR`. A typical example of an error is when the input expression is not valid `JSON`.

Examples

The following statements return TRUE:

```
JSON_EQUAL('{}', '{ }')

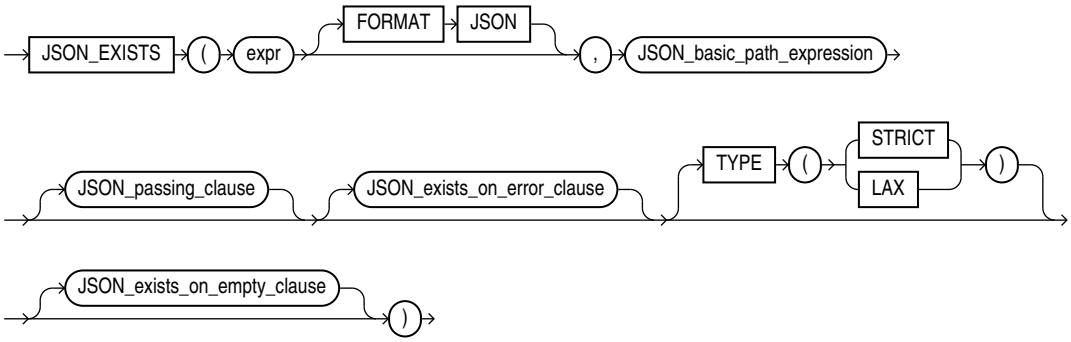
JSON_EQUAL('{a:1, b:2}', '{b:2 , a:1 }')
```

The following statement return FALSE:

```
JSON_EQUAL('{a:"1"}', '{a:1 }') -> FALSE
```

The following statement results in a `ORA-40441` `JSON` syntax error

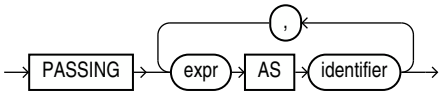
```
JSON_EQUAL('[1]', '[}' ERROR ON ERROR)
```



> **See Also**
>
> - *Oracle Database JSON Developer's Guide* for more information.

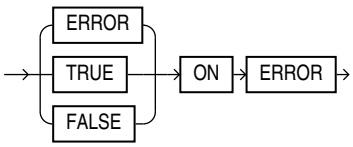
JSON_EXISTS Condition

Use the SQL/JSON condition `JSON_EXISTS` to test whether a specified JSON value exists in JSON data. This condition returns `TRUE` if the JSON value exists and `FALSE` if the JSON value does not exist.

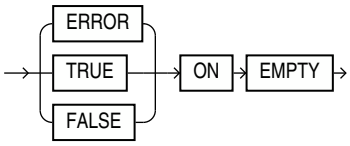


Copyright © 1996, 2026, Oracle and/or its affiliates.

***JSON_exists_condition*::=**



(*JSON_basic_path_expression*: See *Oracle AI Database JSON Developer's Guide*)



***JSON_passing_clause*::=**

***JSON_exists_on_error_clause*::=**

***JSON_exists_on_empty_clause*::=**

expr

Use this clause to specify the JSON data to be evaluated. For *expr*, specify an expression that evaluates to a text literal. If *expr* is a column, then the column must be of data type `VARCHAR2`, `CLOB`, or `BLOB`. If *expr* evaluates to null or a text literal of length zero, then the condition returns `UNKNOWN`.

If *expr* is not a text literal of well-formed JSON data using strict or lax syntax, then the condition returns `FALSE` by default. You can use the *JSON_exists_on_error_clause* to override this default behavior. Refer to the *JSON_exists_on_error_clause*.

FORMAT JSON

You must specify `FORMAT JSON` if *expr* is a column of data type `BLOB`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

JSON_basic_path_expression

Use this clause to specify a SQL/JSON path expression. The condition uses the path expression to evaluate *expr* and determine if a JSON value that matches, or satisfies, the path expression exists. The path expression must be a text literal, but it can contain variables whose values are passed to the path expression by the *JSON_passing_clause*. See *Oracle AI Database JSON Developer's Guide* for the full semantics of *JSON_basic_path_expression*.

JSON_passing_clause

Use this clause to pass values to the path expression. For *expr*, specify a value of data type VARCHAR2, NUMBER, BINARY_DOUBLE, DATE, TIMESTAMP, or TIMESTAMP WITH TIME ZONE. The result of evaluating *expr* is bound to the corresponding identifier in the *JSON_basic_path_expression*.

JSON_exists_on_error_clause

Use this clause to specify the value returned by this condition when *expr* is not well-formed JSON data.

You can specify the following clauses:

- ERROR ON ERROR - Returns the appropriate Oracle error when *expr* is not well-formed JSON data.
- TRUE ON ERROR - Returns TRUE when *expr* is not well-formed JSON data.
- FALSE ON ERROR - Returns FALSE when *expr* is not well-formed JSON data. This is the default.

TYPE Clause

For a full discussion of STRICT and LAX syntax see *About Strict and Lax JSON Syntax*, and *TYPE Clause for SQL Functions and Conditions*

JSON_exists_on_empty_clause

Use this clause to specify the value returned by this function if no match is found when the JSON data is evaluated using the SQL/JSON path expression.

You can specify the following clauses:

- ERROR ON EMPTY - Returns the appropriate Oracle error when *expr* is not well-formed JSON data.
- TRUE ON EMPTY - Returns TRUE when *expr* is not well-formed JSON data.
- FALSE ON EMPTY - Returns FALSE when expr is not well-formed JSON data. This is the default.

Examples

The following statement creates table t with column name:

```
CREATE TABLE t (name VARCHAR2(100));
```

The following statements insert values into column name of table t:

```
INSERT INTO t VALUES ('[{first:"John"}, {middle:"Mark"}, {last:"Smith"}]');
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
INSERT INTO t VALUES ('[{first:"Mary"}, {last:"Jones"}]');
INSERT INTO t VALUES ('[{first:"Jeff"}, {last:"Williams"}]');
INSERT INTO t VALUES ('[{first:"Jean"}, {middle:"Anne"}, {last:"Brown"}]');
INSERT INTO t VALUES (NULL);
INSERT INTO t VALUES ('This is not well-formed JSON data');
```

The following statement queries column `name` in table `t` and returns JSON data that consists of an array whose first element is an object with property name `first`. The `ON ERROR` clause is not specified. Therefore, the `JSON_EXISTS` condition returns `FALSE` for values that are not well-formed JSON data.

```
SELECT name FROM t
  WHERE JSON_EXISTS(name, '$[0].first');

NAME
--------------------------------------------------
[{first:"John"}, {middle:"Mark"}, {last:"Smith"}]
[{first:"Mary"}, {last:"Jones"}]
[{first:"Jeff"}, {last:"Williams"}]
[{first:"Jean"}, {middle:"Anne"}, {last:"Brown"}]
```

The following statement queries column `name` in table `t` and returns JSON data that consists of an array whose second element is an object with property name `middle`. The `ON ERROR` clause is not specified. Therefore, the `JSON_EXISTS` condition returns `FALSE` for values that are not well-formed JSON data.

```
SELECT name FROM t
  WHERE JSON_EXISTS(name, '$[1].middle');

NAME
--------------------------------------------------------------------------------
[{first:"John"}, {middle:"Mark"}, {last:"Smith"}]
[{first:"Jean"}, {middle:"Anne"}, {last:"Brown"}]
```

The following statement is similar to the previous statement, except that the `TRUE ON ERROR` clause is specified. Therefore, the `JSON_EXISTS` condition returns `TRUE` for values that are not well-formed JSON data.

```
SELECT name FROM t
  WHERE JSON_EXISTS(name, '$[1].middle' TRUE ON ERROR);

NAME
--------------------------------------------------------------------------------
[{first:"John"}, {middle:"Mark"}, {last:"Smith"}]
[{first:"Jean"}, {middle:"Anne"}, {last:"Brown"}]
This is not well-formed JSON data
```

The following statement queries column `name` in table `t` and returns JSON data that consists of an array that contains an element that is an object with property name `last`. The wildcard symbol (*) is specified for the array index. Therefore, the query returns arrays that contain such an object, regardless of its index number in the array.

```
SELECT name FROM t
  WHERE JSON_EXISTS(name, '$[*].last');

NAME
--------------------------------------------------
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
[{first:"John"}, {middle:"Mark"}, {last:"Smith"}]
[{first:"Mary"}, {last:"Jones"}]
[{first:"Jeff"}, {last:"Williams"}]
[{first:"Jean"}, {middle:"Anne"}, {last:"Brown"}]
```

The following statement performs a filter expression using the passing clause. The SQL/JSON variable *$var1* in the comparison predicate *(@.middle == $var1)* gets its value from the bind variable *var1* of the PASSING clause.

Using bind variables for value comparisons avoids query re-compilation.

```
SELECT name FROM t

  WHERE JSON_EXISTS(name, '$[1]?(@.middle == $var1)' PASSING 'Anne' as "var1");

NAME

--------------------------------------------------------------------------------

[{first:"Jean"}, {middle:"Anne"}, {last:"Brown"}]
```

>
> Condition JSON_Exists

JSON_TEXTCONTAINS Condition

Use the SQL/JSON condition `JSON_TEXTCONTAINS` to test whether a specified character string exists in JSON property values. You can use this condition to filter JSON data on a specific word or number.

This condition takes the following arguments:

- A table or view column that contains JSON data. A JSON search index, which is an Oracle Text index designed specifically for use with JSON data, must be defined on the column. Each row of JSON data in the column is referred to as a **JSON document**.
- A SQL/JSON path expression. The path expression is applied to each JSON document in an attempt to match a specific JSON object within the document. The path expression can contain only JSON object steps; it cannot contain JSON array steps.
- A character string. The condition searches for the character string in all of the string and numeric property values in the matched JSON object, including array values. The string must exist as a separate word in the property value. For example, if you search for 'beth', then a match will be found for string property value "beth smith", but not for "elizabeth smith". If you search for '10', then a match will be found for numeric property value 10 or string property value "10 main street", but a match will not be found for numeric property value 110 or string property value "102 main street".

This condition returns `TRUE` if a match is found, and `FALSE` if a match is not found.

> **See Also**
>
> JSON Full text search queries

Copyright © 1996, 2026, Oracle and/or its affiliates.

***JSON_textcontains_condition*::=**

(*JSON_basic_path_expression*: See *Oracle AI Database JSON Developer's Guide*)

column

Specify the name of the table or view column containing the JSON data to be tested. The column must be of data type `VARCHAR2`, `CLOB`, or `BLOB`. A JSON search index, which is an Oracle Text index designed specifically for use with JSON data, must be defined on the column. If a column value is a null or a text literal of length zero, then the condition returns `UNKNOWN`.

If a column value is not a text literal of well-formed JSON data using strict or lax syntax, then the condition returns `FALSE`.

JSON_basic_path_expression

Use this clause to specify a SQL/JSON path expression. The condition uses the path expression to evaluate *`column`* and determine if a JSON value that matches, or satisfies, the path expression exists. The path expression must be a text literal. See *Oracle AI Database JSON Developer's Guide* for the full semantics of *`JSON_basic_path_expression`*.

string

The condition searches for the character string specified by *`string`*. The string must be enclosed in single quotation marks.

Examples

The following statement creates table `families` with column `family_doc`:

```
CREATE TABLE families (family_doc VARCHAR2(200));
```

The following statement creates a JSON search index on column `family_doc`:

```
CREATE INDEX ix
  ON families(family_doc)
  INDEXTYPE IS CTXSYS.CONTEXT
  PARAMETERS ('SECTION GROUP CTXSYS.JSON_SECTION_GROUP SYNC (ON COMMIT)');
```

The following statements insert JSON documents that describe families into column `family_doc`:

```
INSERT INTO families
VALUES ('{family : {id:10, ages:[40,38,12], address : {street : "10 Main Street"}}}');

INSERT INTO families
VALUES ('{family : {id:11, ages:[42,40,10,5], address : {street : "200 East Street", apt : 20}}}');

INSERT INTO families
VALUES ('{family : {id:12, ages:[25,23], address : {street : "300 Oak Street", apt : 10}}}');
```

The following statement commits the transaction:

```
COMMIT;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following query returns the JSON documents that contain `10` in any property value in the document:

```
SELECT family_doc FROM families
  WHERE JSON_TEXTCONTAINS(family_doc, '$', '10');

FAMILY_DOC
--------------------------------------------------------------------------------
{family : {id:10, ages:[40,38,12], address : {street : "10 Main Street"}}}
{family : {id:11, ages:[42,40,10,5], address : {street : "200 East Street", apt : 20}}}
{family : {id:12, ages:[25,23], address : {street : "300 Oak Street", apt : 10}}}
```

The following query returns the JSON documents that contain 10 in the `id` property value:

```
SELECT family_doc FROM families
  where json_textcontains(family_doc, '$.family.id', '10');

FAMILY_DOC
--------------------------------------------------------------------------------
{family : {id:10, ages:[40,38,12], address : {street : "10 Main Street"}}}
```

The following query returns the JSON documents that have a 10 in the array of values for the `ages` property:

```
SELECT family_doc FROM families
  WHERE JSON_TEXTCONTAINS(family_doc, '$.family.ages', '10');

FAMILY_DOC
--------------------------------------------------------------------------------
{family : {id:11, ages:[42,40,10,5], address : {street : "200 East Street", apt : 20}}}
```

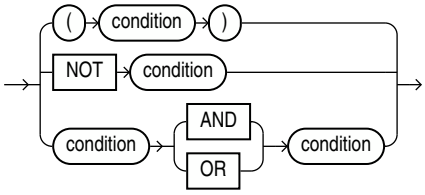
The following query returns the JSON documents that have a 10 in the `address` property value:

```
SELECT family_doc FROM families
  WHERE JSON_TEXTCONTAINS(family_doc, '$.family.address', '10');

FAMILY_DOC
--------------------------------------------------------------------------------
{family : {id:10, ages:[40,38,12], address : {street : "10 Main Street"}}}
{family : {id:12, ages:[25,23], address : {street : "300 Oak Street", apt : 10}}}
```

The following query returns the JSON documents that have a 10 in the `apt` property value:

```
SELECT family_doc FROM families
  WHERE JSON_TEXTCONTAINS(family_doc, '$.family.address.apt', '10');



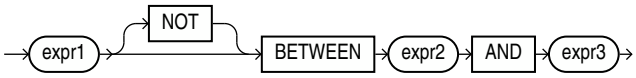
FAMILY_DOC
--------------------------------------------------------------------------------
{family : {id:12, ages:[25,23], address : {street : "300 Oak Street", apt : 10}}}
```

Compound Conditions

A compound condition specifies a combination of other conditions.

Copyright © 1996, 2026, Oracle and/or its affiliates.

***compound_condition*::=**



> **See Also**
>
> Logical Conditions for more information about `NOT`, `AND`, and `OR` conditions

BETWEEN Condition

A `BETWEEN` condition determines whether the value of one expression is in an interval defined by two other expressions.

***between_condition*::=**

All three expressions must be numeric, character, or datetime expressions. In SQL, it is possible that *expr1* will be evaluated more than once. If the `BETWEEN` expression appears in PL/SQL, *expr1* is guaranteed to be evaluated only once. If the expressions are not all the same data type, then Oracle Database implicitly converts the expressions to a common data type. If it cannot do so, then it returns an error.

> **See Also**
>
> Implicit Data Conversion for more information on SQL data type conversion

The value of

```
expr1 NOT BETWEEN expr2 AND expr3
```

is the value of the expression

```
NOT (expr1 BETWEEN expr2 AND expr3)
```

And the value of

```
expr1 BETWEEN expr2 AND expr3
```

is the value of the boolean expression:

```
expr2 <= expr1 AND expr1 <= expr3
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

If *expr3* < *expr2*, then the interval is empty. If *expr1* is NULL, then the result is NULL. If *expr1* is not NULL, then the value is FALSE in the ordinary case and TRUE when the keyword NOT is used.

The boolean operator AND may produce unexpected results. Specifically, in the expression x AND y, the condition x IS NULL is not sufficient to determine the value of the expression. The second operand still must be evaluated. The result is FALSE if the second operand has the value FALSE and NULL otherwise. See Logical Conditions for more information on AND.

Table 6-10 BETWEEN Condition

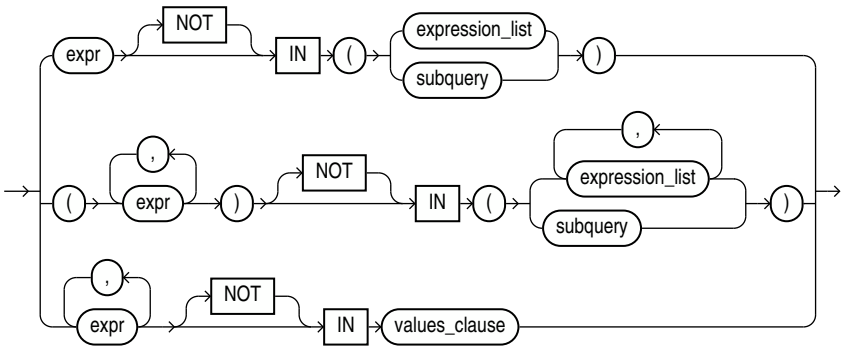
Type of Condition	Operation	Example
[NOT] BETWEEN x AND y	[NOT] (*expr2* less than or equal to *expr1* AND *expr1* less than or equal to *expr3*)	SELECT * FROM employees WHERE salary BETWEEN 2000 AND 3000 ORDER BY employee_id;

EXISTS Condition

An EXISTS condition tests for existence of rows in a subquery.

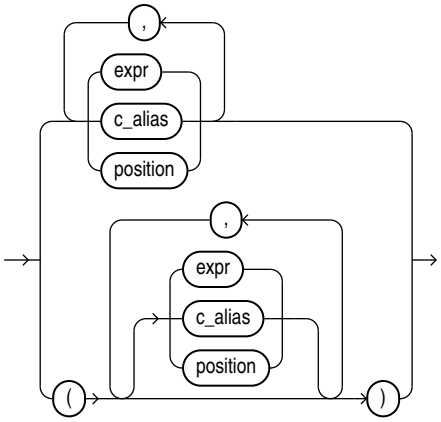
Table 6-11 shows the EXISTS condition.

Table 6-11 EXISTS Condition



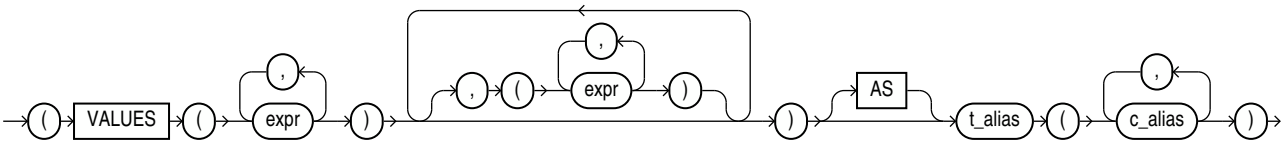
Type of Condition	Operation	Example
EXISTS	TRUE if a subquery returns at least one row.	SELECT department_id FROM departments d WHERE EXISTS (SELECT * FROM employees e WHERE d.department_id = e.department_id) ORDER BY department_id;

IN Condition



An *in_condition* is a membership condition. It tests a value for membership in a list of values or subquery

Copyright © 1996, 2026, Oracle and/or its affiliates.



***in_condition*::=**

***expression_list*::=**

***values_clause*::=**

If you use the upper form of the *in_condition* condition (with a single expression to the left of the operator), then you must use the upper form of *expression_list*. If you use the lower form of this condition (with multiple expressions to the left of the operator), then you must use the lower form of *expression_list*, and the expressions in each *expression_list* must match in number and data type the expressions to the left of the operator. You can specify up to 65535 expressions in *expression_list*.

Oracle Database does not always evaluate the expressions in an *expression_list* in the order in which they appear in the IN list. However, expressions in the select list of a subquery are evaluated in their specified order.

Copyright © 1996, 2026, Oracle and/or its affiliates.

See Also

Expression Lists

Table 6-12 lists the form of IN condition.

Table 6-12 IN Condition

Type of Condition	Operation	Example
IN	Equal-to-any-member-of test. Equivalent to =ANY.	`SELECT * FROM employees WHERE job_id IN ('PU_CLERK','SH_CLERK') ORDER BY employee_id;` `SELECT * FROM employees WHERE salary IN (SELECT salary FROM employees WHERE department_id =30) ORDER BY employee_id;`
NOT IN	Equivalent to !=ALL. Evaluates to FALSE if any member of the set is NULL.	`SELECT * FROM employees WHERE salary NOT IN (SELECT salary FROM employees WHERE department_id = 30) ORDER BY employee_id;` `SELECT * FROM employees WHERE job_id NOT IN ('PU_CLERK', 'SH_CLERK') ORDER BY employee_id;`

values_clause

For semantics of the *values_clause* please see the *values_clause* of the SELECT statement *values_clause* .

If any item in the list following a NOT IN operation evaluates to null, then all rows evaluate to FALSE or UNKNOWN, and no rows are returned. For example, the following statement returns the string 'True' for each row:

```
SELECT 'True' FROM employees
   WHERE department_id NOT IN (10, 20);
```

However, the following statement returns no rows:

```
SELECT 'True' FROM employees
    WHERE department_id NOT IN (10, 20, NULL);
```

The preceding example returns no rows because the WHERE clause condition evaluates to:

```
department_id != 10 AND department_id != 20 AND department_id != null
```

Because the third condition compares department_id with a null, it results in an UNKNOWN, so the entire expression results in FALSE (for rows with department_id equal to 10 or 20). This behavior can easily be overlooked, especially when the NOT IN operator references a subquery.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Moreover, if a `NOT IN` condition references a subquery that returns no rows at all, then all rows will be returned, as shown in the following example:

```
SELECT 'True' FROM employees
   WHERE department_id NOT IN (SELECT 0 FROM DUAL WHERE 1=2);
```

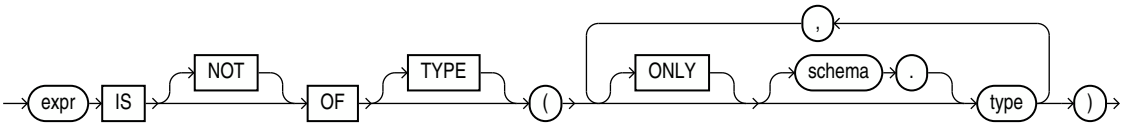
For character arguments, the `IN` condition is collation-sensitive. The collation determination rules determine the collation to use.

> **See Also**
>
> Appendix C in *Oracle AI Database Globalization Support Guide* for the collation determination rules for the `IN` condition

Restriction on LEVEL in WHERE Clauses

In a [`NOT`] `IN` condition in a `WHERE` clause, if the right-hand side of the condition is a subquery, you cannot use `LEVEL` on the left-hand side of the condition. However, you can specify `LEVEL` in a subquery of the `FROM` clause to achieve the same result. For example, the following statement is not valid:

```
SELECT employee_id, last_name FROM employees
   WHERE (employee_id, LEVEL)
      IN (SELECT employee_id, 2 FROM employees)
   START WITH employee_id = 2
   CONNECT BY PRIOR employee_id = manager_id;
```



But the following statement is valid because it encapsulates the query containing the `LEVEL` information in the `FROM` clause:

```
SELECT v.employee_id, v.last_name, v.lev FROM
      (SELECT employee_id, last_name, LEVEL lev
      FROM employees v
      START WITH employee_id = 100
      CONNECT BY PRIOR employee_id = manager_id) v
   WHERE (v.employee_id, v.lev) IN
      (SELECT employee_id, 2 FROM employees);
```

IS OF *type* Condition

Use the `IS OF` *`type`* condition to test object instances based on their specific type information.

***is_of_type_condition*::=**

You must have `EXECUTE` privilege on all types referenced by *`type`*, and all *`type`*s must belong to the same type family.

This condition evaluates to null if *`expr`* is null. If *`expr`* is not null, then the condition evaluates to true (or false if you specify the `NOT` keyword) under either of these circumstances:

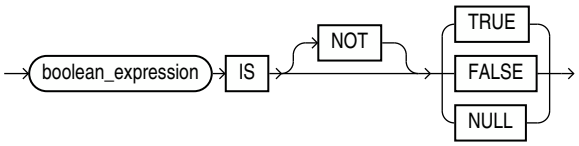
Copyright © 1996, 2026, Oracle and/or its affiliates.

- The most specific type of *expr* is the subtype of one of the types specified in the *type* list and you have not specified ONLY for the type, or
- The most specific type of *expr* is explicitly specified in the *type* list.

The *expr* frequently takes the form of the VALUE function with a correlation variable.

The following example uses the sample table oe.persons, which is built on a type hierarchy in Substitutable Table and Column Examples. The example uses the IS OF *type* condition to restrict the query to specific subtypes:

```
SELECT * FROM persons p
   WHERE VALUE(p) IS OF TYPE (employee_t);



NAME                          SSN
----------------------------
Joe                         32456
Tim                          5678

SELECT * FROM persons p
   WHERE VALUE(p) IS OF (ONLY part_time_emp_t);

NAME                          SSN
----------------------------
Tim                         5678
```

Functions

Functions are similar to operators in that they manipulate data items and return a result. Functions differ from operators in the format of their arguments. This format enables them to operate on zero, one, two, or more arguments:

```
function(argument, argument, ...)
```

A function without any arguments is similar to a pseudocolumn (refer to Pseudocolumns). However, a pseudocolumn typically returns a different value for each row in the result set, whereas a function without any arguments typically returns the same value for each row.

This chapter contains these sections:

- About User-Defined Functions

About SQL Functions

SQL functions are built into Oracle Database and are available for use in various appropriate SQL statements. Do not confuse SQL functions with user-defined functions written in PL/SQL.

If you call a SQL function with an argument of a data type other than the data type expected by the SQL function, then Oracle attempts to convert the argument to the expected data type before performing the SQL function.

> **See Also**
>
> About User-Defined Functions for information on user functions and Data Conversion for implicit conversion of data types

Nulls in SQL Functions

Most scalar functions return null when given a null argument. You can use the `NVL` function to return a value when a null occurs. For example, the expression `NVL(commission_pct,0)` returns 0 if `commission_pct` is null or the value of `commission_pct` if it is not null.

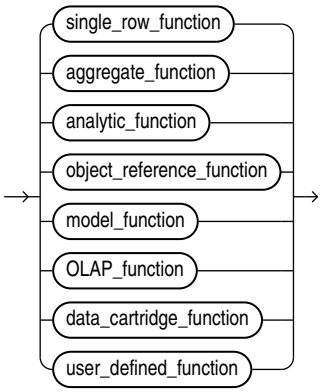
For information on how aggregate functions handle nulls, see Aggregate Functions .

Syntax for SQL Functions

In the syntax diagrams for SQL functions, arguments are indicated by their data types. When the parameter *`function`* appears in SQL syntax, replace it with one of the functions described in this section. Functions are grouped by the data types of their arguments and their return values.

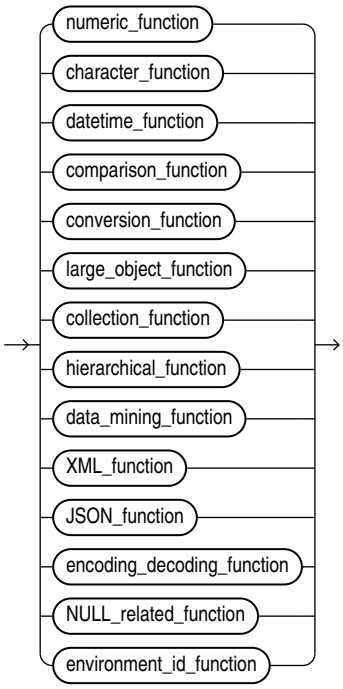
> **Note**
>
> When you apply SQL functions to LOB columns, Oracle Database creates temporary LOBs during SQL and PL/SQL processing. You should ensure that temporary tablespace quota is sufficient for storing these temporary LOBs for your application.

A SQL function may be collation-sensitive, which means that character value comparison or matching that it performs is controlled by a collation. The particular collation to use by the function is determined from the collations of the function's arguments.



If the result of a SQL function has a character data type, the collation derivation rules define the collation to associate with the result.

Copyright © 1996, 2026, Oracle and/or its affiliates.



> **See Also**
>
> Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation and determination rules for SQL functions

The syntax showing the categories of functions follows:

***function*::=**

***single_row_function*::=**

The sections that follow list the built-in SQL functions in each of the groups illustrated in the preceding diagrams except user-defined functions. All of the built-in SQL functions are then described in alphabetical order.

Copyright © 1996, 2026, Oracle and/or its affiliates.

See Also

About User-Defined Functions and CREATE FUNCTION

Aggregate Functions

Aggregate functions return a single result row based on groups of rows, rather than on single rows. Aggregate functions can appear in select lists and in `ORDER BY` and `HAVING` clauses. They are commonly used with the `GROUP BY` clause in a `SELECT` statement, where the database divides the rows of a queried table or view into groups. In a query containing a `GROUP BY` clause, the elements of the select list can be aggregate functions, `GROUP BY` expressions, constants, or expressions involving one of these. Oracle applies the aggregate functions to each group of rows and returns a single result row for each group.

If you omit the `GROUP BY` clause, then Oracle applies aggregate functions in the select list to all the rows in the queried table or view. You use aggregate functions in the `HAVING` clause to eliminate groups from the output based on the results of the aggregate functions, rather than on the values of the individual rows of the queried table or view.

See Also

- Using the GROUP BY Clause: Examples and the HAVING Clause for more information on the `GROUP BY` clause and `HAVING` clauses in queries and subqueries
- Appendix C in *Oracle AI Database Globalization Support Guide* for the collation determination rules for expressions in the `ORDER BY` clause of an aggregate function

Many aggregate functions that take a single argument accept the following clauses:

- `DISTINCT` and `UNIQUE`, which are synonymous, cause an aggregate function to consider only distinct values of the argument expression. The syntax diagrams for aggregate functions in this chapter use the keyword `DISTINCT` for simplicity.
- `ALL` causes an aggregate function to consider all values, including all duplicates.

For example, the `DISTINCT` average of 1, 1, 1, and 3 is 2. The `ALL` average is 1.5. If you specify neither, then the default is `ALL`.

Some aggregate functions allow the *`windowing_clause`*, which is part of the syntax of analytic functions. Refer to *windowing_clause* for information about this clause.

All aggregate functions except `COUNT(*)`, `GROUPING`, and `GROUPING_ID` ignore nulls. You can use the `NVL` function in the argument to an aggregate function to substitute a value for a null. `COUNT` and `REGR_COUNT` never return null, but return either a number or zero. For all the remaining aggregate functions, if the data set contains no rows, or contains only rows with nulls as arguments to the aggregate function, then the function returns null.

The aggregate functions `MIN`, `MAX`, `SUM`, `AVG`, `COUNT`, `VARIANCE`, and `STDDEV`, when followed by the `KEEP` keyword, can be used in conjunction with the `FIRST` or `LAST` function to operate on a set of values from a set of rows that rank as the `FIRST` or `LAST` with respect to a given sorting specification. Refer to FIRST for more information.

Copyright © 1996, 2026, Oracle and/or its affiliates.

You can nest aggregate functions. For example, the following example calculates the average of the maximum salaries of all the departments in the sample schema `hr`:

```
SELECT AVG(MAX(salary))
  FROM employees
  GROUP BY department_id;

AVG(MAX(SALARY))
----------------
      10926.3333
```

This calculation evaluates the inner aggregate (`MAX(salary)`) for each group defined by the `GROUP BY` clause (`department_id`), and aggregates the results again.

FILTER Clause Syntax

```
aggregate_function ( aggregate_function_arguments ) [ FILTER ( WHERE condition )]
```

FILTER Clause Semantics

Specify the `FILTER WHERE` *`condition`* clause optionally at the end of an aggregate function to filter the rows of data that are fed into the aggregate function. The `FILTER WHERE` clause works in the same way that a `WHERE` clause filters rows, but it is localized to the specific aggregate function.

Rules

You can use `FILTER WHERE` before the `OVER` clause when the aggregate function is used as a window function.

You cannot use `FILTER WHERE` after a non-aggregate function.

condition

`condition` can be any conditions that are currently supported in the `WHERE` clause, except for subqueries, window functions, and outer references. It can refer to any columns in the underlying tables that the aggregation function aggregates for. The condition is applied to the rows filtered by the `WHERE` clause, after which the specific aggregation is performed on the filtered rows by the `FILTER` clause.

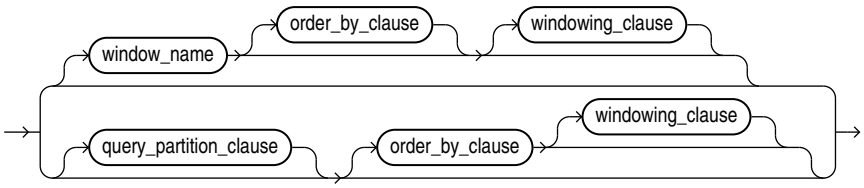
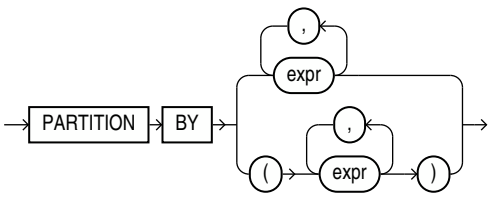
Analytic Functions

Analytic functions compute an aggregate value based on a group of rows. They differ from aggregate functions in that they return multiple rows for each group. The group of rows is called a **window** and is defined by the *analytic_clause*. For each row, a sliding window of rows is defined. The window determines the range of rows used to perform the calculations for the current row. Window sizes can be based on either a physical number of rows or a logical interval such as time.



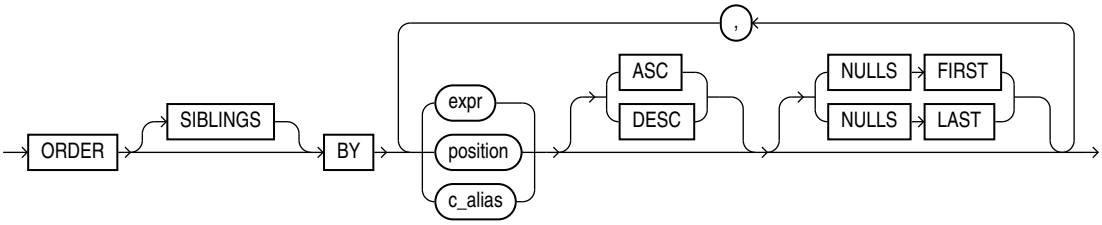
Analytic functions are the last set of operations performed in a query except for the final `ORDER BY` clause. All joins and all `WHERE`, `GROUP BY`, and `HAVING` clauses are completed before the analytic functions are processed. Therefore, analytic functions can appear only in the select list, `QUALIFY` clause, or the `ORDER BY` clause.

Analytic functions are commonly used to compute cumulative, moving, centered, and reporting aggregates.

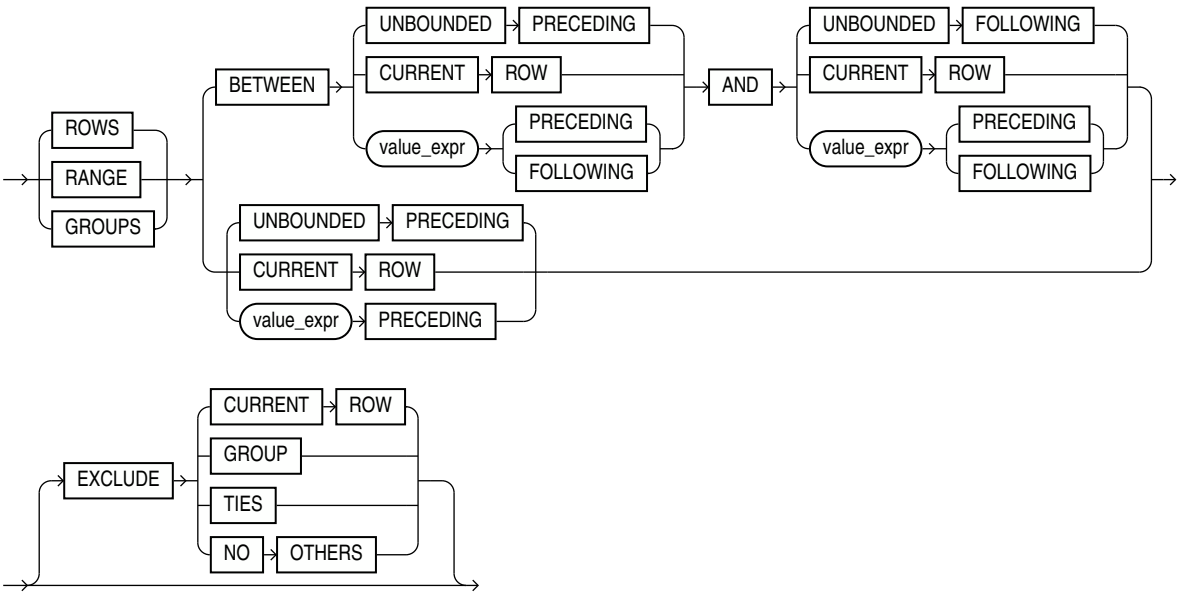


***analytic_function*::=**

***analytic_clause*::=**



***query_partition_clause*::=**



Copyright © 1996, 2026, Oracle and/or its affiliates.

***order_by_clause*::=**

***windowing_clause*::=**

***qualify_clause*::=**

analytic_function

Specify the name of an analytic function (see the listing of analytic functions following this discussion of semantics).

arguments

Analytic functions take 0 to 3 arguments. The arguments can be any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence and implicitly converts the remaining arguments to that data type. The return type is also that data type, unless otherwise noted for an individual function.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> Numeric Precedence for information on numeric precedence and Table 2-9 for more information on implicit conversion

analytic_clause

Use `OVER` *`analytic_clause`* to indicate that the function operates on a query result set. This clause is computed after the `FROM`, `WHERE`, `GROUP BY`, and `HAVING` clauses. You can specify analytic functions with this clause in the select list or `ORDER BY` clause. To filter the results of a query based on an analytic function, nest these functions within the parent query, and then filter the results of the nested subquery.

Notes on the *analytic_clause*:

The following notes apply to the *`analytic_clause`*:

- You cannot nest analytic functions by specifying any analytic function in any part of the *`analytic_clause`*. However, you can specify an analytic function in a subquery and compute another analytic function over it.
- You can specify `OVER` *`analytic_clause`* with user-defined analytic functions as well as built-in analytic functions. See CREATE FUNCTION .
- The `PARTITION BY` and `ORDER BY` clauses in the *`analytic_clause`* are collation-sensitive.

> **See Also**
>
> - Appendix C in *Oracle AI Database Globalization Support Guide* for the collation determination rules for the `OVER (PARTITION BY ... ORDER BY ... )` clause of an analytic function
> - *`window_clause`* in the `SELECT` statement

query_partition_clause

Use the `PARTITION BY` clause to partition the query result set into groups based on one or more *`value_expr`*. If you omit this clause, then the function treats all rows of the query result set as a single group.

To use the *`query_partition_clause`* in an analytic function, use the upper branch of the syntax (without parentheses). To use this clause in a model query (in the *`model_column_clauses`*) or a partitioned outer join (in the *`outer_join_clause`*), use the lower branch of the syntax (with parentheses).

You can specify multiple analytic functions in the same query, each with the same or different `PARTITION BY` keys.

If the objects being queried have the parallel attribute, and if you specify an analytic function with the *`query_partition_clause`*, then the function computations are parallelized as well.

Valid values of *`value_expr`* are constants, columns, nonanalytic functions, function expressions, or expressions involving any of these.

Copyright © 1996, 2026, Oracle and/or its affiliates.

order_by_clause

Use the *order_by_clause* to specify how data is ordered within a partition. For all analytic functions you can order the values in a partition on multiple keys, each defined by a *value_expr* and each qualified by an ordering sequence.

Within each function, you can specify multiple ordering expressions. Doing so is especially useful when using functions that rank values, because the second expression can resolve ties between identical values for the first expression.

Whenever the *order_by_clause* results in identical values for multiple rows, the function behaves as follows:

- CUME_DIST, DENSE_RANK, NTILE, PERCENT_RANK, and RANK return the same result for each of the rows.
- ROW_NUMBER assigns each row a distinct value even if there is a tie based on the *order_by_clause*. The value is based on the order in which the row is processed, which may be nondeterministic if the ORDER BY does not guarantee a total ordering.
- For all other analytic functions, the result depends on the window specification. If you specify a logical window with the RANGE keyword, then the function returns the same result for each of the rows. If you specify a physical window with the ROWS keyword, then the result is nondeterministic.

Restrictions on the ORDER BY Clause

The following restrictions apply to the ORDER BY clause:

- When used in an analytic function, the *order_by_clause* must take an expression (*expr*). The SIBLINGS keyword is not valid (it is relevant only in hierarchical queries). Position (*position*) and column aliases (*c_alias*) are also invalid. Otherwise this *order_by_clause* is the same as that used to order the overall query or subquery.
- An analytic function that uses the RANGE keyword can use multiple sort keys in its ORDER BY clause if it specifies any of the following windows:
  - RANGE BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW. The short form of this is RANGE UNBOUNDED PRECEDING.
  - RANGE BETWEEN CURRENT ROW AND UNBOUNDED FOLLOWING
  - RANGE BETWEEN CURRENT ROW AND CURRENT ROW
  - RANGE BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING

  Window boundaries other than these four can have only one sort key in the ORDER BY clause of the analytic function. This restriction does not apply to window boundaries specified by the ROW keyword.

ASC | DESC

Specify the ordering sequence (ascending or descending). ASC is the default.

NULLS FIRST | NULLS LAST

Specify whether returned rows containing nulls should appear first or last in the ordering sequence.

NULLS LAST is the default for ascending order, and NULLS FIRST is the default for descending order.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Analytic functions always operate on rows in the order specified in the *order_by_clause* of the function. However, the *order_by_clause* of the function does not guarantee the order of the result. Use the *order_by_clause* of the query to guarantee the final result ordering.

> **See Also**
>
> *order_by_clause* of SELECT for more information on this clause

windowing_clause

Some analytic functions allow the *windowing_clause*. In the listing of analytic functions at the end of this section, the functions that allow the *windowing_clause* are followed by an asterisk (*).

ROWS | RANGE | GROUPS

The keywords ROWS, RANGE, and GROUPS are options to define a window frame unit used for calculating the function result. The function is then applied to all the rows in the window. The window moves through the query result set or partition from top to bottom.

- Use ROWS to specify the window frame extent by counting rows forward or backward from the current row. ROWS allows any number of sort keys, of any ordered data types.
- Use RANGE to specify the window frame extent as a logical offset. RANGE allows only one sort key, and its declared data type must allow addition and subtraction operations, for example they must be numeric, datetime, or interval data types.
- Use GROUPS to specifiy the window frame extent with both ROWS and RANGE characteristics. Like ROWS a GROUPS window can have any number of sort keys, or any ordered types. Like RANGE, a GROUPS window does not make cutoffs between adjacent rows with the same values in the sort keys.

You cannot specify this clause unless you have specified the *order_by_clause*. Some window boundaries defined by the RANGE clause let you specify only one expression in the *order_by_clause*. Refer to Restrictions on the ORDER BY Clause.

The value returned by an analytic function with a logical offset is always deterministic. However, the value returned by an analytic function with a physical offset may produce nondeterministic results unless the ordering expression results in a unique ordering. You may have to specify multiple columns in the *order_by_clause* to achieve this unique ordering.

BETWEEN ... AND

Use the BETWEEN ... AND clause to specify a start point and end point for the window. The first expression (before AND) defines the start point and the second expression (after AND) defines the end point.

If you omit BETWEEN and specify only one end point, then Oracle considers it the start point, and the end point defaults to the current row.

UNBOUNDED PRECEDING

Specify UNBOUNDED PRECEDING to indicate that the window starts at the first row of the partition. This is the start point specification and cannot be used as an end point specification.

Copyright © 1996, 2026, Oracle and/or its affiliates.

UNBOUNDED FOLLOWING

Specify `UNBOUNDED FOLLOWING` to indicate that the window ends at the last row of the partition. This is the end point specification and cannot be used as a start point specification.

CURRENT ROW

As a start point, `CURRENT ROW` specifies that the window begins at the current row or value (depending on whether you have specified `ROW`, `RANGE`, or `GROUPS` respectively). In this case the end point cannot be *`value_expr`* `PRECEDING`.

As an end point, `CURRENT ROW` specifies that the window ends at the current row or value (depending on whether you have specified `ROW`, `RANGE`, or `GROUPS`respectively). In this case the start point cannot be *`value_expr`* `FOLLOWING`.

value_expr PRECEDING or *value_expr* FOLLOWING

For `RANGE`, `ROW`, or `GROUPS`:

- If *`value_expr`* `FOLLOWING` is the start point, then the end point must be *`value_expr`* `FOLLOWING`.
- If *`value_expr`* `PRECEDING` is the end point, then the start point must be *`value_expr`* `PRECEDING`.

If you are defining a logical window defined by an interval of time in numeric format, then you may need to use conversion functions.

> **See Also**
>
> NUMTOYMINTERVAL and NUMTODSINTERVAL for information on converting numeric times into intervals

If you specified `ROWS`:

- *`value_expr`* is a physical offset. It must be a constant or expression and must evaluate to a positive numeric value.
- If *`value_expr`* is part of the start point, then it must evaluate to a row before the end point.

If you specified `GROUPS`:

- *`value_expr`* is a physical offset. It must be a constant or expression and must evaluate to a positive numeric value.
- If *`value_expr`* is part of the start point, then it must evaluate to a row before the end point.

If you specified `RANGE`:

- *`value_expr`* is a logical offset. It must be a constant or expression that evaluates to a positive numeric value or an interval literal. Refer to Literals for information on interval literals.
- You can specify only one expression in the *`order_by_clause`*.
- If *`value_expr`* evaluates to a numeric value, then the `ORDER BY` *`expr`* must be a numeric or `DATE` data type.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- If *value_expr* evaluates to an interval value, then the ORDER BY *expr* must be a DATE data type.

If you omit the *windowing_clause* entirely, then the default is RANGE BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW.

EXCLUDE

You can remove rows, groups, and ties from the window frame with the EXCLUDE options:

- If you specify EXCLUDE CURRENT ROW, and the current row in in the window frame, then the current row is removed from the window frame.
- If you specify EXCLUDE GROUP, then the current row and any peers of the current row are removed from the window frame.
- If you specify EXCLUDE TIES, then the peers of the current row are removed from the window frame. The current row is retained. Note, that if the current row is previously removed from the window frame, it remains removed.
- If you specify EXCLUDE NO OTHERS, then no additional rows are removed from the window frame. This is the default option.

qualify_clause

Use the QUALIFY clause to filter the results of an analytic function that appears in a SELECT list or in the predicate specified within the QUALIFY clause.

The relationship between the QUALIFY clause and analytic functions is analogous to the relationship between the HAVING clause and the GROUP BY clause.

- The QUALIFY clause must appear before the ORDER BY and FETCH FIRST clauses, but after the WINDOW clause of a SELECT statement.
- All WHERE, GROUB BY, HAVING clauses and analytic functions are completed before the QUALIFY clause is processed. The general order of operations is as follows: FROM -> WHERE -> GROUP BY -> HAVING -> WINDOW -> QUALIFY -> DISTINCT -> ORDER BY -> FETCH FIRST.

Analytic functions are commonly used in data warehousing environments. In the list of analytic functions that follows, functions followed by an asterisk (*) allow the full syntax, including the *windowing_clause*.

Data Cartridge Functions

Data Cartridge functions are useful for Data Cartridge developers. The Data Cartridge functions are:

DATAOBJ_TO_MAT_PARTITION
DATAOBJ_TO_PARTITION

Model Functions

Model functions can be used only in the *model_clause* of the SELECT statement. The model functions are:

CV
ITERATION_NUMBER
PRESENTNNV
PRESENTV
PREVIOUS

Object Reference Functions

Object reference functions manipulate REF values, which are references to objects of specified object types. The object reference functions are:

DEREF
MAKE_REF
REF
REFTOHEX
VALUE

See Also

Oracle AI Database Object-Relational Developer's Guide for more information about REF data types

OLAP Functions

OLAP functions returns data from a dimensional object in two-dimension relational format. The OLAP function is:

CUBE_TABLE

Single-Row Functions

Single-row functions return a single result row for every row of a queried table or view. These functions can appear in select lists, WHERE clauses, START WITH and CONNECT BY clauses, and HAVING clauses.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Numeric Functions

Numeric functions accept numeric input and return numeric values. Most numeric functions return `NUMBER` values that are accurate to 38 decimal digits. The transcendental functions `COS`, `COSH`, `EXP`, `LN`, `LOG`, `SIN`, `SINH`, `SQRT`, `TAN`, and `TANH` are accurate to 36 decimal digits. The transcendental functions `ACOS`, `ASIN`, `ATAN`, and `ATAN2` are accurate to 30 decimal digits. The numeric functions are:

ABS
ACOS
ASIN
ATAN
ATAN2
BITAND
CEIL (number)
COS
COSH
EXP
FLOOR (number)
LN
LOG
MOD
NANVL
POWER
REMAINDER
ROUND (number)
SIGN
SIN
SINH
SQRT
TAN
TANH
TRUNC (number)
WIDTH_BUCKET

Calendar Functions

Calendar functions accept a `DATE` expression, or any expression that may be implicitly converted to `DATE` as input. They return a formatted string representing the date, with default formats explicitly defined for each function. The calendar functions are:

Formatted Text Functions

CALENDAR
FISCAL
RETAIL

Start/End Date Functions

CALENDAR_START_END
FISCAL_START_END
RETAIL_START_END

X of Y Functions

CALENDAR_X_OF_Y
FISCAL_X_OF_Y
RETAIL_X_OF_Y

Add X Periods Functions

CALENDAR_ADD_X_PERIODS
FISCAL_ADD_X_PERIODS
RETAIL_ADD_X_PERIODS

Calendar Since Function

CALENDAR_SINCE

Retail Day Exists Function

RETAIL_DAY_EXISTS

Character Functions Returning Character Values

Character functions that return character values return values of the following data types unless otherwise documented:

- If the input argument is `CHAR` or `VARCHAR2`, then the value returned is `VARCHAR2`.
- If the input argument is `NCHAR` or `NVARCHAR2`, then the value returned is `NVARCHAR2`.

The length of the value returned by the function is limited by the maximum length of the data type returned.

- For functions that return `CHAR` or `VARCHAR2`, if the length of the return value exceeds the limit, then Oracle Database truncates it and returns the result without an error message.
- For functions that return `CLOB` values, if the length of the return values exceeds the limit, then Oracle raises an error and returns no data.

The character functions that return character values are:

CHR
CONCAT
INITCAP
LOWER
LPAD
LTRIM
NCHR
NLS_INITCAP
NLS_LOWER
NLS_UPPER
NLSSORT
REGEXP_REPLACE
REGEXP_SUBSTR
REPLACE
RPAD
RTRIM
SOUNDEX
SUBSTR

TRANSLATE
TRANSLATE ... USING
TRIM
UPPER

Character Functions Returning Number Values

Character functions that return number values can take as their argument any character data type. The character functions that return number values are:

ASCII
INSTR
LENGTH
REGEXP_COUNT
REGEXP_INSTR

Character Set Functions

The character set functions return information about the character set. The character set functions are:

NLS_CHARSET_DECL_LEN
NLS_CHARSET_ID
NLS_CHARSET_NAME

Collation Functions

The collation functions return information about collation settings. The collation functions are:

COLLATION
NLS_COLLATION_ID
NLS_COLLATION_NAME

Datetime Functions

Datetime functions operate on date (`DATE`), timestamp (`TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, and `TIMESTAMP WITH LOCAL TIME ZONE`), and interval (`INTERVAL DAY TO SECOND`, `INTERVAL YEAR TO MONTH`) values.

Some of the datetime functions were designed for the Oracle `DATE` data type (`ADD_MONTHS`, `CURRENT_DATE`, `LAST_DAY`, `NEW_TIME`, and `NEXT_DAY`). If you provide a timestamp value as their argument, then Oracle Database internally converts the input type to a `DATE` value and returns a `DATE` value. The exceptions are the `MONTHS_BETWEEN` function, which returns a number, and the `ROUND` and `TRUNC` functions, which do not accept timestamp or interval values at all.

The remaining datetime functions were designed to accept any of the three types of data (date, timestamp, and interval) and to return a value of one of these types.

All of the datetime functions that return current system datetime information, such as `SYSDATE`, `SYSTIMESTAMP`, `CURRENT_TIMESTAMP`, and so forth, are evaluated once for each SQL statement, regardless how many times they are referenced in that statement.

The datetime functions are:

ADD_MONTHS

Copyright © 1996, 2026, Oracle and/or its affiliates.

CEIL (datetime)
CURRENT_DATE
CURRENT_TIMESTAMP
DBTIMEZONE
EXTRACT (datetime)
FLOOR (datetime)

General Comparison Functions

The general comparison functions determine the greatest and or least value from a set of values. The general comparison functions are:

GREATEST
LEAST

Conversion Functions

Conversion functions convert a value from one data type to another. Generally, the form of the function names follows the convention *datatype* `TO` *datatype*. The first data type is the input data type. The second data type is the output data type. The SQL conversion functions are:

ASCIISTR
BIN_TO_NUM
CAST
CHARTOROWID
COMPOSE
CONVERT
DECOMPOSE

Copyright © 1996, 2026, Oracle and/or its affiliates.

HEXTORAW

TO_NCLOB
TO_NUMBER
TO_SINGLE_BYTE
TO_TIMESTAMP
TO_TIMESTAMP_TZ
TO_YMINTERVAL
TREAT
UNISTR
VALIDATE_CONVERSION

Large Object Functions

The large object functions operate on LOBs. The large object functions are:

BFILENAME
EMPTY_BLOB, EMPTY_CLOB

Collection Functions

The collection functions operate on nested tables and varrays. The SQL collection functions are:

CARDINALITY
COLLECT
POWERMULTISET

Copyright © 1996, 2026, Oracle and/or its affiliates.

POWERMULTISET_BY_CARDINALITY
SET

Hierarchical Functions

Hierarchical functions applies hierarchical path information to a result set. The hierarchical function is:

SYS_CONNECT_BY_PATH

Oracle Machine Learning for SQL Functions

The Oracle Machine Learning for SQL functions use analytics to score data. The functions can apply a mining model schema object to the data, or they can dynamically mine the data by executing an analytic clause. The OML4SQL functions can be applied to models built using the native algorithms of Oracle, as well as those built using R through the extensibility mechanism.

The Oracle Machine Learning for SQL functions are:

XML Functions

The XML functions operate on or return XML documents or fragments. These functions use arguments that are not defined as part of the ANSI/ISO/IEC SQL Standard but are defined as part of the World Wide Web Consortium (W3C) standards. The processing and operations that the functions perform are defined by the relevant W3C standards. The table below provides a link to the appropriate section of the W3C standard for the rules and guidelines that apply to

Copyright © 1996, 2026, Oracle and/or its affiliates.

each of these XML-related arguments. A SQL statement that uses one of these XML functions, where any of the arguments does not conform to the relevant W3C syntax, will result in an error. Of special note is the fact that not every character that is allowed in the value of a database column is considered legal in XML.

Syntax Element	W3C Standard URL
value_expr	http://www.w3.org/TR/2006/REC-xml-20060816

JSON Functions

JavaScript Object Notation (JSON) functions allow you to query and generate JSON data.

The following SQL/JSON functions allow you to query JSON data:

Copyright © 1996, 2026, Oracle and/or its affiliates.

JSON_QUERY
JSON_TABLE
JSON_VALUE

The following SQL/JSON functions allow you to generate JSON data:

JSON_ARRAY
JSON_ARRAYAGG
JSON_OBJECT
JSON_OBJECTAGG
JSON Type Constructor
JSON_SCALAR
JSON_SERIALIZE
JSON_TRANSFORM

The following Oracle SQL function creates a JSON data guide:

JSON_DATAGUIDE

Encoding and Decoding Functions

The encoding and decoding functions let you inspect and decode data in the database. The encoding and decoding functions are:

DECODE
DUMP
ORA_HASH
STANDARD_HASH
VSIZE

NULL-Related Functions

The `NULL`-related functions facilitate null handling. The `NULL`-related functions are:

COALESCE
LNNVL
NANVL
NULLIF
NVL
NVL2

Environment and Identifier Functions

The environment and identifier functions provide information about the instance and session. The environment and identifier functions are:

CON_DBID_TO_ID
CON_GUID_TO_ID
CON_NAME_TO_ID
CON_UID_TO_ID
ORA_INVOKING_USER
ORA_INVOKING_USERID

USERENV

Domain Functions

Purpose

Use the following domain functions to work with usecase domains more efficiently:

- DOMAIN_DISPLAY
- DOMAIN_ORDER
- DOMAIN_NAME
- DOMAIN_CHECK
- DOMAIN_CHECK_TYPE

Vector Functions

Purpose

You can use the following vector functions in Oracle AI Vector Search to create and manipulate vectors:

Vector Distance Functions

- VECTOR_DISTANCE
- L1_DISTANCE
- L2_DISTANCE
- COSINE_DISTANCE
- INNER_PRODUCT

Vector Constructors

- TO_VECTOR
- VECTOR

Vector Serializers

- FROM_VECTOR
- VECTOR_SERIALIZE

Other Common Vector Functions

- VECTOR_CHUNKS
- VECTOR_DIMS
- VECTOR_DIMENSION_COUNT
- VECTOR_DIMENSION_FORMAT
- VECTOR_EMBEDDING
- VECTOR_NORM

Copyright © 1996, 2026, Oracle and/or its affiliates.

>
> *AI Vector Search User's Guide*

UUID Functions

Use the UUID (Universally Unique Identifier) functions to generate UUIDs and operate on them.

- UUID
- IS_UUID
- UUID_TO_RAW
- RAW_TO_UUID

ABS

Syntax

Purpose

ABS returns the absolute value of *n*.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples

The following example returns the absolute value of -15:

```
SELECT ABS(-15) "Absolute"
  FROM DUAL;

  Absolute
----------
        15
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

ACOS

Syntax

Purpose

`ACOS` returns the arc cosine of *n*. The argument *n* must be in the range of -1 to 1, and the function returns a value in the range of 0 to *pi*, expressed in radians.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is `BINARY_FLOAT`, then the function returns `BINARY_DOUBLE`. Otherwise the function returns the same numeric data type as the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples

The following example returns the arc cosine of .3:

```
SELECT ACOS(.3)"Arc_Cosine"
  FROM DUAL;

Arc_Cosine
----------
1.26610367
```

ADD_MONTHS

Syntax

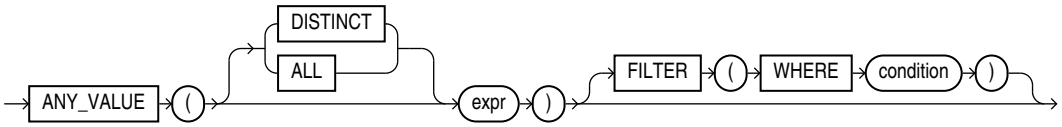
Purpose

`ADD_MONTHS` returns the date *`date`* plus *`integer`* months. A month is defined by the session parameter `NLS_CALENDAR`. The date argument can be a datetime value or any value that can be implicitly converted to `DATE`. The *`integer`* argument can be an integer or any value that can be implicitly converted to an integer. The return type is always `DATE`, regardless of the data type of *`date`*. If *`date`* is the last day of the month or if the resulting month has fewer days than the day component of *`date`*, then the result is the last day of the resulting month. Otherwise, the result has the same day component as *`date`*.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples



The following example returns the month after the *hire_date* in the sample table `employees`:

```
SELECT TO_CHAR(ADD_MONTHS(hire_date, 1), 'DD-MON-YYYY') "Next month"
  FROM employees
  WHERE last_name = 'Baer';

Next Month
-----------
07-JUL-2002
```

ANY_VALUE

Syntax

Purpose

`ANY_VALUE` returns a single non-deterministic value of `expr`. You can use it as an aggregate function.

Use `ANY_VALUE` to optimize a query that has a `GROUP BY` clause. `ANY_VALUE` returns a value of an expression in a group. It is optimized to return the first value.

It ensures that there are no comparisons for any incoming row and also eliminates the necessity to specify every column as part of the `GROUP BY` clause. Because it does not compare values, `ANY_VALUE` returns a value more quickly than `MIN` or `MAX` in a `GROUP BY` query.

Semantics

`ALL`, `DISTINCT`: These keywords are supported by `ANY_VALUE` although they have no effect on the result of the query.

`expr`: The expression can be a column, constant, bind variable, or an expression involving them.

NULL values in the expression are ignored.

Supports all of the data types, except for `LONG`, `LOB`, `FILE`, or `COLLECTION`.

If you use `LONG`, `ORA-00997` is raised.

If you use `LOB`, `FILE`, or `COLLECTION` data types, `ORA-00932` is raised.

`ANY_VALUE` follows the same rules as `MIN` and `MAX`.

Returns any value within each group based on the `GROUP BY` specification. Returns NULL if all rows in the group have NULL expression values.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The result of ANY_VALUE is not deterministic.

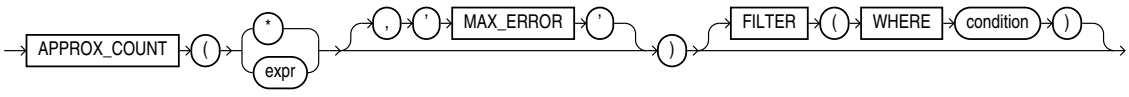
For the semantics of the FILTER clause, see FILTER Clause Semantics.

Restrictions

XMLType and ANYDATA are not supported.

Example 7-1 Using ANY_VALUE As an Aggregate Function

This example uses ANY_VALUE as an aggregate function in a GROUP BY query of the SH schema.



```
SELECT c.cust_id, ANY_VALUE(cust_last_name), SUM(amount_sold)
  FROM customers c, sales s
  WHERE s.cust_id = c.cust_id
  GROUP BY c.cust_id;
```

In the following result of the query, only the first eleven rows are shown.

```
CUST_ID  ANY_VALUE(CUST_LAST_NAME) SUM(AMOUNT_SOLD)
------- ------------------------- ---------------
   6950 Sandburg                               78
  17920 Oliver                               3201
  66800 Case                                 2024
  37280 Edwards                              2256
 109850 Lindegreen                            757
   3910 Oddell                                185

APPROX_COUNT

Syntax

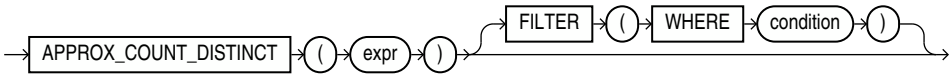
Purpose

APPROX_COUNT returns the approximate count of an expression. If you supply MAX_ERROR as the second argument, then the function returns the maximum error between the actual and approximate count.

You must use this function with a corresponding APPROX_RANK function in the HAVING clause. If a query uses APPROX_COUNT, APPROX_SUM, or APPROX_RANK, then the query must not use any other aggregation functions.

For the semantics of the FILTER clause, see FILTER Clause Semantics.

Copyright © 1996, 2026, Oracle and/or its affiliates.



Examples

The following query returns the 10 most common jobs within every department:

```
SELECT department_id, job_id,
       APPROX_COUNT(*)
FROM employees
GROUP BY department_id, job_id
HAVING
  APPROX_RANK (
  PARTITION BY department_id
  ORDER BY APPROX_COUNT(*)
  DESC ) <= 10;
```

APPROX_COUNT_DISTINCT

Syntax

Purpose

`APPROX_COUNT_DISTINCT` returns the approximate number of rows that contain a distinct value for *`expr`*.

This function provides an alternative to the `COUNT (DISTINCT` *`expr`*`)` function, which returns the exact number of rows that contain distinct values of *`expr`*. `APPROX_COUNT_DISTINCT` processes large amounts of data significantly faster than `COUNT`, with negligible deviation from the exact result.

For *`expr`*, you can specify a column of any scalar data type other than `BFILE`, `BLOB`, `CLOB`, `LONG`, `LONG RAW`, or `NCLOB`.

`APPROX_COUNT_DISTINCT` ignores rows that contain a null value for *`expr`*. This function returns a `NUMBER`.

> **See Also**
>
> - COUNT for more information on the `COUNT (DISTINCT` *`expr`*`)` function
> - Appendix C in *Oracle AI Database Globalization Support Guide* for the collation determination rules, which define the collation `APPROX_COUNT_DISTINCT` uses to compare character values for *`expr`*

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Examples

Example 1:

The following statement returns the approximate number of rows with distinct values for `manager_id`:

```
SELECT APPROX_COUNT_DISTINCT(manager_id) AS "Active Managers"
  FROM employees;

Active Managers
---------------
             18
```

Example 2

```
SELECT COUNT(*) FROM sales;
```

The following statement returns the approximate number of distinct customers for each product:

```
SELECT prod_id, APPROX_COUNT_DISTINCT(cust_id) AS "Number of Customers"
  FROM sales
  GROUP BY prod_id
  ORDER BY prod_id;

   PROD_ID Number of Customers
---------- ------------------
        13               2516
        14               2030
        15               2105
        16               2367
        17               2093
        18               2975
        19               2630
        20               3791
. . .
```

APPROX_COUNT_DISTINCT_AGG

Syntax

Purpose

`APPROX_COUNT_DISTINCT_AGG` takes as its input a column of details containing information about approximate distinct value counts, and enables you to perform aggregations of those counts.

Copyright © 1996, 2026, Oracle and/or its affiliates.

For *detail*, specify a column of details created by the APPROX_COUNT_DISTINCT_DETAIL function or the APPROX_COUNT_DISTINCT_AGG function. This column is of data type BLOB.

You can specify this function in a SELECT statement with a GROUP BY clause to aggregate the information contained in the details within each group of rows and return a single detail for each group.

This function returns a BLOB value, called a detail, which contains information about the count aggregations in a special format. You can store details returned by this function in a table or materialized view, and then again use the APPROX_COUNT_DISTINCT_AGG function to further aggregate those details, or use the TO_APPROX_COUNT_DISTINCT function to convert the detail values to human-readable NUMBER values.

Examples

Refer to Examples for examples of using the APPROX_COUNT_DISTINCT_AGG function in conjunction with the APPROX_COUNT_DISTINCT_DETAIL and TO_APPROX_COUNT_DISTINCT functions.

APPROX_COUNT_DISTINCT_DETAIL

Syntax

Purpose

APPROX_COUNT_DISTINCT_DETAIL calculates information about the approximate number of rows that contain a distinct value for expr and returns a BLOB value, called a detail, which contains that information in a special format.

For *expr*, you can specify a column of any scalar data type other than BFILE, BLOB, CLOB, LONG, LONG RAW, or NCLOB. This function ignores rows for which the value of *expr* is null.

This function is commonly used with the GROUP BY clause in a SELECT statement. When used in this way, it calculates approximate distinct value count information for *expr* within each group of rows and returns a single detail for each group.

The details returned by APPROX_COUNT_DISTINCT_DETAIL can be used as input to the APPROX_COUNT_DISTINCT_AGG function, which enables you to perform aggregations of the details, or the TO_APPROX_COUNT_DISTINCT function, which converts a detail to a human-readable distinct count value. You can use these three functions together to perform resource-intensive approximate count calculations once, store the resulting details, and then perform efficient aggregations and queries on those details. For example:

1. Use the APPROX_COUNT_DISTINCT_DETAIL function to calculate approximate distinct value count information and store the resulting details in a table or materialized view. These could be highly-granular details, such as city demographic counts or daily sales counts.

Copyright © 1996, 2026, Oracle and/or its affiliates.

2. Use the APPROX_COUNT_DISTINCT_AGG function to aggregate the details obtained in the previous step and store the resulting details in a table or materialized view. These could be details of lower granularity, such as state demographic counts or monthly sales counts.
3. Use the TO_APPROX_COUNT_DISTINCT function to convert the stored detail values to human-readable NUMBER values. You can use the TO_APPROX_COUNT_DISTINCT function to query detail values created by the APPROX_COUNT_DISTINCT_DETAIL function or the APPROX_COUNT_DISTNCT_AGG function.

- APPROX_COUNT_DISTINCT_AGG
- TO_APPROX_COUNT_DISTINCT

Examples

The examples in this section demonstrate how to use the APPROX_COUNT_DISTINCT_DETAIL, APPROX_COUNT_DISTINCT_AGG, and TO_APPROX_COUNT_DISTINCT functions together to perform resource-intensive approximate count calculations once, store the resulting details, and then perform efficient aggregations and queries on those details.

Example 1: APPROX_COUNT_DISTINCT_DETAIL

The following statement queries the tables sh.times and sh.sales for the approximate number of distinct products sold each day. The APPROX_COUNT_DISTINCT_DETAIL function returns the information in a detail, called daily_detail, for each day that products were sold. The returned details are stored in a materialized view called daily_prod_count_mv.

```
CREATE MATERIALIZED VIEW daily_prod_count_mv AS
  SELECT t.calendar_year year,
         t.calendar_month_number month,
         t.day_number_in_month day,
         APPROX_COUNT_DISTINCT_DETAIL(s.prod_id) daily_detail
  FROM times t, sales s
  WHERE t.time_id = s.time_id
  GROUP BY t.calendar_year, t.calendar_month_number, t.day_number_in_month;
```

Example 2: APPROX_COUNT_DISTINCT_AGG

The following statement uses the APPROX_COUNT_DISTINCT_AGG function to read the daily details stored in daily_prod_count_mv and create aggregated details that contain the approximate number of distinct products sold each month. These aggregated details are stored in a materialized view called monthly_prod_count_mv.

```
CREATE MATERIALIZED VIEW monthly_prod_count_mv AS
  SELECT year,
         month,
         APPROX_COUNT_DISTINCT_AGG(daily_detail) monthly_detail
  FROM daily_prod_count_mv
  GROUP BY year, month;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following statement is similar to the previous statement, except it creates aggregated details that contain the approximate number of distinct products sold each year. These aggregated details are stored in a materialized view called `annual_prod_count_mv`.

```
CREATE MATERIALIZED VIEW annual_prod_count_mv AS
  SELECT year,
         APPROX_COUNT_DISTINCT_AGG(daily_detail) annual_detail
  FROM daily_prod_count_mv
  GROUP BY year;
```

Example 3: TO_APPROX_COUNT_DISTINCT

The following statement uses the `TO_APPROX_COUNT_DISTINCT` function to query the daily detail information stored in `daily_prod_count_mv` and return the approximate number of distinct products sold each day:

```
SELECT year,
       month,
       day,
       TO_APPROX_COUNT_DISTINCT(daily_detail) "NUM PRODUCTS"
  FROM daily_prod_count_mv
  ORDER BY year, month, day;
```

```
      YEAR      MONTH        DAY NUM PRODUCTS
---------- ---------- ---------- ------------
      2019          1          1           24
      2019          1          2           25
      2019          1          3           11
      2019          1          4           34
      2019          1          5           10
...
```

Example 4: TO_APPROX_COUNT_DISTINCT

The following statement uses the `TO_APPROX_COUNT_DISTINCT` function to query the monthly detail information stored in `monthly_prod_count_mv` and return the approximate number of distinct products sold each month:

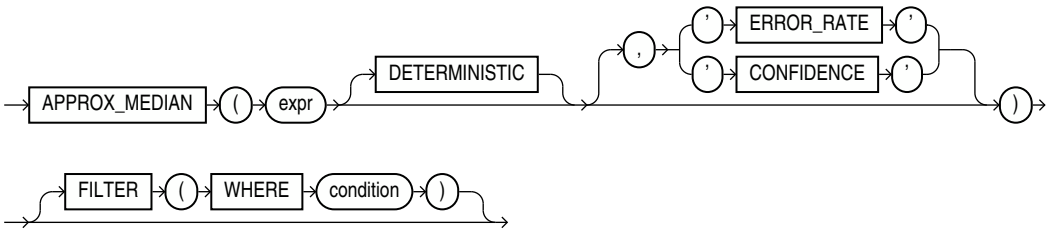
```
SELECT year,
       month,
       TO_APPROX_COUNT_DISTINCT(monthly_detail) "NUM PRODUCTS"
  FROM monthly_prod_count_mv
  ORDER BY year, month;
```

```
 YEAR       MONTH  NUM PRODUCTS
---------- ------- ------------
      2019       1           57
      2019       2           56
      2019       3           55
      2019       4           49
      2019       5           49
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
      2019    6        48
      2019    7        54
      2019    8        56
...
```

Example 5: TO_APPROX_COUNT_DISTINCT



The following statement uses the `TO_APPROX_COUNT_DISTINCT` function to query the annual detail information stored in `annual_prod_count_mv` and return the approximate number of distinct products sold each year:

```
SELECT year,
       TO_APPROX_COUNT_DISTINCT(annual_detail) "NUM PRODUCTS"
  FROM annual_prod_count_mv
  ORDER BY year;
```

```
 YEAR   NUM PRODUCTS
------  ------------
 2019           60
 2020           72
 2021           72
 2022           71
```

APPROX_MEDIAN

Syntax

Purpose

`APPROX_MEDIAN` is an approximate inverse distribution function that assumes a continuous distribution model. It takes a numeric or datetime value and returns an approximate middle value or an approximate interpolated value that would be the middle value once the values are sorted. Nulls are ignored in the calculation.

This function provides an alternative to the `MEDIAN` function, which returns the exact middle value or interpolated value. `APPROX_MEDIAN` processes large amounts of data significantly faster than `MEDIAN`, with negligible deviation from the exact result.

For *expr*, specify the expression for which the approximate median value is being calculated. The acceptable data types for *expr*, and the return value data type for this function, depend on the algorithm that you specify with the `DETERMINISTIC` clause.

DETERMINISTIC

Copyright © 1996, 2026, Oracle and/or its affiliates.

This clause lets you specify the type of algorithm this function uses to calculate the approximate median value.

- If you specify `DETERMINISTIC`, then this function calculates a deterministic approximate median value. In this case, *expr* must evaluate to a numeric value, or to a value that can be implicitly converted to a numeric value. The function returns the same data type as the numeric data type of its argument.
- If you omit `DETERMINSTIC`, then this function calculates a nondeterministic approximate median value. In this case, *expr* must evaluate to a numeric or datetime value, or to a value that can be implicitly converted to a numeric or datetime value. The function returns the same data type as the numeric or datetime data type of its argument.

ERROR_RATE | CONFIDENCE

These clauses let you determine the accuracy of the value calculated by this function. If you specify one of these clauses, then instead of returning the approximate median value for *expr*, the function returns a decimal value from 0 to 1, inclusive, which represents one of the following values:

- If you specify `ERROR_RATE`, then the return value represents the error rate for the approximate median value calculation for *expr*.
- If you specify `CONFIDENCE`, then the return value represents the confidence level for the error rate that is returned when you specify `ERROR_RATE`.

See Also

- MEDIAN
- APPROX_PERCENTILE which returns, for a given percentile, the approximate value that corresponds to that percentile by way of interpolation. `APPROX_MEDIAN` is the specific case of `APPROX_PERCENTILE` where the percentile value is 0.5.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Examples

The following query returns the deterministic approximate median salary for each department in the `hr.employees` table:

```
SELECT department_id "Department",
       APPROX_MEDIAN(salary DETERMINISTIC) "Median Salary"
  FROM employees
  GROUP BY department_id
  ORDER BY department_id;

Department Median Salary
---------- -------------
        10          4400
        20          6000
        30          2765
        40          6500
        50          3100
        60          4800
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
        70         10000
        80          9003
        90         17000
       100          7739
       110          8300
                    7000
```

The following query returns the error rates for the approximate median salaries that were returned by the previous query:

```
SELECT department_id "Department",
       APPROX_MEDIAN(salary DETERMINISTIC, 'ERROR_RATE') "Error Rate"
  FROM employees
  GROUP BY department_id
  ORDER BY department_id;

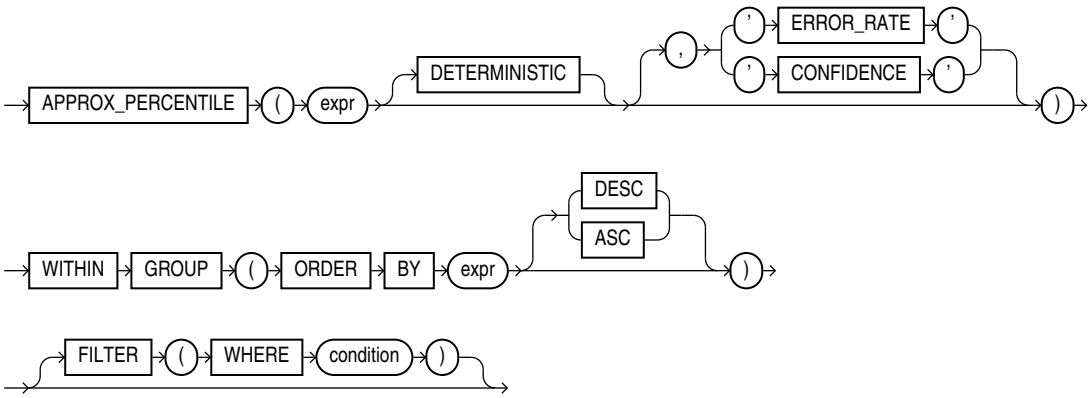
Department Error Rate
---------- ----------
        10 .002718282
        20 .021746255
        30 .021746255
        40 .002718282
        50 .019027973
        60 .019027973
        70 .002718282
        80 .021746255
        90 .021746255
       100 .019027973
       110 .019027973
           .002718282
```

The following query returns the confidence levels for the error rates that were returned by the previous query:

```
SELECT department_id "Department",
       APPROX_MEDIAN(salary DETERMINISTIC, 'CONFIDENCE') "Confidence Level"
  FROM employees
  GROUP BY department_id
  ORDER BY department_id;

Department Confidence Level
---------- ----------------
        10       .997281718
        20       .999660215
        30       .999660215
        40       .997281718
        50       .999611674
        60       .999611674
        70       .997281718
        80       .999660215
        90       .999660215
       100       .999611674
       110       .999611674
                 .997281718
```

The following query returns the nondeterministic approximate median hire date for each department in the `hr.employees` table:



Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT department_id "Department",
       APPROX_MEDIAN(hire_date) "Median Hire Date"
  FROM employees
  GROUP BY department_id
  ORDER BY department_id;

Department Median Hire Date
---------- ----------------
        10        17-SEP-03
        20        17-FEB-04
        30        24-JUL-05
        40        07-JUN-02
        50        15-MAR-06
        60        05-FEB-06
        70        07-JUN-02
        80        23-MAR-06
        90        17-JUN-03
       100        28-SEP-05
       110        07-JUN-02
                  24-MAY-07
```

APPROX_PERCENTILE

Syntax

Purpose

`APPROX_PERCENTILE` is an approximate inverse distribution function. It takes a percentile value and a sort specification, and returns the value that would fall into that percentile value with respect to the sort specification. Nulls are ignored in the calculation

This function provides an alternative to the `PERCENTILE_CONT` and `PERCENTILE_DISC` functions, which returns the exact results. `APPROX_PERCENTILE` processes large amounts of data significantly faster than `PERCENTILE_CONT` and `PERCENTILE_DISC`, with negligible deviation from the exact result.

The first *expr* is the percentile value, which must evaluate to a numeric value between 0 and 1.

The second *expr*, which is part of the `ORDER BY` clause, is a single expression over which this function calculates the result. The acceptable data types for *expr*, and the return value data type for this function, depend on the algorithm that you specify with the `DETERMINISTIC` clause.

DETERMINISTIC

Copyright © 1996, 2026, Oracle and/or its affiliates.

This clause lets you specify the type of algorithm this function uses to calculate the return value.

- If you specify `DETERMINISTIC`, then this function calculates a deterministic result. In this case, the `ORDER BY` clause expression must evaluate to a numeric value, or to a value that can be implicitly converted to a numeric value, in the range -2,147,483,648 through 2,147,483,647. The function rounds numeric input to the closest integer. The function returns the same data type as the numeric data type of the `ORDER BY` clause expression. The return value is not necessarily one of the values of *expr*
- If you omit `DETERMINSTIC`, then this function calculates a nondeterministic result. In this case, the `ORDER BY` clause expression must evaluate to a numeric or datetime value, or to a value that can be implicitly converted to a numeric or datetime value. The function returns the same data type as the numeric or datetime data type of the `ORDER BY` clause expression. The return value is one of the values of *expr*.

ERROR_RATE | CONFIDENCE

These clauses let you determine the accuracy of the result calculated by this function. If you specify one of these clauses, then instead of returning the value that would fall into the specified percentile value for *expr*, the function returns a decimal value from 0 to 1, inclusive, which represents one of the following values:

- If you specify `ERROR_RATE`, then the return value represents the error rate for calculating the value that would fall into the specified percentile value for*expr*.
- If you specify `CONFIDENCE`, then the return value represents the confidence level for the error rate that is returned when you specify `ERROR_RATE`.

DESC | ASC

Specify the sort specification for the calculating the value that would fall into the specified percentile value. Specify `DESC` to sort the `ORDER BY` clause expression values in descending order, or `ASC` to sort the values in ascending order. `ASC` is the default.

> **See Also**
>
> - PERCENTILE_CONT and PERCENTILE_DISC
> - APPROX_MEDIAN, which is the specific case of `APPROX_PERCENTILE` where the percentile value is 0.5

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Examples

The following query returns the deterministic approximate 25th percentile, 50th percentile, and 75th percentile salaries for each department in the `hr.employees` table. The salaries are sorted in ascending order for the interpolation calculation.

```
SELECT department_id "Department",
       APPROX_PERCENTILE(0.25 DETERMINISTIC)
         WITHIN GROUP (ORDER BY salary ASC) "25th Percentile Salary",
       APPROX_PERCENTILE(0.50 DETERMINISTIC)
         WITHIN GROUP (ORDER BY salary ASC) "50th Percentile Salary",
       APPROX_PERCENTILE(0.75 DETERMINISTIC)
         WITHIN GROUP (ORDER BY salary ASC) "75th Percentile Salary"
  FROM employees
  GROUP BY department_id
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
  ORDER BY department_id;

Department 25th Percentile Salary 50th Percentile Salary 75th Percentile Salary
---------- ---------------------- ---------------------- ----------------------
        10                   4400                   4400                   4400
        20                   6000                   6000                  13000
        30                   2633                   2765                   3100
        40                   6500                   6500                   6500
        50                   2600                   3100                   3599
        60                   4800                   4800                   6000
        70                  10000                  10000                  10000
        80                   7400                   9003                  10291
        90                  17000                  17000                  24000
       100                   7698                   7739                   8976
       110                   8300                   8300                  12006
                             7000                   7000                   7000
```

The following query returns the error rates for the approximate 25th percentile salaries that were calculated in the previous query:

```
SELECT department_id "Department",
       APPROX_PERCENTILE(0.25 DETERMINISTIC, 'ERROR_RATE')
         WITHIN GROUP (ORDER BY salary ASC) "Error Rate"
  FROM employees
  GROUP BY department_id
  ORDER BY department_id;

Department Error Rate
---------- ----------
        10 .002718282
        20 .021746255
        30 .021746255
        40 .002718282
        50 .019027973
        60 .019027973
        70 .002718282
        80 .021746255
        90 .021746255
       100 .019027973
       110 .019027973
           .002718282
```

The following query returns the confidence levels for the error rates that were calculated in the previous query:

```
SELECT department_id "Department",
       APPROX_PERCENTILE(0.25 DETERMINISTIC, 'CONFIDENCE')
         WITHIN GROUP (ORDER BY salary ASC) "Confidence"
FROM employees
GROUP BY department_id
ORDER BY department_id;

```

APPROX_PERCENTILE_AGG

Syntax

Purpose

`APPROX_PERCENTILE_AGG` takes as its input a column of details containing approximate percentile information, and enables you to perform aggregations of that information.

For *`detail`*, specify a column of details created by the `APPROX_PERCENT_DETAIL` function or the `APPROX_PERCENTILE_AGG` function. This column is of data type `BLOB`.

You can specify this function in a `SELECT` statement with a `GROUP BY` clause to aggregate the information contained in the details within each group of rows and return a single detail for each group.

This function returns a `BLOB` value, called a detail, which contains approximate percentile information in a special format. You can store details returned by this function in a table or materialized view, and then again use the `APPROX_PERCENTILE_AGG` function to further aggregate those details, or use the `TO_APPROX_PERCENTILE` function to convert the details to specified percentile values.

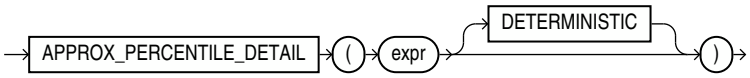
See Also



- APPROX_PERCENTILE_DETAIL
- TO_APPROX_PERCENTILE

Examples

Refer to APPROX_PERCENTILE_AGG: Examples for examples of using the `APPROX_PERCENTILE_AGG` function in conjunction with the `APPROX_PERCENTILE_DETAIL` and `TO_APPROX_PERCENTILE` functions.

APPROX_PERCENTILE_DETAIL

Syntax

Purpose

`APPROX_PERCENTILE_DETAIL` calculates approximate percentile information for the values of *expr* and returns a `BLOB` value, called a detail, which contains that information in a special format.

The acceptable data types for *expr* depend on the algorithm that you specify with the `DETERMINISTIC` clause. Refer to the DETERMINISTIC clause for more information.

This function is commonly used with the `GROUP BY` clause in a `SELECT` statement. It calculates approximate percentile information for *expr* within each group of rows and returns a single detail for each group.

The details returned by `APPROX_PERCENTILE_DETAIL` can be used as input to the `APPROX_PERCENTILE_AGG` function, which enables you to perform aggregations of the details, or the `TO_APPROX_PERCENTILE` function, which converts a detail to a specified percentile value. You can use these three functions together to perform resource-intensive approximate percentile calculations once, store the resulting details, and then perform efficient aggregations and queries on those details. For example:

1. Use the `APPROX_PERCENTILE_DETAIL` function to perform approximate percentile calculations and store the resulting details in a table or materialized view. These could be highly-granular percentile details, such as income percentile information for cities.
2. Use the `APPROX_PERCENTILE_AGG` function to aggregate the details obtained in the previous step and store the resulting details in a table or materialized view. These could be details of lower granularity, such as income percentile information for states.
3. Use the `TO_APPROX_PERCENTILE` function to convert the stored detail values to percentile values. You can use the `TO_APPROX_PERCENTILE` function to query detail values created by the `APPROX_PERCENTILE_DETAIL` function or the `APPROX_PERCENTILE_AGG` function.

DETERMINISTIC

This clause lets you control the type of algorithm used to calculate the approximate percentile values.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- If you specify `DETERMINISTIC`, then this function calculates deterministic approximate percentile information. In this case, *expr* must evaluate to a numeric value, or to a value that can be implicitly converted to a numeric value.
- If you omit `DETERMINSTIC`, then this function calculates nondeterministic approximate percentile information. In this case, *expr* must evaluate to a numeric or datetime value, or to a value that can be implicitly converted to a numeric or datetime value.

- APPROX_PERCENTILE_AGG
- TO_APPROX_PERCENTILE

Examples

The examples in this section demonstrate how to use the `APPROX_PERCENTILE_DETAIL`, `APPROX_PERCENTILE_AGG`, and `TO_APPROX_PERCENTILE` functions together to perform resource-intensive approximate percentile calculations once, store the resulting details, and then perform efficient aggregations and queries on those details.

APPROX_PERCENTILE_DETAIL: Example

The following statement queries the tables `sh.customers` and `sh.sales` for the monetary amounts for products sold to each customer. The `APPROX_PERCENTILE_DETAIL` function returns the information in a detail, called `city_detail`, for each city in which customers reside. The returned details are stored in a materialized view called `amt_sold_by_city_mv`.

```
CREATE MATERIALIZED VIEW amt_sold_by_city_mv
ENABLE QUERY REWRITE AS
SELECT c.country_id country,
       c.cust_state_province state,
       c.cust_city city,
       APPROX_PERCENTILE_DETAIL(s.amount_sold) city_detail
FROM customers c, sales s
WHERE c.cust_id = s.cust_id
GROUP BY c.country_id, c.cust_state_province, c.cust_city;
```

APPROX_PERCENTILE_AGG: Examples

The following statement uses the `APPROX_PERCENTILE_AGG` function to read the details stored in `amt_sold_by_city_mv` and create aggregated details that contain the monetary amounts for products sold to customers in each state. These aggregated details are stored in a materialized view called `amt_sold_by_state_mv`.

```
CREATE MATERIALIZED VIEW amt_sold_by_state_mv AS
SELECT country,
       state,
       APPROX_PERCENTILE_AGG(city_detail) state_detail
FROM amt_sold_by_city_mv
GROUP BY country, state;
```

The following statement is similar to the previous statement, except it creates aggregated details that contain the approximate monetary amounts for products sold to customers in each country. These aggregated details are stored in a materialized view called `amt_sold_by_country_mv`.

```
CREATE MATERIALIZED VIEW amt_sold_by_country_mv AS
  SELECT country,
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
        APPROX_PERCENTILE_AGG(city_detail) country_detail
  FROM amt_sold_by_city_mv
  GROUP BY country;
```

TO_APPROX_PERCENTILE: Examples

The following statement uses the `TO_APPROX_PERCENTILE` function to query the details stored in `amt_sold_by_city_mv` and return approximate 25th percentile, 50th percentile, and 75th percentile values for monetary amounts for products sold to customers in each city:

```
SELECT country,
       state,
       city,
       TO_APPROX_PERCENTILE(city_detail, .25, 'NUMBER') "25th Percentile",
       TO_APPROX_PERCENTILE(city_detail, .50, 'NUMBER') "50th Percentile",
       TO_APPROX_PERCENTILE(city_detail, .75, 'NUMBER') "75th Percentile"
FROM amt_sold_by_city_mv
ORDER BY country, state, city;

COUNTRY STATE        CITY           25th Percentile 50th Percentile 75th Percentile
------- ------------ -------------- --------------- --------------- ---------------
  52769 Kuala Lumpur Kuala Lumpur             19.29            38.1           53.84
  52769 Penang       Batu Ferringhi           21.51           42.09           57.26
  52769 Penang       Georgetown               19.15           33.25           56.12
  52769 Selangor     Klang                    18.08           32.06           51.29
  52769 Selangor     Petaling Jaya            19.29           35.43            60.2
. . .
```

The following statement uses the `TO_APPROX_PERCENTILE` function to query the details stored in `amt_sold_by_state_mv` and return approximate 25th percentile, 50th percentile, and 75th percentile values for monetary amounts for products sold to customers in each state:

```
SELECT country,
       state,
       TO_APPROX_PERCENTILE(state_detail, .25, 'NUMBER') "25th Percentile",
       TO_APPROX_PERCENTILE(state_detail, .50, 'NUMBER') "50th Percentile",
       TO_APPROX_PERCENTILE(state_detail, .75, 'NUMBER') "75th Percentile"
FROM amt_sold_by_state_mv
ORDER BY country, state;

COUNTRY STATE        25th Percentile 50th Percentile 75th Percentile
------- ------------ --------------- --------------- ---------------
  52769 Kuala Lumpur           19.29            38.1           53.84
  52769 Penang                 20.19           36.84           56.12
  52769 Selangor               16.97           32.41           52.69
  52770 Drenthe                16.76            31.7           53.89
  52770 Flevopolder            20.38           39.73           61.81
. . .
```

The following statement uses the `TO_APPROX_PERCENTILE` function to query the details stored in `amt_sold_by_country_mv` and return approximate 25th percentile, 50th percentile, and 75th percentile values for monetary amounts for products sold to customers in each country:

```
SELECT country,
       TO_APPROX_PERCENTILE(country_detail, .25, 'NUMBER') "25th Percentile",
       TO_APPROX_PERCENTILE(country_detail, .50, 'NUMBER') "50th Percentile",
       TO_APPROX_PERCENTILE(country_detail, .75, 'NUMBER') "75th Percentile"
FROM amt_sold_by_country_mv
ORDER BY country;

  COUNTRY 25th Percentile 50th Percentile 75th Percentile
--------- --------------- --------------- ---------------
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
    52769           19.1          35.43          52.78
    52770          19.29          38.99          59.58
    52771          11.99          44.99         561.47
    52772          18.08          33.72          54.16
    52773          15.67          29.61          50.65
. . .
```

APPROX_PERCENTILE_AGG takes as its input a column of details containing approximate percentile information, and enables you to perform aggregations of that information. The following statement demonstrates how approximate percentile details can interpreted by APPROX_PERCENTILE_AGG to provide an input to the TO_APPROX_PERCENTILE function. Like the previous example, this query returns approximate 25th percentile values for monetary amounts for products sold to customers in each country. Note that the results are identical to those returned for the 25th percentile in the previous example.

```
SELECT country,
       TO_APPROX_PERCENTILE(APPROX_PERCENTILE_AGG(city_detail), .25, 'NUMBER') "25th
Percentile"
FROM amt_sold_by_city_mv
GROUP BY country
ORDER BY country;

  COUNTRY 25th Percentile
---------- ---------------
     52769            19.1
     52770           19.29
     52771           11.99
     52772           18.08
     52773           15.67
. . .
```

Query Rewrite and Materialized Views Based on Approximate Queries: Example

In APPROX_PERCENTILE_DETAIL: Example, the ENABLE QUERY REWRITE clause is specified when creating the materialized view amt_sold_by_city_mv. This enables queries that contain approximation functions, such as APPROX_MEDIAN or APPROX_PERCENTILE, to be rewritten using the materialized view.

For example, ensure that query rewrite is enabled at either the database level or for the current session, and run the following query:

```
SELECT c.country_id country,
       APPROX_MEDIAN(s.amount_sold) amount_median
FROM customers c, sales s
WHERE c.cust_id = s.cust_id
GROUP BY c.country_id;
```

Explain the plan by querying DBMS_XPLAN:

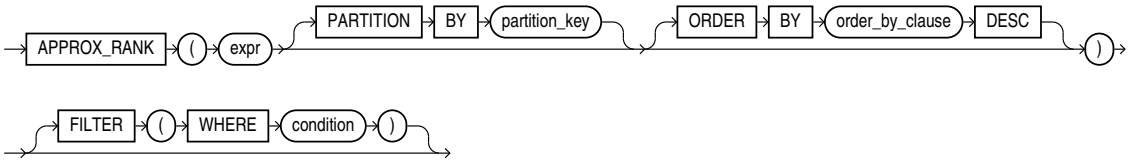
```
SET LINESIZE 300
SET PAGESIZE 0
COLUMN plan_table_output FORMAT A150

SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY_CURSOR(format=>'BASIC'));
```

As shown in the following plan, the optimizer used the materialized view amt_sold_by_city_mv for the query:

```
EXPLAINED SQL STATEMENT:
------------------------
SELECT c.country_id country, APPROX_MEDIAN(s.amount_sold)
amount_median FROM customers c, sales s WHERE c.cust_id = s.cust_id
```

Copyright © 1996, 2026, Oracle and/or its affiliates.



```
GROUP BY c.country_id

Plan hash value: 2232676046

-------------------------------------------------------------
| Id  | Operation                     | Name                |
-------------------------------------------------------------
|   0 | SELECT STATEMENT              |                     |
|   1 |  HASH GROUP BY APPROX         |                     |

-------------------------------------------------------------
```

APPROX_RANK

Syntax

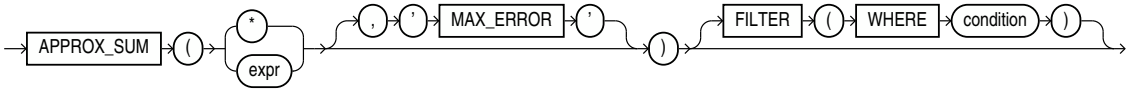
Purpose

`APPROX_RANK` returns the approximate value in a group of values.

This function takes an optional `PARTITION BY` clause followed by a mandatory `ORDER BY ... DESC` clause. The `PARTITION BY` key must be a subset of the `GROUP BY` key. The `ORDER BY` clause must include either `APPROX_COUNT` or `APPROX_SUM`.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Examples



The query returns the jobs that are among the top 10 total salary per department. For each job, the total salary and ranking is also given.

```
SELECT job_id,
            APPROX_SUM(sal),
      APPROX_RANK(PARTITION BY department_id ORDER BY APPROX_SUM(salary)
DESC)
FROM employees
GROUP BY department_id, job_id
HAVING
   APPROX_RANK(
   PARTITION BY department_id
   ORDER BY APPROX_SUM (salary)
   DESC) <= 10;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

APPROX_SUM

Syntax

Purpose

`APPROX_SUM` returns the approximate sum of an expression. If you supply `MAX_ERROR` as the second argument, then the function returns the maximum error between the actual and approximate sum.

You must use this function with a corresponding `APPROX_RANK` function in the `HAVING` clause. If a query uses `APPROX_COUNT`, `APPROX_SUM`, or `APPROX_RANK`, then the query must not use any other aggregation functions.

Note that `APPROX_SUM` returns an error when the input is a negative number.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Examples

The following query returns the 10 job types within every department that have the highest aggregate salary:

```
SELECT department_id, job_id,
       APPROX_SUM(salary)
FROM   employees
GROUP BY department_id, job_id
HAVING
  APPROX_RANK (
  PARTITION BY department_id
  ORDER BY APPROX_SUM(salary)
  DESC ) <= 10;
```

ASCII

Syntax

Purpose

`ASCII` returns the decimal representation in the database character set of the first character of *`char`*.

`char` can be of data type `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. The value returned is of data type `NUMBER`. If your database character set is 7-bit ASCII, then this function returns an ASCII

Copyright © 1996, 2026, Oracle and/or its affiliates.

value. If your database character set is EBCDIC Code, then this function returns an EBCDIC value. There is no corresponding EBCDIC character function.

This function does not support `CLOB` data directly. However, `CLOB`s can be passed in as arguments through implicit data conversion.

> **See Also**
>
> Data Type Comparison Rules for more information

Examples

The following example returns employees whose last names begin with the letter L, whose ASCII equivalent is 76:

```
SELECT last_name
  FROM employees
  WHERE ASCII(SUBSTR(last_name, 1, 1)) = 76
  ORDER BY last_name;

LAST_NAME
-------------------------
Ladwig
Landry
Lee
Livingston
Lorentz
```

ASCIISTR

Syntax

Purpose

`ASCIISTR` takes as its argument a string, or an expression that resolves to a string, in any character set and returns an ASCII version of the string in the database character set. Non-ASCII characters are converted to the form `\xxxx`, where `xxxx` represents a UTF-16 code unit.

> **See Also**
>
> - *Oracle Database Globalization Support Guide* for information on Unicode character sets and character semantics
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `ASCIISTR`

Examples

The following example returns the ASCII string equivalent of the text string `"ABÄCDE"`:

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT ASCIISTR('ABÄCDE')
  FROM DUAL;

ASCIISTR('
----------
AB\00C4CDE
```

ASIN

Syntax

Purpose

`ASIN` returns the arc sine of *n*. The argument *n* must be in the range of -1 to 1, and the function returns a value in the range of -*pi*/2 to *pi*/2, expressed in radians.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is `BINARY_FLOAT`, then the function returns `BINARY_DOUBLE`. Otherwise the function returns the same numeric data type as the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples

The following example returns the arc sine of .3:

```
SELECT ASIN(.3) "Arc_Sine"
  FROM DUAL;

 Arc_Sine
----------
.304692654
```

ATAN

Syntax

Purpose

`ATAN` returns the arc tangent of *n*. The argument *n* can be in an unbounded range and returns a value in the range of -*pi*/2 to *pi*/2, expressed in radians.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is `BINARY_FLOAT`, then the

Copyright © 1996, 2026, Oracle and/or its affiliates.

function returns BINARY_DOUBLE. Otherwise the function returns the same numeric data type as the argument.

> **See Also**
>
> ATAN2 for information about the ATAN2 function and Table 2-9 for more information on implicit conversion

Examples

The following example returns the arc tangent of .3:

```
SELECT ATAN(.3) "Arc_Tangent"
  FROM DUAL;

Arc_Tangent
----------
.291456794
```

ATAN2

Syntax

Purpose

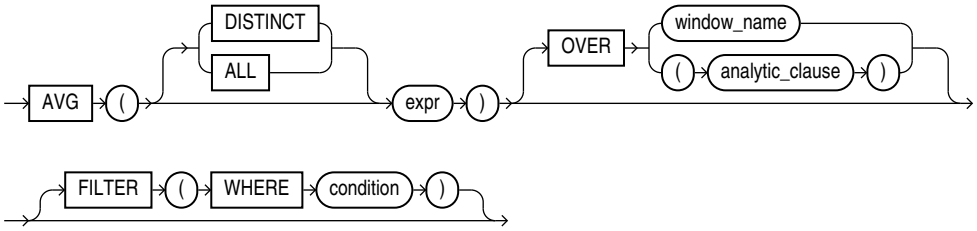
ATAN2 returns the arc tangent of *n1* and *n2*. The argument *n1* can be in an unbounded range and returns a value in the range of *-pi* to *pi*, depending on the signs of *n1* and *n2*, expressed in radians.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If any argument is BINARY_FLOAT or BINARY_DOUBLE, then the function returns BINARY_DOUBLE. Otherwise the function returns NUMBER.

> **See Also**
>
> ATAN for information on the ATAN function and Table 2-9 for more information on implicit conversion

Examples

The following example returns the arc tangent of .3 and .2:



```
SELECT ATAN2(.3, .2) "Arc_Tangent2"
  FROM DUAL;

Arc_Tangent2
------------
  .982793723
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

AVG

Syntax

> **See Also**
>
> Analytic Functions for information on syntax, semantics, and restrictions

Purpose

`AVG` returns average value of *`expr`*.

It takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type or an interval data type.

The function returns the same data type as the numeric data type of the argument. If the input is an interval, this returns an interval with the same units as the input.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

If you specify `DISTINCT`, then you can specify only the *`query_partition_clause`* of the *`analytic_clause`*. The *`order_by_clause`* and *`windowing_clause`* are not allowed.

> **See Also**
>
> About SQL Expressions for information on valid forms of *`expr`* and Aggregate Functions

Vector Aggregate Operations

You can use `AVG` on vectors to return the average on non-null inputs.

`expr` must evaluate to `VECTOR` and must not be `BINARY` vectors. The returned vector has the same number of dimensions as the input, and the format is always `FLOAT64`. For flexible number of dimensions, all inputs must have the same number of dimensions within each aggregation group.

Copyright © 1996, 2026, Oracle and/or its affiliates.

NULL vectors are ignored. They are not counted when calculating the average vector. If all inputs within an aggregation group are NULL, the result is NULL for that group. If a certain dimension overflows when applying arithmetic operations, an error is raised.

Rules

- `DISTINCT` syntax is not allowed.
- Only `GROUP BY` and `GROUP BY ROLLUP` are supported.
- Analytic functions are not supported for input arguments of type `VECTOR`.

See *Arithmetic Operators*of the *AI Vector Search User's Guide* for examples.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Aggregate Example

The following example calculates the average salary of all employees in the `hr.employees` table:

```
SELECT AVG(salary) "Average"
  FROM employees;

       Average
--------------
    6461.83178
```

Analytic Example

The following example calculates, for each employee in the `employees` table, the average salary of the employees reporting to the same manager who were hired in the range just before through just after the employee:

```
SELECT manager_id, last_name, hire_date, salary,
       AVG(salary) OVER (PARTITION BY manager_id ORDER BY hire_date
  ROWS BETWEEN 1 PRECEDING AND 1 FOLLOWING) AS c_mavg
  FROM employees
  ORDER BY manager_id, hire_date, salary;

MANAGER_ID LAST_NAME                 HIRE_DATE     SALARY     C_MAVG
---------- ------------------------- --------- ---------- ----------
       100 De Haan                   13-JAN-01      17000      14000
       100 Raphaely                  07-DEC-02      11000 11966.6667
       100 Kaufling                  01-MAY-03       7900 10633.3333
       100 Hartstein                 17-FEB-04      13000 9633.33333
       100 Weiss                     18-JUL-04       8000 11666.6667
       100 Russell                   01-OCT-04      14000 11833.3333
       100 Partners                  05-JAN-05      13500 13166.6667
       100 Errazuriz                 10-MAR-05      12000 11233.3333
. . .
```

BFILENAME

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

`BFILENAME` returns a `BFILE` locator that is associated with a physical LOB binary file on the server file system.

- '*directory*' is a database object that serves as an alias for a full path name on the server file system where the files are actually located.
- '*filename*' is the name of the file in the server file system.

You must create the directory object and associate a `BFILE` value with a physical file before you can use them as arguments to `BFILENAME` in a SQL or PL/SQL statement, `DBMS_LOB` package, or OCI operation.

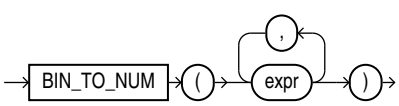
You can use this function in two ways:

- In a DML statement to initialize a `BFILE` column
- In a programmatic interface to access `BFILE` data by assigning a value to the `BFILE` locator

The directory argument is case sensitive. You must ensure that you specify the directory object name exactly as it exists in the data dictionary. For example, if an `"Admin"` directory object was created using mixed case and a quoted identifier in the `CREATE DIRECTORY` statement, then when using the `BFILENAME` function you must refer to the directory object as `'Admin'`. You must specify the filename argument according to the case and punctuation conventions for your operating system.

> **See Also**
>
> - *Oracle AI Database SecureFiles and Large Objects Developer's Guide* and *Oracle Call Interface Developer's Guide* for more information on LOBs and for examples of retrieving `BFILE` data
> - CREATE DIRECTORY

Examples



The following example inserts a row into the sample table `pm.print_media`. The example uses the `BFILENAME` function to identify a binary file on the server file system in the directory `/demo/schema/product_media`. The example shows how the directory database object `media_dir` was created in the `pm` schema.

```
CREATE DIRECTORY media_dir AS '/demo/schema/product_media';

INSERT INTO print_media (product_id, ad_id, ad_graphic)
  VALUES (3000, 31001, BFILENAME('MEDIA_DIR', 'modem_comp_ad.gif'));
```

BIN_TO_NUM

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

`BIN_TO_NUM` converts a bit vector to its equivalent number. Each argument to this function represents a bit in the bit vector. This function takes as arguments any numeric data type, or any nonnumeric data type that can be implicitly converted to `NUMBER`. Each *expr* must evaluate to 0 or 1. This function returns Oracle `NUMBER`.

`BIN_TO_NUM` is useful in data warehousing applications for selecting groups of interest from a materialized view using grouping sets.

> **See Also**
>
> - *group_by_clause* for information on `GROUPING SETS` syntax
> - Table 2-9 for more information on implicit conversion
> - *Oracle AI Database Data Warehousing Guide* for information on data aggregation in general

Examples

The following example converts a binary value to a number:

```
SELECT BIN_TO_NUM(1,0,1,0)
  FROM DUAL;

BIN_TO_NUM(1,0,1,0)
-------------------
                 10
```

The next example converts three values into a single binary value and uses `BIN_TO_NUM` to convert that binary into a number. The example uses a PL/SQL declaration to specify the original values. These would normally be derived from actual data sources.

```
SELECT order_status
  FROM orders
  WHERE order_id = 2441;

ORDER_STATUS
------------
           5
DECLARE
  warehouse NUMBER := 1;
  ground    NUMBER := 1;
  insured   NUMBER := 1;
  result    NUMBER;
BEGIN
  SELECT BIN_TO_NUM(warehouse, ground, insured) INTO result FROM DUAL;
  UPDATE orders SET order_status = result WHERE order_id = 2441;
END;
/
PL/SQL procedure successfully completed.

SELECT order_status
  FROM orders
  WHERE order_id = 2441;

ORDER_STATUS
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
------------
           7
```

Refer to the examples for BITAND for information on reversing this process by extracting multiple values from a single column value.

BITAND

Syntax

Purpose

The `BITAND` function treats its inputs and its output as vectors of bits; the output is the bitwise `AND` of the inputs.

The types of *expr1* and *expr2* are `NUMBER`, and the result is of type `NUMBER`. If either argument to `BITAND` is `NULL`, the result is `NULL`.

The arguments must be in the range $-(2^{(n-1)})$ .. $((2^{(n-1)})-1)$. If an argument is out of this range, the result is undefined.

The result is computed in several steps. First, each argument A is replaced with the value `SIGN(A)*FLOOR(ABS(A))`. This conversion has the effect of truncating each argument towards zero. Next, each argument A (which must now be an integer value) is converted to an n-bit two's complement binary integer value. The two bit values are combined using a bitwise `AND` operation. Finally, the resulting n-bit two's complement value is converted back to `NUMBER`.

Notes on the BITAND Function

- The current implementation of `BITAND` defines *n* = 128.
- PL/SQL supports an overload of `BITAND` for which the types of the inputs and of the result are all `BINARY_INTEGER` and for which *n* = 32.

Examples

The following example performs an `AND` operation on the numbers 6 (binary 1,1,0) and 3 (binary 0,1,1):

```
SELECT BITAND(6,3)
  FROM DUAL;

BITAND(6,3)
-----------
          2
```

This is the same as the following example, which shows the binary values of 6 and 3. The `BITAND` function operates only on the significant digits of the binary values:

```
SELECT BITAND(
    BIN_TO_NUM(1,1,0),
    BIN_TO_NUM(0,1,1)) "Binary"
  FROM DUAL;

    Binary
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
----------
         2
```

Refer to the example for BIN_TO_NUM for information on encoding multiple values in a single column value.

The following example supposes that the *order_status* column of the sample table oe.orders encodes several choices as individual bits within a single numeric value. For example, an order still in the warehouse is represented by a binary value 001 (decimal 1). An order being sent by ground transportation is represented by a binary value 010 (decimal 2). An insured package is represented by a binary value 100 (decimal 4). The example uses the DECODE function to provide two values for each of the three bits in the *order_status* value, one value if the bit is turned on and one if it is turned off.

```
SELECT order_id, customer_id, order_status,
    DECODE(BITAND(order_status, 1), 1, 'Warehouse', 'PostOffice') "Location",
    DECODE(BITAND(order_status, 2), 2, 'Ground', 'Air') "Method",
    DECODE(BITAND(order_status, 4), 4, 'Insured', 'Certified') "Receipt"
  FROM orders
  WHERE sales_rep_id = 160
  ORDER BY order_id;

  ORDER_ID CUSTOMER_ID ORDER_STATUS Location   Method Receipt
---------- ----------- ------------ ---------- ------ ---------
      2416         104            6 PostOffice Ground Insured
      2419         107            3 Warehouse  Ground Certified
      2420         108            2 PostOffice Ground Certified
      2423         145            3 Warehouse  Ground Certified
      2441         106            5 Warehouse  Air    Insured
      2455         145            7 Warehouse  Ground Insured
```

For the Location column, BITAND first compares *order_status* with 1 (binary 001). Only significant bit values are compared, so any binary value with a 1 in its rightmost bit (any odd number) will evaluate positively and return 1. Even numbers will return 0. The DECODE function compares the value returned by BITAND with 1. If they are both 1, then the location is "Warehouse". If they are different, then the location is "PostOffice".

The Method and Receipt columns are calculated similarly. For Method, BITAND performs the AND operation on *order_status* and 2 (binary 010). For Receipt, BITAND performs the AND operation on *order_status* and 4 (binary 100).

BIT_AND_AGG

Syntax

Purpose

BIT_AND_AGG is a bitwise aggregation function that returns the result of a bitwise AND operation.

You can use BIT_AND_AGG as part of a GROUP BY query, window function, or as an analytical function. The return type of BIT_AND_AGG is always a number.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Semantics

The keywords `DISTINCT` or `UNIQUE` ensure that only unique values in `expr` are used for computation. `UNIQUE` is an Oracle-specific keyword and not an ANSI standard.

NULL values in the `expr` column are ignored.

Returns NULL if all rows in the group have NULL `expr` values.

Floating point values are truncated to the integer prior to aggregation. For instance, the value 4.64 is converted to 4, and the value 4.4 is also converted to 4.

Negative numbers are represented in two's complement form internally prior to performing an aggregate operation. The resultant aggregate could be a negative value.

Range of inputs supported: -2 raised to 127 to (2 raised to 127) -1

Numbers are internally converted to a 128b decimal representation prior to aggregation. The resultant aggregate is converted back into an Oracle Number.

For a given set of values, the result of a bitwise aggregate is always deterministic and independent of ordering.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Example 7-2 Use the BIT_AND_AGG Function

Select two numbers and their bitwise representation:

```
SELECT '011' num, bin_to_num(0,1,1) bits FROM dual
  UNION ALL SELECT '101' num, bin_to_num(1,0,1) bits FROM dual;

NUM       BITS
--- ----------
011          3
101          5
```

Perform the bitwise AND operation:

```
SELECT bit_and_agg(bits)
  FROM (SELECT '011' num, bin_to_num(0,1,1) bits FROM dual
        UNION ALL SELECT '101' num, bin_to_num(1,0,1) bits FROM dual);

BIT_AND_AGG(BITS)
-----------------
                1
```

Only the first bit is identical in both rows, thus the result is 001, which is the number 1.

BITMAP_BIT_POSITION

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

Use `BITMAP_BIT_POSITION` to construct the one-to-one mapping between a number and a bit position.

The argument *expr* is of type `NUMBER`. It is the absolute bit position in the bitmap.

`BITMAP_BIT_POSITION` returns a `NUMBER`, the relative bit position.

If *expr* is NULL, the function returns NULL.

If *expr* is not an integer, you will see the following error message:

```
Invalid value has been passed to a BITMAP COUNT DISTINCT related operator.
```

BITMAP_BUCKET_NUMBER

Syntax

Purpose

Use `BITMAP_BUCKET_NUMBER` to construct a one-to-one mapping between a number and a bit position in a bitmap.

The argument *expr* is of type `NUMBER`. It represents the absolute bit position in the bitmap.

`BITMAP_BUCKET_NUMBER` returns a `NUMBER`. It represents the relative bit position.

If *expr* is NULL, the function returns NULL.

If *expr* is not an integer, you will see the following error message:

```
Invalid value has been passed to a BITMAP COUNT DISTINCT related operator.
```

BITMAP_CONSTRUCT_AGG

Syntax

Purpose

`BITMAP_CONSTRUCT_AGG` is an aggregation function that operates on bit positions and returns the bitmap representation of the set of all input bit positions. It essentially maintains a bitmap and sets into it all the input bit positions. It returns the representation of the bitmap.

The argument `expr` is of type `NUMBER`.

The return type is of type `BLOB`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

If expr is NULL, the function returns NULL.

Restrictions

- The argument must be of NUMBER type. If the input value cannot be converted to a natural number, error ORA-62575 is raised:

```
62575, 00000, "Invalid value has been passed to a BITMAP COUNT DISTINCT
related operator."
// *Cause: An attempt was made to pass an invalid value to a BITMAP COUNT
DISTINCT operator.
// *Action: Pass only natural number values to BITMAP_CONSTRUCT_AGG.
```

- If the bitmap exceeds the maximum value of a BLOB, you will see error ORA-62577:

```
62577, 00000, "The bitmap size exceeds maximum size of its SQL data type."
// *Cause: An attempt was made to construct a bitmap larger than its maximum SQL
type size.
// *Action: Break the input to BITMAP_CONSTRUCT_AGG into smaller ranges.
```

BITMAP_COUNT

Syntax

Purpose

BITMAP_COUNT is a scalar function that returns the 1-bit count for the input bitmap.

The argument expr is of type BLOB.

It returns a NUMBER representing the count of bits set in its input.

If expr is NULL, it returns 0.

Restrictions

The argument must be of type BLOBtype. The argument is expected to be a bitmap produced by BITMAP_CONSTRUCT_AGG or, recursively, by BITMAP_OR_AGG. Any other input results in ORA-62578:

```
62578, 00000, "The input is not a valid bitmap produced by BITMAP COUNT
DISTINCT related operators."
// *Cause: An attempt was made to pass a bitmap that was not produced by one
of the BITMAP COUNT DISTINCT operators.
// *Action: Only pass bitmaps constructed via BITMAP_CONSTRUCT_AGG or
BITMAP_OR_AGG to BITMAP COUNT DISTINCT related operators.
```

BITMAP_OR_AGG

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

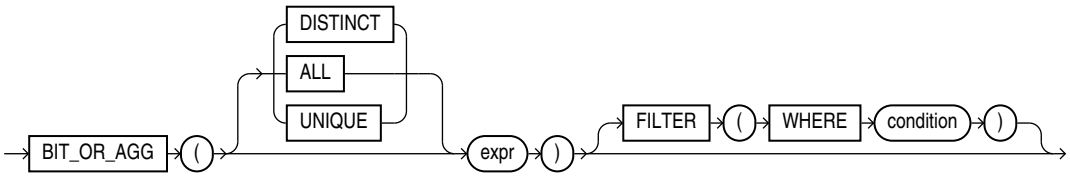
`BITMAP_OR_AGG` is an aggregation function that operates on bitmaps and computes the OR of its inputs.

The argument `expr` must be of type `BLOB`.

The return type is of type `BLOB`. It returns the bitmap representing the OR of all the bitmaps it has aggregated.

The output of `BITMAP_OR_AGG` is not human-readable. It is meant to be processed by further aggregations via `BITMAP_OR_AGG` or by the scalar function `BITMAP_COUNT`.

If `expr` is NULL, the function returns NULL.



Restrictions

The argument must be of type `BLOB`. The argument is expected to be a bitmap produced by `BITMAP_CONSTRUCT_AGG` or, recursively, by `BITMAP_OR_AGG`. Any other input results in `ORA-62578`:

```
62578, 00000, "The input is not a valid bitmap produced by BITMAP COUNT
DISTINCT related operators."
// *Cause: An attempt was made to pass a bitmap that was not produced by one
of the BITMAP COUNT DISTINCT operators.
// *Action: Only pass bitmaps constructed via BITMAP_CONSTRUCT_AGG or
BITMAP_OR_AGG to BITMAP COUNT DISTINCT related operators.
```

BIT_OR_AGG

Syntax

Purpose

`BIT_OR_AGG` is a bitwise aggregation function that returns the result of a bitwise OR operation.

You can use `BIT_OR_AGG` as part of a `GROUP BY` query, window function, or as an analytical function. The return type of `BIT_OR_AGG` is always a number.

Semantics

The keywords `DISTINCT` or `UNIQUE` ensure that only unique values in `expr` are used for computation. `UNIQUE` is an Oracle-specific keyword and not an ANSI standard.

NULL values in the `expr` column are ignored.

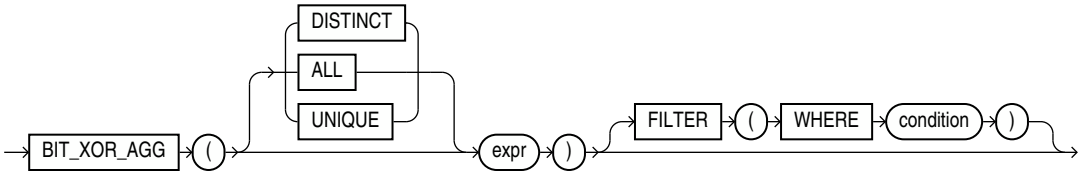
Returns NULL if all rows in the group have NULL `expr` values.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Floating point values are truncated to the integer prior to aggregation. For instance, the value 4.64 is converted to 4 and the value 4.4 is also converted to 4.

Negative numbers are represented in two's complement form internally prior to performing an aggregate operation. The resultant aggregate could be a negative value.

Range of inputs supported: -2 raised to 127 to (2 raised to 127) -1



Numbers are internally converted to a 128b decimal representation prior to aggregation. The resultant aggregate is converted back into an Oracle Number.

For a given set of values, the result of a bitwise aggregate is always deterministic and independent of ordering.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

BIT_XOR_AGG

Syntax

Purpose

`BIT_XOR_AGG` is a bitwise aggregation function that returns the result of a bitwise XOR operation.

You can use `BIT_XOR_AGG` as part of a `GROUP BY` query, window function, or as an analytical function. The return type of `BIT_XOR_AGG` is always a number.

Semantics

The keywords `DISTINCT` or `UNIQUE` ensure that only unique values in `expr` are used for computation. `BIT_XOR_AGG` could potentially return a different value when `DISTINCT` is present. `UNIQUE` is an Oracle-specific keyword and not an ANSI standard.

NULL values in the `expr` column are ignored.

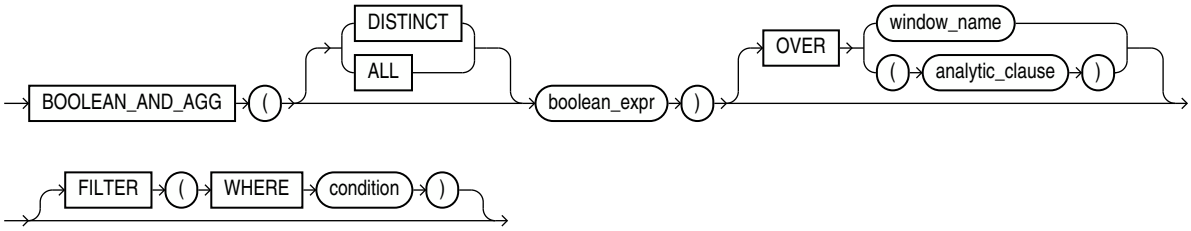
Returns NULL if all rows in the group have NULL `expr` values.

Floating point values are truncated to the integer prior to aggregation. For instance, the value 4.64 is converted to 4 and the value 4.4 is also converted to 4.

Negative numbers are represented in two's complement form internally prior to performing an aggregate operation. The resultant aggregate could be a negative value.

Range of inputs supported: -2 raised to 127 to (2 raised to 127) -1

Numbers are internally converted to a 128b decimal representation prior to aggregation. The resultant aggregate is converted back into an Oracle Number.



For a given set of values, the result of a bitwise aggregate is always deterministic and independent of ordering.

Copyright © 1996, 2026, Oracle and/or its affiliates.

For the semantics of the FILTER clause, see FILTER Clause Semantics.

BOOLEAN_AND_AGG

Syntax

Purpose

BOOLEAN_AND_AGG returns 'TRUE' if the *boolean_expr* evaluates to true for every row that qualifies. Otherwise it returns 'FALSE'. You can use it as an aggregate or analytic function.

For the semantics of the FILTER clause, see FILTER Clause Semantics.

Examples

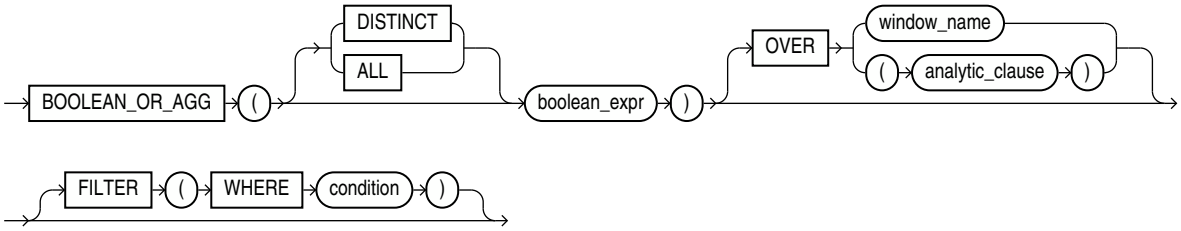
```
SELECT BOOLEAN_AND_AGG(c2)
    FROM t;

SELECT BOOLEAN_AND_AGG(c2)
    FROM t
    WHERE c1 = 0;

SELECT BOOLEAN_AND_AGG(c2)
    FROM t
    WHERE c2 IS FALSE;

SELECT BOOLEAN_AND_AGG(c2)
    FROM t
    WHERE c2 IS FALSE OR c2 IS NULL;

SELECT BOOLEAN_AND_AGG(c2)
    FROM t
    WHERE c2 IS NOT TRUE OR c2 IS NULL;



SELECT BOOLEAN_AND_AGG(c2)
    FROM t
    WHERE c2 IS NOT FALSE OR c2 IS NULL;

SELECT BOOLEAN_AND_AGG(c2 OR c2 OR (c2))
    FROM t
    WHERE c2 IS NOT FALSE OR c2 IS NULL;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

BOOLEAN_OR_AGG

Syntax

Purpose

`BOOLEAN_OR_AGG` returns `'TRUE'` if the *`boolean_expr`* evaluates to true for at least one row that qualifies. Otherwise it returns `'FALSE'`. You can use it as an aggregate or analytic function.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Examples

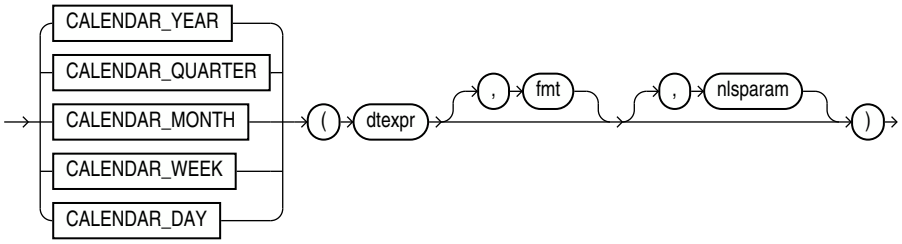
```
SELECT BOOLEAN_OR_AGG(c2)
    FROM t;

SELECT BOOLEAN_OR_AGG(c2)
    FROM t
    WHERE c1 = 0;

SELECT BOOLEAN_OR_AGG(c2)
    FROM t
    WHERE c2 IS TRUE;

SELECT BOOLEAN_OR_AGG(c2)
    FROM t
    WHERE c2 IS TRUE OR c2 IS NULL;

SELECT BOOLEAN_OR_AGG(c2)
    FROM t
    WHERE c2 IS NOT FALSE OR c2 IS NULL;



SELECT BOOLEAN_OR_AGG(c2)
    FROM t
    WHERE c2 IS NOT TRUE OR c2 IS NULL;

SELECT BOOLEAN_OR_AGG(c2 OR c2)
    FROM t
    WHERE c2 IS NOT TRUE OR c2 IS NULL;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

CALENDAR

Syntax

Purpose

Calendar functions accept a `DATE` expression, or any expression that may be implicitly converted to `DATE` as input. They return a formatted string representing the date, with default formats explicitly defined for each function.

Semantics

Each of the calendar , fiscal , and retail functions returns a `VARCHAR2` value that uniquely identifies a member in an implicit hierarchy at a particular level. For this reason, the `NLS_DATE_FORMAT`, `NLS_TIMESTAMP_FORMAT`, and `NLS_TIMESTAMP_TZ_FORMAT` do not apply to these functions. They each have their own default formats. These functions respect the setting of `NLS_DATE_LANGUAGE`.

- *`dtexpr`* is a datetime expression with one of the following types (or any value that can be implicitly converted to `DATE`): `DATE`, `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, `TIMESTAMP WITH LOCAL TIME ZONE` .
- *`fmt`* is a text expression representing a format string. In all cases, the case-sensitivity of the format specifiers follows the same behavior as `TO_CHAR`. For example, `MON` specifies an abbreviated month in upper-case (e.g. `JAN`), `mon` specifies an abbreviated month name in lower-case (e.g. `jan`), and `Mon` specifies an abbreviated month name in title-case (e.g. `Jan`).
- *`nlsparam`* is a text expression representing an NLS parameter setting. The only currently supported parameter is `NLS_DATE_LANGUAGE`, and is specified in the same manner as for `TO_CHAR` and `TO_DATE`.

Formats for Calendar Functions

The calendar functions return a `VARCHAR2` value that uniquely identifies a member in the specified level within the standard Gregorian calendar. The required formats must appear somewhere in the format string, and an error will be raised if not present. The optional formats may appear in the format string. All other format specifiers are prohibited and an error will be raised if included.

Punctuation and quoted text (using double-quotes) are allowed in the same manner as `TO_CHAR`. The format specifiers are a subset of the datetime format specifiers used for `TO_CHAR`.

The following table describes the format strings for each of the functions.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-1 Formats for calendar functions

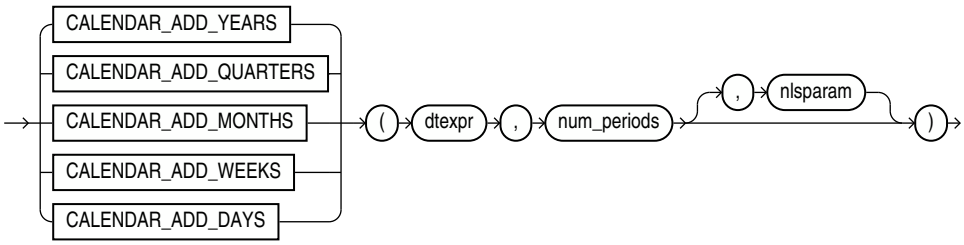
Function	Required Formats	Optional Formats	Default Format String
CALENDAR_YEAR	YYYY or SYYYY	None	SYYYY Example: 2024
CALENDAR_QUARTER	YYYYor SYYYY Q	None	"Q"Q-SYYYY Example: Q1-2024
CALENDAR_MONTH	YYYYor SYYYY One of MM, mon, MONTH	Q	MON-SYYYY Example: JAN-2024
CALENDAR_WEEK	YYYYor SYYYY WW	None	"W"WW-SYYYY Example: W01-2024
CALENDAR_DAY	YYYYor SYYYY • WW and one of and one of : – DY – DAY • DD and one of – MM – MON – MONTH • DDD	Q	DD-MON-SYYYY Example: 01-JAN-2024

Format Descriptions for Calendar Functions

The following table describes the interpretation of the format specifiers for calendar hierarchies, which is consistent with the definition for TO_CHAR and TO_DATE, but are included here for completeness. The capitalization rules for MON, MONTH, DY, and DAY all follow the usage elsewhere (i.e. TO_CHAR) with regard to lower-case (e.g. month => june), upper-case (e.g. MONTH => JUNE), and title-case (e.g. Month => June).

Table 7-2 Format descriptions for calendar functions

Format Specifier	Description
YYYY	4-digit year (only positive years supported)
SYYYY	4-digit year, with BC years as negative
Q	Quarter of year (1-4)
MM	Month of year (1-12), 2-digits
MON	Abbreviated name of month
MONTH	Name of month
WW	Week number (1-53), 2-digits
DY	Abbreviated name of day
DAY	Name of day
D	Day number (1-7). Depends on the NLS_TERRITORY
DD	Day of month (1-31), 2-digits



Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-2 (Cont.) Format descriptions for calendar functions

Format Specifier	Description
DDD	Day of year (1-366), 3-digits

CALENDAR_ADD_X_PERIODS

Syntax

Purpose

These functions add (or subtract if interval is negative) a given number of periods from the given date based on the Gregorian calendar.

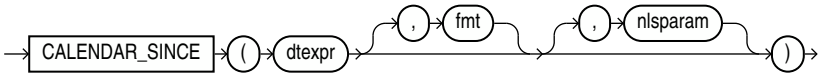
- *dtexpr* is a datetime expression with one of the following types (or any value that can be implicitly converted to DATE): DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE .
- The *num_periods* parameter is an integer that when positive will add periods and when negative will subtract periods.
- *nlsparam* is a text expression representing an NLS parameter setting. The only currently supported parameter is NLS_DATE_LANGUAGE, and is specified in the same manner as for TO_CHAR and TO_DATE.

The CALENDAR_ADD_X_PERIODS, FISCAL_ADD_X_PERIODS, and RETAIL_ADD_X_PERIODS functions take a *num_periods* parameter indicating how many periods (years, quarters, months, weeks, days) to add to the given *dtexpr*. The functions will return a DATE (with hour/minute/second components retained from the given DATE).

CALENDAR_ADD_YEARS adds or subtracts the given number of years, where a year is always defined as a period of 12 months.

CALENDAR_ADD_QUARTERS adds or subtracts the given number of quarters, where a quarter is always defined as a period of 3 months.

CALENDAR_ADD_MONTHS is identical to the existing ADD_MONTHS function. This will add or subtract to get a target month. If the given date is the last day of its month or if the resulting month has fewer days than the day component of the given date, the last day of the resulting month is used. Otherwise, the result has the same day component as the given date.



CALENDAR_ADD_WEEKS adds or subtracts the given number of weeks, where a week is always defined as a period of 7 days.

CALENDAR_ADD_DAYS simply adds or subtracts the given number of days.

Copyright © 1996, 2026, Oracle and/or its affiliates.

CALENDAR_SINCE

Syntax

Purpose

The `CALENDAR_SINCE` function determines the relative interval between the *`dtexpr`* and `SYSDATE`. It reports the interval in human-readable text using an interval of the appropriate scope using the following rules:

If < 2 minutes, then seconds.

If < 120 minutes, then minutes.

If < 2 days, then hours.

If < 14 days, then days.

If < 60 days, then weeks.

If < 365 days, then months.

Else years.

If the *`dtexpr`* < `SYSDATE` then the text is reported as `"X periods ago"` (e.g. 2 days ago, 4 months ago, etc.).

If the *`dtexpr`* > `SYSDATE` then the text is reported as `"In X periods"` (i.e. 3 days from now, 5 months from now, etc.)

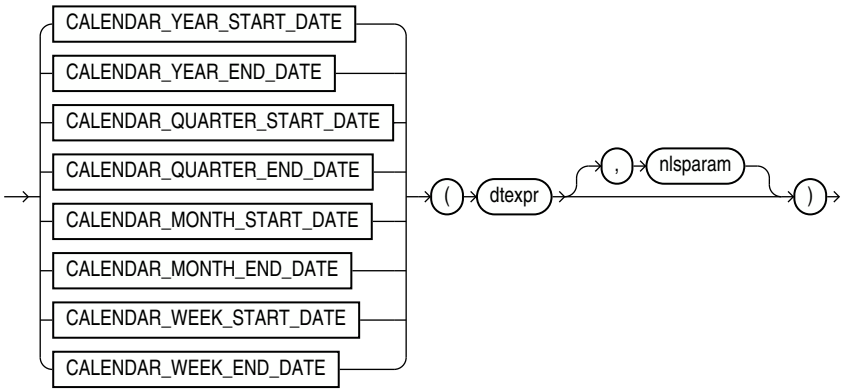
If the *`dtexpr`* = `SYSDATE` then the returned text is `"Now"`. The text will be properly translated based on the `NLS_LANGUAGE`.

For all periods except for year, the reported intervals will be truncated to an integer (i.e. 2.8 weeks would be reported as 2 weeks). For years, it is truncated at the tenths place (i.e. 1.89 years would be reported as 1.8 years, with 1.0 years omitting the decimal).

The *`fmt`* parameter is a text value that must be either `LONG` or `SHORT` (case-insensitive) and represents the format of the output text. The format shown above is the `LONG` format and is the default. When *`fmt`* is `SHORT`, however, the short format is used. For example, "2 days ago" becomes "2d" and "3 days from now" becomes "in 3d". The following are the shorted period names in English.

Table 7-3 Shorted Period Names in English

LONG	SHORT
`Now`	`Now`
`seconds`	`s`
`minutes`	`m`
`hours`	`h`



Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-3 (Cont.) Shorted Period Names in English

LONG	SHORT
days	d
weeks	w
months	mo
years	y

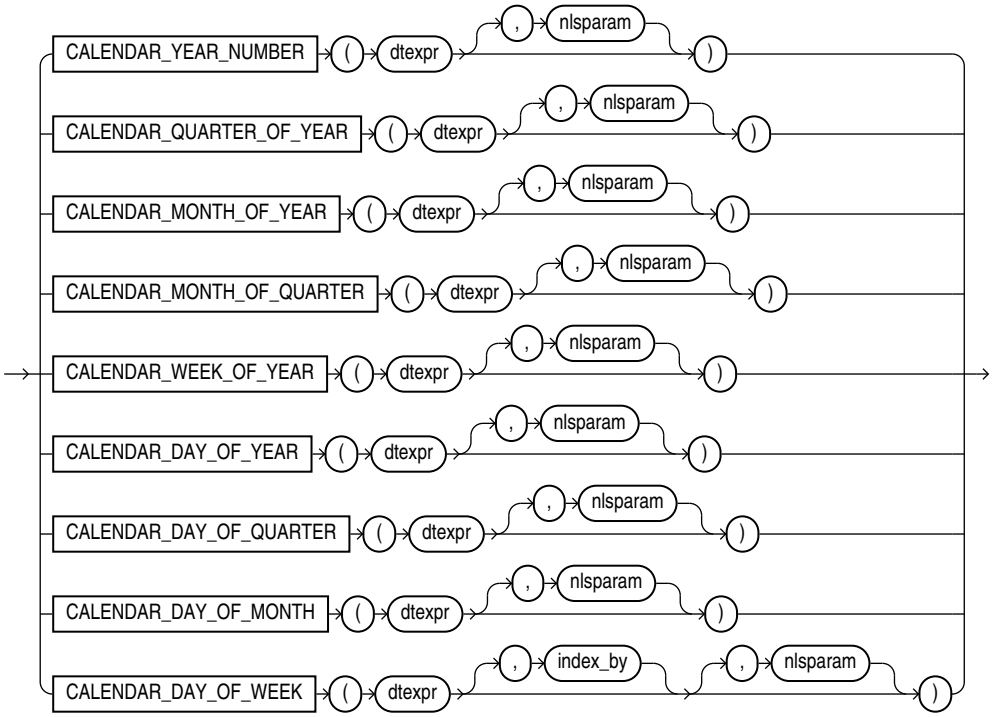
CALENDAR_START_END

Syntax

- *dtexpr* is a datetime expression with one of the following types (or any value that can be implicitly converted to DATE): DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE .
- *nlsparam* is a text expression representing an NLS parameter setting. The only currently supported parameter is NLS_DATE_LANGUAGE, and is specified in the same manner as for TO_CHAR and TO_DATE.

CALENDAR_START_END, FISCAL_START_END, CALENDAR_X_OF_Y, FISCAL_X_OF_Y, CALENDAR_ADD_X_PERIODS, and FISCAL_ADD_PERIODS functions accept a *nlsparam*.

All functions that take an *nlsparam* allow the specification of NLS_CALENDAR, with the exception of the retail functions.



The NLS_CALENDAR, either inherited from the session or explicitly specified in the *nlsparam*, indicates which calendar is used for navigation and output. Only the GREGORIAN calendar is supported.

The CALENDAR_START_END, FISCAL_START_END, and RETAIL_START_END functions return a DATE (with hour/minute/second components set to midnight) representing the Gregorian date of the start or end of the associated period (year, quarter, month, week) in the associated calendar (calendar, fiscal, retail). Note that there are no functions for DAY because they would all just return the given date for both start and end.

Copyright © 1996, 2026, Oracle and/or its affiliates.

CALENDAR_X_OF_Y

Syntax

- *dtexpr* is a datetime expression with one of the following types (or any value that can be implicitly converted to DATE): DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE .
- *nlsparam* is a text expression representing an NLS parameter setting. The only currently supported parameter is NLS_DATE_LANGUAGE, and is specified in the same manner as for TO_CHAR and TO_DATE.
- The *index_by* parameter is a text value that must resolve to either POSITION or DATE (case-insensitive, defaults to DATE). It is used to distinguish between absolute and position-based numbers for the following cases:
  - CALENDAR_DAY_OF_WEEK
  - FISCAL_DAY_OF_WEEK
  - RETAIL_DAY_OF_WEEK
  - FISCAL_MONTH_OF_YEAR
  - RETAIL_MONTH_OF_YEAR

The CALENDAR_X_OF_Y functions return a NUMBER indicating the relative number of one period with a given ancestor period. Since years have no ancestor, year numbers are obtained with the YEAR_NUMBER functions.

Copyright © 1996, 2026, Oracle and/or its affiliates.

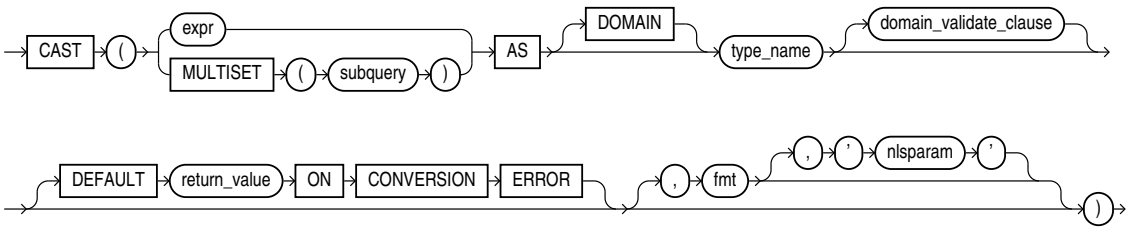
CARDINALITY

Syntax

Purpose

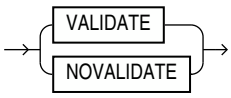
`CARDINALITY` returns the number of elements in a nested table. The return type is `NUMBER`. If the nested table is empty, or is a null collection, then `CARDINALITY` returns `NULL`.

Examples



The following example shows the number of elements in the nested table column `ad_textdocs_ntab` of the sample table `pm.print_media`:

```
SELECT product_id, CARDINALITY(ad_textdocs_ntab) cardinality
  FROM print_media
  ORDER BY product_id;



PRODUCT_ID CARDINALITY
---------- -----------
      2056           3
      2268           3
      3060           3
      3106           3
```

CAST

Syntax

***domain_validate_clause*::=**

Purpose

`CAST` lets you convert built-in data types or collection-typed values of one type into another built-in data type or collection type. You can cast an unnamed operand (such as a date or the

Copyright © 1996, 2026, Oracle and/or its affiliates.

result set of a subquery) or a named collection (such as a varray or a nested table) into a type-compatible data type or named collection. The *type_name* must be the name of a built-in data type, collection type, or domain name and the operand must be a built-in data type or must evaluate to a collection value.

For the operand, *expr* can be either a built-in data type, a collection type, or an instance of an ANYDATA type. If *expr* is an instance of an ANYDATA type, then CAST tries to extract the value of the ANYDATA instance and return it if it matches the cast target type, otherwise, null will be returned. MULTISET informs Oracle Database to take the result set of the subquery and return a collection value. Table 7-4 shows which built-in data types can be cast into which other built-in data types. (CAST does not support LONG, LONG RAW, or the Oracle-supplied types.)

CAST does not directly support any of the LOB data types. When you use CAST to convert a CLOB value into a character data type or a BLOB value into the RAW data type, the database implicitly converts the LOB value to character or raw data and then explicitly casts the resulting value into the target data type. If the resulting value is larger than the target type, then the database returns an error.

When you use CAST ... MULTISET to get a collection value, each select list item in the query passed to the CAST function is converted to the corresponding attribute type of the target collection element type.

The cells with an 'X' indicate the possible conversions from source to destination data type using CAST.

Table 7-4 Casting Built-In Data Types

Destination Data Type	from BINARY_FLOAT, BINARY_DOUBLE	from CHAR, VARCHAR2	from NUMBER/ INTEGER	from DATETIME / INTERVAL (Note 1)	from RAW	from ROWID, UROWID (Note 2)	from NCHAR, NVARCHAR2	from BOOLEAN
to BINARY_FLOAT, BINARY_DOUBLE	X (Note 3)	X (Note 3)	X (Note 3)	--	--	--	X (Note 3)	X(Note 4)
to CHAR, VARCHAR2	X	X	X	X	X	X	X	X (Note 5)
to NUMBER/ INTEGER	X (Note 3)	X (Note 3)	X (Note 3)	--	--	--	X (Note 3)	X(Note 4)
to DATETIME/ INTERVAL	--	X (Note 3)	--	X (Note 3)	--	--	--	--
to RAW	--	X	--	--	X	--	X	--
to ROWID, UROWID	--	X	--	--	--	X	--	--
to NCHAR, NVARCHAR2	X	--	X	X	X	X	X	X(Note 5)
to BOOLEAN	X(Note 4)	X(Note 6)	x (Note 4)	--	--	--	X(Note 6)	X

Note 1: Datetime/interval includes DATE, TIMESTAMP, TIMESTAMP WITH TIMEZONE, TIMESTAMP WITH LOCAL TIME ZONE, INTERVAL DAY TO SECOND, and INTERVAL YEAR TO MONTH.

Note 2: You cannot cast a UROWID to a ROWID if the UROWID contains the value of a ROWID of an index-organized table.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Note 3: You can specify the `DEFAULT return_value ON CONVERSION ERROR` clause for this type of conversion. You can specify the *`fmt`* and *`nlsparam`* clauses for this type of conversion with the following exceptions: you cannot specify fmt when converting to `INTERVAL DAY TO SECOND`, and you cannot specify *`fmt`* or *`nlsparam`* when converting to `INTERVAL YEAR TO MONTH`.

Note 4: Casting Between Boolean and Numeric

When casting `BOOLEAN` to numeric :

- If the boolean value is true, then resulting value is 1.
- If the boolean value is false, then resulting value is 0.

When casting numeric to `BOOLEAN` :

- If the numeric value is non-zero (e.g., 1, 2, -3, 1.2), then resulting value is true.
- If the numeric value is zero, then resulting value is false.

Note 5: Casting Between Boolean and Char(n), NCHAR(n)

When casting `BOOLEAN` to `VARCHAR(n)`, `NVARCHAR(n)`

- If the boolean value is true and `n` is not less than 4, then resulting value is true.
- If the boolean value is false and `n` is not less than 5, then resulting value is false.
- Otherwise, a data exception error is raised.

Note 6: Casting Character Strings to Boolean

When casting a character string to boolean, you must trim both leading and trailing spaces of the character string first. If the resulting character string is one of the accepted literals used to determine a valid boolean value, then the result is that valid boolean value.

If you want to cast a named collection type into another named collection type, then the elements of both collections must be of the same type.

See Also

- Boolean Data Type
- Implicit Data Conversion for information on how Oracle Database implicitly converts collection type data into character data and Security Considerations for Data Conversion
- Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of `CAST` when it is a character value

MULTISET

If the result set of *`subquery`* can evaluate to multiple rows, then you must specify the `MULTISET` keyword. The rows resulting from the subquery form the elements of the collection value into which they are cast. Without the `MULTISET` keyword, the subquery is treated as a scalar subquery.

Restriction on MULTISET

If you specify the `MULTISET` keyword, then you cannot specify the `DEFAULT return_value ON CONVERSION ERROR`, *`fmt`*, or *`nlsparam`* clauses.

Copyright © 1996, 2026, Oracle and/or its affiliates.

DOMAIN

The DOMAIN clause specifies that type_name is a domain. type_name must be the name of a domain that the user has execute privileges on.

domain_validate_clause

This clause is only valid when casting to domain types. It controls whether domain constraints are applied when converting *expr* to *type_name*. If *type_name* is a domain with constraints, and *domain_validate_clause* is not specified, enabled constraints will be applied to *expr*. Any disabled constraints are ignored.

VALIDATE

All the domain constraints are applied to *expr*, regardless of their state.

NOVALIDATE

None of the domain constraints are applied to *expr*, regardless of their state.

DEFAULT *return_value* ON CONVERSION ERROR

This clause allows you to specify the value returned by this function if an error occurs while converting *expr* to *type_name*. This clause has no effect if an error occurs while evaluating *expr*.

This clause is valid if *expr* evaluates to a character string of type CHAR, VARCHAR2, NCHAR, or NVARCHAR2, and *type_name* is BINARY_DOUBLE, BINARY_FLOAT, DATE, INTERVAL DAY TO SECOND, INTERVAL YEAR TO MONTH, NUMBER, TIMESTAMP, TIMESTAMP WITH TIME ZONE, or TIMESTAMP WITH LOCAL TIME ZONE.

The *return_value* can be a string literal, null, constant expression, or a bind variable, and must evaluate to null or a character string of type CHAR, VARCHAR2, NCHAR, or NVARCHAR2. If *return_value* cannot be converted to *type_name*, then the function returns an error.

fmt* and *nlsparam

The *fmt* argument lets you specify a format model and the *nlsparam* argument lets you specify NLS parameters. If you specify these arguments, then they are applied when converting *expr* and *return_value*, if specified, to *type_name*.

You can specify *fmt* and *nlsparam* if *type_name* is one of the following data types:

- BINARY_DOUBLE

  If you specify BINARY_DOUBLE, then the optional *fmt* and *nlsparam* arguments serve the same purpose as for the TO_BINARY_DOUBLE function. Refer to TO_BINARY_DOUBLE for more information.

- BINARY_FLOAT

  If you specify BINARY_FLOAT, then the optional *fmt* and *nlsparam* arguments serve the same purpose as for the TO_BINARY_FLOAT function. Refer to TO_BINARY_FLOAT for more information.

- DATE

  If you specify DATE, then the optional *fmt* and *nlsparam* arguments serve the same purpose as for the TO_DATE function. Refer to TO_DATE for more information.

- NUMBER

  If you specify NUMBER, then the optional *fmt* and *nlsparam* arguments serve the same purpose as for the TO_NUMBER function. Refer to TO_NUMBER for more information.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- TIMESTAMP

  If you specify TIMESTAMP, then the optional *fmt* and *nlsparam* arguments serve the same purpose as for the TO_TIMESTAMP function. If you omit *fmt*, then *expr* must be in the default format of the TIMESTAMP data type, which is determined explicitly by the NLS_TIMESTAMP_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. Refer to TO_TIMESTAMP for more information.

- TIMESTAMP WITH TIME ZONE

  If you specify TIMESTAMP WITH TIME ZONE, then the optional *fmt* and *nlsparam* arguments serve the same purpose as for the TO_TIMESTAMP_TZ function. If you omit *fmt*, then *expr* must be in the default format of the TIMESTAMP WITH TIME ZONE data type, which is determined explicitly by the NLS_TIMESTAMP_TZ_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. Refer to TO_TIMESTAMP_TZ for more information.

- TIMESTAMP WITH LOCAL TIME ZONE

  If you specify TIMESTAMP WITH LOCAL TIME ZONE then the optional *fmt* and *nlsparam* arguments serve the same purpose as for the TO_TIMESTAMP function. If you omit *fmt*, then *expr* must be in the default format of the TIMESTAMP data type, , which is determined explicitly by the NLS_TIMESTAMP_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. Refer to TO_TIMESTAMP for more information.

Built-In Data Type Examples

The following examples use the CAST function with scalar data types. The first example converts text to a timestamp value by applying the format model provided in the session parameter NLS_TIMESTAMP_FORMAT. If you want to avoid dependency on this NLS parameter, then you can use the TO_DATE as shown in the second example.

```
SELECT CAST('22-OCT-1997'
       AS TIMESTAMP WITH LOCAL TIME ZONE)
  FROM DUAL;

SELECT CAST(TO_DATE('22-Oct-1997', 'DD-Mon-YYYY')
       AS TIMESTAMP WITH LOCAL TIME ZONE)
  FROM DUAL;
```

In the preceding example, TO_DATE converts from text to DATE, and CAST converts from DATE to TIMESTAMP WITH LOCAL TIME ZONE, interpreting the date in the session time zone (SESSIONTIMEZONE).

```
SELECT product_id, CAST(ad_sourcetext AS VARCHAR2(30)) text
  FROM print_media
  ORDER BY product_id;
```

The following examples return a default value if an error occurs while converting the specified value to the specified data type. In these examples, the conversions occurs without error.

```
SELECT CAST(200
       AS NUMBER
       DEFAULT 0 ON CONVERSION ERROR)
  FROM DUAL;

SELECT CAST('January 15, 1989, 11:00 A.M.'
       AS DATE
       DEFAULT NULL ON CONVERSION ERROR,
       'Month dd, YYYY, HH:MI A.M.')
  FROM DUAL;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT CAST('1999-12-01 11:00:00 -8:00'
       AS TIMESTAMP WITH TIME ZONE
       DEFAULT '2000-01-01 01:00:00 -8:00' ON CONVERSION ERROR,
       'YYYY-MM-DD HH:MI:SS TZH:TZM',
       'NLS_DATE_LANGUAGE = American')
  FROM DUAL;
```

In the following example, an error occurs while converting `'N/A'` to a `NUMBER` value. Therefore, the `CAST` function returns the default value of `0`.

```
SELECT CAST('N/A'
       AS NUMBER
       DEFAULT '0' ON CONVERSION ERROR)
  FROM DUAL;
```

The following example converts data types `VARCHAR2`, `NUMBER` as `BOOLEAN`:

```
SELECT
  CAST ( 'yes' AS BOOLEAN ),
  CAST ( true AS NUMBER ),
  CAST ( false AS VARCHAR2(10) ) ;

CAST('YES'ASBOOLEAN) CAST(TRUEASNUMBER) CAST(FALSE
-------------------- ------------------ ----------
                TRUE                  1 FALSE
```

Collection Examples

The `CAST` examples that follow build on the `cust_address_typ` found in the sample order entry schema, `oe`.

```
CREATE TYPE address_book_t AS TABLE OF cust_address_typ;

CREATE TYPE address_array_t AS VARRAY(3) OF cust_address_typ;

CREATE TABLE cust_address (
  custno            NUMBER,
  street_address    VARCHAR2(40),
  postal_code       VARCHAR2(10),
  city              VARCHAR2(30),
  state_province    VARCHAR2(10),
  country_id        CHAR(2));

CREATE TABLE cust_short (custno NUMBER, name VARCHAR2(31));

CREATE TABLE states (state_id NUMBER, addresses address_array_t);
```

This example casts a subquery:

```
SELECT s.custno, s.name,
       CAST(MULTISET(SELECT ca.street_address,
                            ca.postal_code,
                            ca.city,
                            ca.state_province,
                            ca.country_id
                       FROM cust_address ca
                       WHERE s.custno = ca.custno)
       AS address_book_t)
  FROM cust_short s
  ORDER BY s.custno;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

CAST converts a varray type column into a nested table:

```
SELECT CAST(s.addresses AS address_book_t)
  FROM states s
  WHERE s.state_id = 111;
```

The following objects create the basis of the example that follows:

```
CREATE TABLE projects
  (employee_id NUMBER, project_name VARCHAR2(10));

CREATE TABLE emps_short
  (employee_id NUMBER, last_name VARCHAR2(10));

CREATE TYPE project_table_typ AS TABLE OF VARCHAR2(10);
```

The following example of a MULTISET expression uses these objects:

```
SELECT e.last_name,
       CAST(MULTISET(SELECT p.project_name
                     FROM projects p
                     WHERE p.employee_id = e.employee_id
                     ORDER BY p.project_name)
       AS project_table_typ)
  FROM emps_short e
  ORDER BY e.last_name;
```

The following example casts the string 'yes' to a boolean value, the boolean value true to a NUMBER and the boolean value false to VARCHAR2(10):

```
SELECT
    CAST ( 'yes' AS BOOLEAN ),
    CAST ( true AS NUMBER ),
    CAST ( false AS VARCHAR2(10) );

   CAST('YES'ASBOOLEAN) CAST(TRUEASNUMBER) CAST(FALSE
   -------------------- ------------------ ----------
                TRUE                   1      FALSE
```

Domain Examples

The following example creates the domain DAY_OF_WEEK with a disabled check constraint. The first query omits the *domain_validate_clause*, so uses the constraint state to determine whether to verify the value. As this is disabled, the database does not check the value.

The second query uses the VALIDATE clause. This applies the constraint to "N/A", even though it's disabled. The value "N/A" is not in the list permitted by the constraints, so CAST raises an exception.

```
CREATE DOMAIN day_of_week AS VARCHAR2(3 CHAR)
  CONSTRAINT CHECK (day_of_week IN('MON','TUE','WED','THU','FRI','SAT','SUN'))
  DISABLE;

SELECT CAST ( 'N/A' AS day_of_week ) use_constraint_state;

USE_CONSTRAINT_STATE
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
--------------------
N/A

SELECT CAST ( 'N/A' AS day_of_week VALIDATE ) apply_constraints;

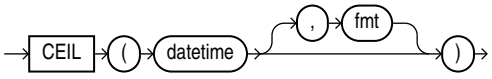
ORA-11513: CAST AS DOMAIN has failed due to domain constraints.
```

The following example creates the domain `DAY_OF_WEEK` with an enabled check constraint. The first query omits the *`domain_validate_clause`*, so uses the constraint state to determine whether to verify the value. As this is enabled, the database applies the constraint to "`N/A`". This is not in the list of permitted values so `CAST` raises an error.

The second query uses the `NOVALIDATE` clause. This ignores the constraint even though it is enabled and the statement completes without error.

```
CREATE DOMAIN day_of_week AS VARCHAR2(3 CHAR)
  CONSTRAINT CHECK (day_of_week IN('MON','TUE','WED','THU','FRI','SAT','SUN'))
  ENABLE;

SELECT CAST ( 'N/A' AS day_of_week ) use_constraint_state;



ORA-11513: CAST AS DOMAIN has failed due to domain constraints.

SELECT CAST ( 'N/A' AS DOMAIN day_of_week NOVALIDATE ) ignore_constraints;

IGNORE_CONSTRAINTS
------------------
N/A
```

CEIL (datetime)

Syntax

Purpose

`CEIL(datetime)` returns the date or the timestamp rounded up to the unit specified by the second argument `fmt`, the format model. If the input value is already truncated to the specified unit, then the return value is the same as the input. That is, if `datetime` = `TRUNC(datetime, fmt)`, then `CEIL(datetime, fmt)` = `datetime`. For example, `CEIL(DATE '2023-02-01', 'MONTH')` returns February 1 2023.

This function is not sensitive to the `NLS_CALENDAR` session parameter. It operates according to the rules of the Gregorian calendar. The value returned is always of data type `DATE`, even if you specify a different datetime data type for the argument. If you do not specify the second argument, the default format model '`DD`' is used.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> Refer to CEIL, FLOOR, ROUND, and TRUNC Date Functions for the permitted format models to use in *fmt*.

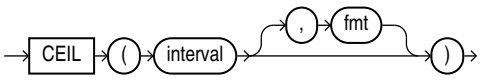
Examples

For these examples NLS_DATE_FORMAT is set:

```
ALTER SESSION SET NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';

ALTER SESSION SET NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
SELECT CEIL(TO_DATE ('28-FEB-2023','DD-MON-YYYY'), 'MM') AS month_ceiling;
```

The output is:



```
MONTH_CEILING
--------------------
01-MAR-2023 00:00:00

SELECT CEIL(TO_TIMESTAMP ('28-FEB-2023 14:10:10','DD-MON-YYYY HH24:MI:SS'),'HH24') AS
hour_ceiling;

HOUR_CEILING
--------------------
28-FEB-2023 15:00:00
```

CEIL (interval)

Syntax

Purpose

CEIL(interval) returns the interval rounded up to the unit specified by the second argument *fmt*, the format model. If the first argument is truncated to the units of *fmt*, the output equals the input. For example, CEIL(INTERVAL '+123-0' YEAR(3) TO MONTH) returns 123 years and no months (+123-00).

The result of CEIL(interval) is never smaller than *interval*. The result precision for year and day is the input precision for year plus one and day plus one, since CEIL(interval) can have overflow. If an interval already has the maximum precision for year and day, the statement compiles but errors at runtime.

For INTERVAL YEAR TO MONTH, *fmt* can only be year. The default *fmt* is year.

For INTERVAL DAY TO SECOND, *fmt* can be day, hour, and minute. The default *fmt* is day. Note that *fmt* does not support second.

CEIL(interval) supports the format models of ROUND and TRUNC.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> Refer to CEIL, FLOOR, ROUND, and TRUNC Date Functions for the permitted format models to use in *fmt*.

Examples

```
SELECT CEIL(INTERVAL '+123-5' YEAR(3) TO MONTH) AS year_ceil;

YEAR_CEIL
---------
+124-00

SELECT CEIL(INTERVAL '+99-11' YEAR(2) TO MONTH, 'YEAR');

YEAR_CEIL
---------
+100-00

SELECT CEIL(INTERVAL '+999999999-11' YEAR(9) TO MONTH, 'YEAR') AS year_ceil;

ORA-01873: the leading precision of the interval is too small

SELECT CEIL(INTERVAL '+4 12:42:10.222' DAY(2) TO SECOND(3), 'DD') AS day_ceil;

DAY_CEIL
-------------------
+05 00:00:00.000000
```

CEIL (number)

Syntax

Purpose

`CEIL` returns the smallest integer that is greater than or equal to *n*. The number *n* can always be written as the difference of an integer *k* and a positive fraction *f* such that 0 <= *f* < 1 and *n* = *k* - *f*. The value of `CEIL` is the integer *k*. Thus, the value of `CEIL` is *n* itself if and only if *n* is precisely an integer.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion and FLOOR (number)

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

The following example returns the smallest integer greater than or equal to the order total of a specified order:

```
SELECT order_total, CEIL(order_total)
  FROM orders
  WHERE order_id = 2434;

ORDER_TOTAL CEIL(ORDER_TOTAL)
----------- -----------------
   268651.8            268652
```

CHARTOROWID

Syntax

Purpose

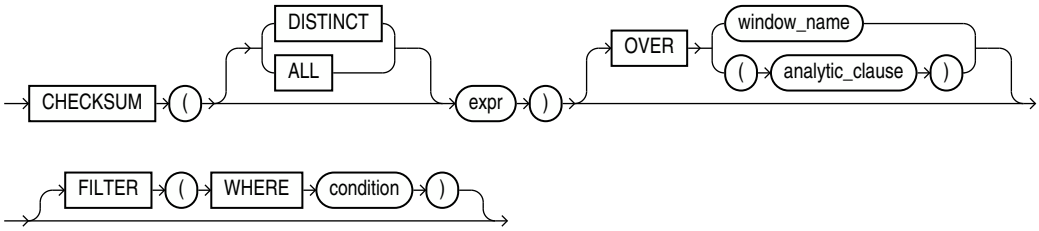
`CHARTOROWID` converts a value from `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2` data type to `ROWID` data type.

This function does not support `CLOB` data directly. However, `CLOB`s can be passed in as arguments through implicit data conversion.

> **See Also**
>
> Data Type Comparison Rules for more information.

Examples

The following example converts a character rowid representation to a rowid. (The actual rowid is different for each database instance.)



```
SELECT last_name
  FROM employees
  WHERE ROWID = CHARTOROWID('AAAFd1AAFAAAABSAA/');

LAST_NAME
-------------------------
Greene
```

CHECKSUM

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

Use `CHECKSUM` to detect changes in a table. The order of the rows in the table does not affect the result. You can use `CHECKSUM` with `DISTINCT`, as part of a `GROUP BY` query, as a window function, or an analytical function.

Semantics

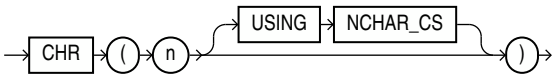
`ALL`: Applies the aggregate function to all values. `ALL` is the default option.

`DISTINCT` or `UNIQUE`: Returns the checksum of unique values. `UNIQUE` is an Oracle-specific keyword and not an ANSI standard.

`expr`: Can be a column, constant, bind variable, or an expression involving them. All data types except ADT and JSON are supported.

The return data type is an Oracle number (converted from an (8-byte) signed long long) regardless of the data type of `expr`.

NULL values in `expr` column are ignored.



It returns NULL if `expr` is NULL.

The output of the `CHECKSUM` function is deterministic and independent of the ordering of the input rows.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

CHR

Syntax

Purpose

`CHR` returns the character having the binary equivalent to *n* as a `VARCHAR2` value in either the database character set or, if you specify `USING NCHAR_CS`, the national character set.

For single-byte character sets, if `n` > 256, then Oracle Database returns the binary equivalent of `n mod 256`. For multibyte character sets, `n` must resolve to one entire code point. Invalid code points are not validated, and the result of specifying invalid code points is indeterminate.

This function takes as an argument a `NUMBER` value, or any value that can be implicitly converted to `NUMBER`, and returns a character.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **Note**
>
> Use of the CHR function (either with or without the optional USING NCHAR_CS clause) results in code that is not portable between ASCII- and EBCDIC-based machine architectures.

> **See Also**
>
> - NCHR and Table 2-9 for more information on implicit conversion
> - Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of CHR

Examples

The following example is run on an ASCII-based machine with the database character set defined as WE8ISO8859P1:

```
SELECT CHR(67)||CHR(65)||CHR(84) "Dog"
  FROM DUAL;

Dog
---
CAT
```

To produce the same results on an EBCDIC-based machine with the WE8EBCDIC1047 character set, the preceding example would have to be modified as follows:

```
SELECT CHR(195)||CHR(193)||CHR(227) "Dog"
  FROM DUAL;

Dog
---
CAT
```

For multibyte character sets, this sort of concatenation gives different results. For example, given a multibyte character whose hexadecimal value is a1a2 (a1 representing the first byte and a2 the second byte), you must specify for n the decimal equivalent of 'a1a2', or 41378:

```
SELECT CHR(41378)
  FROM DUAL;
```

You cannot specify the decimal equivalent of a1 concatenated with the decimal equivalent of a2, as in the following example:

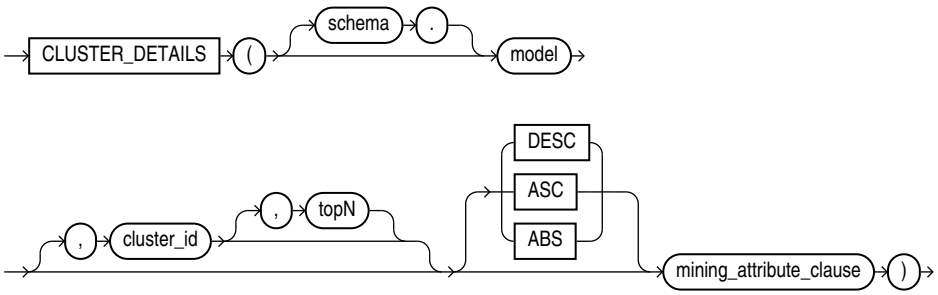
```
SELECT CHR(161)||CHR(162)
  FROM DUAL;
```

However, you can concatenate whole multibyte code points, as in the following example, which concatenates the multibyte characters whose hexadecimal values are a1a2 and a1a3:

```
SELECT CHR(41378)||CHR(41379)
  FROM DUAL;
```

The following example assumes that the national character set is UTF16:

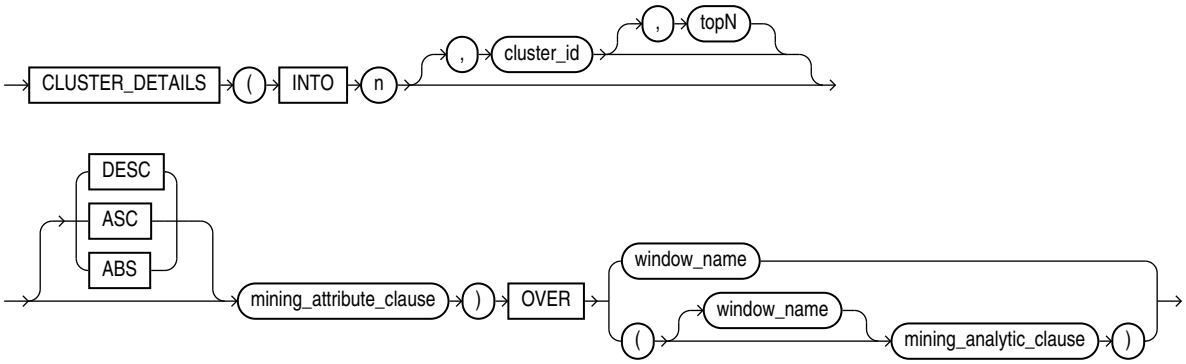
Copyright © 1996, 2026, Oracle and/or its affiliates.



```
SELECT CHR (196 USING NCHAR_CS)
  FROM DUAL;

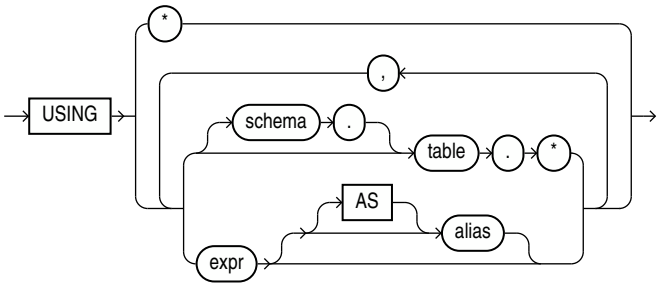
CH
--
Ä
```

CLUSTER_DETAILS



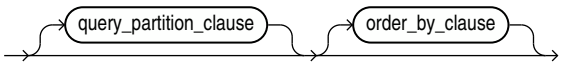
Syntax

***cluster_details*::=**



Analytic Syntax

***cluster_details_analytic*::=**



***mining_attribute_clause*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

***mining_analytic_clause*::=**

> **See Also**
>
> Analytic Functions for information on the syntax, semantics, and restrictions of *mining_analytic_clause*

Purpose

`CLUSTER_DETAILS` returns cluster details for each row in the selection. The return value is an XML string that describes the attributes of the highest probability cluster or the specified *cluster_id*.

topN

If you specify a value for *topN*, the function returns the *N* attributes that most influence the cluster assignment (the score). If you do not specify *topN*, the function returns the 5 most influential attributes.

DESC, ASC, or ABS

The returned attributes are ordered by weight. The weight of an attribute expresses its positive or negative impact on cluster assignment. A positive weight indicates an increased likelihood of assignment. A negative weight indicates a decreased likelihood of assignment.

By default, `CLUSTER_DETAILS` returns the attributes with the highest positive weights (`DESC`). If you specify `ASC`, the attributes with the highest negative weights are returned. If you specify `ABS`, the attributes with the greatest weights, whether negative or positive, are returned. The results are ordered by absolute value from highest to lowest. Attributes with a zero weight are not included in the output.

Syntax Choice

`CLUSTER_DETAILS` can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose **Syntax** or **Analytic Syntax**:

- **Syntax** — Use the first syntax to score the data with a pre-defined model. Supply the name of a clustering model.
- **Analytic Syntax** — Use the analytic syntax to score the data without a pre-defined model. Include `INTO` *n*, where *n* is the number of clusters to compute, and *mining_analytic_clause*, which specifies if the data should be partitioned for multiple model builds. The *mining_analytic_clause* supports a *query_partition_clause* and an *order_by_clause*. (See *analytic_clause*::=.)

The syntax of the `CLUSTER_DETAILS` function can use an optional `GROUPING` hint when scoring a partitioned model. See GROUPING Hint.

Copyright © 1996, 2026, Oracle and/or its affiliates.

mining_attribute_clause

mining_attribute_clause identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The *mining_attribute_clause* behaves as described for the PREDICTION function. (See *mining_attribute_clause*::=.)

> - *Oracle Machine Learning for SQL Concepts* for information about clustering.

> **Note**
>
> The following examples are excerpted from the Oracle Machine Learning for SQL sample programs. For more information about the sample programs, see Appendix A in *Oracle Machine Learning for SQL User's Guide*.

Example

This example lists the attributes that have the greatest impact (more that 20% probability) on cluster assignment for customer ID 100955. The query invokes the CLUSTER_DETAILS and CLUSTER_SET functions, which apply the clustering model em_sh_clus_sample.

```
SELECT S.cluster_id, probability prob,
       CLUSTER_DETAILS(em_sh_clus_sample, S.cluster_id, 5 USING T.*) det
FROM
  (SELECT v.*, CLUSTER_SET(em_sh_clus_sample, NULL, 0.2 USING *) pset
    FROM mining_data_apply_v v
   WHERE cust_id = 100955) T,
  TABLE(T.pset) S
ORDER BY 2 DESC;

CLUSTER_ID  PROB DET
---------- ----- --------------------------------------------------------------------------------
        14 .6761 <Details algorithm="Expectation Maximization" cluster="14">

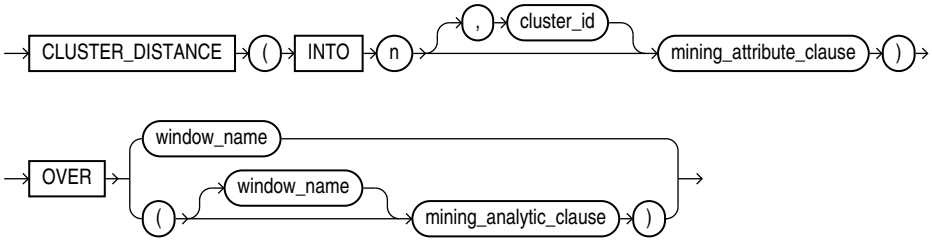
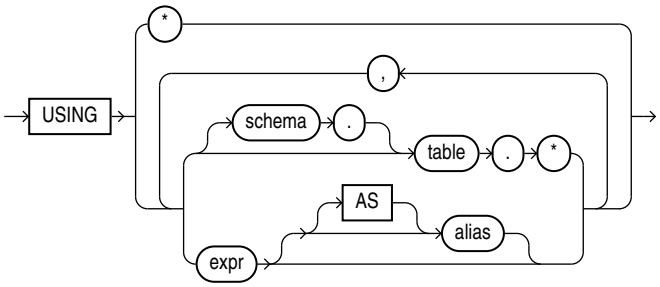
CLUSTER_DISTANCE

Syntax

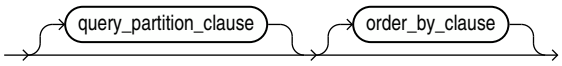


***cluster_distance*::=**



Copyright © 1996, 2026, Oracle and/or its affiliates.

Analytic Syntax



***cluster_distance_analytic*::=**

***mining_attribute_clause*::=**

***mining_analytic_clause*::=**

> **See Also**
>
> Analytic Functions for information on the syntax, semantics, and restrictions of *mining_analytic_clause*

Purpose

`CLUSTER_DISTANCE` returns a cluster distance for each row in the selection. The cluster distance is the distance between the row and the centroid of the highest probability cluster or the specified *`cluster_id`*. The distance is returned as `BINARY_DOUBLE`.

Syntax Choice

`CLUSTER_DISTANCE` can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose **Syntax** or **Analytic Syntax**:

- **Syntax** — Use the first syntax to score the data with a pre-defined model. Supply the name of a clustering model.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- **Analytic Syntax** — Use the analytic syntax to score the data without a pre-defined model. Include `INTO` *`n`*, where *`n`* is the number of clusters to compute, and *`mining_analytic_clause`*, which specifies if the data should be partitioned for multiple model builds. The *`mining_analytic_clause`* supports a *`query_partition_clause`* and an *`order_by_clause`*. (See *analytic_clause*::=.)

The syntax of the `CLUSTER_DISTANCE` function can use an optional `GROUPING` hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

`mining_attribute_clause` identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, this data is also used for building the transient models. The *`mining_attribute_clause`* behaves as described for the `PREDICTION` function. (See *mining_attribute_clause*::=.)

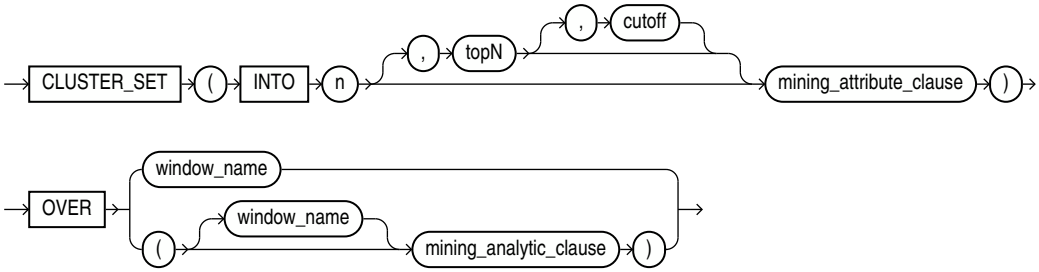
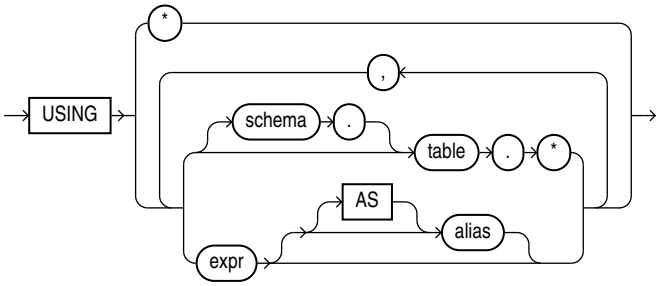
CLUSTER_SET

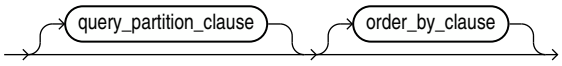


Syntax

***cluster_set*::=**



Analytic Syntax



***cluster_set_analytic*::=**

***mining_attribute_clause*::=**

***mining_analytic_clause*::=**

See Also

Analytic Functions for information on the syntax, semantics, and restrictions of *mining_analytic_clause*

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

`CLUSTER_SET` returns a set of cluster ID and probability pairs for each row in the selection. The return value is a varray of objects with field names `CLUSTER_ID` and `PROBABILITY`. The cluster identifier is an Oracle `NUMBER`; the probability is `BINARY_DOUBLE`.

topN and cutoff

You can specify *`topN`* and *`cutoff`* to limit the number of clusters returned by the function. By default, both *`topN`* and *`cutoff`* are null and all clusters are returned.

- *`topN`* is the *`N`* most probable clusters. If multiple clusters share the *`N`*th probability, then the function chooses one of them.
- *`cutoff`* is a probability threshold. Only clusters with probability greater than or equal to *`cutoff`* are returned. To filter by *`cutoff`* only, specify `NULL` for *`topN`*.

To return up to the *`N`* most probable clusters that are greater than or equal to *`cutoff`*, specify both *`topN`* and *`cutoff`*.

Syntax Choice

`CLUSTER_SET` can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose **Syntax** or **Analytic Syntax**:

- **Syntax** — Use the first syntax to score the data with a pre-defined model. Supply the name of a clustering model.
- **Analytic Syntax** — Use the analytic syntax to score the data without a pre-defined model. Include `INTO` *`n`*, where *`n`* is the number of clusters to compute, and *`mining_analytic_clause`*, which specifies if the data should be partitioned for multiple model builds. The *`mining_analytic_clause`* supports a *`query_partition_clause`* and an *`order_by_clause`*. (See *analytic_clause::=*.)

The syntax of the `CLUSTER_SET` function can use an optional `GROUPING` hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

`mining_attribute_clause` identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The *`mining_attribute_clause`* behaves as described for the `PREDICTION` function. (See *mining_attribute_clause::=*.)

COALESCE

Syntax

Purpose

`COALESCE` returns the first non-null *expr* in the expression list. You must specify at least two expressions. If all occurrences of *expr* evaluate to null, then the function returns null.

Oracle Database uses **short-circuit evaluation**. The database evaluates each *expr* value and determines whether it is `NULL`, rather than evaluating all of the *expr* values before determining whether any of them is `NULL`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

If all occurrences of *expr* are numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type, then Oracle Database determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

See Also

- Table 2-9 for more information on implicit conversion and Numeric Precedence for information on numeric precedence
- Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of `COALESCE` when it is a character value

This function is a generalization of the `NVL` function.

You can also use `COALESCE` as a variety of the `CASE` expression. For example,

```
COALESCE(expr1, expr2)
```

is equivalent to:

```
CASE WHEN expr1 IS NOT NULL THEN expr1 ELSE expr2 END
```

Similarly,

```
COALESCE(expr1, expr2, ..., exprn)
```

where n >= 3, is equivalent to:

```
CASE WHEN expr1 IS NOT NULL THEN expr1
   ELSE COALESCE (expr2, ..., exprn) END
```

See Also

NVL and CASE Expressions

Examples

The following example uses the sample `oe.product_information` table to organize a clearance sale of products. It gives a 10% discount to all products with a list price. If there is no list price, then the sale price is the minimum price. If there is no minimum price, then the sale price is "5":

```
SELECT product_id, list_price, min_price,
       COALESCE(0.9*list_price, min_price, 5) "Sale"
  FROM product_information
  WHERE supplier_id = 102050
  ORDER BY product_id;

PRODUCT_ID LIST_PRICE  MIN_PRICE       Sale
---------- ---------- ---------- ----------
      1769         48                 43.2
      1770                    73         73
      2378        305        247      274.5
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
      2382         850         731         765
      3355                                   5
```

COLLATION

Syntax

Purpose

`COLLATION` returns the name of the derived collation for *expr*. This function returns named collations and pseudo-collations. If the derived collation is a Unicode Collation Algorithm (UCA) collation, then the function returns the long form of its name. This function is evaluated during compilation of the SQL statement that contains it. If the derived collation is undefined due to a collation conflict while evaluating *expr*, then the function returns null.

expr must evaluate to a character string of type `CHAR`, `VARCHAR2`, `LONG`, `NCHAR`, or `NVARCHAR2`.

This function returns a `VARCHAR2` value.

> **Note**
>
> The `COLLATION` function returns only the data-bound collation, and not the dynamic collation set by the `NLS_SORT` parameter. Thus, for a column declared as `COLLATE USING_NLS_SORT`, the function returns the character value `'USING_NLS_SORT'`, not the actual value of the session parameter `NLS_SORT`. You can use the built-in function `SYS_CONTEXT('USERENV','NLS_SORT')` to get the actual value of the session parameter `NLS_SORT`.

> **See Also**
>
> Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `COLLATION`

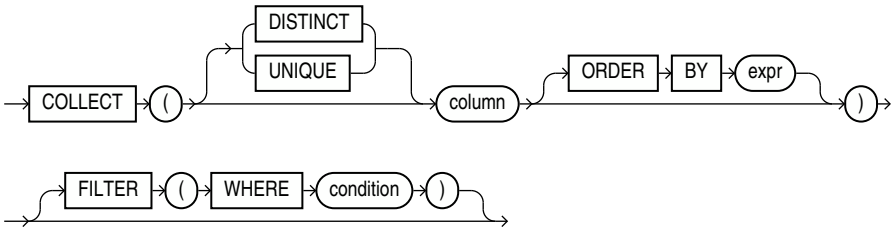
Examples

The following example returns the derived collation of columns `name` and `id` in table `id_table`:

```
CREATE TABLE id_table
  (name VARCHAR2(64) COLLATE BINARY_AI,
   id VARCHAR2(8) COLLATE BINARY_CI);

INSERT INTO id_table VALUES('Christopher', 'ABCD1234');

SELECT COLLATION(name), COLLATION(id)
  FROM id_table;



COLLATION COLLATION
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
--------- ---------
BINARY_AI BINARY_CI
```

COLLECT

Syntax

Purpose

`COLLECT` is an aggregate function that takes as its argument a column of any type and creates a nested table of the input type out of the rows selected. To get accurate results from this function you must use it within a `CAST` function.

If *`column`* is itself a collection, then the output of `COLLECT` is a nested table of collections. If *`column`* is of a user-defined type, then *`column`* must have a `MAP` or `ORDER` method defined on it in order for you to use the optional `DISTINCT`, `UNIQUE`, and `ORDER BY` clauses.

> **See Also**
>
> - CAST and Aggregate Functions
> - Appendix C in *Oracle AI Database Globalization Support Guide* for the collation determination rules, which define the collation `COLLECT` uses to compare character values for the `DISTINCT` and `ORDER BY` clauses

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Examples

The following example creates a nested table from the varray column of phone numbers in the sample table `oe.customers`. The nested table includes only the phone numbers of customers with an income level of `L: 300,000 and above`.

```
CREATE TYPE phone_book_t AS TABLE OF phone_list_typ;
/

SELECT CAST(COLLECT(phone_numbers) AS phone_book_t) "Income Level L Phone Book"
  FROM customers
  WHERE income_level = 'L: 300,000 and above';

Income Level L Phone Book
--------------------------------------------------------------------------------
PHONE_BOOK_T(PHONE_LIST_TYP('+1 414 123 4307'), PHONE_LIST_TYP('+1 608 123 4344'
), PHONE_LIST_TYP('+1 814 123 4696'), PHONE_LIST_TYP('+1 215 123 4721'), PHONE_L
IST_TYP('+1 814 123 4755'), PHONE_LIST_TYP('+91 11 012 4817', '+91 11 083 4817')
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
, PHONE_LIST_TYP('+91 172 012 4837'), PHONE_LIST_TYP('+41 31 012 3569', '+41 31
083 3569'))
```

The following example creates a nested table from the column of warehouse names in the sample table `oe.warehouses`. It uses `ORDER BY` to order the warehouse names.

```
CREATE TYPE warehouse_name_t AS TABLE OF VARCHAR2(35);
/

SELECT CAST(COLLECT(warehouse_name ORDER BY warehouse_name)
       AS warehouse_name_t) "Warehouses"
   FROM warehouses;

Warehouses
--------------------------------------------------------------------------------
WAREHOUSE_NAME_TYP('Beijing', 'Bombay', 'Mexico City', 'New Jersey', 'San Franci
sco', 'Seattle, Washington', 'Southlake, Texas', 'Sydney', 'Toronto')
```

COMPOSE

Syntax

Purpose

`COMPOSE` takes as its argument a character value *char* and returns the result of applying the Unicode canonical composition, as described in the Unicode Standard definition D117, to it. If the character set of the argument is not one of the Unicode character sets, COMPOSE returns its argument unmodified.

`COMPOSE` does not directly return strings in any of the Unicode normalization forms. To get a string in the NFC form, first call `DECOMPOSE` with the `CANONICAL` setting and then `COMPOSE` . To get a string in the NFKC form, first call `DECOMPOSE` with the `COMPATIBILITY` setting and then `COMPOSE` .

char can be of any of the data types: `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. Other data types are allowed if they can be implicitly converted to `VARCHAR2` or `NVARCHAR2`. The return value of `COMPOSE` is in the same character set as its argument.

`CLOB` and `NCLOB` values are supported through implicit conversion. If *char* is a character LOB value, then it is converted to a `VARCHAR2` value before the `COMPOSE` operation. The operation will fail if the size of the LOB value exceeds the supported length of the `VARCHAR2` in the particular execution environment.

See Also

- Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `COMPOSE`
- DECOMPOSE

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

The following example returns the o-umlaut code point:

```
SELECT COMPOSE( 'o' || UNISTR('\0308') )
  FROM DUAL;

CO
--
ö
```

> **See Also**
>
> UNISTR

CON_DBID_TO_ID

Syntax

Purpose

`CON_DBID_TO_ID` takes as its argument a container DBID and returns the container ID. For *`container_dbid`*, specify a `NUMBER` value or any value that can be implicitly converted to `NUMBER`. The function returns a `NUMBER` value.

This function is useful in a multitenant container database (CDB). If you use this function in a non-CDB, then it returns 0.

Example

The following query displays the ID and DBID for all containers in a CDB. The sample output shown is for the purpose of this example.

```
SELECT CON_ID, DBID
  FROM V$CONTAINERS;

    CON_ID       DBID
---------- ----------
         1 1930093401
         2 4054529501
         4 2256797992
```

The following statement returns the ID for the container with DBID 2256797992:

```
SELECT CON_DBID_TO_ID(2256797992) "Container ID"
  FROM DUAL;

Container ID
------------
           4
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

CON_GUID_TO_ID

Syntax

Purpose

`CON_GUID_TO_ID` takes as its argument a container GUID (globally unique identifier) and returns the container ID. For *`container_guid`*, specify a raw value. The function returns a `NUMBER` value.

This function is useful in a multitenant container database (CDB). If you use this function in a non-CDB, then it returns 0.

Example

The following query displays the ID and GUID for all containers in a CDB. The GUID is stored as a 16-byte `RAW` value in the `V$CONTAINERS` view. The query returns the 32-character hexadecimal representation of the GUID. The sample output shown is for the purpose of this example.

```
SELECT CON_ID, GUID
  FROM V$CONTAINERS;

    CON_ID GUID
---------- --------------------------------
         1 DB0A9F33DF99567FE04305B4F00A667D
         2 D990C280C309591EE04305B4F00A593E
         4 D990F4BD938865C1E04305B4F00ACA18
```

The following statement returns the ID for the container whose GUID is represented by the hexadecimal value `D990F4BD938865C1E04305B4F00ACA18`. The `HEXTORAW` function converts the GUID's hexadecimal representation to a raw value.

```
SELECT CON_GUID_TO_ID(HEXTORAW('D990F4BD938865C1E04305B4F00ACA18')) "Container ID"
  FROM DUAL;

Container ID
------------
           4
```

CON_ID_TO_CON_NAME

Syntax

Purpose

`CON_ID_TO_CON_NAME` takes as an argument a container `CON_ID` and returns the container `NAME`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

For CON_ID you must specify a number or an expression that resolves to a number. The function returns a NUMBER value.

This function is useful in a multitentant container database (CDB). If you use this function in a non-CDB, then it returns 0.

Example

```
SELECT CON_ID, NAME FROM V$CONTAINERS;
    CON_ID         NAME
   ---------       -------------
       1           CDB$ROOT
       2           PDB$SEED
       3           CDB1_PDB1
       4           SALESPDB
```

The following statement returns the container NAME given the container CON_ID 4:

```
SELECT CON_ID_TO_CON_NAME(4) "CON_NAME" FROM DUAL;
     CON_NAME
     --------
     SALESDB
```

CON_ID_TO_DBID

Syntax

Purpose

CON_ID_TO_DBID takes as an argument a container CON_ID and returns the container DBID. For CON_ID you must specify a number or an expression that resolves to a number. The function returns a NUMBER value.

This function is useful in a multitentant container database (CDB). If you use this function in a non-CDB, then it returns 0.

Example

```
SELECT CON_ID, NAME, DBID FROM V$CONTAINERS;

CON_ID      NAME           DBID
-------     ------------   ---------------
   1        CDB$ROOT       2048400776
   2        PDB$SEED       2929762556
   3        CDB1_PDB1      3483444080
   4        SALESPDB       2221053340
```

The following statement returns the container DBID given the container CON_ID 4:

```
SELECT CON_ID_TO_DBID(4) FROM DUAL;
    DBID
    -------------
    2221053340
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

CON_ID_TO_GUID

Syntax

Purpose

`CON_ID_TO_GUID` takes as an argument a container `CON_ID` and returns the container's `GLOBAL UNIQUE ID` (`GUID`). For `CON_ID` you must specify a number or an expression that resolves to a number. The function returns a `NUMBER` value.

This function is useful in a multitentant container database (CDB).

Example

The following query displays the `CON_ID`, `NAME` and `GUID` for all containers in a CDB:

```
SELECT CON_ID, NAME, GUID FROM V$CONTAINERS;

CON_ID      NAME           GUID
-------     ------------   ---------------
   1        CDB$ROOT       A8C0E03CB11A132FE0532684E80A96B3
   2        PDB$SEED       A8DA5D32F8F5590DE053C4E15A0A6EED
   3        CDB1_PDB1      A8DA63CEAD385A5BE053C4E15A0A774A
   4        SALESPDB       A8DA9AB18CE85BD0E053C4E15A0AE2C3
```

The following statement returns the container `GUID` given the container `CON_ID` 4:

```
SELECT CON_ID_TO_GUID(4) "CON_GUID" FROM DUAL;
    CON_GUID
    -----------------
    A8DA9AB18CE85BD0E053C4E15A0AE2C3
```

CON_ID_TO_UID

Syntax

Purpose

`CON_ID_TO_UID` takes as an argument a container `CON_ID` and returns the container's `UNIQUE ID` (`UID`). For `CON_ID` you must specify a number or an expression that resolves to a number. The function returns a `NUMBER` value.

This function is useful in a multitentant container database (CDB).

Example

The following query displays the `CON_ID`, `NAME` and `CON_UID` for all containers in a CDB:

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT CON_ID, NAME, CON_UID FROM V$CONTAINERS;

CON_ID      NAME           CON_UID
-------     ------------   ---------------
   1        CDB$ROOT       1
   2        PDB$SEED       2929762556
   3        CDB1_PDB1      3483444080
   4        SALESPDB       2221053340
```

The following statement returns the container `CON_UID` given the container `CON_ID` 4:

```
SELECT CON_ID_TO_UID(4) "PDB_UID" FROM DUAL;
    PDB_UID
    -------------
    2221053340
```

CON_NAME_TO_ID

Syntax

Purpose

`CON_NAME_TO_ID` takes as its argument a container name and returns the container ID. For *`container_name`*, specify a string, or an expression that resolves to a string, in any data type. The function returns a `NUMBER` value.

This function is useful in a multitenant container database (CDB). If you use this function in a non-CDB, then it returns 0.

Example

The following query displays the ID and name for all containers in a CDB. The sample output shown is for the purpose of this example.

```
SELECT CON_ID, NAME
  FROM V$CONTAINERS;

    CON_ID NAME
---------- ----------
         1 CDB$ROOT
         2 PDB$SEED
         4 SALESPDB
```

The following statement returns the ID for the container named `SALESPDB`:

```
SELECT CON_NAME_TO_ID('SALESPDB') "Container ID"
  FROM DUAL;

Container ID
------------
           4
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

CON_UID_TO_ID

Syntax

Purpose

`CON_UID_TO_ID` takes as its argument a container UID (unique identifier) and returns the container ID. For *`container_uid`*, specify a `NUMBER` value or any value that can be implicitly converted to `NUMBER`. The function returns a `NUMBER` value.

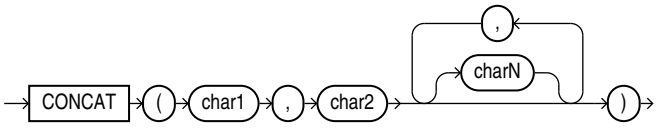
This function is useful in a multitenant container database (CDB). If you use this function in a non-CDB, then it returns 0.

Example

The following query displays the ID and UID for all containers in a CDB. The sample output shown is for the purpose of this example.

```
SELECT CON_ID, CON_UID
  FROM V$CONTAINERS;

    CON_ID    CON_UID
---------- ----------
         1          1
         2 4054529501
         4 2256797992
```



The following query returns the ID for the container with UID 2256797992:

```
SELECT CON_UID_TO_ID(2256797992) "Container ID"
  FROM DUAL;

Container ID
------------
           4
```

CONCAT

Syntax

Purpose

`CONCAT` takes as input two or more arguments and returns the concatenation of all arguments.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The arguments can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`. Arguments of other data types are implicitly converted to `VARCHAR2` before concatenation.

The string returned is in the same character set as *`char1`*. Its data type depends on the data types of the arguments.

In concatenations of two or more different data types, Oracle Database returns the data type that results in a lossless conversion. Therefore, if one of the arguments is a LOB, then the returned value is a LOB. If one of the arguments is a national data type, then the returned value is a national data type.

Rules for the Data Types of Return Values

Among all arguments:

- if there is a NCLOB, or if there is a CLOB and a NVARCHAR2 /NCHAR, then the return type is NCLOB.
- otherwise, if there is CLOB, then the return type is CLOB
- otherwise, if there is NVARCHAR2, or if there is a VARCHAR2 and a NCHAR, then the return type is NVARCHAR2
- otherwise, if there is VARCHAR2, then the return type is VARCHAR2
- otherwise, if there is NCHAR, then the return type is NCHAR
- otherwise, the return type is CHAR

Examples of Data Types Returned

`CONCAT(CLOB, NCLOB)` returns `NCLOB`

`CONCAT(CLOB, NCHAR)` returns `NCLOB`

`CONCAT(CLOB, CHAR)` returns `CLOB`

`CONCAT(VARCHAR2, NCHAR)` returns `NVARCHAR2`

`CONCAT(CHAR, VARCHAR2)` returns `VARCHAR2`

`CONCAT(CHAR, VARCHAR2, CLOB)` returns `CLOB`

`CONCAT(CHAR, NVARCHAR2, CLOB)` returns `NCLOB`

This function is equivalent to the concatenation operator (||).

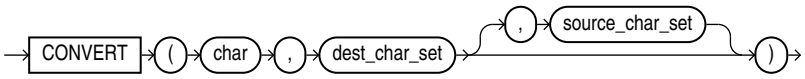
See Also

- Concatenation Operator for information on the `CONCAT` operator
- Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `CONCAT`

Examples

This example concatenates three character strings:

```
SELECT CONCAT( last_name, '''s job category is ', job_id) "Job"
  FROM employees
```



Copyright © 1996, 2026, Oracle and/or its affiliates.

```
  WHERE employee_id = 152;

Job
----------------------------------------------------
Hall's job category is SA_REP
```

CONVERT

Syntax

Purpose

`CONVERT` converts a character string from one character set to another.

- The *char* argument is the value to be converted. It can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`.
- The *dest_char_set* argument is the name of the character set to which *char* is converted.
- The *source_char_set* argument is the name of the character set in which *char* is stored in the database. The default value is the database character set.

The return value for `CHAR` and `VARCHAR2` is `VARCHAR2`. For `NCHAR` and `NVARCHAR2`, it is `NVARCHAR2`. For `CLOB`, it is `CLOB`, and for `NCLOB`, it is `NCLOB`.

Both the destination and source character set arguments can be either literals or columns containing the name of the character set.

For complete correspondence in character conversion, it is essential that the destination character set contains a representation of all the characters defined in the source character set. Where a character does not exist in the destination character set, a replacement character appears. Replacement characters can be defined as part of a character set definition.

> **Note**
>
> Oracle discourages the use of the `CONVERT` function in the current Oracle Database release. The return value of `CONVERT` has a character data type, so it should be either in the database character set or in the national character set, depending on the data type. Any *dest_char_set* that is not one of these two character sets is unsupported. The *char* argument and the *source_char_set* have the same requirements. Therefore, the only practical use of the function is to correct data that has been stored in a wrong character set.
>
> Values that are in neither the database nor the national character set should be processed and stored as `RAW` or `BLOB`. Procedures in the PL/SQL packages `UTL_RAW` and `UTL_I18N`—for example, `UTL_RAW.CONVERT`—allow limited processing of such values. Procedures accepting a `RAW` argument in the packages `UTL_FILE`, `UTL_TCP`, `UTL_HTTP`, and `UTL_SMTP` can be used to output the processed data.

Copyright © 1996, 2026, Oracle and/or its affiliates.

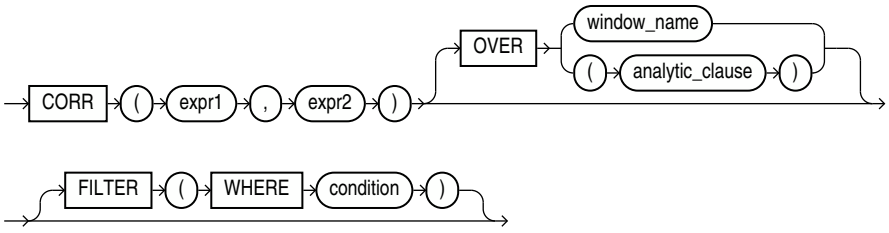
> **See Also**
>
> Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `CONVERT`

Examples

The following example illustrates character set conversion by converting a Latin-1 string to ASCII. The result is the same as importing the same string from a WE8ISO8859P1 database to a US7ASCII database.

```
SELECT CONVERT('Ä Ê Í Õ Ø A B C D E ', 'US7ASCII', 'WE8ISO8859P1')
   FROM DUAL;

CONVERT('ÄÊÍÕØABCDE'
--------------------
A E I ? ? A B C D E ?
```



You can query the `V$NLS_VALID_VALUES` view to get a listing of valid character sets, as follows:

```
SELECT * FROM V$NLS_VALID_VALUES WHERE parameter = 'CHARACTERSET';
```

> **See Also**
>
> *Oracle AI Database Globalization Support Guide* for the list of character sets that Oracle Database supports and *Oracle AI Database Reference* for information on the `V$NLS_VALID_VALUES` view

CORR

Syntax

> **See Also**
>
> Analytic Functions for information on syntax, semantics, and restrictions

Purpose

`CORR` returns the coefficient of correlation of a set of number pairs. You can use it as an aggregate or analytic function.

Copyright © 1996, 2026, Oracle and/or its affiliates.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

> **See Also**
>
> Table 2-9 for more information on implicit conversion and Numeric Precedence for information on numeric precedence

Oracle Database applies the function to the set of (*expr1*, *expr2*) after eliminating the pairs for which either *expr1* or *expr2* is null. Then Oracle makes the following computation:

```
COVAR_POP(expr1, expr2) / (STDDEV_POP(expr1) * STDDEV_POP(expr2))
```

The function returns a value of type `NUMBER`. If the function is applied to an empty set, then it returns null.

> **Note**
>
> The `CORR` function calculates the Pearson's correlation coefficient, which requires numeric expressions as arguments. Oracle also provides the `CORR_S` (Spearman's rho coefficient) and `CORR_K` (Kendall's tau-b coefficient) functions to support nonparametric or rank correlation.

> **See Also**
>
> Aggregate Functions , About SQL Expressions for information on valid forms of *expr*, and CORR_* for information on the `CORR_S` and `CORR_K` functions

Aggregate Example

The following example calculates the coefficient of correlation between the list prices and minimum prices of products by weight class in the sample table `oe.product_information`:

```
SELECT weight_class, CORR(list_price, min_price) "Correlation"
  FROM product_information
  GROUP BY weight_class
  ORDER BY weight_class, "Correlation";

WEIGHT_CLASS Correlation
------------ -----------
           1  .999149795
           2  .999022941
           3  .998484472
           4  .999359909
           5  .999536087
```

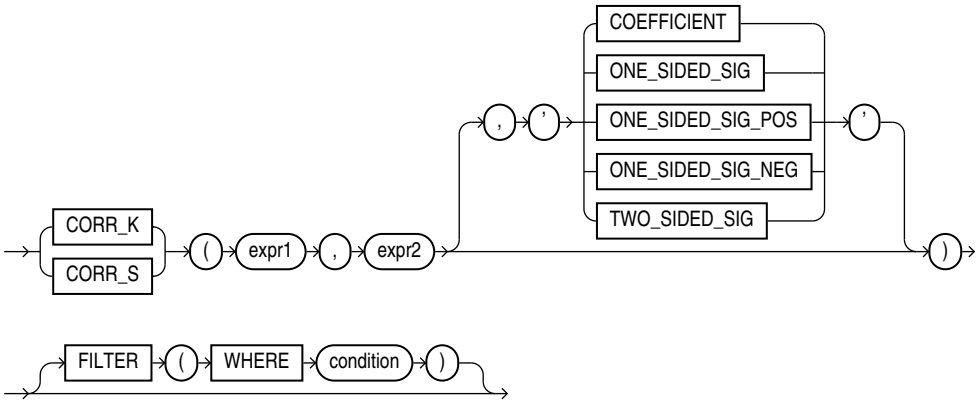
Copyright © 1996, 2026, Oracle and/or its affiliates.

Analytic Example

The following example shows the correlation between duration at the company and salary by the employee's position. The result set shows the same correlation for each employee in a given job:

```
SELECT employee_id, job_id,
       TO_CHAR((SYSDATE - hire_date) YEAR TO MONTH ) "Yrs-Mns",     salary,
       CORR(SYSDATE-hire_date, salary)
       OVER(PARTITION BY job_id) AS "Correlation"
  FROM employees
  WHERE department_id in (50, 80)
  ORDER BY job_id, employee_id;

EMPLOYEE_ID JOB_ID     Yrs-Mns     SALARY Correlation
----------- ---------- ------- ---------- -----------
        145 SA_MAN     +04-09       14000  .912385598
        146 SA_MAN     +04-06       13500  .912385598
        147 SA_MAN     +04-04       12000  .912385598
        148 SA_MAN     +01-08       11000  .912385598
        149 SA_MAN     +01-05       10500  .912385598
        150 SA_REP     +04-05       10000   .80436755
        151 SA_REP     +04-03        9500   .80436755
        152 SA_REP     +03-10        9000   .80436755
        153 SA_REP     +03-03        8000   .80436755
        154 SA_REP     +02-07        7500   .80436755
        155 SA_REP     +01-07        7000   .80436755
. . .
```



CORR_*

The CORR_* functions are:

- CORR_S
- CORR_K

Syntax

***correlation*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

The CORR function (see CORR) calculates the Pearson's correlation coefficient and requires numeric expressions as input. The CORR_* functions support nonparametric or rank correlation. They let you find correlations between expressions that are ordinal scaled (where a ranking of the values is possible). Correlation coefficients take on a value ranging from -1 to 1, where 1 indicates a perfect relationship, -1 a perfect inverse relationship (when one variable increases as the other decreases), and a value close to 0 means no relationship.

These functions take two mandatory arguments, *expr1* and *expr2*, and an optional third argument. The return value of the functions is a NUMBER.

The mandatory arguments are the two variables being analyzed. They can be of any data type that is comparable other than LONG, CLOB, BLOB, BFILE, or VECTOR. If the data type is a user-defined type (UDT), it must have a MAP or ORDER method to be comparable.

The third argument specifies the variant of the result returned by the functions. It is of type VARCHAR2 and must be a constant expression, for example, a character literal. If you omit the third argument, then the default is 'COEFFICIENT'. The allowed argument values and their meaning are shown in Table 7-2 Table 7-5:

See Also

- Table 2-9 for more information on implicit conversion and Numeric Precedence for information on numeric precedence
- Appendix C in *Oracle AI Database Globalization Support Guide* for the collation determination rules, which define the collation CORR_K and CORR_S use to compare characters from *expr1* with characters from *expr2*

For the semantics of the FILTER clause, see FILTER Clause Semantics.

Table 7-5 CORR_* Return Values

Return Value	Meaning
'COEFFICIENT'	Coefficient of correlation
'ONE_SIDED_SIG'	Positive one-tailed significance of the correlation
'ONE_SIDED_SIG_POS'	Same as ONE_SIDED_SIG
'ONE_SIDED_SIG_NEG'	Negative one-tailed significance of the correlation
'TWO_SIDED_SIG'	Two-tailed significance of the correlation

CORR_S

CORR_S calculates the Spearman's rho correlation coefficient. The input expressions should be a set of (x_i, y_i) pairs of observations. The function first replaces each value with a rank. Each value of x_i is replaced with its rank among all the other x_is in the sample, and each value of y_i is replaced with its rank among all the other y_is. Thus, each x_i and y_i take on a value from 1 to *n*, where *n* is the total number of pairs of values. Ties are assigned the average of the ranks they would have had if their values had been slightly different. Then the function calculates the linear correlation coefficient of the ranks.

Copyright © 1996, 2026, Oracle and/or its affiliates.

CORR_S Example

Using Spearman's rho correlation coefficient, the following example derives a coefficient of correlation for each of two different comparisons -- `salary` and `commission_pct`, and `salary` and `employee_id`:

```
SELECT COUNT(*) count,
       CORR_S(salary, commission_pct) commission,
       CORR_S(salary, employee_id) empid
  FROM employees;

     COUNT COMMISSION      EMPID
---------- ---------- ----------
       107 .735837022 -.04473016
```

CORR_K

`CORR_K` calculates the Kendall's tau-b correlation coefficient. As for `CORR_S`, the input expressions are a set of (x_i, y_i) pairs of observations. To calculate the coefficient, the function counts the number of concordant and discordant pairs. A pair of observations is concordant if the observation with the larger x also has a larger value of y. A pair of observations is discordant if the observation with the larger x has a smaller y.

The significance of tau-b is the probability that the correlation indicated by tau-b was due to chance—a value of 0 to 1. A small value indicates a significant correlation for positive values of tau-b (or anticorrelation for negative values of tau-b).

CORR_K Example

Using Kendall's tau-b correlation coefficient, the following example determines whether a correlation exists between an employee's salary and commission percent:

```
SELECT CORR_K(salary, commission_pct, 'COEFFICIENT') coefficient,
       CORR_K(salary, commission_pct, 'TWO_SIDED_SIG') two_sided_p_value
  FROM employees;

COEFFICIENT TWO_SIDED_P_VALUE
----------- -----------------
 .603079768        3.4702E-07
```

COS

Syntax

Purpose

`COS` returns the cosine of *n* (an angle expressed in radians).

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is `BINARY_FLOAT`, then the function returns `BINARY_DOUBLE`. Otherwise the function returns the same numeric data type as the argument.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples

The following example returns the cosine of 180 degrees:

```
SELECT COS(180 * 3.14159265359/180) "Cosine of 180 degrees"
  FROM DUAL;

Cosine of 180 degrees
---------------------
                   -1
```

COSH

Syntax

Purpose

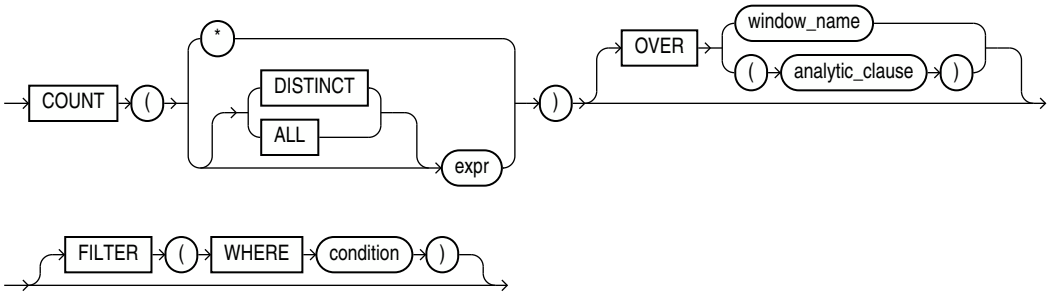
`COSH` returns the hyperbolic cosine of *n*.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is `BINARY_FLOAT`, then the function returns `BINARY_DOUBLE`. Otherwise the function returns the same numeric data type as the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples

The following example returns the hyperbolic cosine of zero:



```
SELECT COSH(0) "Hyperbolic cosine of 0"
  FROM DUAL;

Hyperbolic cosine of 0
----------------------
                     1
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

COUNT

Syntax

> **See Also**
>
> Analytic Functions for information on syntax, semantics, and restrictions

Purpose

`COUNT` returns the number of rows returned by the query. You can use it as an aggregate or analytic function.

If you specify `DISTINCT`, then you can specify only the *`query_partition_clause`* of the *`analytic_clause`*. The *`order_by_clause`* and *`windowing_clause`* are not allowed.

If you specify *`expr`*, then `COUNT` returns the number of rows where *`expr`* is not null. You can count either all rows, or only distinct values of *`expr`*.

If you specify the asterisk (*), then this function returns all rows, including duplicates and nulls. `COUNT` never returns null.

> **Note**
>
> Before performing a `COUNT (DISTINCT` *`expr`*`)`operation on a large amount of data, consider using one of the following methods to obtain approximate results more quickly than exact results:
>
> - Set the `APPROX_FOR_COUNT_DISTINCT` initialization parameter to true before using the `COUNT (DISTINCT` *`expr`*`)` function. Refer to *Oracle AI Database Reference* for more information on this parameter.
> - Use the `APPROX_COUNT_DISTINCT` function instead of the `COUNT (DISTINCT` *`expr`*`)` function. Refer to APPROX_COUNT_DISTINCT.

Copyright © 1996, 2026, Oracle and/or its affiliates.

See Also

- "About SQL Expressions " for information on valid forms of *expr* and Aggregate Functions
- Appendix C in *Oracle AI Database Globalization Support Guide* for the collation determination rules, which define the collation `COUNT` uses to compare character values for the `DISTINCT` clause

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Aggregate Examples

The following examples use `COUNT` as an aggregate function:

```
SELECT COUNT(*) "Total"
  FROM employees;

     Total
----------
       107

SELECT COUNT(*) "Allstars"
  FROM employees
  WHERE commission_pct > 0;

 Allstars
---------
       35

SELECT COUNT(commission_pct) "Count"
  FROM employees;

     Count
----------
        35

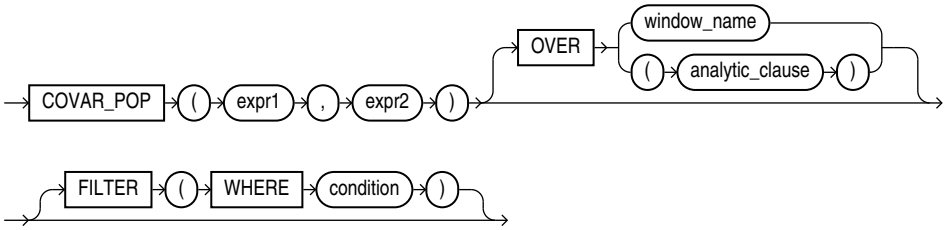
SELECT COUNT(DISTINCT manager_id) "Managers"
  FROM employees;

  Managers
----------
        18
```

Analytic Example

The following example calculates, for each employee in the `employees` table, the moving count of employees earning salaries in the range 50 less than through 150 greater than the employee's salary.

```
SELECT last_name, salary,
       COUNT(*) OVER (ORDER BY salary RANGE BETWEEN 50 PRECEDING AND
                      150 FOLLOWING) AS mov_count
  FROM employees
  ORDER BY salary, last_name;



LAST_NAME                     SALARY  MOV_COUNT
------------------------- ---------- ----------
Olson                           2100          3
Markle                          2200          2
```

Patel                          2500         10
. . .
```

COVAR_POP

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

`COVAR_POP` returns the population covariance of a set of number pairs. You can use it as an aggregate or analytic function.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

> **See Also**
>
> Table 2-9 for more information on implicit conversion and Numeric Precedence for information on numeric precedence

The database applies the function to the set of (*expr1*, *expr2*) pairs after eliminating all pairs for which either *expr1* or *expr2* is null. Then the database makes the following computation:

```
(SUM(expr1 * expr2) - SUM(expr2) * SUM(expr1) / n) / n
```

where *n* is the number of (*expr1*, *expr2*) pairs where neither *expr1* nor *expr2* is null.

The function returns a value of type `NUMBER`. If the function is applied to an empty set, then it returns null.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> About SQL Expressions for information on valid forms of *expr* and Aggregate Functions

For the semantics of the FILTER clause, see FILTER Clause Semantics.

Aggregate Example

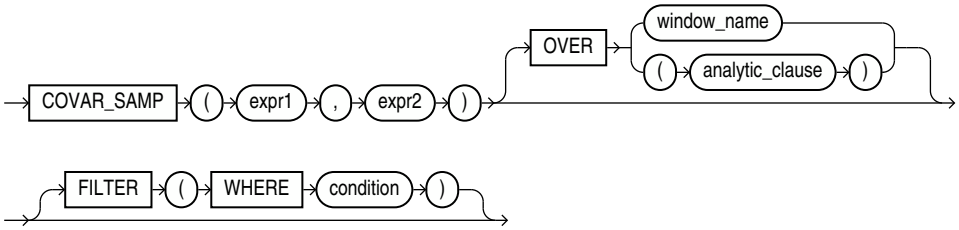
The following example calculates the population covariance and sample covariance for time employed (SYSDATE - hire_date) and salary using the sample table hr.employees:

```
SELECT job_id,
       COVAR_POP(SYSDATE-hire_date, salary) AS covar_pop,
       COVAR_SAMP(SYSDATE-hire_date, salary) AS covar_samp
  FROM employees
  WHERE department_id in (50, 80)
  GROUP BY job_id
  ORDER BY job_id, covar_pop, covar_samp;

JOB_ID       COVAR_POP  COVAR_SAMP
---------- ----------- -----------
SA_MAN          660700      825875
SA_REP      579988.466   600702.34
SH_CLERK      212432.5  223613.158
ST_CLERK     176577.25  185870.789
ST_MAN          436092      545115
```

Analytic Example

The following example calculates cumulative sample covariance of the list price and minimum price of the products in the sample schema oe:



```
SELECT product_id, supplier_id,
       COVAR_POP(list_price, min_price)
         OVER (ORDER BY product_id, supplier_id)
         AS CUM_COVP,
       COVAR_SAMP(list_price, min_price)
         OVER (ORDER BY product_id, supplier_id)
         AS CUM_COVS
  FROM product_information p
  WHERE category_id = 29
  ORDER BY product_id, supplier_id;

PRODUCT_ID SUPPLIER_ID   CUM_COVP   CUM_COVS
---------- ----------- ---------- ----------
      1774      103088          0
      1775      103087    1473.25     2946.5
      1794      103096 1702.77778 2554.16667
      1825      103093    1926.25 2568.33333
      2004      103086     1591.4    1989.25
      2005      103086     1512.5       1815
      2416      103088 1475.97959 1721.97619
. . .
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

COVAR_SAMP

Syntax

> **See Also**
>
> Analytic Functions for information on syntax, semantics, and restrictions

Purpose

`COVAR_SAMP` returns the sample covariance of a set of number pairs. You can use it as an aggregate or analytic function.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The database determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

> **See Also**
>
> Table 2-9 for more information on implicit conversion and Numeric Precedence for information on numeric precedence

The database applies the function to the set of (*expr1*, *expr2*) pairs after eliminating all pairs for which either *expr1* or *expr2* is null. Then the database makes the following computation:

```
(SUM(expr1 * expr2) - SUM(expr1) * SUM(expr2) / n) / (n-1)
```

where *n* is the number of (*expr1*, *expr2*) pairs where neither *expr1* nor *expr2* is null.

The function returns a value of type `NUMBER`. If the function is applied to an empty set, then it returns null.

> **See Also**
>
> About SQL Expressions for information on valid forms of *expr* and Aggregate Functions

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

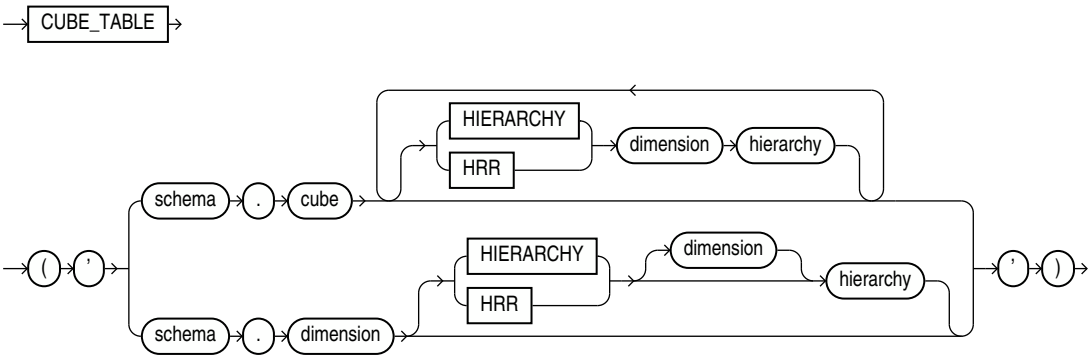
Aggregate Example



Refer to the aggregate example for COVAR_POP .

Analytic Example

Refer to the analytic example for COVAR_POP .

CUBE_TABLE

Syntax

Purpose

CUBE_TABLE extracts data from a cube or dimension and returns it in the two-dimensional format of a relational table, which can be used by SQL-based applications.

The function takes a single VARCHAR2 argument. The optional hierarchy clause enables you to specify a dimension hierarchy. A cube can have multiple hierarchy clauses, one for each dimension.

You can generate these different types of tables:

- A cube table contains a key column for each dimension and a column for each measure and calculated measure in the cube. To create a cube table, you can specify the cube with or without a cube hierarchy clause. For a dimension with multiple hierarchies, this clause limits the return values to the dimension members and levels in the specified hierarchy. Without a hierarchy clause, all dimension members and all levels are included.
- A dimension table contains a key column, and a column for each level and each attribute. It also contains a MEMBER_TYPE column, which identifies each member with one of the following codes:
  - L - Loaded from a table, view, or synonym
  - A - Loaded member and the single root of all hierarchies in the dimension, that is, the "all" aggregate member
  - C - Calculated member

  All dimension members and all levels are included in the table. To create a dimension table, specify the dimension **without** a dimension hierarchy clause.
- A hierarchy table contains all the columns of a dimension table plus a column for the parent member and a column for each source level. It also contains a MEMBER_TYPE

Copyright © 1996, 2026, Oracle and/or its affiliates.

column, as described for dimension tables. Any dimension members and levels that are not part of the named hierarchy are excluded from the table. To create a hierarchy table, specify the dimension **with** a dimension hierarchy clause.

CUBE_TABLE is a table function and is always used in the context of a SELECT statement with this syntax:

```
SELECT ... FROM TABLE(CUBE_TABLE('arg'));
```

> **See Also**
>
> - *Oracle OLAP User's Guide* for information about dimensional objects and about the tables generated by CUBE_TABLE.
> - Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to each character data type column in the table generated by CUBE_TABLE

Examples

The following examples require Oracle Database with the OLAP option and the GLOBAL sample schema. Refer to *Oracle OLAP User's Guide* for information on downloading and installing the GLOBAL sample schema.

The following SELECT statement generates a dimension table of CHANNEL in the GLOBAL schema.

```
SELECT dim_key, level_name, long_description, channel_total_id tot_id,
       channel_channel_id chan_id, channel_long_description chan_desc,
       total_long_description tot_desc
  FROM TABLE(CUBE_TABLE('global.channel'));

DIM_KEY      LEVEL_NAME LONG_DESCRIPTION TOT_ID CHAN_ID CHAN_DESC    TOT_DESC
-----------  ---------- ---------------- ------ ------- ------------ -------------
CHANNEL_CAT  CHANNEL    Catalog          TOTAL  CAT     Catalog      Total Channel
CHANNEL_DIR  CHANNEL    Direct Sales     TOTAL  DIR     Direct Sales Total Channel
CHANNEL_INT  CHANNEL    Internet         TOTAL  INT     Internet     Total Channel
TOTAL_TOTAL  TOTAL      Total Channel    TOTAL                       Total Channel
```

The next statement generates a cube table of UNITS_CUBE. It restricts the table to the MARKET and CALENDAR hierarchies.

```
SELECT sales, units, cost, time, customer, product, channel
  FROM TABLE(CUBE_TABLE('global.units_cube HIERARCHY customer market HIERARCHY time calendar'))
  WHERE rownum < 20;

     SALES      UNITS       COST TIME                       CUSTOMER       PRODUCT     CHANNEL
---------- ---------- ---------- -------------------------- -------------- ----------- -----------
24538587.9      61109 22840853.7 CALENDAR_QUARTER_CY1998.Q1 TOTAL_TOTAL    TOTAL_TOTAL TOTAL_TOTAL

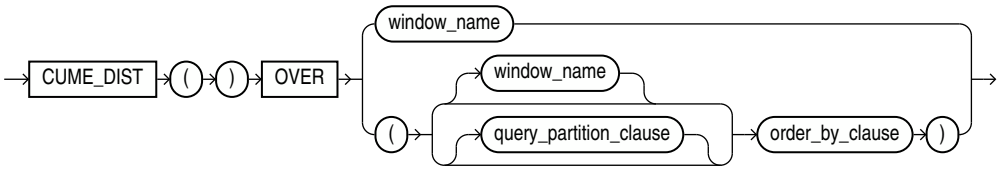
  32785170      77589 30607218.1 CALENDAR_QUARTER_CY1999.Q1 TOTAL_TOTAL    TOTAL_TOTAL TOTAL_TOTAL
. . .
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

CUME_DIST



Aggregate Syntax

***cume_dist_aggregate*::=**

Analytic Syntax

***cume_dist_analytic*::=**

> **See Also**
>
> Analytic Functions for information on syntax, semantics, and restrictions

Purpose

`CUME_DIST` calculates the cumulative distribution of a value in a group of values. The range of values returned by `CUME_DIST` is >0 to <=1. Tie values always evaluate to the same cumulative distribution value.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle Database determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, makes the calculation, and returns `NUMBER`.

> **See Also**
>
> Table 2-9 for more information on implicit conversion and Numeric Precedence for information on numeric precedence

Copyright © 1996, 2026, Oracle and/or its affiliates.

- As an aggregate function, CUME_DIST calculates, for a hypothetical row *r* identified by the arguments of the function and a corresponding sort specification, the relative position of row *r* among the rows in the aggregation group. Oracle makes this calculation as if the hypothetical row *r* were inserted into the group of rows to be aggregated over. The arguments of the function identify a single hypothetical row within each aggregate group. Therefore, they must all evaluate to constant expressions within each aggregate group. The constant argument expressions and the expressions in the ORDER BY clause of the aggregate match by position. Therefore, the number of arguments must be the same and their types must be compatible.
- As an analytic function, CUME_DIST computes the relative position of a specified value in a group of values. For a row *r*, assuming ascending ordering, the CUME_DIST of *r* is the number of rows with values lower than or equal to the value of *r*, divided by the number of rows being evaluated (the entire query result set or a partition).

Aggregate Example

The following example calculates the cumulative distribution of a hypothetical employee with a salary of $15,500 and commission rate of 5% among the employees in the sample table oe.employees:

```
SELECT CUME_DIST(15500, .05) WITHIN GROUP
  (ORDER BY salary, commission_pct) "Cume-Dist of 15500"
  FROM employees;

Cume-Dist of 15500
------------------
        .972222222
```

Analytic Example

The following example calculates the salary percentile for each employee in the purchasing division. For example, 40% of clerks have salaries less than or equal to Himuro.

```
SELECT job_id, last_name, salary, CUME_DIST()
  OVER (PARTITION BY job_id ORDER BY salary) AS cume_dist
  FROM employees
  WHERE job_id LIKE 'PU%'
  ORDER BY job_id, last_name, salary, cume_dist;

JOB_ID     LAST_NAME                     SALARY  CUME_DIST
---------- ------------------------- ---------- ----------
PU_CLERK   Baida                           2900         .8
PU_CLERK   Colmenares                      2500         .2
PU_CLERK   Himuro                          2600         .4
PU_CLERK   Khoo                            3100          1
PU_CLERK   Tobias                          2800         .6
PU_MAN     Raphaely                       11000          1
```

CURRENT_DATE

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

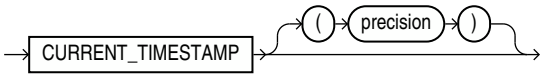
Purpose

`CURRENT_DATE` returns the current date in the session time zone, in a value in the Gregorian calendar of data type `DATE`.

Examples

The following example illustrates that `CURRENT_DATE` is sensitive to the session time zone:

```
ALTER SESSION SET TIME_ZONE = '-5:0';
ALTER SESSION SET NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
SELECT SESSIONTIMEZONE, CURRENT_DATE FROM DUAL;



SESSIONTIMEZONE CURRENT_DATE
--------------- --------------------
-05:00          29-MAY-2000 13:14:03

ALTER SESSION SET TIME_ZONE = '-8:0';
SELECT SESSIONTIMEZONE, CURRENT_DATE FROM DUAL;

SESSIONTIMEZONE CURRENT_DATE
--------------- --------------------
-08:00          29-MAY-2000 10:14:33
```

CURRENT_TIMESTAMP

Syntax

Purpose

`CURRENT_TIMESTAMP` returns the current date and time in the session time zone, in a value of data type `TIMESTAMP WITH TIME ZONE`. The time zone offset reflects the current local time of the SQL session. If you omit precision, then the default is 6. The difference between this function and `LOCALTIMESTAMP` is that `CURRENT_TIMESTAMP` returns a `TIMESTAMP WITH TIME ZONE` value while `LOCALTIMESTAMP` returns a `TIMESTAMP` value.

In the optional argument, *`precision`* specifies the fractional second precision of the time value returned.

> **See Also**
>
> LOCALTIMESTAMP

Examples

The following example illustrates that `CURRENT_TIMESTAMP` is sensitive to the session time zone:

```
ALTER SESSION SET TIME_ZONE = '-5:0';
ALTER SESSION SET NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
SELECT SESSIONTIMEZONE, CURRENT_TIMESTAMP FROM DUAL;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SESSIONTIMEZONE CURRENT_TIMESTAMP
--------------- ---------------------------------------------------
-05:00          04-APR-00 01.17.56.917550 PM -05:00

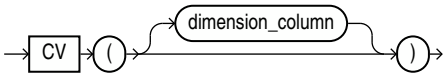
ALTER SESSION SET TIME_ZONE = '-8:0';
SELECT SESSIONTIMEZONE, CURRENT_TIMESTAMP FROM DUAL;

SESSIONTIMEZONE CURRENT_TIMESTAMP
--------------- ---------------------------------------------------
-08:00          04-APR-00 10.18.21.366065 AM -08:00
```

When you use the `CURRENT_TIMESTAMP` with a format mask, take care that the format mask matches the value returned by the function. For example, consider the following table:

```
CREATE TABLE current_test (col1 TIMESTAMP WITH TIME ZONE);
```

The following statement fails because the mask does not include the `TIME ZONE` portion of the type returned by the function:



```
INSERT INTO current_test VALUES
  (TO_TIMESTAMP_TZ(CURRENT_TIMESTAMP, 'DD-MON-RR HH.MI.SSXFF PM'));
```

The following statement uses the correct format mask to match the return type of `CURRENT_TIMESTAMP`:

```
INSERT INTO current_test VALUES
  (TO_TIMESTAMP_TZ(CURRENT_TIMESTAMP, 'DD-MON-RR HH.MI.SSXFF PM TZH:TZM'));
```

CV

Syntax

Purpose

The `CV` function can be used only in the *`model_clause`* of a `SELECT` statement and then only on the right-hand side of a model rule. It returns the current value of a dimension column or a partitioning column carried from the left-hand side to the right-hand side of a rule. This function is used in the *`model_clause`* to provide relative indexing with respect to the dimension column. The return type is that of the data type of the dimension column. If you omit the argument, then it defaults to the dimension column associated with the relative position of the function within the cell reference.

The `CV` function can be used outside a cell reference. In this case, *`dimension_column`* is required.

> **See Also**
>
> - *model_clause* and Model Expressions for the syntax and semantics
> - Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of `CV` when it is a character value

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

The following example assigns the sum of the sales of the product represented by the current value of the dimension column (Mouse Pad or Standard Mouse) for years 1999 and 2000 to the sales of that product for year 2001:

```
SELECT country, prod, year, s
  FROM sales_view_ref
  MODEL
    PARTITION BY (country)
    DIMENSION BY (prod, year)
    MEASURES (sale s)
    IGNORE NAV
    UNIQUE DIMENSION
    RULES UPSERT SEQUENTIAL ORDER
    (
      s[FOR prod IN ('Mouse Pad', 'Standard Mouse'), 2001] =
        s[CV( ), 1999] + s[CV( ), 2000]
    )
  ORDER BY country, prod, year;

COUNTRY       PROD                                     YEAR          S
----------    ----------------------------------      --------   ---------
France        Mouse Pad                                   1998     2509.42
France        Mouse Pad                                   1999     3678.69
France        Mouse Pad                                   2000     3000.72
France        Mouse Pad                                   2001     6679.41
France        Standard Mouse                              1998     2390.83
France        Standard Mouse                              1999     2280.45
France        Standard Mouse                              2000     1274.31
France        Standard Mouse                              2001     3554.76
Germany       Mouse Pad                                   1998     5827.87
Germany       Mouse Pad                                   1999     8346.44
Germany       Mouse Pad                                   2000     7375.46
Germany       Mouse Pad                                   2001     15721.9
Germany       Standard Mouse                              1998     7116.11
Germany       Standard Mouse                              1999     6263.14
Germany       Standard Mouse                              2000     2637.31
Germany       Standard Mouse                              2001     8900.45

16 rows selected.

The preceding example requires the view `sales_view_ref`. Refer to The MODEL clause: Examples to create this view.

DATAOBJ_TO_MAT_PARTITION

Syntax

Purpose

`DATAOBJ_TO_MAT_PARTITION` is useful only to Data Cartridge developers who are performing data maintenance or query operations on system-partitioned tables that are used to store domain index data. The DML or query operations are triggered by corresponding operations on the base table of the domain index.

Copyright © 1996, 2026, Oracle and/or its affiliates.

This function takes as arguments the name of the base table and the partition ID of the base table partition, both of which are passed to the function by the appropriate ODCIIndex method. The function returns the materialized partition number of the corresponding system-partitioned table, which can be used to perform the operation (DML or query) on that partition of the system-partitioned table.

If the base table is interval partitioned, then Oracle recommends that you use this function instead of the `DATAOBJ_TO_PARTITION` function. The `DATAOBJ_TO_PARTITION` function determines the absolute partition number, given the physical partition identifier. However, if the base table is interval partitioned, then there might be holes in the partition numbers corresponding to unmaterialized partitions. Because the system partitioned table only has materialized partitions, `DATAOBJ_TO_PARTITION` numbers can cause a mis-match between the partitions of the base table and the partitions of the underlying system partitioned index storage tables. The `DATAOBJ_TO_MAT_PARTITION` function returns the materialized partition number (as opposed to the absolute partition number) and helps keep the two tables in sync. Indextypes planning to support local domain indexes on interval partitioned tables should migrate to the use of this function.

DATEADD

Syntax

***time_unit*::=**

Purpose

`DATEADD` adds or subtracts a specified time interval from a date or timestamp value.

Semantics

`DATEADD` takes three arguments:

- *`time_unit`*: refers to the time unit you want to add, one of `YEAR`, `MONTH`, `DAY`, `WEEK`, `QUARTER`, `HOUR`, `MINUTE`, `SECOND`, `MILLISECOND`, `MICROSECOND`, `NANOSECOND`. It is either a keyword from the list or a run-time `CHAR` value that evaluates to one of these keywords.
- *`value`*: refers to the number of units of time that you want to add. *`value`* can be an integer or an expression that yields an integer value, or one that can be implicitly converted to an integer. If the number has fractional parts it is rounded up.
- *`datetime`*: can be one of `DATE`, `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, `TIMESTAMP WITH LOCAL TIME ZONE`. It can also be an expression that evaluates to one of the valid input types listed.

The return type of the output matches the input type of *`datetime`*.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Note, if the input is of type `DATE`, and *`value`* evaluates to a number less than a `SECOND` (for example, 1 `MILLISECOND`, 9 `MICROSECOND`, 10 `NANOSECOND`), the added *`integer`* is ignored, because `DATE` does not store fractional seconds.

Examples

Examples : When Time Unit is MONTH

The following example subtracts one month from the timestamp. It keeps the same time and time zone offset, and moves the date from April 30, 2023 back to March 30, 2023.

```
SELECT DATEADD(MONTH, -1, TIMESTAMP '2023-04-30 11:24:54 +01:00');
```

Result:

```
2023-03-30 11:24:54 +01:00
```

The following example adds one month to the timestamp. Because May has a 30th day, the day stays 30. The time and timezone offset stay the same.

```
SELECT DATEADD(MONTH, 1, TIMESTAMP '2023-04-30 11:24:54 +01:00');
```

Result:

```
2023-05-30 11:24:54 +01:00
```

The following example adds one month to February 28 2023.

```
SELECT DATEADD(MONTH, 1, TIMESTAMP '2023-02-28 11:24:54 +01:00');
```

Result:

```
2023-03-28 11:24:54 +01:00
```

Example 2: DATEADD behavior for Non_Existent Time

The timestamp is just before the 2025 spring Daylight Savings Time jump in America/Los Angeles. So adding one real hour to `01:59:59` lands at `03:59:59` because the `02:00` hour does not exist locally on that day.

```
SELECT DATEADD(
  HOUR,
  1,
  TO_TIMESTAMP_TZ(
     '09-MAR-2025 01:59:59 AMERICA/LOS_ANGELES PST',
     'DD-MON-YYYY HH24:MI:SS TZR TZD'
    )
 );
```

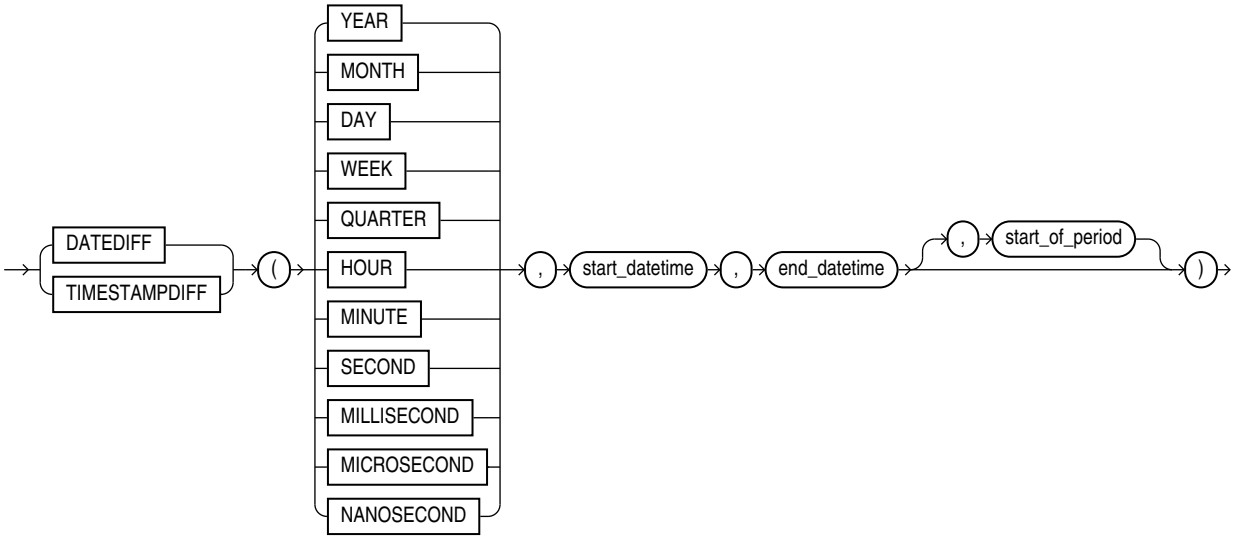
Result:

```
2025-03-09 03:59:59 America/Los_Angeles PDT
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Example 3: When Integer has Fractional Parts

The `1.9` value is rounded up to `2`, so 2 years are added.



```
SELECT DATEADD(YEAR, 1.9, DATE '2023-02-02');
```

Result:

```
2023-02-02
```

DATEDIFF

Syntax

Purpose

`DATEDIFF` computes the difference between two datetime values in years, months, days, weeks, and other time units.

`TIMESTAMPDIFF` is a synonym of `DATEDIFF`.

Semantics

The function takes three arguments, *`time_unit`*, *`start_datetime`*, *`end_datetime`*, and returns a number that represents the number of time unit boundaries between start and end datetimes. The return value is an integer that is positive when the end datetime is later than the start datetime and negative when the end datetime is earlier than start datetime.

The first argument *`time_unit`*, is one of `YEAR`, `MONTH`,`DAY`, `WEEK`, `QUARTER`, `HOUR`, `MINUTE`, `SECOND`, `MILLISECOND`, `MICROSECOND`, and `NANOSECOND`.

The second and third arguments, *`start_datetime`*, *`end_datetime`*, must be expressions evaluating to values of the data type `DATE`, `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, `TIMESTAMP WITH LOCAL TIME ZONE`.

The optional fourth argument *`start_of_period`* can be specified when the time unit is `WEEK`, `QUARTER`, or `YEAR` and means the following:

Copyright © 1996, 2026, Oracle and/or its affiliates.

- When time unit is WEEK, *start_of_period* means “start of week”. The allowed values are 0, 1, 2, 3, 4, 5, 6, and 7. The default value is 0, which means that the first day of the week is determined by the NLS_TERRITORY parameter. The value 1 means Monday, 2 means Tuesday, 3 means Wednesday, 4 means Thursday, 5 means Friday, 6 means Saturday, and 7 means Sunday.
- When time unit is QUARTER, *start_of_period* means “start of quarter”. The allowed values are 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, and 12. The default value is 1. The values 1, 4, 7, and 10 mean that quarters start on the first days of January, April, July, and October. All four values are equivalent. The values 2, 5, 8, and 11 mean that quarters start on first days of February, May, August, and November. These four values are also equivalent. The values 3, 6, 9, and 12 mean that quarters start on first days of March, June, September, and December. Again, these four values are equivalent.
- When time unit is YEAR, *start_of_period* means “start month of year”. The allowed values are 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, and 12. The default value is 1. The value 1 means that the year starts on the first day of January, 2 means that it starts on the first day of February, and so on until 12, which means that the year starts on the first day of December.

Non-default values for the start of the quarter and the start of the year are useful in calculations pertaining to fiscal quarters and years when the fiscal year does not begin on January 1st.

DATEDIFF does not support non-Gregorian calendars. The calculations are always performed in the Gregorian calendar even if the value of the corresponding NLS_CALENDAR setting is not GREGORIAN.

Use Oracle Locale Builder to check the first day of calendar week for particular values of NLS_TERRITORY.

Specifying *start_of_period* if time unit is not WEEK, QUARTER, or YEAR is a syntax error.

Time Unit Boundaries

Time units begin with the following datetime values.

Time Unit	First Datetime of the Unit
YEAR	Each midnight of the first day of the month determined by the *start_of_period* parameter or of January if the parameter is not specified
QUARTER	Each midnight of the first day of one of the months determined by the *start_of_period* parameter or of January, April, July, or October if the parameter is not specified
MONTH	Each midnight of the first day of a month
WEEK	Each midnight of the first day of a week as determined by the *start_of_period* parameter (see the previous section) or by the value of NLS_TERRITORY if the parameter is not specified
DAY	Each midnight
HOUR	Each value that has zero as minutes, seconds, and fractional seconds
MINUTE	Each datetime value that has zero as seconds and fractional seconds
SECOND	Each value that has zero as fractional seconds

Copyright © 1996, 2026, Oracle and/or its affiliates.

Time Unit	First Datetime of the Unit
MILLISECOND	Each value that has zero as fourth to ninth fraction digits
MICROSECOND	Each value that has zero as seventh to ninth fraction digits
NANOSECOND	Each datetime value

The midnight is the time 00:00:00.000000000. A time unit begins with one of the values defined above and ends with a value that is one nanosecond earlier than the next suitable start value for this unit.

If the start and end datetime does not have fractional second part at a given precision, for example, `TIMESTAMP(6)`does not have nanoseconds, the calculation assumes that the missing part is 0.

Time passing between two datetime values crosses a unit boundary if the start value is earlier than and the end value is equal to or later than a beginning datetime of the unit.

Converting Start Datetime and End Datetime to UTC

If both *start_datetime* and *end_datetime* after data type coercion are of `DATE` or `TIMESTAMP` data type, `DATEDIFF` performs calculations without taking any time zone into consideration.

Otherwise, both *start_datetime* and *end_datetime* are converted to the UTC time zone before performing any calculations are performed.

For example, in the below query, the *start_datetime* is `2024/04/08 06:00:00` AM UTC time. The *end_datetime* is `2024/04/08 07:00:00` AM UTC time. Although the *start_datetime* and *end_datetime* are in different days in Pacific time, they belong to the same day if converted to UTC time.

```
SELECT DATEDIFF (DAY, TIMESTAMP '2024-04-07 23:00:00 -07:00', TIMESTAMP '2024-04-08
00:00:00 -07:00');
```

Result: 0 In below example, *start_datetime* and *end_datetime* seems to belong to the same day in PDT time, but they belong to different days in UTC time.

```
SELECT DATEDIFF (DAY, TIMESTAMP '2023-04-08 16:00:00 -07:00', TIMESTAMP '2023-04-08
17:00:00 -07:00');
```

Result: 1 The above query is equivalent to:

```
SELECT DATEDIFF (DAY, TIMESTAMP '2023-04-08 23:00:00 +00:00', TIMESTAMP '2023-04-09
00:00:00 +00:00');
```

Result: 1

Examples

Example 1: Start of Week

When *start_of_period* is 7, Sunday is the first day of the week. Although the *start_datetime* and *end_datetime* below are adjacent and differ in time by only 1 nanosecond, the former is a Saturday and latter is a Sunday. Therefore, the time crosses the week boundary between the *start_datetime* and *end_datetime* so the query returns 1.

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT DATEDIFF (WEEK, TIMESTAMP '2005-12-31 23:59:59.9999999', TIMESTAMP '2006-01-01
00:00:00.0000000', 7);
```

Result: 1

Example 2: Start of Quarter

A calendar year consists of four quarters. By default, the first quarter is January 1st to March 31st, the second quarter is April 1st to June 30th, the third quarter is July 1st to September 30th, the fourth quarter is October 1st to December 31st. In the two examples below, the result is based on these default quarter boundaries.

```
SELECT DATEDIFF (QUARTER, DATE '2023-03-31', DATE '2023-04-01');
```

Result: 1

```
SELECT DATEDIFF (QUARTER, DATE '2023-04-01', DATE '2023-06-30');
```

Result: 0

Example 3: Start of Year

A calendar year always starts from Jan 1st. Similar to fiscal quarter, users can specify the start of fiscal year by leveraging the *start_of_period* parameter when time unit is YEAR.

The following example calculates the number of fiscal year boundaries between two timestamps with the fiscal year starting on June 1st.

```
SELECT DATEDIFF (YEAR, TIMESTAMP '2005-05-31 23:59:59.9999999', TIMESTAMP '2006-06-01
00:00:00.0000000', 6);
```

Result: 2

Example 4: MILLISECOND/MICROSECOND/NANOSECOND

Time Unit: SECOND

When the time unit is SECOND, the result only calculates the difference between '1996-11-09 09:26:50′ to '1996-11-09 10:26:51′

```
SELECT DATEDIFF (SECOND, TIMESTAMP '1996-11-09 09:26:50.13', TIMESTAMP '1996-11-09
10:26:50.12');
```

Result: 3601

Time Unit: MILLISECOND

When time unit is MILLISECOND, the first three digits of the fractional seconds are kept.

```
SELECT DATEDIFF (MILLISECOND, TIMESTAMP '1996-11-09 09:26:50.13', TIMESTAMP '1996-11-09
10:26:51.12');
```

Result: 3600990

Time Unit: MICROSECOND

When time unit is MICROSECOND, the first 6 digits of the fractional seconds are kept.

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT DATEDIFF (MICROSECOND, TIMESTAMP '1996-11-09 10:26:51.13', TIMESTAMP '1996-11-09
10:26:51.12');
```

Result: -10000

Time Unit: NANOSECOND

When time unit is `NANOSECOND`, all 9 digits of the fractional seconds are kept.

```
SELECT DATEDIFF (NANOSECOND, TIMESTAMP '1996-11-09 10:26:51.13', TIMESTAMP '1996-11-09
10:26:51.12');
```

Result: -10000000

DBTIMEZONE

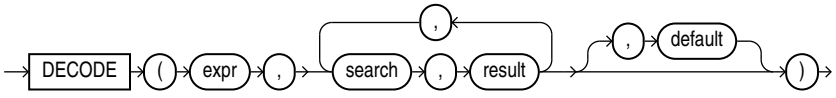
Syntax

Purpose

`DBTIMEZONE` returns the value of the database time zone. The return type is a time zone offset (a character type in the format `'[+|-]TZH:TZM'`) or a time zone region name, depending on how the user specified the database time zone value in the most recent `CREATE DATABASE` or `ALTER DATABASE` statement.

> **See Also**
>
> Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `DBTIMEZONE`

Examples



The following example assumes that the database time zone is set to UTC time zone:

```
SELECT DBTIMEZONE
  FROM DUAL;

DBTIME
------
+00:00
```

DECODE

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

DECODE compares *expr* to each *search* value one by one. If *expr* is equal to a *search*, then Oracle Database returns the corresponding *result*. If no match is found, then Oracle returns *default*. If *default* is omitted, then Oracle returns null.

- If *expr* and *search* are character data, then Oracle compares them using nonpadded comparison semantics. *expr*, *search*, and *result* can be any of the data types CHAR, VARCHAR2, NCHAR, or NVARCHAR2. The string returned is of VARCHAR2 data type and is in the same character set as the first *result* parameter.
- If the first *search-result* pair are numeric, then Oracle compares all *search-result* expressions and the first *expr* to determine the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

The *search*, *result*, and *default* values can be derived from expressions. Oracle Database uses **short-circuit evaluation**. The database evaluates each *search* value only before comparing it to *expr*, rather than evaluating all *search* values before comparing any of them with *expr*. Consequently, Oracle never evaluates a *search* if a previous *search* is equal to *expr*.

Oracle automatically converts *expr* and each *search* value to the data type of the first *search* value before comparing. Oracle automatically converts the return value to the same data type as the first *result*. If the first *result* has the data type CHAR or if the first *result* is null, then Oracle converts the return value to the data type VARCHAR2.

In a DECODE function, Oracle considers two nulls to be equivalent. If *expr* is null, then Oracle returns the *result* of the first *search* that is also null.

The maximum number of components in the DECODE function, including *expr*, *searches*, *results*, and *default*, is 255.

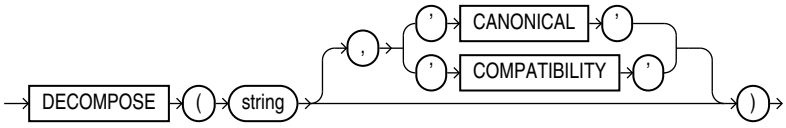
- Data Conversion for information on data type conversion in general
- Floating-Point Numbers for information on floating-point comparison semantics
- Implicit and Explicit Data Conversion for information on the drawbacks of implicit conversion
- COALESCE and CASE Expressions, which provide functionality similar to that of DECODE
- Appendix C in *Oracle AI Database Globalization Support Guide* for the collation determination rules, which define the collation DECODE uses to compare characters from *expr* with characters from *search*, and for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value

Examples



This example decodes the value warehouse_id. If warehouse_id is 1, then the function returns 'Southlake'; if warehouse_id is 2, then it returns 'San Francisco'; and so forth. If warehouse_id is not 1, 2, 3, or 4, then the function returns 'Non domestic'.

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT product_id,
       DECODE (warehouse_id, 1, 'Southlake',
                             2, 'San Francisco',
                             3, 'New Jersey',
                             4, 'Seattle',
                                'Non domestic') "Location"
  FROM inventories
  WHERE product_id < 1775
  ORDER BY product_id, "Location";
```

DECOMPOSE

Syntax

Purpose

`DECOMPOSE` takes as its first argument a character value *`string`* and returns the result of applying one of the Unicode decompositions to it. The decomposition to apply is determined by the second, optional parameter. If the character set of the first argument is not one of the Unicode character sets, `DECOMPOSE` returns the argument unmodified.

If the second argument to `DECOMPOSE` is the string `CANONICAL` (case-insensitively), `DECOMPOSE` applies canonical decomposition, as described in the Unicode Standard definition D68, and returns a string in the NFD normalization form. If the second argument is the string `COMPATIBILITY`, `DECOMPOSE` applies compatibility decomposition, as described in the Unicode Standard definition D65, and returns a string in the NFKD normalization form. The default behavior is to apply the canonical decomposition.

In a pessimistic case, the return value of `DECOMPOSE` may be a few times longer than *`string`*. If a string to be returned is longer than the maximum length `VARCHAR2` value in a given runtime environment, the value is silently truncated to the maximum `VARCHAR2` length.

Both arguments to `DECOMPOSE` can be of any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. Other data types are allowed if they can be implicitly converted to `VARCHAR2`or `NVARCHAR2`. The return value of `DECOMPOSE` is in the same character set as its first argument.

`CLOB` and `NCLOB` values are supported through implicit conversion. If *`string`* is a character LOB value, then it is converted to a `VARCHAR2` value before the `DECOMPOSE` operation. The operation will fail if the size of the LOB value exceeds the supported length of the `VARCHAR2` in the particular execution environment.

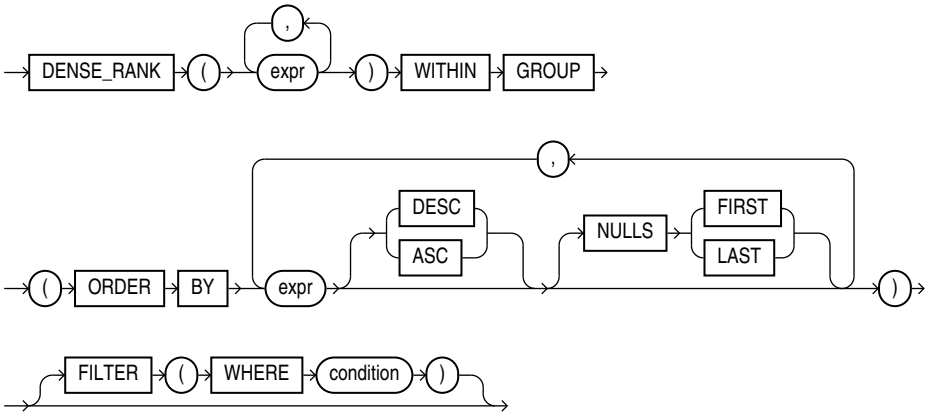
> - Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `DECOMPOSE`
> - COMPOSE

Examples

The following example decomposes the string "`Châteaux`" into its component code points:

```
SELECT DECOMPOSE ('Châteaux')
  FROM DUAL;



DECOMPOSE
---------
Châteaux
```

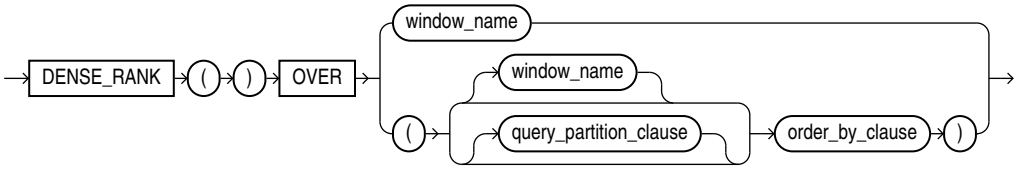
DENSE_RANK

Aggregate Syntax



***dense_rank_aggregate*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

Analytic Syntax

***dense_rank_analytic*::=**

> **See Also**
>
> Analytic Functions for information on syntax, semantics, and restrictions

Purpose

`DENSE_RANK` computes the rank of a row in an ordered group of rows and returns the rank as a `NUMBER`. The ranks are consecutive integers beginning with 1. The largest rank value is the number of unique values returned by the query. Rank values are not skipped in the event of ties. Rows with equal values for the ranking criteria receive the same rank. This function is useful for top-N and bottom-N reporting.

This function accepts as arguments any numeric data type and returns `NUMBER`.

- As an aggregate function, `DENSE_RANK` calculates the dense rank of a hypothetical row identified by the arguments of the function with respect to a given sort specification. The arguments of the function must all evaluate to constant expressions within each aggregate group, because they identify a single row within each group. The constant argument expressions and the expressions in the *`order_by_clause`* of the aggregate match by position. Therefore, the number of arguments must be the same and types must be compatible.
- As an analytic function, `DENSE_RANK` computes the rank of each row returned from a query with respect to the other rows, based on the values of the *`value_exprs`* in the *`order_by_clause`*.

> **See Also**
>
> Appendix C in *Oracle AI Database Globalization Support Guide* for the collation determination rules, which define the collation `DENSE_RANK` uses to compare character values for the `ORDER BY` clause

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Aggregate Example

The following example computes the ranking of a hypothetical employee with the salary $15,500 and a commission of 5% in the sample table `oe.employees`:

```
SELECT DENSE_RANK(15500, .05) WITHIN GROUP
  (ORDER BY salary DESC, commission_pct) "Dense Rank"
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
  FROM employees;

Dense Rank
----------
         3
```

Analytic Example

The following statement ranks the employees in the sample `hr` schema in department 60 based on their salaries. Identical salary values receive the same rank. However, no rank values are skipped. Compare this example with the analytic example for RANK .

```
SELECT department_id, last_name, salary,
       DENSE_RANK() OVER (PARTITION BY department_id ORDER BY salary) DENSE_RANK
  FROM employees WHERE department_id = 60
  ORDER BY DENSE_RANK, last_name;

DEPARTMENT_ID LAST_NAME                     SALARY DENSE_RANK
------------- ------------------------- ---------- ----------
           60 Lorentz                         4200          1
           60 Austin                          4800          2
           60 Pataballa                       4800          2
           60 Ernst                           6000          3
           60 Hunold                          9000          4
```

DEPTH

Syntax

Purpose

`DEPTH` is an ancillary function used only with the `UNDER_PATH` and `EQUALS_PATH` conditions. It returns the number of levels in the path specified by the `UNDER_PATH` condition with the same correlation variable.

The *`correlation_integer`* can be any `NUMBER` integer. Use it to correlate this ancillary function with its primary condition if the statement contains multiple primary conditions. Values less than 1 are treated as 1.

> **See Also**
>
> EQUALS_PATH Condition , UNDER_PATH Condition , and the related function PATH

Examples

The `EQUALS_PATH` and `UNDER_PATH` conditions can take two ancillary functions, `DEPTH` and `PATH`. The following example shows the use of both ancillary functions. The example assumes the existence of the XMLSchema `warehouses.xsd` (created in Using XML in SQL Statements).

```
SELECT PATH(1), DEPTH(2)
  FROM RESOURCE_VIEW
  WHERE UNDER_PATH(res, '/sys/schemas/OE', 1)=1
    AND UNDER_PATH(res, '/sys/schemas/OE', 2)=1;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
PATH(1)                          DEPTH(2)
-------------------------------- --------
. . .
www.example.com                         1
www.example.com/xwarehouses.xsd         2
. . .
```

DEREF

Syntax

Purpose

DEREF returns the object reference of argument *expr*, where *expr* must return a REF to an object. If you do not use this function in a query, then Oracle Database returns the object ID of the REF instead, as shown in the example that follows.

> **See Also**
>
> MAKE_REF

Examples

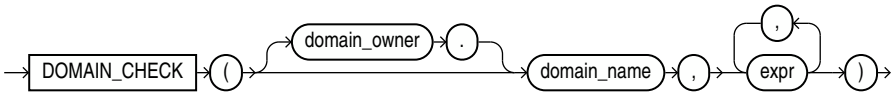
The sample schema oe contains an object type cust_address_typ. The REF Constraint Examples create a similar type, cust_address_typ_new, and a table with one column that is a REF to the type. The following example shows how to insert into such a column and how to use DEREF to extract information from the column:

```
INSERT INTO address_table VALUES
  ('1 First', 'G45 EU8', 'Paris', 'CA', 'US');

INSERT INTO customer_addresses
  SELECT 999, REF(a) FROM address_table a;

SELECT address
  FROM customer_addresses
  ORDER BY address;

ADDRESS
--------------------------------------------------------------------------------
000022020876B2245DBE325C5FE03400400B40DCB176B2245DBE305C5FE03400400B40DCB1



SELECT DEREF(address)
  FROM customer_addresses;

DEREF(ADDRESS)(STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID)
--------------------------------------------------------------------------------
CUST_ADDRESS_TYP_NEW('1 First', 'G45 EU8', 'Paris', 'CA', 'US')
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

DOMAIN_CHECK

Syntax

Purpose

`DOMAIN_CHECK` first converts the data type of the arguments in *`expr`* to the data type of their corresponding domain columns. It then applies the constraint conditions (not null or check constraint) on *`domain_name`* to *`expr`*.

If the domain's constraint is deferred or unvalidated, `DOMAIN_CHECK` still applies the conditions to *`expr`*. If the domain's constraint is disabled, it is not checked as part of `DOMAIN_CHECK`.

> **See Also**
>
> Domain Functions

- *`domain_name`* must be an identifier and can be specified using *`domain_owner.domain_name`*. If you specify it without *`domain_owner`*, it resolves first to the current user then as a public synonym. If the name cannot be resolved, an error is raised.
- If *`domain_name`* refers to a non-existent domain or one that you do not have `EXECUTE` privileges on, then `DOMAIN_CHECK` will raise an error.
- If the domain column data type is `STRICT`, then the value is converted to the domain column's data type. For example, if the domain column data type is `VARCHAR2(100) STRICT`, then the value is converted to `VARCHAR2(100)`. Note that the conversion will not automatically trim the input to the maximum length. If the value evaluates to 'abc' for some row and the domain data type is `CHAR(2 CHAR)`, the conversion will fail instead of returning 'ab'.

  If the domain column data type is not `STRICT`, then the value is converted to the most permissive variant of the domain column's data type in terms of length, scale, and precision. For example, if the input value is a `VARCHAR2(30)`, it is converted to a `VARCHAR2(100)` because it is shorter than the domain length. If the input value is a `VARCHAR2(200)`, it remains a `VARCHAR2(200)` because this is larger than the domain length.
- If the data type conversion fails, the error is masked and `DOMAIN_CHECK` returns `FALSE`. You can use `DOMAIN_CHECK` to filter out values that cannot be inserted into a column of the given domain.

  If the data type conversion succeeds and *`domain_name`* does not have any enabled constraint associated with it, `DOMAIN_CHECK` returns `TRUE`.
- If the data type conversion succeeds and *`domain_name`* has enabled constraints that are all satisfied for a given converted value, `DOMAIN_CHECK` returns `TRUE`. If any of the domain constraints are not satisfied, it returns `FALSE` .

MULTI-COLUMN Domains

Copyright © 1996, 2026, Oracle and/or its affiliates.

When calling DOMAIN_CHECK for multicolumn domains, the number if arguments for *expr* must match the number of columns in the domain. If there is a mismatch, DOMAIN_CHECK raises an error.

If domain D has n columns, then you should call DOMAIN_CHECK should be called with D+1 arguments, like DOMAIN_CHECK(D, arg1, ..., argn).

If D does not exist or you have no privilege to access D, then an error is raised. If all the checks return true, TRUE is returned. This means that:

- arg1 is successfully converted to the data type of column 1 in D, arg2 is successfully converted to the data type of column 2 in Dand so on to argn is successfully converted to the data type of column n in D .
- All of D's enabled constraints are all satisfied with column 1 substituted by arg1 converted to D's column 1 data type, column 2 substituted by arg2 converted to D's column 2 data type, and so on to column n substituted by argn converted to D's column n data type .

Example

The following example creates a domain dgreater with two columns c1 and c2 of type NUMBER and a check constraint that c1 be greater than c2:

```
CREATE DOMAIN dgreater AS (c1 AS NUMBER, c2 AS NUMBER ) CHECK (c1 > c2);
```

Then DOMAIN_CHECK (dgreater, 1, 2) returns FALSE because c1 is less than c2 (the check condition fails). DOMAIN_CHECK (dgreater, 2, 1) returns TRUE because because c1 is greater than c2 (the check condition passes).

Flexible Domains

When calling DOMAIN_CHECK for flexible domains, the number of arguments for *expr* must match the number of domain columns plus discriminant columns. If there is a mismatch DOMAIN_CHECK raises an error.

Checking flexible domain constraints is equivalent to checking constraints of the corresponding subdomain.

You must have the EXECUTE privilege on the flexible domain in order to use DOMAIN_CHECK.

Operations that require EXECUTE privilege on a flexible domain (such as when associating columns with the flexible domain, or during DOMAIN_CHECK with the first argument the flexible domain name) require EXECUTE privilege on the sub-domains. This is because a flexible domain is translated during its creation to a multi-column domain. Therefore the following rules apply:

- Associating columns to a flex domain is equivalent to associating them to the corresponding multi-column domain.
- Checking flexible domain constraints is equivalent to checking constraints of the corresponding multi-column domain.
- Evaluating flexible domain display and order properties is equivalent to evaluating properties on the corresponding multi-column domain.

Examples

Example 1

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following example creates a strict domain of data type CHAR(3 CHAR):

```
CREATE DOMAIN three_chars AS CHAR(3 CHAR) STRICT;
```

Calling DOMAIN_CHECK returns true for strings three characters or shorter. For strings four characters or more long it returns false:

```
SELECT DOMAIN_CHECK (three_chars, 'ab') two_chars,
       DOMAIN_CHECK (three_chars, 'abc') three_chars,
       DOMAIN_CHECK (three_chars, 'abcd') four_chars;
```

Result:

```
TWO_CHARS   THREE_CHARS FOUR_CHARS
----------- ----------- -----------
true        true        false
```

Example 2

The following example creates a domain dgreater with two columns c1 and c2 of type NUMBER and a check constraint that c1 be greater than c2:

```
CREATE DOMAIN dgreater AS (
  c1 AS NUMBER, c2 AS NUMBER
)
  CHECK (c1 > c2);
```

```
SELECT DOMAIN_CHECK (dgreater, 1) one_expr;

ORA-11515: incorrect number of columns in domain association list
```

The query passes one expression value. This raises an error because there are two columns in the domain.

```
SELECT DOMAIN_CHECK (dgreater, 1, 2) first_lower,
       DOMAIN_CHECK (dgreater, 2, 1) first_higher,
       DOMAIN_CHECK (dgreater, 'b', 'a') letters;
```

Result:

```
FIRST_LOWER FIRST_HIGHER LETTERS
----------- -----------  -------
false       true         false
```

In the query above :

- first_lower is false because this fails the domain constraint
- first_higher is true because it passes the domain constraint
- letters is false because the values cannot be converted to numbers

Copyright © 1996, 2026, Oracle and/or its affiliates.

Example 3

The following example creates the domain DAY_OF_WEEK with no domain constraints. All calls to DOMAIN_CHECK return true because all the input values can be converted to CHAR. It is a non-strict domain, so there is no length check.

```
CREATE DOMAIN day_of_week AS CHAR(3 CHAR);

CREATE TABLE calendar_dates (
  calendar_date    DATE,
  day_of_week_abbr day_of_week
);

INSERT INTO calendar_dates
VALUES(DATE'2023-05-01', 'MON'),
      (DATE'2023-05-02', 'tue'),
      (DATE'2023-05-05', 'fRI');

SELECT day_of_week_abbr,
       DOMAIN_CHECK(day_of_week, day_of_week_abbr) domain_column,
       DOMAIN_CHECK(day_of_week, calendar_date) nondomain_column,
       DOMAIN_CHECK(day_of_week, CAST('MON' AS day_of_week)) domain_value,
       DOMAIN_CHECK(day_of_week, 'mon') nondomain_value
  FROM calendar_dates;
```

Result:

```
DAY_OF_WEEK_ABBR DOMAIN_COLUMN   NONDOMAIN_COLUMN   DOMAIN_VALUE   NONDOMAIN_VALUE

--------------   -------------- ------------------  -------------- -----------------
MON           true         true             true        true
tue           true         true             true        true
fRI           true         true             true        true
```

Example 4

The following example creates the domain DAY_OF_WEEK with a constraint to ensure the values are the uppercase day name abbreviations (MON, TUE, etc.). Validating this constraint is deferred until commit, so you can insert invalid values.

Using DOMAIN_CHECK to test the values for the domain column DAY_OF_WEEK_ABBR returns true for the value that conforms to the constraint (MON) and FALSE for those that do not (tue, fRI):

```
CREATE DOMAIN day_of_week AS CHAR(3 CHAR)
  CONSTRAINT CHECK(day_of_week IN ('MON','TUE','WED','THU','FRI','SAT','SUN'))
  INITIALLY DEFERRED;

CREATE TABLE calendar_dates (
  calendar_date    DATE,
  day_of_week_abbr day_of_week
);

INSERT INTO calendar_dates
VALUES(DATE'2023-05-01', 'MON'),
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
      (DATE'2023-05-02', 'tue'),
      (DATE'2023-05-05', 'fRI');

SELECT day_of_week_abbr,
       DOMAIN_CHECK(day_of_week, day_of_week_abbr) domain_column,
       DOMAIN_CHECK(day_of_week, calendar_date) nondomain_column,
       DOMAIN_CHECK(day_of_week, CAST('MON' AS day_of_week)) domain_value,
       DOMAIN_CHECK(day_of_week, 'mon') nondomain_value
  FROM calendar_dates;
```

Result:

```
DAY_OF_WEEK_ABBR  DOMAIN_COLUMN  NONDOMAIN_COLUMN DOMAIN_VALUE NONDOMAIN_VALUE
----------------  -------------  ---------------- ------------ ------------
MON               true        false          true      false
tue               false          false            true         false
fRI               false          false            true         false
```

Example 5

The following example creates the multicolumn domain currency with two deferred constraints:

```
CREATE DOMAIN currency AS (
  amount        AS NUMBER(10, 2),
  currency_code AS CHAR(3 CHAR)
)
CONSTRAINT supported_currencies_c
  CHECK ( currency_code IN ( 'USD', 'GBP', 'EUR', 'JPY' ) )
  DEFERRABLE INITIALLY DEFERRED
CONSTRAINT non_negative_amounts_c
  CHECK ( amount >= 0 )
  DEFERRABLE INITIALLY DEFERRED;
```

The columns `amount` and `currency_code` in the table `order_items` are associated with domain `currency`:

```
CREATE TABLE order_items (
  order_id      INTEGER,
  product_id    INTEGER,
  amount        NUMBER(10, 2),
  currency_code CHAR(3 CHAR),
  DOMAIN currency(amount, currency_code)
);
INSERT INTO order_items
VALUES (1, 1,    9.99, 'USD'),
       (2, 2, 1234.56, 'GBP'),
       (3, 3, -999999, 'JPY'),
       (4, 4, 3141592, 'XXX') ,
       (5, 5, 2718281, '123');
SELECT order_id,
       product_id,
       amount,
       currency_code,
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

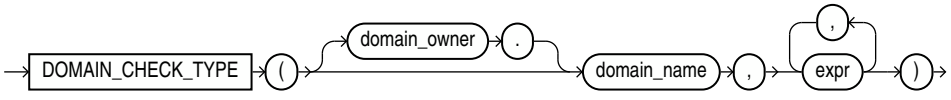
```
       DOMAIN_CHECK(currency, order_id, product_id) order_product,
       DOMAIN_CHECK(currency, amount, currency_code) amount_currency,
       DOMAIN_CHECK(currency, currency_code, amount) currency_amount,
       DOMAIN_CHECK(currency, order_id, currency_code) order_currency
  FROM order_items;
```

The query makes four calls to `DOMAIN_CHECK`:

```
  ORDER_ID PRODUCT_ID     AMOUNT CUR ORDER_PRODUCT AMOUNT_CURRENCY CURRENCY_AMOUNT
ORDER_CURRENCY
---------- ---------- ---------- --- ------------- --------------- ---------------
-----------
         1          1       9.99 USD true          true            false           true
         2          2    1234.56 GBP true          true            false           true
         3          3    -999999 JPY true          true            false           true
         4          4    3141592 XXX true          true            false           true
         5          5    2718281 123 true          true            true            true
```

In the example above:

- `ORDER_PRODUCT` is `FALSE` for all rows because the values for `PRODUCT_ID` do not conform to the `supported_currencies_c` constraint.
- `AMOUNT_CURRENCY` is `FALSE` for the rows with values that violate the constraints (`AMOUNT = -999999`, and `CURRENCY_CODE = "XXX"` and `"123"`). It is `true` for the valid values.
- `CURRENCY_AMOUNT` is `FALSE` for all rows. For the first four rows this is because the values for the first argument, `CURRENCY_CODE` are all letters. These cannot be converted to the type of the first column in the domain (`NUMBER`), leading to a type error. For the fifth row, the amount (`2718281`) does not conform to the `supported_currencies_c` constraint.
- `ORDER_CURRENCY` is `FALSE` for the row with values that violate the constraints (`CURRENCY_CODE = "XXX"` and `"123"`). It is `true` for the valid values.



Example 6

The following statement tries to validate the string "raises an error" against the non-existent domain `NOT_A_DOMAIN`. This raises an exception:

```
SELECT DOMAIN_CHECK(not_a_domain, 'raises an error');
ORA-11504: The domain specified does not exist or the user does not have privileges on
the domain for the operation.
```

DOMAIN_CHECK_TYPE

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

Use `DOMAIN_CHECK_TYPE` to convert the value expression to the data type of the domain column without checking domain constraints. If you want to check constraints, you must use DOMAIN_CHECK.

`DOMAIN_CHECK_TYPE` takes the same arguments as `DOMAIN_CHECK` and returns `TRUE` if the data type of the arguments match the data types of the corresponding domain columns. If the data type match fails, it returns `FALSE`.

> **See Also**
>
> Domain Functions

- *domain_name* must be an identifier and can be specified using *domain_owner.domain_name*. If you specify it without *domain_owner*, it resolves first to the current user then as a public synonym. If the name cannot be resolved, an error is raised.
- If *domain_name* refers to a non-existent domain or one that you do not have `EXECUTE` privileges on, then `DOMAIN_CHECK` will raise an error.
- If the domain column data type is `STRICT`, then the value is converted to the domain column's data type. For example, if the domain column data type is `VARCHAR2(100) STRICT`, then the value is converted to `VARCHAR2(100)`. Note that the conversion will not automatically trim the input to the maximum length. If the value evaluates to 'abc' for some row and the domain data type is `CHAR(2 CHAR)`, the conversion will fail instead of returning 'ab'.

  If the domain column data type is not `STRICT`, then the value is converted to the most permissive variant of the domain column's data type in terms of length, scale and precision. For example, if the input value is a `VARCHAR2(30)`, it is converted to a `VARCHAR2(100)` because it is shorter than the domain length. If the input value is a `VARCHAR2(200)`, it remains a`VARCHAR2(200)` because this is larger than the domain length.
- If the data type conversion fails, the error is masked and `DOMAIN_CHECK_TYPE` returns `FALSE`. You can use `DOMAIN_CHECK_TYPE` to filter out values that cannot be inserted into a column of the given domain..

MULTI-COLUMN Domains

When calling `DOMAIN_CHECK_TYPE` for multicolumn domains, the number of arguments for *expr* must match the number of columns in the domain. If there is a mismatch `DOMAIN_CHECK_TYPE` raises an error.

Flexible Domains

When calling `DOMAIN_CHECK_TYPE` for flexible domains, the number of arguments for *expr* must match the number of domain columns plus discriminant columns. If there is a mismatch `DOMAIN_CHECK_TYPE` raises an error.

Examples

Example 1

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following example creates a strict domain of data type CHAR(3 CHAR):

```
CREATE DOMAIN three_chars AS CHAR(3 CHAR) STRICT;
```

Calling DOMAIN_CHECK_TYPE returns true for strings three characters or shorter. For strings four characters or more long it returns false:

```
SELECT DOMAIN_CHECK_TYPE (three_chars, 'ab') two_chars,
       DOMAIN_CHECK_TYPE (three_chars, 'abc') three_chars,
       DOMAIN_CHECK_TYPE (three_chars, 'abcd') four_chars;
```

Result:

```
TWO_CHARS   THREE_CHARS FOUR_CHARS
----------- ----------- -----------
TRUE        TRUE        FALSE
```

Example 2

The following example creates a domain dgreater with two columns c1 and c2 of type NUMBER and a check constraint that c1 be greater than c2:

```
CREATE DOMAIN dgreater AS (
  c1 AS NUMBER, c2 AS NUMBER
)
  CHECK (c1 > c2);
```

The first query passes one expression value. This raises an error because there are two columns in the domain.

```
SELECT DOMAIN_CHECK_TYPE (dgreater, 1) one_expr;
```

```
ORA-11515: incorrect number of columns in domain association list
```

In the second query:

- first_lower and first_higher are both TRUE because the values are numbers. The domain constraint is not checked.
- letters is FALSE because the values cannot be converted to numbers.

```
SELECT DOMAIN_CHECK_TYPE (dgreater, 1, 2) first_lower,
       DOMAIN_CHECK_TYPE (dgreater, 2, 1) first_higher,
       DOMAIN_CHECK_TYPE (dgreater, 'b', 'a') letters;
```

Result:

```
FIRST_LOWER FIRST_HIGHER LETTERS
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
----------- -----------  -----------
TRUE        TRUE         FALSE
```

Example 3

The following example creates the domain `DAY_OF_WEEK` with no domain constraints. All calls to `DOMAIN_CHECK_TYPE` return true because all the input values can be converted to `CHAR`. It's a non-strict domain, so there is no length check.

```
CREATE DOMAIN day_of_week AS CHAR(3 CHAR);

CREATE TABLE calendar_dates (
  calendar_date    DATE,
  day_of_week_abbr day_of_week
);

INSERT INTO calendar_dates
VALUES(DATE'2023-05-01', 'MON'),
      (DATE'2023-05-02', 'tue'),
      (DATE'2023-05-05', 'fRI');

SELECT day_of_week_abbr,
       DOMAIN_CHECK_TYPE(day_of_week, day_of_week_abbr) domain_column,
       DOMAIN_CHECK_TYPE(day_of_week, calendar_date) nondomain_column,
       DOMAIN_CHECK_TYPE(day_of_week, CAST('MON' AS day_of_week))
domain_value,
       DOMAIN_CHECK_TYPE(day_of_week, 'mon') nondomain_value
  FROM calendar_dates;

DAY DOMAIN_COLUMN   NONDOMAIN_COLUMN   DOMAIN_VALUE   NONDOMAIN_VALUE
--- --------------- ------------------ -------------- -----------------
MON TRUE            TRUE               TRUE           TRUE
tue TRUE            TRUE               TRUE           TRUE
fRI TRUE            TRUE               TRUE           TRUE
```

Example 4

The following example creates the domain `day_of_week` with a constraint to ensure the values are the uppercase day name abbreviations (MON, TUE, etc.).

Validating this constraint is deferred until commit, so you can insert invalid values.

Using `DOMAIN_CHECK_TYPE` returns `TRUE` for all values because they all pass the type check:

```
CREATE DOMAIN day_of_week AS CHAR(3 CHAR)
  CONSTRAINT CHECK(day_of_week IN ('MON','TUE','WED','THU','FRI','SAT','SUN'))
  INITIALLY DEFERRED;

CREATE TABLE calendar_dates (
  calendar_date    DATE,
  day_of_week_abbr day_of_week
);

INSERT INTO calendar_dates
VALUES(DATE'2023-05-01', 'MON'),
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
      (DATE'2023-05-02', 'tue'),
      (DATE'2023-05-05', 'fRI');

SELECT day_of_week_abbr,
       DOMAIN_CHECK_TYPE(day_of_week, day_of_week_abbr) domain_column,
       DOMAIN_CHECK_TYPE(day_of_week, calendar_date) nondomain_column,
       DOMAIN_CHECK_TYPE(day_of_week, CAST('MON' AS day_of_week)) domain_value,
       DOMAIN_CHECK_TYPE(day_of_week, 'mon') nondomain_value
  FROM calendar_dates;

DAY DOMAIN_COLUMN NONDOMAIN_COLUMN DOMAIN_VALUE NONDOMAIN_VALUE
--- ------------- ---------------- ------------ -----------
MON TRUE          TRUE             TRUE         TRUE
tue FALSE         TRUE             TRUE         TRUE
fRI FALSE         TRUE             TRUE         TRUE
```

Example 5

The following example creates the multicolumn domain currency with two deferred constraints:

```
CREATE DOMAIN currency AS (
  amount        AS NUMBER(10, 2),
  currency_code AS CHAR(3 CHAR)
)
CONSTRAINT supported_currencies_c
  CHECK ( currency_code IN ( 'USD', 'GBP', 'EUR', 'JPY' ) )
  DEFERRABLE INITIALLY DEFERRED
CONSTRAINT non_negative_amounts_c
  CHECK ( amount >= 0 )
  DEFERRABLE INITIALLY DEFERRED;
```

The columns `AMOUNT` and `CURRENCY_CODE` in the table `ORDER_ITEMS` are associated with domain `currency`:

```
CREATE TABLE order_items (
  order_id      INTEGER,
  product_id    INTEGER,
  amount        NUMBER(10, 2),
  currency_code CHAR(3 CHAR),
  DOMAIN currency(amount, currency_code)
);
INSERT INTO order_items
VALUES (1, 1,    9.99, 'USD'),
       (2, 2, 1234.56, 'GBP'),
       (3, 3, -999999, 'JPY'),
       (4, 4, 3141592, 'XXX') ,
       (5, 5, 2718281, '123');

SELECT order_id,
       product_id,
       amount,
       currency_code,
       DOMAIN_CHECK_TYPE(currency, order_id, product_id) order_product,
       DOMAIN_CHECK_TYPE(currency, amount, currency_code) amount_currency,
       DOMAIN_CHECK_TYPE(currency, currency_code, amount) currency_amount,
       DOMAIN_CHECK_TYPE(currency, order_id, currency_code) order_currency
  FROM order_items;
```

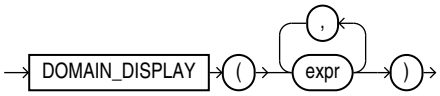
Copyright © 1996, 2026, Oracle and/or its affiliates.

The query makes four calls to DOMAIN_CHECK_TYPE:

```
  ORDER_ID PRODUCT_ID     AMOUNT CUR ORDER_PRODUCT AMOUNT_CURRENCY CURRENCY_AMOUNT
ORDER_CURRENCY
---------- ---------- ---------- --- ------------- --------------- ---------------
-----------
         1          1       9.99 USD TRUE          TRUE            FALSE           TRUE
         2          2    1234.56 GBP TRUE          TRUE            FALSE           TRUE
         3          3    -999999 JPY TRUE          TRUE            FALSE           TRUE
         4          4    3141592 XXX TRUE          TRUE            FALSE           TRUE
         5          5    2718281 123 TRUE          TRUE            TRUE            TRUE
```

In the example above:

- ORDER_PRODUCT is TRUE for all rows because the values for ORDER_ID and PRODUCT_ID can be converted to the corresponding column types in the domain (NUMBER and CHAR).
- AMOUNT_CURRENCY is TRUE for all rows because the table columns match the domain columns.
- CURRENCY_AMOUNT is FALSE for the first four rows because the values for the first argument, CURRENCY_CODE are all letters. These cannot be converted to the type of the first column in the domain (NUMBER), leading to a type error. The fifth row is TRUE because the amount (2718281) can be converted to CHAR.
- ORDER_CURRENCY is TRUE for all rows because the types for ORDER_ID and CURRENCY_CODE match the corresponding domain column types (NUMBER and CHAR).



Example 6

The following statement tries to validate the string "raises an error" against the non-existent domain NOT_A_DOMAIN. This raises an exception:

```
SELECT DOMAIN_CHECK_TYPE(not_a_domain, 'raises an error');
ORA-11504: The domain specified does not exist or the user does not have privileges on
the domain for the operation.
```

DOMAIN_DISPLAY

Syntax

Purpose

DOMAIN_DISPLAY returns *expr* formatted according to the domain's display expression. This returns NULL if the arguments are not associated with a domain or the domain has no display expression.

When calling DOMAIN_DISPLAY for multicolumn domains, all values of *expr* should be from the same domain. It returns NULL if the number of *expr* arguments are different from the number of domain columns or they are in a different order in the domain.

To get the display expression for a non-domain value, cast *expr* to the domain type. This is only possible for single column domains.

Copyright © 1996, 2026, Oracle and/or its affiliates.

>
> - Domain Functions

Examples

The following example creates the domain `DAY_OF_WEEK` and associates it with the column `CALENDAR_DATES.DAY_OF_WEEK_ABBR`. Passing this column to `DOMAIN_DISPLAY` returns it with the first letter of each word capitalized and all other letters in lowercase. `DOMAIN_DISPLAY` also returns this format when casting a string to the domain.

All other calls to `DOMAIN_DISPLAY` pass non-domain values, so return `NULL`.

```
CREATE DOMAIN day_of_week AS CHAR(3 CHAR)
  DISPLAY INITCAP(day_of_week);

CREATE TABLE calendar_dates (
  calendar_date DATE,
  day_of_week_abbr day_of_week
);

INSERT INTO calendar_dates
VALUES(DATE'2023-05-01', 'MON'),
      (DATE'2023-05-02', 'tue'),
      (DATE'2023-05-05', 'fRI');

SELECT day_of_week_abbr,
       DOMAIN_DISPLAY(day_of_week_abbr) domain_column,
       DOMAIN_DISPLAY(calendar_date) nondomain_column,
       DOMAIN_DISPLAY(CAST('MON' AS day_of_week)) domain_value,
       DOMAIN_DISPLAY('MON') nondomain_value
  FROM calendar_dates;

DAY_OF_WEEK_ABBR DOMAIN_COLUMN NONDOMAIN_COLUMN DOMAIN_VALUE NONDOMAIN_VALUE
---------------- ------------- ---------------- ------------ ---------------
MON              Mon           <null>           Mon          <null>
tue              Tue           <null>           Mon          <null>
fRI              Fri           <null>           Mon          <null>
```

The following example creates the multicolumn domain `CURRENCY` with a display expression. The columns `AMOUNT` and `CURRENCY_CODE` in `ORDER_ITEMS` are associated with this domain.

In the query, only the domain_cols expression formats the columns according to the domain expression. All other calls to `DOMAIN_DISPLAY` have a mismatch between its arguments and the domain columns so return `NULL`:

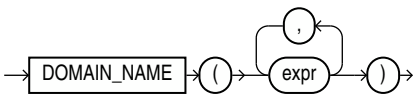
```
CREATE DOMAIN currency AS (
  amount        AS NUMBER(10, 2)
  currency_code AS CHAR(3 CHAR)
)
DISPLAY CASE currency_code
  WHEN 'USD' THEN '$'
  WHEN 'GBP' THEN '£'
  WHEN 'EUR' THEN '€'
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
  WHEN 'JPY' THEN '¥'
END || TO_CHAR(amount, '999,999,999.00');

CREATE TABLE pre_order (
  order_id      INTEGER,
  product_id    INTEGER,
  amount        NUMBER(10, 2),
  currency_code CHAR(3 CHAR),
  DOMAIN currency(amount, currency_code)
);

INSERT INTO pre_order
VALUES (1, 1,    9.99, 'USD'),
       (2, 2, 1234.56, 'GBP'),
       (3, 3, 4321,    'EUR'),
       (4, 4, 3141592, 'JPY');



SELECT order_id,
       product_id,
       DOMAIN_DISPLAY(amount, currency_code) domain_cols,
       DOMAIN_DISPLAY(currency_code, amount) domain_cols_wrong_order,
       DOMAIN_DISPLAY(order_id, product_id) nondomain_cols,
       DOMAIN_DISPLAY(amount) domain_cols_subset
  FROM pre_order;

  ORDER_ID PRODUCT_ID DOMAIN_COLS      DOMAIN_COLS_WRONG_ORDER NONDOMAIN_COLS
DOMAIN_COLS_SUBSET
---------- ---------- ---------------- ----------------------- --------------

         1          1 $ 9.99           <null>                  <null>
<null>
         2          2 £ 1,234.56       <null>                  <null>
<null>
         3          3 € 4,321.00       <null>                  <null>
<null>
         4          4 ¥ 3,141,592.00   <null>                  <null>         <null>
```

DOMAIN_NAME

Syntax

Purpose

`DOMAIN_NAME` returns the fully qualified name of the domain associated with *expr*. This returns `NULL` if expr is associated with a domain.

Copyright © 1996, 2026, Oracle and/or its affiliates.

When calling DOMAIN_NAME for multicolumn domains, all values of *expr* should be from the same domain. It returns NULL if the number of *expr* arguments are different from the number of domain columns or they are in a different order in the domain.

- Domain Functions

Examples

The following example creates the domain DAY_OF_WEEK in the schema HR and associates it with the column HR.CALENDAR_DATES.DAY_OF_WEEK_ABBR. Passing this column to DOMAIN_NAME returns the fully qualified name of the domain.

The query casts the string "MON" to DAY_OF_WEEK to get the domain name.

All other calls to DOMAIN_NAME return NULL.

```
CREATE DOMAIN hr.day_of_week AS CHAR(3 CHAR);

CREATE TABLE hr.calendar_dates (
  calendar_date    DATE,
  day_of_week_abbr hr.day_of_week
);

INSERT INTO hr.calendar_dates
VALUES(DATE'2023-05-01', 'MON');

SELECT day_of_week_abbr,
       DOMAIN_NAME(day_of_week_abbr) domain_column,
       DOMAIN_NAME(calendar_date) nondomain_column,
       DOMAIN_NAME(CAST('MON' AS hr.day_of_week)) domain_value,
       DOMAIN_NAME('MON') nondomain_value
  FROM hr.calendar_dates;

DAY_OF_WEEK_ABBR DOMAIN_COLUMN  NONDOMAIN_COLUMN DOMAIN_VALUE   NONDOMAIN_VALUE
---------------- -------------- ---------------- -------------- ---------------
MON              HR.DAY_OF_WEEK <null>           HR.DAY_OF_WEEK <null>
```

The following example creates the multicolumn domain CURRENCY in the schema CO. The columns AMOUNT and CURRENCY_CODE in CO.ORDER_ITEMS are associated with this domain.

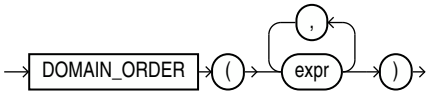
In the query, the arguments for DOMAIN_NAME only match the domain definition for the domain_cols expression. This returns the fully qualified name of the domain. All other calls to DOMAIN_NAME have a mismatch between its arguments and the domain columns so return NULL:

```
CREATE DOMAIN co.currency AS (
  amount        AS NUMBER(10, 2)
  currency_code AS CHAR(3 CHAR)
);

CREATE TABLE co.order_items (
  order_id      INTEGER,
  product_id    INTEGER,
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
  amount        NUMBER(10, 2),
  currency_code CHAR(3 CHAR),
  DOMAIN co.currency(amount, currency_code)
);



INSERT INTO co.order_items
VALUES (1, 1, 9.99, 'USD');

SELECT order_id,
       product_id,
       DOMAIN_NAME(amount, currency_code) domain_cols,
       DOMAIN_NAME(currency_code, amount) domain_cols_wrong_order,
       DOMAIN_NAME(order_id, product_id) nondomain_cols,
       DOMAIN_NAME(amount) domain_cols_subset
  FROM co.order_items
  ORDER BY domain_cols;

  ORDER_ID PRODUCT_ID DOMAIN_COLS     DOMAIN_COLS_WRONG_ORDER   NONDOMAIN_COLS
DOMAIN_COLS_SUBSET
---------- ---------- -------------- ------------------------ --------------
--------------------
         1          1 CO.CURRENCY    <null>                   <null>          <null>
```

DOMAIN_ORDER

Syntax

Purpose

`DOMAIN_ORDER` returns expr formatted according to the domain's order expression. This returns `NULL` if the arguments are not associated with a domain or the domain has no order expression.

When calling `DOMAIN_ORDER` for multicolumn domains, all values of *expr* should be from the same domain. It returns `NULL` if the number expr arguments are different from the number of domain columns or they are in a different order in the domain.

To get the display expression for a non-domain value, cast *expr* to the domain type. This is only possible for single column domains.

> **See Also**
>
> - Domain Functions

Examples

The following example creates the domain `DAY_OF_WEEK` and associates it with the column `CALENDAR_DATES.DAY_OF_WEEK_ABBR`. Passing this column to `DOMAIN_ORDER` returns the result of

Copyright © 1996, 2026, Oracle and/or its affiliates.

the ORDER expression (MON = 0, TUE = 1, etc.). Using this in the ORDER BY returns the rows sorted by their position in the week instead of alphabetically.

The query casts the string "MON" to DAY_OF_WEEK to get its sort value.

All other calls to DOMAIN_ORDER pass non-domain values, so return NULL.

```
CREATE DOMAIN day_of_week AS CHAR(3 CHAR)
  ORDER CASE UPPER(day_of_week)
     WHEN 'MON' THEN 0
     WHEN 'TUE' THEN 1
     WHEN 'WED' THEN 2
     WHEN 'THU' THEN 3
     WHEN 'FRI' THEN 4
     WHEN 'SAT' THEN 5
     WHEN 'SUN' THEN 6
     ELSE 7
  END;

CREATE TABLE calendar_dates (
  calendar_date    DATE,
  day_of_week_abbr day_of_week
);

INSERT INTO calendar_dates
VALUES(DATE'2023-05-01', 'MON'),
      (DATE'2023-05-02', 'TUE'),
      (DATE'2023-05-05', 'FRI'),
      (DATE'2023-05-08', 'mon');

SELECT day_of_week_abbr,
       DOMAIN_ORDER(day_of_week_abbr) domain_column,
       DOMAIN_ORDER(calendar_date) nondomain_column,
       DOMAIN_ORDER(CAST('MON' AS day_of_week)) domain_value,
       DOMAIN_ORDER('MON') nondomain_value
  FROM calendar_dates
  ORDER BY DOMAIN_ORDER(day_of_week_abbr);
```

Result:

```
DAY_OF_WEEK_ABBR DOMAIN_COLUMN NONDOMAIN_COLUMN DOMAIN_VALUE NONDOMAIN_VALUE
---------------- ------------- ---------------- ------------ ---------------
MON                          0 <null>                      0 <null>
mon                          0 <null>                      0 <null>
TUE                          1 <null>                      0 <null>
FRI                          4 <null>                      0 <null>
```

```

Copyright © 1996, 2026, Oracle and/or its affiliates.

DUMP

Syntax

Purpose

`DUMP` returns a `VARCHAR2` value containing the data type code, length in bytes, and internal representation of *`expr`*. The returned result is always in the database character set. For the data type corresponding to each code, see Table 2-1.

The argument *`return_fmt`* specifies the format of the return value and can have any of the following values:

- 8 returns result in octal notation.
- 10 returns result in decimal notation.
- 16 returns result in hexadecimal notation.
- 17 returns each byte printed as a character if and only if it can be interpreted as a printable character in the character set of the compiler—typically ASCII or EBCDIC. Some ASCII control characters may be printed in the form ^X as well. Otherwise the character is printed in hexadecimal notation. All NLS parameters are ignored. Do not depend on any particular output format for `DUMP` with *`return_fmt`* 17.

By default, the return value contains no character set information. To retrieve the character set name of *`expr`*, add 1000 to any of the preceding format values. For example, a *`return_fmt`* of 1008 returns the result in octal and provides the character set name of *`expr`*.

The arguments *`start_position`* and *`length`* combine to determine which portion of the internal representation to return. The default is to return the entire internal representation in decimal notation.

If *`expr`* is null, then this function returns `NULL`.

This function does not support `CLOB` data directly. However, `CLOB`s can be passed in as arguments through implicit data conversion.

> **See Also**
>
> - Data Type Comparison Rules for more information
> - Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `DUMP`

Examples

The following examples show how to extract dump information from a string expression and a column:

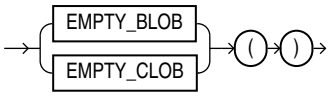
Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT DUMP('abc', 1016)
  FROM DUAL;

DUMP('ABC',1016)
----------------------------------------
Typ=96 Len=3 CharacterSet=WE8DEC: 61,62,63

SELECT DUMP(last_name, 8, 3, 2) "OCTAL"
  FROM employees
  WHERE last_name = 'Hunold'
  ORDER BY employee_id;

OCTAL
----------------------------------------------------------------
Typ=1 Len=6: 156,157



SELECT DUMP(last_name, 10, 3, 2) "ASCII"
  FROM employees
  WHERE last_name = 'Hunold'
  ORDER BY employee_id;

ASCII
----------------------------------------------------------------
Typ=1 Len=6: 110,111
```

EMPTY_BLOB, EMPTY_CLOB

Syntax

***empty_LOB*::=**

Purpose

`EMPTY_BLOB` and `EMPTY_CLOB` return an empty LOB locator that can be used to initialize a LOB variable or, in an `INSERT` or `UPDATE` statement, to initialize a LOB column or attribute to `EMPTY`. `EMPTY` means that the LOB is initialized, but not populated with data.

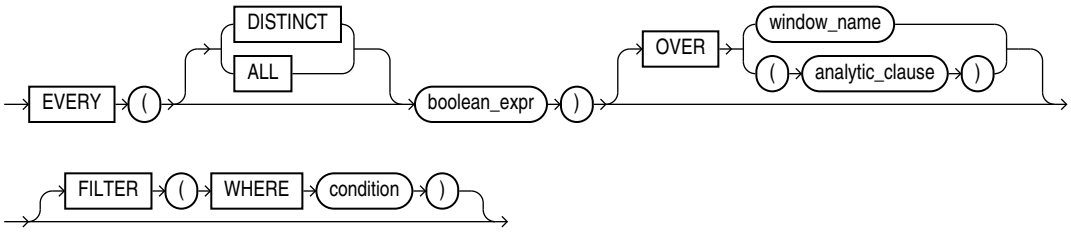
> **Note**
>
> An empty LOB is not the same as a null LOB, and an empty `CLOB` is not the same as a LOB containing a string of 0 length. For more information, see *Oracle AI Database SecureFiles and Large Objects Developer's Guide*.

> **See Also**
>
> Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of `EMPTY_CLOB`

Copyright © 1996, 2026, Oracle and/or its affiliates.

Restriction on LOB Locators

You cannot use the locator returned from this function as a parameter to the `DBMS_LOB` package or the OCI.



Examples

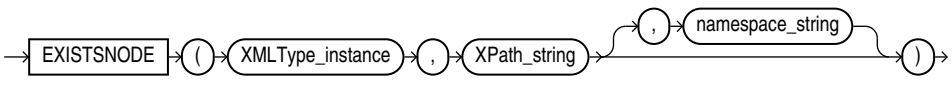
The following example initializes the `ad_photo` column of the sample `pm.print_media` table to `EMPTY`:

```
UPDATE print_media
  SET ad_photo = EMPTY_BLOB();
```

EVERY

Syntax

Purpose



`EVERY` returns `'TRUE'` if the *`boolean_expr`* evaluates to true for every row that qualifies. Otherwise it returns `'FALSE'`. You can use it as an aggregate or analytic function. It is the same as the function `BOOLEAN_AND_AGG`.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

EXISTSNODE

> **Note**
>
> The `EXISTSNODE` function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use the `XMLEXISTS` function instead. See XMLEXISTS for more information.

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

`EXISTSNODE` determines whether traversal of an XML document using a specified path results in any nodes. It takes as arguments the `XMLType` instance containing an XML document and a `VARCHAR2` XPath string designating a path. The optional *`namespace_string`* must resolve to a `VARCHAR2` value that specifies a default mapping or namespace mapping for prefixes, which Oracle Database uses when evaluating the XPath expression(s).

The *`namespace_string`* argument defaults to the namespace of the root element. If you refer to any subelement in *`Xpath_string`*, then you must specify *`namespace_string`*, and you must specify the "who" prefix in both of these arguments.

> **See Also**
>
> Using XML in SQL Statements for examples that specify *`namespace_string`* and use the "who" prefix.

The return value is `NUMBER`:

- 0 if no nodes remain after applying the XPath traversal on the document
- 1 if any nodes remain

Examples

The following example tests for the existence of the `/Warehouse/Dock` node in the XML path of the `warehouse_spec` column of the sample table `oe.warehouses`:

```
SELECT warehouse_id, warehouse_name
  FROM warehouses
  WHERE EXISTSNODE(warehouse_spec, '/Warehouse/Docks') = 1
  ORDER BY warehouse_id;

WAREHOUSE_ID WAREHOUSE_NAME
------------ ----------------------------------
           1 Southlake, Texas
           2 San Francisco
           4 Seattle, Washington
```

EXP

Syntax

Purpose

`EXP` returns `e` raised to the *n*th power, where `e` = 2.71828183... . The function returns a value of the same type as the argument.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is `BINARY_FLOAT`, then the

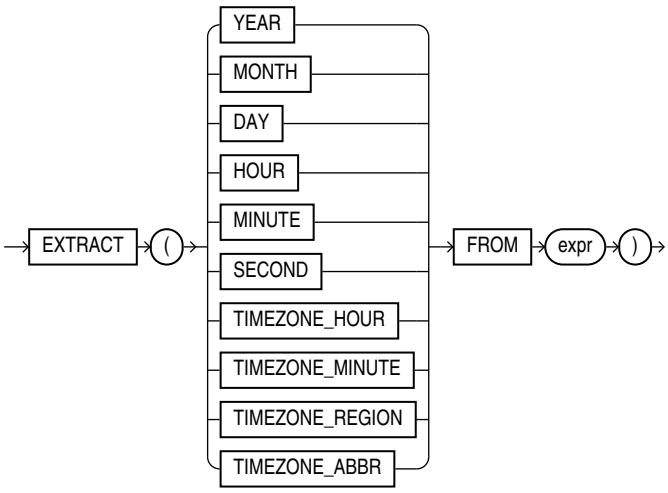
Copyright © 1996, 2026, Oracle and/or its affiliates.

function returns BINARY_DOUBLE. Otherwise the function returns the same numeric data type as the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples

The following example returns e to the 4th power:



```
SELECT EXP(4) "e to the 4th power"
  FROM DUAL;

e to the 4th power
------------------
          54.59815
```

EXTRACT (datetime)

Syntax

***extract_datetime*::=**

Purpose

EXTRACT extracts and returns the value of a specified datetime field from a datetime or interval expression. The *expr* can be any expression that evaluates to a datetime or interval data type compatible with the requested field:

- If YEAR or MONTH is requested, then *expr* must evaluate to an expression of data type DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE, or INTERVAL YEAR TO MONTH.
- If DAY is requested, then *expr* must evaluate to an expression of data type DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE, or INTERVAL DAY TO SECOND.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- If HOUR, MINUTE, or SECOND is requested, then *expr* must evaluate to an expression of data type TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE, or INTERVAL DAY TO SECOND. DATE is not valid here, because Oracle Database treats it as ANSI DATE data type, which has no time fields.
- If TIMEZONE_HOUR, TIMEZONE_MINUTE, TIMEZONE_ABBR, TIMEZONE_REGION, or TIMEZONE_OFFSET is requested, then *expr* must evaluate to an expression of data type TIMESTAMP WITH TIME ZONE or TIMESTAMP WITH LOCAL TIME ZONE.

EXTRACT interprets *expr* as an ANSI datetime data type. For example, EXTRACT treats DATE not as legacy Oracle DATE but as ANSI DATE, without time elements. Therefore, you can extract only YEAR, MONTH, and DAY from a DATE value. Likewise, you can extract TIMEZONE_HOUR and TIMEZONE_MINUTE only from the TIMESTAMP WITH TIME ZONE data type.

When you specify TIMEZONE_REGION or TIMEZONE_ABBR (abbreviation), the value returned is a VARCHAR2 string containing the appropriate time zone region name or abbreviation. When you specify any of the other datetime fields, the value returned is an integer value of NUMBER data type representing the datetime value in the Gregorian calendar. When extracting from a datetime with a time zone value, the value returned is in UTC. For a listing of time zone region names and their corresponding abbreviations, query the V$TIMEZONE_NAMES dynamic performance view.

This function can be very useful for manipulating datetime field values in very large tables, as shown in the first example below.

Note

Time zone region names are needed by the daylight saving feature. These names are stored in two types of time zone files: one large and one small. One of these files is the default file, depending on your environment and the release of Oracle Database you are using. For more information regarding time zone files and names, see *Oracle AI Database Globalization Support Guide*.

Some combinations of datetime field and datetime or interval value expression result in ambiguity. In these cases, Oracle Database returns UNKNOWN (see the examples that follow for additional information).

See Also

- *Oracle AI Database Globalization Support Guide* for a complete listing of the time zone region names in both files
- Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of EXTRACT
- Datetime/Interval Arithmetic for a description of *datetime_value_expr* and *interval_value_expr*
- *Oracle AI Database Reference* for information on the dynamic performance views

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

The following example returns from the `oe.orders` table the number of orders placed in each month:

```
SELECT EXTRACT(month FROM order_date) "Month", COUNT(order_date) "No. of Orders"
  FROM orders
  GROUP BY EXTRACT(month FROM order_date)
  ORDER BY "No. of Orders" DESC, "Month";

     Month No. of Orders
---------- -------------
        11            15
         6            14
         7            14
         3            11
         5            10
         2             9
         9             9
         8             7
        10             6
         1             5
        12             4
         4             1

12 rows selected.
```

The following example returns the year 1998.

```
SELECT EXTRACT(YEAR FROM DATE '1998-03-07')
  FROM DUAL;

EXTRACT(YEARFROMDATE'1998-03-07')
---------------------------------
                             1998
```

The following example selects from the sample table `hr.employees` all employees who were hired after 2007:

```
SELECT last_name, employee_id, hire_date
  FROM employees
  WHERE EXTRACT(YEAR FROM hire_date) > 2007
  ORDER BY hire_date;

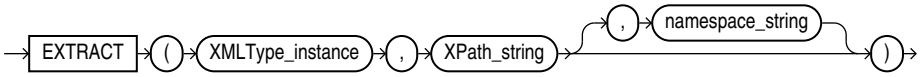
LAST_NAME                 EMPLOYEE_ID HIRE_DATE
------------------------- ----------- ---------
Johnson                           179 04-JAN-08
Grant                             199 13-JAN-08
Marvins                           164 24-JAN-08
. . .
```

The following example results in ambiguity, so Oracle returns `UNKNOWN`:

```
SELECT EXTRACT(TIMEZONE_REGION FROM TIMESTAMP '1999-01-01 10:00:00 -08:00')
  FROM DUAL;

EXTRACT(TIMEZONE_REGIONFROMTIMESTAMP'1999-01-0110:00:00-08:00')
---------------------------------------------------------------
UNKNOWN
```

Copyright © 1996, 2026, Oracle and/or its affiliates.



The ambiguity arises because the time zone numerical offset is provided in the expression, and that numerical offset may map to more than one time zone region name.

EXTRACT (XML)

> **Note**
>
> The `EXTRACT` (XML) function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use the `XMLQUERY` function instead. See XMLQUERY for more information.

Syntax

***extract_xml*::=**

Purpose

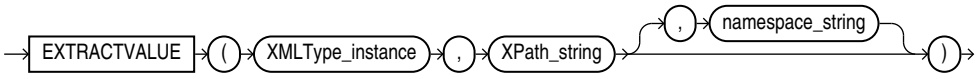
`EXTRACT` (XML) is similar to the `EXISTSNODE` function. It applies a `VARCHAR2` XPath string and returns an `XMLType` instance containing an XML fragment. You can specify an absolute *`XPath_string`* with an initial slash or a relative *`XPath_string`* by omitting the initial slash. If you omit the initial slash, then the context of the relative path defaults to the root node. The optional *`namespace_string`* is required if the XML you are handling uses a namespace prefix. This argument must resolve to a `VARCHAR2` value that specifies a default mapping or namespace mapping for prefixes, which Oracle Database uses when evaluating the XPath expression(s).

Examples

The following example extracts the value of the `/Warehouse/Dock` node of the XML path of the `warehouse_spec` column in the sample table `oe.warehouses`:

```
SELECT warehouse_name,
       EXTRACT(warehouse_spec, '/Warehouse/Docks') "Number of Docks"
  FROM warehouses
  WHERE warehouse_spec IS NOT NULL
  ORDER BY warehouse_name;

WAREHOUSE_NAME            Number of Docks
------------------------- -------------------------
New Jersey
San Francisco             <Docks>1</Docks>
Seattle, Washington       <Docks>3</Docks>
Southlake, Texas          <Docks>2</Docks>
```



Compare this example with the example for EXTRACTVALUE , which returns the scalar value of the XML fragment.

Copyright © 1996, 2026, Oracle and/or its affiliates.

EXTRACTVALUE

> **Note**
>
> The EXTRACTVALUE function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use the XMLTABLE function, or the XMLCAST and XMLQUERY functions instead. See XMLTABLE , XMLCAST, and XMLQUERY for more information.

Syntax

The EXTRACTVALUE function takes as arguments an XMLType instance and an XPath expression and returns a scalar value of the resultant node. The result must be a single node and be either a text node, attribute, or element. If the result is an element, then the element must have a single text node as its child, and it is this value that the function returns. You can specify an absolute *XPath_string* with an initial slash or a relative *XPath_string* by omitting the initial slash. If you omit the initial slash, the context of the relative path defaults to the root node.

If the specified XPath points to a node with more than one child, or if the node pointed to has a non-text node child, then Oracle returns an error. The optional *namespace_string* must resolve to a VARCHAR2 value that specifies a default mapping or namespace mapping for prefixes, which Oracle uses when evaluating the XPath expression(s).

For documents based on XML schemas, if Oracle can infer the type of the return value, then a scalar value of the appropriate type is returned. Otherwise, the result is of type VARCHAR2. For documents that are not based on XML schemas, the return type is always VARCHAR2.

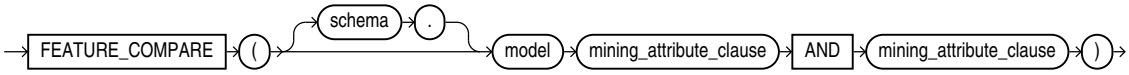
> **See Also**
>
> Appendix C in *Oracle AI Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of EXTRACTVALUE

Examples

The following example takes as input the same arguments as the example for EXTRACT (XML) . Instead of returning an XML fragment, as does the EXTRACT function, it returns the scalar value of the XML fragment:

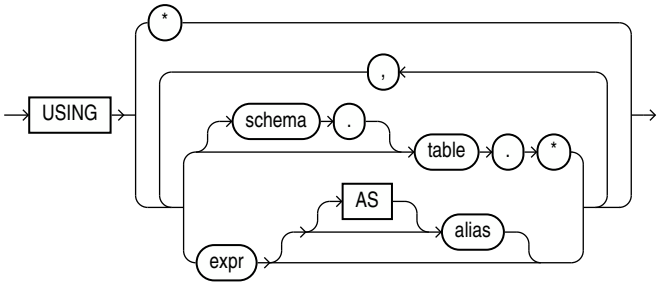
```
SELECT warehouse_name, EXTRACTVALUE(e.warehouse_spec, '/Warehouse/Docks') "Docks"
  FROM warehouses e
  WHERE warehouse_spec IS NOT NULL
  ORDER BY warehouse_name;

WAREHOUSE_NAME       Docks
-------------------- ------------
```



Copyright © 1996, 2026, Oracle and/or its affiliates.

```
New Jersey
San Francisco        1
Seattle, Washington  3
Southlake, Texas     2
```



FEATURE_COMPARE

Syntax

***feature_compare*::=**

***mining_attribute_clause*::=**

Purpose

The `FEATURE_COMPARE` function uses a Feature Extraction model to compare two different documents, including short ones such as keyword phrases or two attribute lists, for similarity or dissimilarity. The `FEATURE_COMPARE` function can be used with Feature Extraction algorithms such as Singular Value Decomposition (SVD), Principal Component Analysis PCA), Non-Negative Matrix Factorization (NMF), and Explicit Semantic Analysis (ESA). This function is applicable not only to documents, but also to numeric and categorical data.

The input to the `FEATURE_COMPARE` function is a single feature model built using the Feature Extraction algorithms of Oracle Machine Learning for SQL, such as NMF, SVD, and ESA. The double `USING` clause provides a mechanism to compare two different documents or constant keyword phrases, or any combination of the two, for similarity or dissimilarity using the extracted features in the model.

The syntax of the `FEATURE_COMPARE` function can use an optional `GROUPING` hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

The *`mining_attribute_clause`* identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The *`mining_attribute_clause`* behaves as described for the `PREDICTION` function. See mining_attribute_clause.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> - *Oracle Machine Learning for SQL User's Guide* for information about scoring
> - *Oracle Machine Learning for SQL Concepts* for information about clustering

> **Note**
>
> The following examples are excerpted from the Oracle Machine Learning for SQL sample programs. For more information about the sample programs, see Appendix A in *Oracle Machine Learning for SQL User's Guide*.

Examples

An ESA model is built against a 2005 Wiki dataset rendering over 200,000 features. The documents are mined as text and the document titles are considered as the Feature IDs.

The examples show the `FEATURE_COMPARE` function with the ESA algorithm, which compares a similar set of texts and then a dissimilar set of texts.

Similar texts

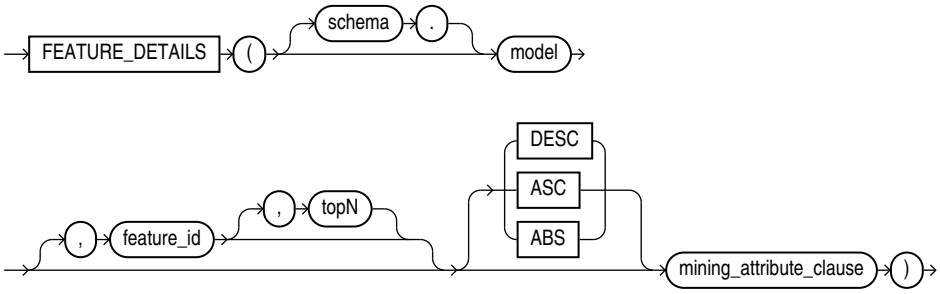
```
SELECT 1-FEATURE_COMPARE(esa_wiki_mod USING 'There are several PGA tour golfers from South
Africa' text AND USING 'Nick Price won the 2002 Mastercard Colonial Open' text) similarity
FROM DUAL;

SIMILARITY
----------
      .258
```

The output metric shows the results of a distance calculation. Therefore, a smaller number represents more similar texts. So 1 minus the distance in the queries represents a document similarity metric.

Dissimilar texts

```
SELECT 1-FEATURE_COMPARE(esa_wiki_mod USING 'There are several PGA tour golfers from South
Africa' text AND USING 'John Elway played quarterback for the Denver Broncos' text)
similarity FROM DUAL;



SIMILARITY
----------
      .007
```

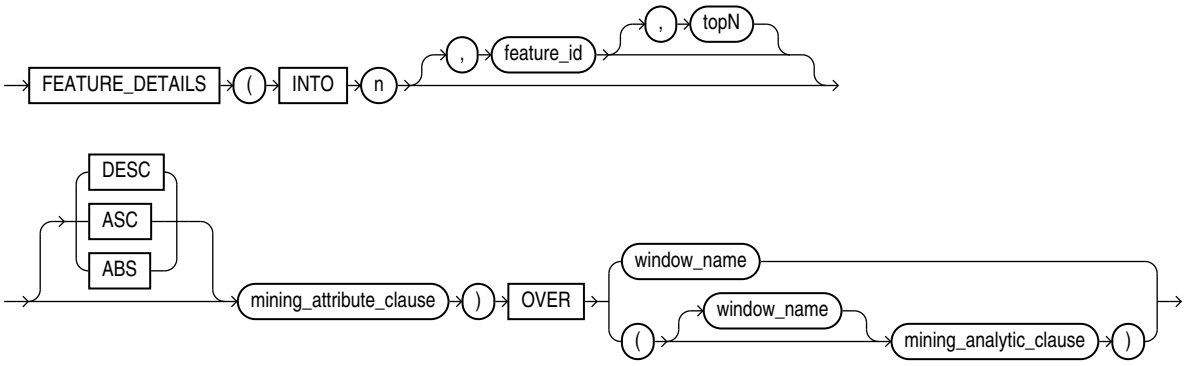
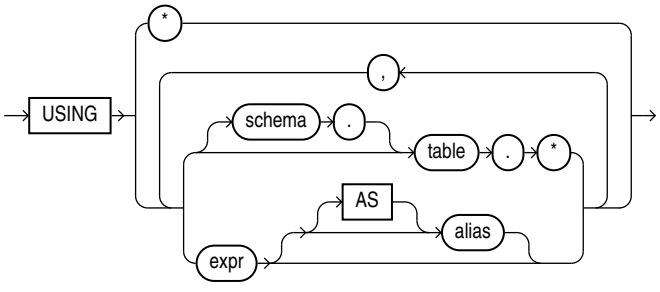
FEATURE_DETAILS

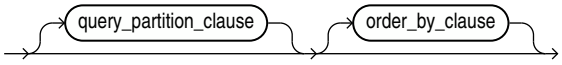


Syntax

***feature_details*::=**



Analytic Syntax



***feature_details_analytic*::=**

***mining_attribute_clause*::=**

***mining_analytic_clause*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> "Analytic Functions " for information on the syntax, semantics, and restrictions of *mining_analytic_clause*

Purpose

FEATURE_DETAILS returns feature details for each row in the selection. The return value is an XML string that describes the attributes of the highest value feature or the specified *feature_id*.

topN

If you specify a value for *topN*, the function returns the *N* attributes that most influence the feature value. If you do not specify *topN*, the function returns the 5 most influential attributes.

DESC, ASC, or ABS

The returned attributes are ordered by weight. The weight of an attribute expresses its positive or negative impact on the value of the feature. A positive weight indicates a higher feature value. A negative weight indicates a lower feature value.

By default, FEATURE_DETAILS returns the attributes with the highest positive weight (DESC). If you specify ASC, the attributes with the highest negative weight are returned. If you specify ABS, the attributes with the greatest weight, whether negative or positive, are returned. The results are ordered by absolute value from highest to lowest. Attributes with a zero weight are not included in the output.

Syntax Choice

FEATURE_DETAILS can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose **Syntax** or **Analytic Syntax**:

- **Syntax** — Use the first syntax to score the data with a pre-defined model. Supply the name of a feature extraction model.
- **Analytic Syntax** — Use the analytic syntax to score the data without a pre-defined model. Include INTO *n*, where *n* is the number of features to extract, and *mining_analytic_clause*, which specifies if the data should be partitioned for multiple model builds. The *mining_analytic_clause* supports a *query_partition_clause* and an *order_by_clause*. (See "*analytic_clause*::=".)

The syntax of the FEATURE_DETAILS function can use an optional GROUPING hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

mining_attribute_clause identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The *mining_attribute_clause* behaves as described for the PREDICTION function. (See "*mining_attribute_clause*::=".)

> **Note**
>
> The following examples are excerpted from the Oracle Machine Learning for SQL sample programs. For more information about the sample programs, see Appendix A in *Oracle Machine Learning for SQL User's Guide*.

Example

This example uses the feature extraction model `nmf_sh_sample` to score the data. The query returns the three features that best represent customer 100002 and the attributes that most affect those features.

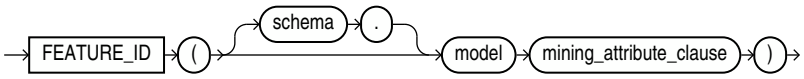
```
SELECT S.feature_id fid, value val,
       FEATURE_DETAILS(nmf_sh_sample, S.feature_id, 5 using T.*) det
   FROM
     (SELECT v.*, FEATURE_SET(nmf_sh_sample, 3 USING *) fset
         FROM mining_data_apply_v v
         WHERE cust_id = 100002) T,
   TABLE(T.fset) S
ORDER BY 2 DESC;

 FID    VAL  DET
---- ------  --------------------------------------------------------------------------------
   5  3.492  <Details algorithm="Non-Negative Matrix Factorization" feature="5">
             <Attribute name="BULK_PACK_DISKETTES" actualValue="1" weight=".077" rank="1"/>
             <Attribute name="OCCUPATION" actualValue="Prof." weight=".062" rank="2"/>
             <Attribute name="BOOKKEEPING_APPLICATION" actualValue="1" weight=".001" rank="3"/>
             <Attribute name="OS_DOC_SET_KANJI" actualValue="0" weight="0" rank="4"/>
             <Attribute name="YRS_RESIDENCE" actualValue="4" weight="0" rank="5"/>
             </Details>
   3  1.928  <Details algorithm="Non-Negative Matrix Factorization" feature="3">
             <Attribute name="HOUSEHOLD_SIZE" actualValue="2" weight=".239" rank="1"/>
             <Attribute name="CUST_INCOME_LEVEL" actualValue="L: 300\,000 and above"
              weight=".051" rank="2"/>
             <Attribute name="FLAT_PANEL_MONITOR" actualValue="1" weight=".02" rank="3"/>
             <Attribute name="HOME_THEATER_PACKAGE" actualValue="1" weight=".006" rank="4"/>
             <Attribute name="AGE" actualValue="41" weight=".004" rank="5"/>
             </Details>
   8   .816  <Details algorithm="Non-Negative Matrix Factorization" feature="8">
             <Attribute name="EDUCATION" actualValue="Bach." weight=".211" rank="1"/>
             <Attribute name="CUST_MARITAL_STATUS" actualValue="NeverM" weight=".143" rank="2"/>
             <Attribute name="FLAT_PANEL_MONITOR" actualValue="1" weight=".137" rank="3"/>
             <Attribute name="CUST_GENDER" actualValue="F" weight=".044" rank="4"/>
             <Attribute name="BULK_PACK_DISKETTES" actualValue="1" weight=".032" rank="5"/>
             </Details>
```

Analytic Example

This example dynamically maps customer attributes into six features and returns the feature mapping for customer 100001.

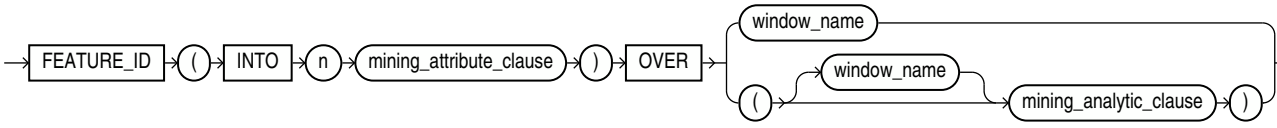
Copyright © 1996, 2026, Oracle and/or its affiliates.



```
SELECT feature_id, value
  FROM (
     SELECT cust_id, feature_set(INTO 6 USING *) OVER () fset
        FROM mining_data_apply_v),
  TABLE (fset)
  WHERE cust_id = 100001
  ORDER BY feature_id;

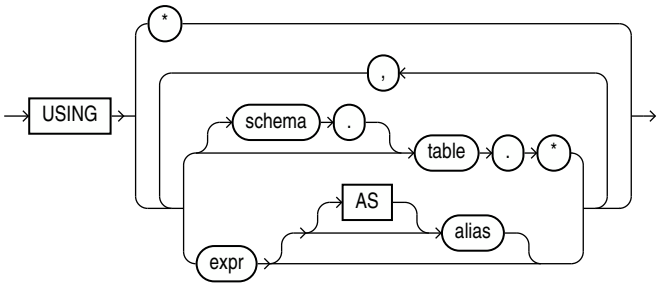
FEATURE_ID    VALUE
---------- --------
         1    2.670
         2     .000
         3    1.792
         4     .000
         5     .000
         6    3.379
```

FEATURE_ID



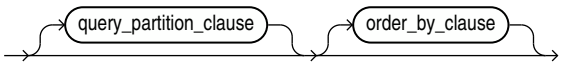
Syntax

***feature_id*::=**



Analytic Syntax

***feature_id_analytic*::=**



***mining_attribute_clause*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

***mining_analytic_clause*::=**

> **See Also**
>
> "Analytic Functions " for information on the syntax, semantics, and restrictions of *mining_analytic_clause*

Purpose

`FEATURE_ID` returns the identifier of the highest value feature for each row in the selection. The feature identifier is returned as an Oracle `NUMBER`.

Syntax Choice

`FEATURE_ID` can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose **Syntax** or **Analytic Syntax**:

- **Syntax** — Use the first syntax to score the data with a pre-defined model. Supply the name of a feature extraction model.
- **Analytic Syntax** — Use the analytic syntax to score the data without a pre-defined model. Include `INTO` *n*, where *n* is the number of features to extract, and *mining_analytic_clause*, which specifies if the data should be partitioned for multiple model builds. The *mining_analytic_clause* supports a *query_partition_clause* and an *order_by_clause*. (See "*analytic_clause*::=".)

The syntax of the `FEATURE_ID` function can use an optional `GROUPING` hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

mining_attribute_clause identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The *mining_attribute_clause* behaves as described for the `PREDICTION` function. (See "*mining_attribute_clause*::=".)

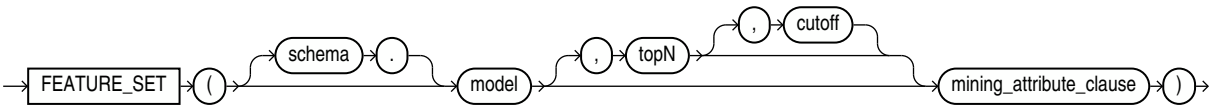
Copyright © 1996, 2026, Oracle and/or its affiliates.

> **Note**
>
> The following example is excerpted from the Oracle Machine Learning for SQL sample programs. For more information about the sample programs, see Appendix A in *Oracle Machine Learning for SQL User's Guide*.

Example

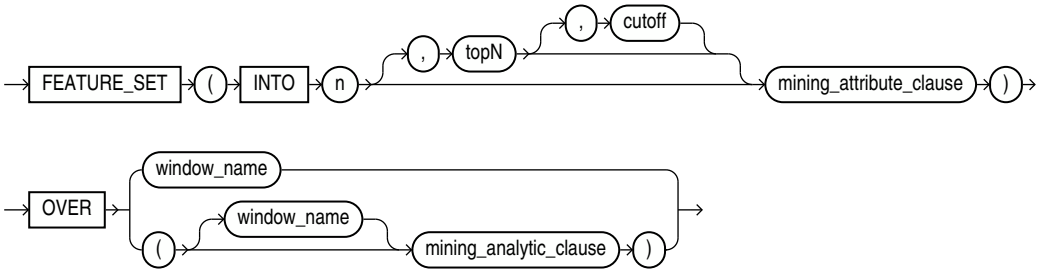
This example lists the features and corresponding count of customers in a data set.



```
SELECT FEATURE_ID(nmf_sh_sample USING *) AS feat, COUNT(*) AS cnt
  FROM nmf_sh_sample_apply_prepared
  GROUP BY FEATURE_ID(nmf_sh_sample USING *)
  ORDER BY cnt DESC, feat DESC;

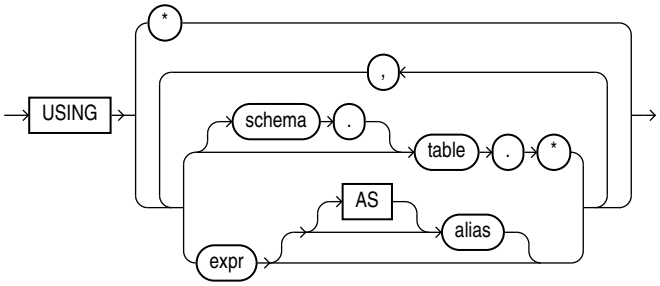
      FEAT        CNT
---------- ----------
         7       1443
         2         49
         3          6
         6          1
         1          1
```

FEATURE_SET



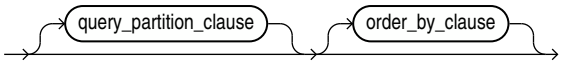
Syntax

***feature_set*::=**



Analytic Syntax

***feature_set_analytic*::=**



Copyright © 1996, 2026, Oracle and/or its affiliates.

***mining_attribute_clause*::=**

***mining_analytic_clause*::=**

> **See Also**
>
> "Analytic Functions " for information on the syntax, semantics, and restrictions of *mining_analytic_clause*

Purpose

FEATURE_SET returns a set of feature ID and feature value pairs for each row in the selection. The return value is a varray of objects with field names FEATURE_ID and VALUE. The data type of both fields is NUMBER.

topN and cutoff

You can specify *topN* and *cutoff* to limit the number of features returned by the function. By default, both *topN* and *cutoff* are null and all features are returned.

- *topN* is the *N* highest value features. If multiple features have the *N*th value, then the function chooses one of them.
- *cutoff* is a value threshold. Only features that are greater than or equal to *cutoff* are returned. To filter by *cutoff* only, specify NULL for *topN*.

To return up to *N* features that are greater than or equal to *cutoff*, specify both *topN* and *cutoff*.

Syntax Choice

FEATURE_SET can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose **Syntax** or **Analytic Syntax**:

- **Syntax** — Use the first syntax to score the data with a pre-defined model. Supply the name of a feature extraction model.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- **Analytic Syntax** — Use the analytic syntax to score the data without a pre-defined model. Include `INTO` *`n`*, where *`n`* is the number of features to extract, and *`mining_analytic_clause`*, which specifies if the data should be partitioned for multiple model builds. The *`mining_analytic_clause`* supports a *`query_partition_clause`* and an *`order_by_clause`*. (See "*analytic_clause::=*".)

The syntax of the `FEATURE_SET` function can use an optional `GROUPING` hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

`mining_attribute_clause` identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The *`mining_attribute_clause`* behaves as described for the `PREDICTION` function. (See "*mining_attribute_clause::=*".)

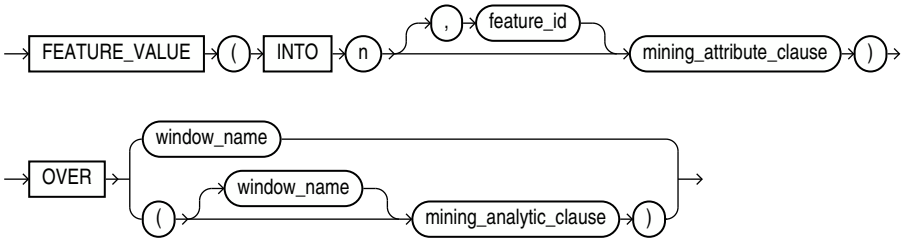
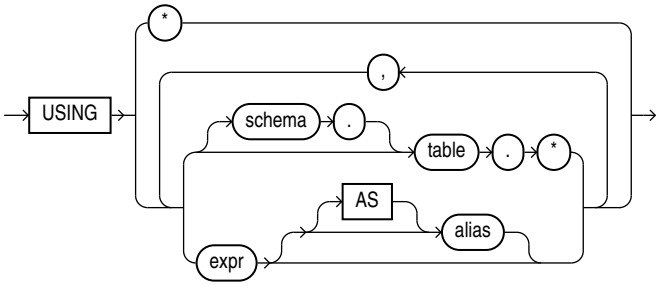
FEATURE_VALUE



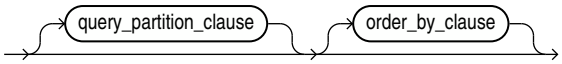
Syntax

***feature_value*::=**



Analytic Syntax

***feature_value_analytic*::=**



Copyright © 1996, 2026, Oracle and/or its affiliates.

***mining_attribute_clause*::=**

***mining_analytic_clause*::=**

> **See Also**
>
> "Analytic Functions " for information on the syntax, semantics, and restrictions of *mining_analytic_clause*

Purpose

FEATURE_VALUE returns a feature value for each row in the selection. The value refers to the highest value feature or to the specified *feature_id*. The feature value is returned as BINARY_DOUBLE.

Syntax Choice

FEATURE_VALUE can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose **Syntax** or **Analytic Syntax**:

- **Syntax** — Use the first syntax to score the data with a pre-defined model. Supply the name of a feature extraction model.
- **Analytic Syntax** — Use the analytic syntax to score the data without a pre-defined model. Include INTO *n*, where *n* is the number of features to extract, and *mining_analytic_clause*, which specifies if the data should be partitioned for multiple model builds. The *mining_analytic_clause* supports a *query_partition_clause* and an *order_by_clause*. (See "*analytic_clause*::=".)

The syntax of the FEATURE_VALUE function can use an optional GROUPING hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

mining_attribute_clause identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, this data is also used for building the

Copyright © 1996, 2026, Oracle and/or its affiliates.

transient models. The *mining_attribute_clause* behaves as described for the PREDICTION function. (See "*mining_attribute_clause*::=".)

FIRST

Syntax

***first*::=**

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions of the `ORDER BY` clause and `OVER` clause

Purpose

`FIRST` and `LAST` are very similar functions. Both are aggregate and analytic functions that operate on a set of values from a set of rows that rank as the `FIRST` or `LAST` with respect to a given sorting specification. If only one row ranks as `FIRST` or `LAST`, then the aggregate operates on the set with only one element.

If you omit the `OVER` clause, then the `FIRST` and `LAST` functions are treated as aggregate functions. You can use these functions as analytic functions by specifying the `OVER` clause. The *`query_partition_clause`* is the only part of the `OVER` clause valid with these functions. If you include the `OVER` clause but omit the *`query_partition_clause`*, then the function is treated as an analytic function, but the window defined for analysis is the entire table.

These functions take as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

When you need a value from the first or last row of a sorted group, but the needed value is not the sort key, the `FIRST` and `LAST` functions eliminate the need for self-joins or views and enable better performance.

- The *`aggregate_function`* argument is any one of the `MIN`, `MAX`, `SUM`, `AVG`, `COUNT`, `VARIANCE`, or `STDDEV` functions. It operates on values from the rows that rank either `FIRST` or `LAST`. If

Copyright © 1996, 2026, Oracle and/or its affiliates.

only one row ranks as FIRST or LAST, then the aggregate operates on a singleton (nonaggregate) set.

- The KEEP keyword is for semantic clarity. It qualifies *aggregate_function*, indicating that only the FIRST or LAST values of *aggregate_function* will be returned.
- DENSE_RANK FIRST or DENSE_RANK LAST indicates that Oracle Database will aggregate over only those rows with the minimum (FIRST) or the maximum (LAST) dense rank (also called olympic rank).

> **See Also**
>
> Table 2-9 for more information on implicit conversion and LAST

For the semantics of the FILTER clause, see FILTER Clause Semantics.

Aggregate Example

The following example returns, within each department of the sample table hr.employees, the minimum salary among the employees who make the lowest commission and the maximum salary among the employees who make the highest commission:

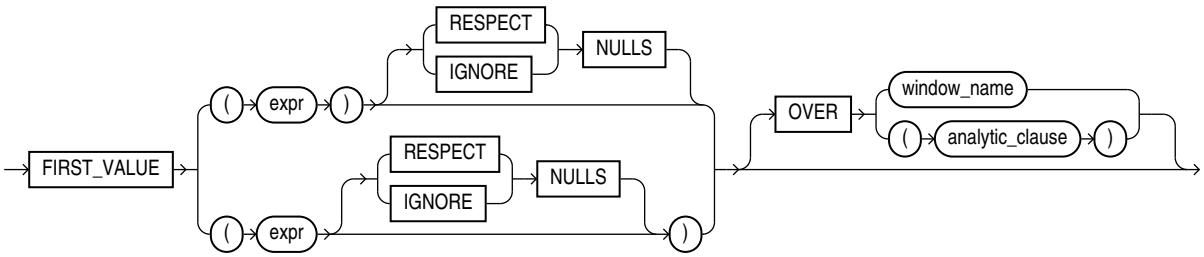
```
SELECT department_id,
       MIN(salary) KEEP (DENSE_RANK FIRST ORDER BY commission_pct) "Worst",
       MAX(salary) KEEP (DENSE_RANK LAST ORDER BY commission_pct) "Best"
  FROM employees
  GROUP BY department_id
  ORDER BY department_id;

DEPARTMENT_ID      Worst       Best
------------- ---------- ----------
           10       4400       4400
           20       6000      13000
           30       2500      11000
           40       6500       6500
           50       2100       8200
           60       4200       9000
           70      10000      10000
           80       6100      14000
           90      17000      24000
          100       6900      12008
          110       8300      12008
                    7000       7000
```

Analytic Example

The next example makes the same calculation as the previous example but returns the result for each employee within the department:

```
SELECT last_name, department_id, salary,
       MIN(salary) KEEP (DENSE_RANK FIRST ORDER BY commission_pct)
         OVER (PARTITION BY department_id) "Worst",
       MAX(salary) KEEP (DENSE_RANK LAST ORDER BY commission_pct)
         OVER (PARTITION BY department_id) "Best"
   FROM employees
   ORDER BY department_id, salary, last_name;



LAST_NAME           DEPARTMENT_ID     SALARY      Worst       Best
------------------- ------------- ---------- ---------- ----------
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
Whalen                    10       4400       4400       4400
Fay                       20       6000       6000      13000

```

FIRST_VALUE

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions, including valid forms of *expr*

Purpose

`FIRST_VALUE` is an analytic function. It returns the first value in an ordered set of values. If the first value in the set is null, then the function returns `NULL` unless you specify `IGNORE NULLS`. This setting is useful for data densification.

> **Note**
>
> The two forms of this syntax have the same behavior. The top branch is the ANSI format, which Oracle recommends for ANSI compatibility.

{`RESPECT` | `IGNORE`} `NULLS` determines whether null values of *expr* are included in or eliminated from the calculation. The default is `RESPECT NULLS`. If you specify `IGNORE NULLS`, then `FIRST_VALUE` returns the first non-null value in the set, or `NULL` if all values are null. Refer to "Using Partitioned Outer Joins: Examples" for an example of data densification.

You cannot nest analytic functions by using `FIRST_VALUE` or any other analytic function for *expr*. However, you can use other built-in function expressions for *expr*. Refer to "About SQL Expressions " for information on valid forms of *expr*.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of `FIRST_VALUE` when it is a character value

Examples

The following example selects, for each employee in Department 90, the name of the employee with the lowest salary.

```
SELECT employee_id, last_name, salary, hire_date,
       FIRST_VALUE(last_name)
         OVER (ORDER BY salary ASC ROWS UNBOUNDED PRECEDING) AS fv
  FROM (SELECT * FROM employees
          WHERE department_id = 90
          ORDER BY hire_date);

EMPLOYEE_ID LAST_NAME                     SALARY HIRE_DATE FV
----------- ------------------------- ---------- --------- -------
        102 De Haan                        17000 13-JAN-01 De Haan
        101 Kochhar                        17000 21-SEP-05 De Haan
        100 King                           24000 17-JUN-03 De Haan
```

The example illustrates the nondeterministic nature of the `FIRST_VALUE` function. Kochhar and DeHaan have the same salary, so are in adjacent rows. Kochhar appears first because the rows returned by the subquery are ordered by `hire_date`. However, if the rows returned by the subquery are ordered by `hire_date` in descending order, as in the next example, then the function returns a different value:

```
SELECT employee_id, last_name, salary, hire_date,
       FIRST_VALUE(last_name)
         OVER (ORDER BY salary ASC ROWS UNBOUNDED PRECEDING) AS fv
  FROM (SELECT * FROM employees
          WHERE department_id = 90
          ORDER by hire_date DESC);

EMPLOYEE_ID LAST_NAME                     SALARY HIRE_DATE FV
----------- ------------------------- ---------- --------- -------
        101 Kochhar                        17000 21-SEP-05 Kochhar
        102 De Haan                        17000 13-JAN-01 Kochhar
        100 King                           24000 17-JUN-03 Kochhar
```

The following two examples show how to make the `FIRST_VALUE` function deterministic by ordering on a unique key. By ordering within the function by both salary and the unique key `employee_id`, you can ensure the same result regardless of the ordering in the subquery.

```
SELECT employee_id, last_name, salary, hire_date,
       FIRST_VALUE(last_name)
         OVER (ORDER BY salary ASC, employee_id ROWS UNBOUNDED PRECEDING) AS fv
  FROM (SELECT * FROM employees
          WHERE department_id = 90
          ORDER BY hire_date);

EMPLOYEE_ID LAST_NAME                     SALARY HIRE_DATE FV
----------- ------------------------- ---------- --------- -------
        101 Kochhar                        17000 21-SEP-05 Kochhar
        102 De Haan                        17000 13-JAN-01 Kochhar
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

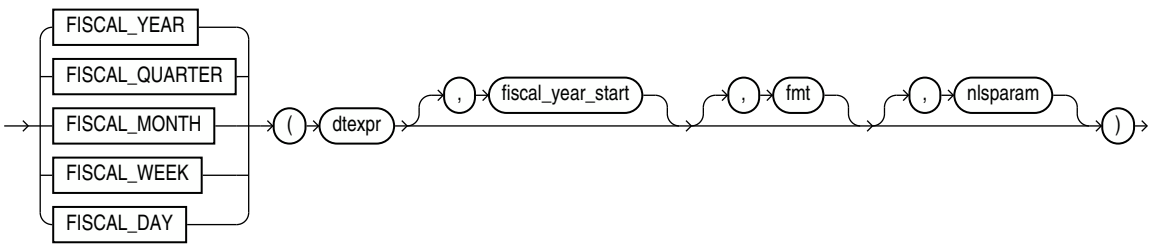
```
        100 King                          24000 17-JUN-03 Kochhar

SELECT employee_id, last_name, salary, hire_date,
       FIRST_VALUE(last_name)
         OVER (ORDER BY salary ASC, employee_id ROWS UNBOUNDED PRECEDING) AS fv
   FROM (SELECT * FROM employees
           WHERE department_id = 90
           ORDER BY hire_date DESC);

EMPLOYEE_ID LAST_NAME                 SALARY HIRE_DATE FV
----------- ------------------------- ---------- --------- -------
        101 Kochhar                    17000 21-SEP-05 Kochhar
        102 De Haan                    17000 13-JAN-01 Kochhar
        100 King                       24000 17-JUN-03 Kochhar
```

The following two examples show that the FIRST_VALUE function is deterministic when you use a logical offset (RANGE instead of ROWS). When duplicates are found for the ORDER BY expression, the FIRST_VALUE is the lowest value of *expr*:

```
SELECT employee_id, last_name, salary, hire_date,
       FIRST_VALUE(last_name)
         OVER (ORDER BY salary ASC RANGE UNBOUNDED PRECEDING) AS fv
  FROM (SELECT * FROM employees
          WHERE department_id = 90
          ORDER BY hire_date);



EMPLOYEE_ID LAST_NAME                 SALARY HIRE_DATE FV
----------- ------------------------- ---------- --------- -------
        102 De Haan                    17000 13-JAN-01 De Haan
        101 Kochhar                    17000 21-SEP-05 De Haan
        100 King                       24000 17-JUN-03 De Haan

SELECT employee_id, last_name, salary, hire_date,
       FIRST_VALUE(last_name)
         OVER (ORDER BY salary ASC RANGE UNBOUNDED PRECEDING) AS fv
  FROM (SELECT * FROM employees
          WHERE department_id = 90
          ORDER BY hire_date DESC);

EMPLOYEE_ID LAST_NAME                 SALARY HIRE_DATE FV
----------- ------------------------- ---------- --------- -------
        102 De Haan                    17000 13-JAN-01 De Haan
        101 Kochhar                    17000 21-SEP-05 De Haan
        100 King                       24000 17-JUN-03 De Haan
```

FISCAL

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

The fiscal functions return a VARCHAR2 value that uniquely identifies a member in the specified level within the standard Gregorian calendar offset by the fiscal start day.

The fiscal functions return a VARCHAR2 value that uniquely identifies a member in an implicit hierarchy at a particular level. For this reason, the NLS_DATE_FORMAT, NLS_TIMESTAMP_FORMAT, and NLS_TIMESTAMP_TZ_FORMAT do not apply to these functions. They each have their own default formats. These functions respect the setting of NLS_DATE_LANGUAGE.

- *dtexpr* is a datetime expression with one of the following types (or any value that can be implicitly converted to DATE): DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE .
- *fmt* is a text expression representing a format string. In all cases, the case-sensitivity of the format specifiers follows the same behavior as TO_CHAR. For example, MON specifies an abbreviated month in upper-case (e.g. JAN), mon specifies an abbreviated month name in lower-case (e.g. jan), and Mon specifies an abbreviated month name in title-case (e.g. Jan).
- *nlsparam* is a text expression representing an NLS parameter setting. The only currently supported parameter is NLS_DATE_LANGUAGE, and is specified in the same manner as for TO_CHAR and TO_DATE.
- All fiscal functions take an optional *fiscal_year_start* parameter defining the month and day of the start of the fiscal year.

  If the *fiscal_year_start* parameter is specified, it's an expression of type DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, or TIMESTAMP WITH LOCAL TIME ZONE representing the first day in the fiscal year. All components other than the month and day are ignored.

  If the *fiscal_year_start* function argument is not specified, the value of the CALENDAR_FISCAL_YEAR_START system/session parameter is used (which itself defaults to January 1 if not specified). The CALENDAR_FISCAL_YEAR_START system/session parameter is a text value that will be converted to a DATE using the NLS_DATE_FORMAT. An optional second parameter value may be specified to use an explicit format, such as:

```
ALTER SESSION SET CALENDAR_FISCAL_YEAR_START = '01-JUN-2025', 'DD-MON-YYYY'
```

Format for Fiscal Functions

The following table describes the format strings for each of the functions. The required formats must appear somewhere in the format string, and an error will be raised if not present. The optional formats may appear in the format string. All other format specifiers are prohibited and an error will be raised if included. The default format strings are similar to the ones for the calendar hierarchies, with years prefixed with FY.

Table 7-6 Format for Fiscal Functions

Function	Required Formats	Optional Formats	Default Format String
FISCAL_YEAR	YYYYor SYYYY	None	"FY"SYYYY Example: FY2024
FISCAL_QUARTER	YYYYor SYYYY Q	None	"Q"Q-"FY"SYYYY Example: Q1-FY2024

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-6 (Cont.) Format for Fiscal Functions

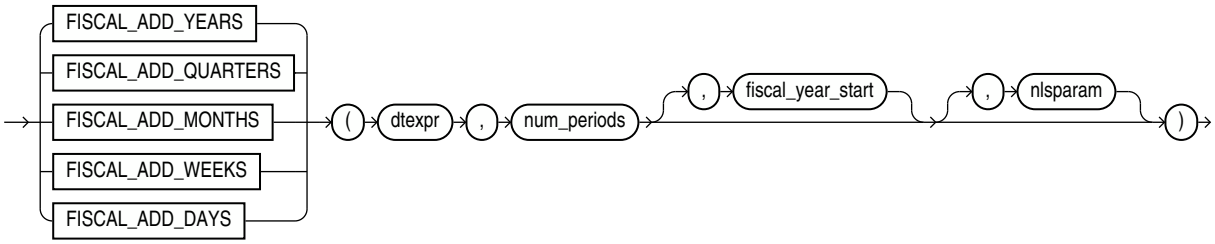
Function	Required Formats	Optional Formats	Default Format String
FISCAL_MONTH	YYYYor SYYYY One of MM, mon, MONTH	Q	MON-"FY"SYYYY Example: JAN-FY2024
FISCAL_WEEK	YYYYor SYYYY WW	None	"W"WW-"FY"SYYYY Example: W01-FY2024
FISCAL_DAY	YYYYor SYYYY • WW and one of and one of : – DY – DAY • DD and one of – MM – MON – MONTH • DDD	Q	DD-MON-"FY"SYYYY Example: 01-FYJAN-2024

Format Descriptions for Fiscal Functions

The following table describes the interpretation of the format specifiers for fiscal hierarchies. Note that all numeric formats are relative to the start of the fiscal year, and the fiscal year and month are determined by the last calendar day of the associated fiscal year or month respectively. The capitalization rules for MON, MONTH, DY, and DAY all follow the usage elsewhere (i.e. TO_CHAR) with regard to lower-case (e.g. month => june), upper-case (e.g. MONTH => JUNE), and title-case (e.g. Month => June).

Table 7-7 Format Descriptions for Fiscal Functions

Format Specifier	Description
YYYY	4-digit calendar year of the last day in the fiscal year (only positive years supported). For example, if the fiscal year starts on June 1, then June 1, 2024 would be in year 2025.
SYYYY	4-digit calendar year of the last day in the fiscal year, with BC years as negative.
Q	Quarter of fiscal year (1-4), with quarter 1 representing the start of the fiscal year. For example, if the fiscal year starts on June 1, then June 1 would be in quarter 1.
MM	Month of year (1-12), 2-digit, representing the associated calendar month of the last day in the fiscal month. For example, if the fiscal year starts on June 15, then June 20 would be in month 07.
MON	Abbreviated name of month, where the month name is determined by the calendar month of the last day in the fiscal month. For example, if the fiscal year starts on June 15, then June 20 would be in month JUL.



Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-7 (Cont.) Format Descriptions for Fiscal Functions

Format Specifier	Description
MONTH	Name of month, where the month name is determined by the calendar month of the last day in the fiscal month. For example, if the fiscal year starts on June 15, then June 20 would be in month JULY.
WW	Week number (1-53), 2-digits with week 1 representing the start of the fiscal year. For example, if the fiscal year starts on June 1, then June 1 would be in week 1.
DY	Abbreviated name of day
DAY	Name of day
D	Day of week (1-7). Depends on the NLS_TERRITORY
DD	Day of month (1-31), 2-digits, with day 1 representing the first day of the fiscal month. For example, if the fiscal year starts on June 15, then June 20 would be day 6 (in the month of July).
DDD	Day of year (1-366), 3-digits, with day 1 representing the first day in the fiscal year.

FISCAL_ADD_X_PERIODS

Syntax

Purpose

The fiscal variants of this class of functions is equivalent to the definitions above for calendar. The difference has to do with what constitutes a month. If the fiscal year start is on the 1st of a month, these functions will return exactly the same value as their calendar counterparts. If the fiscal year start is not on the 1st, however, then they will diverge.

- *dtexpr* is a datetime expression with one of the following types (or any value that can be implicitly converted to DATE): DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE .
- The *num_periods* parameter is an integer that when positive will add periods and when negative will subtract periods.
- All fiscal functions take an optional *fiscal_year_start* parameter defining the month and day of the start of the fiscal year.

Copyright © 1996, 2026, Oracle and/or its affiliates.

If the *fiscal_year_start* parameter is specified, it's an expression of type DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, or TIMESTAMP WITH LOCAL TIME ZONE representing the first day in the fiscal year. All components other than the month and day are ignored.

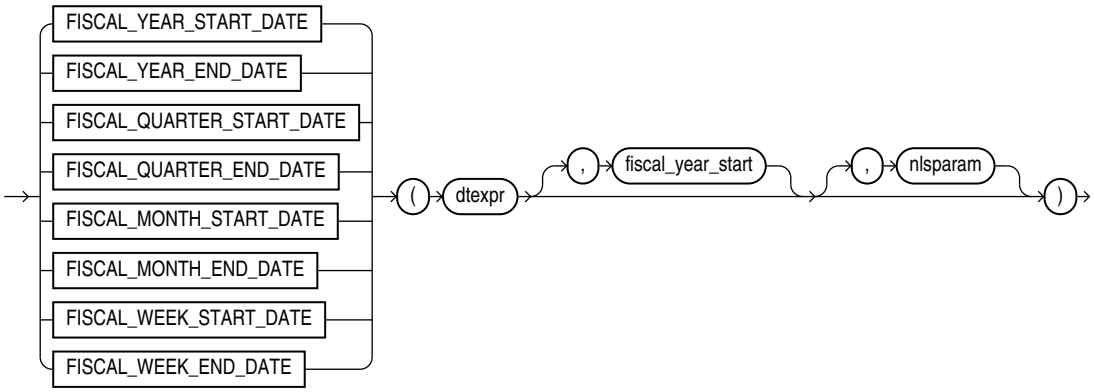
If the *fiscal_year_start* function argument is not specified, the value of the CALENDAR_FISCAL_YEAR_START system/session parameter is used (which itself defaults to January 1 if not specified). The CALENDAR_FISCAL_YEAR_START system/session parameter is a text value that will be converted to a DATE using the NLS_DATE_FORMAT. An optional second parameter value may be specified to use an explicit format, such as:

```
ALTER SESSION SET CALENDAR_FISCAL_YEAR_START = '01-JUN-2025', 'DD-MON-YYYY'
```

- *nlsparam* is a text expression representing an NLS parameter setting. The only currently supported parameter is NLS_DATE_LANGUAGE, and is specified in the same manner as for TO_CHAR and TO_DATE.

FISCAL_ADD_YEARS adds or subtracts the given number of years, where a year is always defined as a period of 12 months. See below for how months are handled.

FISCAL_ADD_QUARTERS adds or subtracts the given number of quarters, where a quarter is always defined as a period of 3 months. See below for how months are handled.



FISCAL_ADD_MONTHS This is handled the same as CALENDAR_ADD_MONTHS. When the fiscal year start is not on the first of the month, the positional day within the given month is mapped to the corresponding positional day within the target month. The same rules apply when the starting positional day is the last day of the starting fiscal month, or when the starting positional day is greater than the number of days in the target fiscal month.

FISCAL_ADD_WEEKS adds or subtracts the given number of weeks, where a week is always defined as a period of 7 days.

FISCAL_ADD_DAYS simply adds or subtracts the given number of days.

FISCAL_START_END

Syntax

- *dtexpr* is a datetime expression with one of the following types (or any value that can be implicitly converted to DATE): DATE, TIMESTAMP,

Copyright © 1996, 2026, Oracle and/or its affiliates.

- All fiscal functions take an optional *fiscal_year_start* parameter defining the month and day of the start of the fiscal year.

  If the *fiscal_year_start* parameter is specified, it's an expression of type DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, or TIMESTAMP WITH LOCAL TIME ZONE representing the first day in the fiscal year. All components other than the month and day are ignored.

  If the *fiscal_year_start* function argument is not specified, the value of the CALENDAR_FISCAL_YEAR_START system/session parameter is used (which itself defaults to January 1 if not specified). The CALENDAR_FISCAL_YEAR_START system/session parameter is a text value that will be converted to a DATE using the NLS_DATE_FORMAT. An optional second parameter value may be specified to use an explicit format, such as:

  ```
  ALTER SESSION SET CALENDAR_FISCAL_YEAR_START = '01-JUN-2025', 'DD-MON-YYYY'
  ```

- TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE .
- *nlsparam* is a text expression representing an NLS parameter setting. The only currently supported parameter is NLS_DATE_LANGUAGE, and is specified in the same manner as for TO_CHAR and TO_DATE.

FISCAL_X_OF_Y

Syntax

- *dtexpr* is a datetime expression with one of the following types (or any value that can be implicitly converted to DATE): DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE .
- *fmt* is a text expression representing a format string. In all cases, the case-sensitivity of the format specifiers follows the same behavior as TO_CHAR. For example, MON specifies an

Copyright © 1996, 2026, Oracle and/or its affiliates.

abbreviated month in upper-case (e.g. JAN), mon specifies an abbreviated month name in lower-case (e.g. jan), and Mon specifies an abbreviated month name in title-case (e.g. Jan).

- *nlsparam* is a text expression representing an NLS parameter setting. The only currently supported parameter is NLS_DATE_LANGUAGE, and is specified in the same manner as for TO_CHAR and TO_DATE.
- All fiscal functions take an optional *fiscal_year_start* parameter defining the month and day of the start of the fiscal year.

  If the *fiscal_year_start* parameter is specified, it's an expression of type DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, or TIMESTAMP WITH LOCAL TIME ZONE representing the first day in the fiscal year. All components other than the month and day are ignored.

  If the *fiscal_year_start* function argument is not specified, the value of the CALENDAR_FISCAL_YEAR_START system/session parameter is used (which itself defaults to January 1 if not specified). The CALENDAR_FISCAL_YEAR_START system/session parameter is a text value that will be converted to a DATE using the NLS_DATE_FORMAT. An optional second parameter value may be specified to use an explicit format, such as:

  ```
  ALTER SESSION SET CALENDAR_FISCAL_YEAR_START = '01-JUN-2025', 'DD-MON-YYYY'
  ```

- The *index_by* parameter is a text value that must resolve to either POSITION or DATE (case-insensitive, defaults to DATE). It is used to distinguish between absolute and position-based numbers for the following cases:
  - CALENDAR_DAY_OF_WEEK
  - FISCAL_DAY_OF_WEEK
  - RETAIL_DAY_OF_WEEK
  - FISCAL_MONTH_OF_YEAR
  - RETAIL_MONTH_OF_YEAR

FLOOR (datetime)

Syntax

Purpose

FLOOR(datetime) returns the date or the timestamp rounded down to the unit specified by the second argument *fmt*, the format model. This function is not sensitive to the NLS_CALENDAR session parameter. It operates according to the rules of the Gregorian calendar. The value returned is always of data type DATE, even if you specify a different datetime data type for the first argument. If you do not specify the second argument, the default format model 'DD' is used.

The FLOOR and TRUNC functions are synonymous for dates and timestamps.

Copyright © 1996, 2026, Oracle and/or its affiliates.

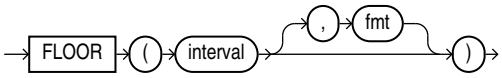
> **See Also**
>
> Refer to CEIL, FLOOR, ROUND, and TRUNC Date Functions for the permitted format models to use in *fmt*.

Examples

For these examples NLS_DATE_FORMAT is set:

```
ALTER SESSION SET NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';

SELECT FLOOR(TO_DATE ('28-FEB-2023','DD-MON-YYYY'), 'MM') AS month_floor;



MONTH_FLOOR
--------------------
01-FEB-2023 00:00:00

SELECT FLOOR(TO_TIMESTAMP
   ('28-FEB-2023 14:10:10','DD-MON-YYYY HH24:MI:SS'),'HH24')
   AS hour_floor;

HOUR_FLOOR
--------------------
28-FEB-2023 14:00:00
```

FLOOR (interval)

Syntax

Purpose

FLOOR(interval) returns the interval rounded down to the unit specified by the second argument *fmt*, the format model .

The result of FLOOR(interval) is never larger than *interval* . The result precision for year and day is the input precision for year plus one and day plus one, since FLOOR(interval) can have overflow . If an interval already has the maximum precision for year and day, the statement compiles but errors at runtime.

For INTERVAL YEAR TO MONTH, *fmt* can only be year. The default *fmt* is year.

For INTERVAL DAY TO SECOND, *fmt* can be day, hour and minute. The default *fmt* is day. Note that *fmt* does not support second.

Copyright © 1996, 2026, Oracle and/or its affiliates.

`FLOOR(interval)` supports the format models of `ROUND` and `TRUNC`.

> **See Also**
>
> Refer to CEIL, FLOOR, ROUND, and TRUNC Date Functions for the permitted format models to use in *fmt*.

Examples

```
SELECT FLOOR(INTERVAL '+123-5' YEAR(3) TO MONTH) as year_floor;

YEAR_FLOOR
------------------------------------------------------------------------
+000000123-00

SELECT FLOOR(INTERVAL '+99-11' YEAR(2) TO MONTH, 'YEAR') as year_floor;

YEAR_FLOOR
------------------------------------------------------------------------
+000000099-00

SELECT FLOOR(INTERVAL '+4 12:42:10.222' DAY(2) TO SECOND(3), 'DD') as year_floor;

YEAR_FLOOR
------------------------------------------------------------------------
+000000004 00:00:00.000000000
```

FLOOR (number)

Syntax

Purpose

`FLOOR` returns the largest integer equal to or less than *n*. The number *n* can always be written as the sum of an integer *k* and a positive fraction *f* such that 0 <= *f* < 1 and *n* = *k* + *f*. The value of `FLOOR` is the integer *k*. Thus, the value of `FLOOR` is *n* itself if and only if *n* is precisely an integer.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion and CEIL (number)

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

The following example returns the largest integer equal to or less than 15.7:

```
SELECT FLOOR(15.7) "Floor"
  FROM DUAL;

     Floor
----------
        15
```

FROM_TZ

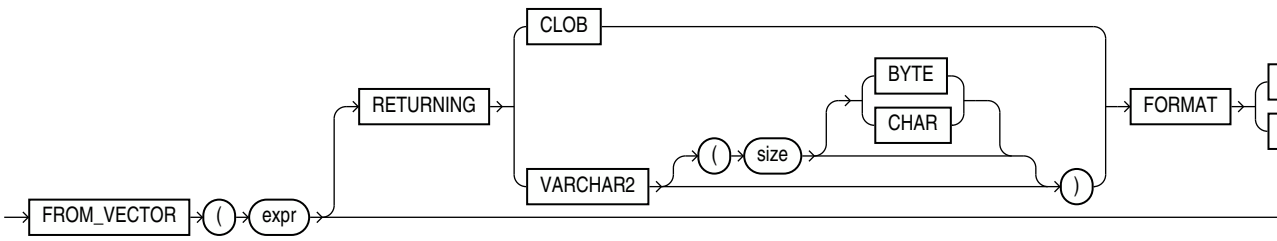
Syntax

Purpose

`FROM_TZ` converts a timestamp value and a time zone to a `TIMESTAMP WITH TIME ZONE` value. *`time_zone_value`* is a character string in the format `'TZH:TZM'` or a character expression that returns a string in `TZR` with optional `TZD` format.

Examples

The following example returns a timestamp value to `TIMESTAMP WITH TIME ZONE`:



```
SELECT FROM_TZ(TIMESTAMP '2000-03-28 08:00:00', '3:00')
  FROM DUAL;

FROM_TZ(TIMESTAMP'2000-03-2808:00:00','3:00')
---------------------------------------------------------------
28-MAR-00 08.00.000000000 AM +03:00
```

FROM_VECTOR

`FROM_VECTOR` takes a vector as input and returns a string of type `VARCHAR2` or `CLOB` as output.

Syntax

Purpose

`FROM_VECTOR` optionally takes a `RETURNING` clause to specify the data type of the returned value.

Copyright © 1996, 2026, Oracle and/or its affiliates.

If VARCHAR2 is specified without size, the size of the returned value size is 32767.

You can optionally specify the text format of the output in the FORMAT clause, using the tokens SPARSE or DENSE. Note that the input vector storage format does not need to match the specified output format.

There is no support to convert to CHAR, NCHAR, and NVARCHAR2.

FROM_VECTOR is synonymous with VECTOR_SERIALIZE.

Parameters

expr must evaluate to a vector. The function returns NULL if *expr* is NULL.

Examples

```
SELECT FROM_VECTOR(TO_VECTOR('[1, 2, 3]') );

FROM_VECTOR(TO_VECTOR('[1,2,3]'))
------------------------------------------------------------
[1.0E+000,2.0E+000,3.0E+000]

1 row selected.

SELECT FROM_VECTOR(TO_VECTOR('[1.1, 2.2, 3.3]', 3, FLOAT32) );

FROM_VECTOR(TO_VECTOR('[1.1,2.2,3.3]',3,FLOAT32))
------------------------------------------------------------
[1.10000002E+000,2.20000005E+000,3.29999995E+000]

1 row selected.

SELECT FROM_VECTOR( TO_VECTOR('[1.1, 2.2, 3.3]', 3, FLOAT32) RETURNING VARCHAR2(1000));

FROM_VECTOR(TO_VECTOR('[1.1,2.2,3.3]',3,FLOAT32)RETURNINGVARCHAR2(1000))
------------------------------------------------------------------------
[1.10000002E+000,2.20000005E+000,3.29999995E+000]

1 row selected.

SELECT FROM_VECTOR(TO_VECTOR('[1.1, 2.2, 3.3]', 3, FLOAT32) RETURNING CLOB );

FROM_VECTOR(TO_VECTOR('[1.1,2.2,3.3]',3,FLOAT32)RETURNINGCLOB)
------------------------------------------------------------------------
[1.10000002E+000,2.20000005E+000,3.29999995E+000]

1 row selected.

SELECT FROM_VECTOR(TO_VECTOR('[5,[2,4],[1.0,2.0]]', 5, FLOAT64, SPARSE) RETURNING CLOB
FORMAT SPARSE);

FROM_VECTOR(TO_VECTOR('[5,[2,4],[1.0,2.0]]',5,FLOAT64,SPARSE)RETURNINGCLOBFORMAT
------------------------------------------------------------------------
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
[5,[2,4],[1.0E+000,2.0E+000]]

1 row selected.

SELECT FROM_VECTOR(TO_VECTOR('[5,[2,4],[1.0,2.0]]', 5, FLOAT64, SPARSE) RETURNING CLOB
FORMAT DENSE);

FROM_VECTOR(TO_VECTOR('[5,[2,4],[1.0,2.0]]',5,FLOAT64,SPARSE)RETURNINGCLOBFORMAT
--------------------------------------------------------------------------------
[0,1.0E+000,0,2.0E+000,0]

1 row selected.
```

Note

- Applications using Oracle Client 23.26ai libraries or Thin mode drivers can fetch vector data directly, as shown in the following example:

  ```
  SELECT dataVec FROM vecTab;
  ```

- For applications using Oracle Client libraries prior to Oracle AI Database 26ai Release Update 23.6 connected to Oracle Database 23.26ai, use the `FROM_VECTOR` to fetch vector data, as shown by the following example:

  ```
  SELECT FROM_VECTOR(dataVec) FROM vecTab;
  ```

Purpose

The `GRAPHQL` table function is a SQL table function that you can use to query database tables and get the result in the form of JSON documents.

The `GRAPHQL` table function evaluates the embedded GraphQL query that is passed in as a string literal. The function returns rows derived from the GraphQL selection set, consistent with the JSON-relational duality mapping of the referenced object.

You can use the function only in the `FROM` clause of the `SELECT` statement.

> **Note**
>
> Whitespaces and comments can appear anywhere in the *`graphql_query`* clause.

Semantics

graphql_query

The input to the function, *`graphql_query`*, is a structured and hierarchical representation of the objects and fields to be queried .

The output of the function is a single column of type JSON consisting of the set of JSON documents corresponding to *`graphql_query`*.

graphql_passing_clause

If present, *`graphql_passing_clause`* provides variable bindings used by *`graphql_field_arguments`* or QBE. It starts with the keyword `PASSING`, and is followed by mappings of GraphQL variables to SQL expressions, literal, or bind variables.

- *`graphql_object_name`* refers to fully qualified names, for example, `schema_name.table_name` or `table_name.column_name`.
- *`graphql_field_arguments`* refers to a set of predicates that restricts the result set. These predicates compare field values to provided literals (or even variables in the GraphQL table function). If multiple arguments are present, they are combined conjunctively (logical `AND`). Each graphql field argument is a name: value pair or a name: variable pair.

  You must enclose the list of arguments in parentheses.

  A variable in the GraphQL table is identified by the `'$'` sign as the first character.

graphql_selection_set

`graphql_selection_set` declares the the fields that you want to project from the current object.

`graphql_field` maps the underlying relational object (column or table) to the JSON field.

The optional argument *`graphql_alias`* changes the output key name.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The optional argument *graphql_directives* alters how the field is resolved or how it affects the metadata of the duality view.

Optional nested graphql_selection_set declares the fields to be projected in the nested object.

graphql_field_name can be the name of a table or a column or even a numeric literal.

graphql_alias renames the output key of the selected field. The underlying field lookup uses *graphql_field_name*. The output uses *graphql_alias*.

graphql_qbe_clause

Use *graphql_qbe_clause* to filter the JSON documents, by having predicates on the fields in the GraphQL query. It can express equality, relational, logical, and item-level operators.

graphql_qbe_clause is enclosed within parentheses and starts with the CHECK keyword, followed by the colon and the list of QBE arguments within curly braces.

qbe_equality_argument is a field-level equality predicate. It evaluates to true when the field equals the provided literal or bound variable.

qbe_relational_argument is a field-level relational predicate. The QBE operator refers to a comparison, which is applied to the specified field and the provided operand.

qbe_logical_argument refers to logical composition (for example, AND, or OR). The operator combines the enclosed argument list according to its truth table, evaluated against the current scope. Nested logical clauses are also allowed.

qbe_item_operator_argument refers to QBE item operators that can be used to first perform some transformations on the field before comparing it to the value.

graphql_directives

Directives are metadata-driven modifiers applied to fields or selection sets, written as @directive_name(directive_arguments) where each *graphql_directive_argument* is written as *graphql_directive_argument_name*: *graphql_directive_argument_value*. They control behavior like conditional inclusion, shape in the response, computed transformations, access and mutability. The arguments for a directive are name: value pairs. The value can be a name, a string, a number or even a list of values.

Comments in a GraphQL Expression

You can specify comments in a single line in a GraphQL expression. A single line comment is preceded by a hash (#)sign, in accordance with the GraphQL standard.

You can also specify SQL comments in the query containing the GraphQL expression. A single line SQL comment is preceded by a double dash (--). A SQL comment spanning multiple lines is enclosed within "/*" and "*/".

Rules

- The SQL comments can be placed anywhere in the query, but the GraphQL comments are valid only within the GraphQL expression.
- These comments will be preserved in the DDL, that is when you fetch the create view DDL using DBMS_METADATA.GET_DDL, these comments will be present in the output.
- Only single line GraphQL style comments (comments starting with #) are allowed in the GraphQL expression provided in the GraphQL table function.

Example: Valid Comments

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
  CREATE OR REPLACE JSON RELATIONAL DUALITY VIEW student_ov AS
    student { # this is a valid single line GraphQL comment
    _id: stuid
    Name: name
    -- SQL comments can be placed within GraphQL expression as well
};
```

Example

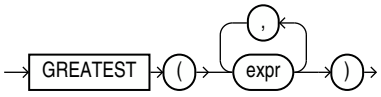
Querying the DB using GraphQL query

```
  SELECT * FROM GRAPHQL
('
    employees {
          _id: employee_id
          Name: first_name
           }
');
```

The output is:

```
{
  "_id" : 174,
  "Name" : "Ellen"
}

{
  "_id" : 166,
  "Name" : "Sundar"
}



{
  "_id" : 130,
  "Name" : "Mozhe"
}

{
  "_id" : 105,
  "Name" : "David"
}
```

See *Declarative GraphQL Developer's Guide* for more information on GraphQL.

GREATEST

Syntax

Purpose

`GREATEST` returns the greatest of a list of one or more expressions. Oracle Database uses the first *expr* to determine the return type. If the first *expr* is numeric, then Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to

Copyright © 1996, 2026, Oracle and/or its affiliates.

that data type before the comparison, and returns that data type. If the first *expr* is not numeric, then each *expr* after the first is implicitly converted to the data type of the first *expr* before the comparison.

Oracle Database compares each *expr* using nonpadded comparison semantics. The comparison is binary by default and is linguistic if the `NLS_COMP` parameter is set to `LINGUISTIC` and the `NLS_SORT` parameter has a setting other than `BINARY`. Character comparison is based on the numerical codes of the characters in the database character set and is performed on whole strings treated as one sequence of bytes, rather than character by character. If the value returned by this function is character data, then its data type is `VARCHAR2` if the first *expr* is a character data type and `NVARCHAR2` if the first *expr* is a national character data type.

See Also

- "Data Type Comparison Rules " for more information on character comparison
- Table 2-9 for more information on implicit conversion and "Floating-Point Numbers " for information on binary-float comparison semantics
- "LEAST ", which returns the least of a list of one or more expressions
- Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation `GREATEST` uses to compare character values for *expr*, and for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value

Examples

The following statement selects the string with the greatest value:

```
SELECT GREATEST('HARRY', 'HARRIOT', 'HAROLD') "Greatest"
  FROM DUAL;

Greatest
--------
HARRY
```

In the following statement, the first argument is numeric. Oracle Database determines that the argument with the highest numeric precedence is the second argument, converts the remaining arguments to the data type of the second argument, and returns the greatest value as that data type:

```
SELECT GREATEST (1, '3.925', '2.4') "Greatest"
  FROM DUAL;

Greatest
--------
   3.925
```

GROUP_ID

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

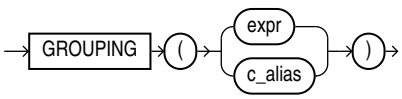
`GROUP_ID` distinguishes duplicate groups resulting from a `GROUP BY` specification. It is useful in filtering out duplicate groupings from the query result. It returns an Oracle `NUMBER` to uniquely identify duplicate groups. This function is applicable only in a `SELECT` statement that contains a `GROUP BY` clause.

If *n* duplicates exist for a particular grouping, then `GROUP_ID` returns numbers in the range 0 to *n*-1.

Examples

The following example assigns the value `1` to the duplicate `co.country_region` grouping from a query on the sample tables `sh.countries` and `sh.sales`:

```
SELECT co.country_region, co.country_subregion,
       SUM(s.amount_sold) "Revenue", GROUP_ID() g
  FROM sales s, customers c, countries co
  WHERE s.cust_id = c.cust_id
    AND c.country_id = co.country_id
    AND s.time_id = '1-JAN-00'
    AND co.country_region IN ('Americas', 'Europe')
  GROUP BY GROUPING SETS ( (co.country_region, co.country_subregion),
                           (co.country_region, co.country_subregion) )
  ORDER BY co.country_region, co.country_subregion, "Revenue", g;



COUNTRY_REGION       COUNTRY_SUBREGION                Revenue          G
-------------------- ------------------------------ ---------- ----------
Americas             Northern America                  944.6          0
Americas             Northern America                  944.6          1
Europe               Western Europe                   566.39          0
Europe               Western Europe                   566.39          1
```

To ensure that only rows with `GROUP_ID` < 1 are returned, add the following `HAVING` clause to the end of the statement :

```
HAVING GROUP_ID() < 1
```

GROUPING

Syntax

Purpose

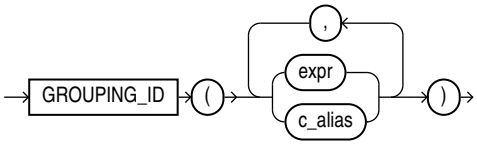
`GROUPING` distinguishes superaggregate rows from regular grouped rows. `GROUP BY` extensions such as `ROLLUP` and `CUBE` produce superaggregate rows where the set of all values is represented by null. Using the `GROUPING` function, you can distinguish a null representing the set of all values in a superaggregate row from a null in a regular row.

The *expr* in the `GROUPING` function must match one of the expressions in the `GROUP BY` clause. The function returns a value of 1 if the value of *expr* in the row is a null representing the set of all values. Otherwise, it returns zero. The data type of the value returned by the `GROUPING`

Copyright © 1996, 2026, Oracle and/or its affiliates.

function is Oracle NUMBER. Refer to the SELECT *group_by_clause* for a discussion of these terms.

Examples



In the following example, which uses the sample tables hr.departments and hr.employees, if the GROUPING function returns 1 (indicating a superaggregate row rather than a regular row from the table), then the string "All Jobs" appears in the "JOB" column instead of the null that would otherwise appear:

```
SELECT
    DECODE(GROUPING(department_name), 1, 'ALL DEPARTMENTS', department_name)
      AS department,
    DECODE(GROUPING(job_id), 1, 'All Jobs', job_id) AS job,
    COUNT(*) "Total Empl",
    AVG(salary) * 12 "Average Sal"
  FROM employees e, departments d
  WHERE d.department_id = e.department_id
  GROUP BY ROLLUP (department_name, job_id)
  ORDER BY department, job;

DEPARTMENT                     JOB        Total Empl Average Sal
------------------------------ ---------- ---------- -----------
ALL DEPARTMENTS                All Jobs          106  77481.0566
Accounting                     AC_ACCOUNT          1       99600
Accounting                     AC_MGR              1      144096
Accounting                     All Jobs            2      121848
Administration                 AD_ASST             1       52800
Administration                 All Jobs            1       52800

GROUPING_ID

Syntax

Purpose

GROUPING_ID returns a number corresponding to the GROUPING bit vector associated with a row. GROUPING_ID is applicable only in a SELECT statement that contains a GROUP BY extension, such as ROLLUP or CUBE, and a GROUPING function. In queries with many GROUP BY expressions, determining the GROUP BY level of a particular row requires many GROUPING functions, which leads to cumbersome SQL. GROUPING_ID is useful in these cases.

GROUPING_ID is functionally equivalent to taking the results of multiple GROUPING functions and concatenating them into a bit vector (a string of ones and zeros). By using GROUPING_ID you can avoid the need for multiple GROUPING functions and make row filtering conditions easier to express. Row filtering is easier with GROUPING_ID because the desired rows can be identified

Copyright © 1996, 2026, Oracle and/or its affiliates.

with a single condition of `GROUPING_ID` = *n*. The function is especially useful when storing multiple levels of aggregation in a single table.

Examples

The following example shows how to extract grouping IDs from a query of the sample table `sh.sales`:

```
SELECT channel_id, promo_id, sum(amount_sold) s_sales,
       GROUPING(channel_id) gc,
       GROUPING(promo_id) gp,
       GROUPING_ID(channel_id, promo_id) gcp,
       GROUPING_ID(promo_id, channel_id) gpc
  FROM sales
  WHERE promo_id > 496
  GROUP BY CUBE(channel_id, promo_id)
  ORDER BY channel_id, promo_id, s_sales, gc;

CHANNEL_ID   PROMO_ID    S_SALES         GC         GP        GCP        GPC
---------- ---------- ---------- ---------- ---------- ---------- ----------
         2        999 25797563.2          0          0          0          0
         2            25797563.2          0          1          1          2
         3        999 55336945.1          0          0          0          0
         3            55336945.1          0          1          1          2
         4        999 13370012.5          0          0          0          0
         4            13370012.5          0          1          1          2
                  999 94504520.8          1          0          2          1
                      94504520.8          1          1          3          3
```

HEXTORAW

Syntax

Purpose

`HEXTORAW` converts *char* containing hexadecimal digits in the `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2` data type to a raw value.

This function does not support `CLOB` data directly. However, `CLOB`s can be passed in as arguments through implicit data conversion.

> **See Also**
>
> "Data Type Comparison Rules " for more information.

Examples

The following example creates a simple table with a raw column, and inserts a hexadecimal value that has been converted to `RAW`:

```
CREATE TABLE test (raw_col RAW(10));

INSERT INTO test VALUES (HEXTORAW('7D'));
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following example converts hexadecimal digits to a raw value and casts the raw value to VARCHAR2:

```
SELECT UTL_RAW.CAST_TO_VARCHAR2(HEXTORAW('4041424344'))
  FROM DUAL;

UTL_RAW.CAST_TO_VARCHAR2(HEXTORAW('4041424344'))
------------------------------------------------
@ABCD
```

> **See Also**
>
> "RAW and LONG RAW Data Types " and RAWTOHEX

INITCAP

Syntax

Purpose

`INITCAP` returns *char*, with the first letter of each word in uppercase, all other letters in lowercase. Words are delimited by white space or characters that are not alphanumeric.

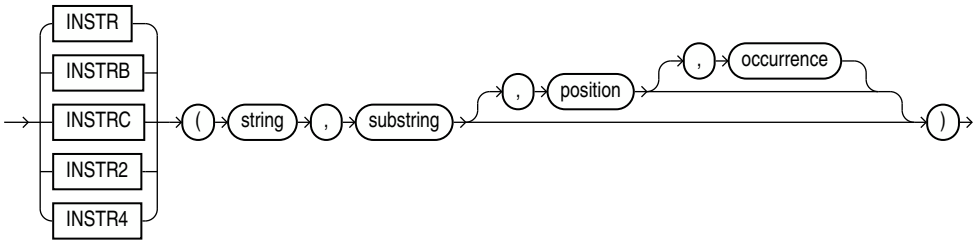
char can be of any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. The return value is the same data type as *char*. The database sets the case of the initial characters based on the binary mapping defined for the underlying character set. For linguistic-sensitive uppercase and lowercase, refer to NLS_INITCAP .

This function does not support `CLOB` data directly. However, `CLOB`s can be passed in as arguments through implicit data conversion.

> **See Also**
>
> - "Data Type Comparison Rules " for more information.
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `INITCAP`

Examples

The following example capitalizes each word in the string:



```
SELECT INITCAP('the soap') "Capitals"
  FROM DUAL;

Capitals
---------
The Soap
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

INSTR

Syntax

Purpose

The `INSTR` functions search *`string`* for *`substring`*. The search operation is defined as comparing the *`substring`* argument with substrings of *`string`* of the same length for equality until a match is found or there are no more substrings left. Each consecutive compared substring of *`string`* begins one character to the right (for forward searches) or one character to the left (for backward searches) from the first character of the previous compared substring. If a substring that is equal to *`substring`* is found, then the function returns an integer indicating the position of the first character of this substring. If no such substring is found, then the function returns zero.

- *`position`* is an nonzero integer indicating the character of *`string`* where Oracle Database begins the search—that is, the position of the first character of the first substring to compare with *`substring`*. If *`position`* is negative, then Oracle counts backward from the end of *`string`* and then searches backward from the resulting position.
- *`occurrence`* is an integer indicating which occurrence of *`substring`* in *`string`* Oracle should search for. The value of *`occurrence`* must be positive. If *`occurrence`* is greater than 1, then the database does not return on the first match but continues comparing consecutive substrings of *`string`*, as described above, until match number *`occurrence`* has been found.

`INSTR` accepts and returns positions in characters as defined by the input character set, with the first character of string having position 1. `INSTRB` uses bytes instead of characters. `INSTRC` uses Unicode complete characters. `INSTR2` uses UCS2 code points. `INSTR4` uses UCS4 code points.

`string` can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`. The exceptions are `INSTRC`, `INSTR2`, and `INSTR4`, which do not allow *`string`* to be a `CLOB` or `NCLOB`.

`substring` can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`.

The value returned is of `NUMBER` data type.

Both *`position`* and *`occurrence`* must be of data type `NUMBER`, or any data type that can be implicitly converted to `NUMBER`, and must resolve to an integer. The default values of both *`position`* and *`occurrence`* are 1, meaning Oracle begins searching at the first character of *`string`* for the first occurrence of *`substring`*. The return value is relative to the beginning of *`string`*, regardless of the value of *`position`*.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> - *Oracle Database Globalization Support Guide* for more on character length.
> - *Oracle Database SecureFiles and Large Objects Developer's Guide* for more on character length.
> - Table 2-9 for more information on implicit conversion
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation the `INSTR` functions use to compare the *`substring`* argument with substrings of *`string`*

Examples

The following example searches the string `CORPORATE FLOOR`, beginning with the third character, for the string "`OR`". It returns the position in `CORPORATE FLOOR` at which the second occurrence of "`OR`" begins:

```
SELECT INSTR('CORPORATE FLOOR','OR', 3, 2) "Instring"
  FROM DUAL;

  Instring
----------
        14
```

In the next example, Oracle counts backward from the last character to the third character from the end, which is the first `O` in `FLOOR`. Oracle then searches backward for the second occurrence of `OR`, and finds that this second occurrence begins with the second character in the search string :

```
SELECT INSTR('CORPORATE FLOOR','OR', -3, 2) "Reversed Instring"
  FROM DUAL;

Reversed Instring
-----------------
                2
```

The next example assumes a double-byte database character set.

```
SELECT INSTRB('CORPORATE FLOOR','OR',5,2) "Instring in bytes"
  FROM DUAL;

Instring in bytes
-----------------
               27
```

ITERATION_NUMBER

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

The `ITERATION_NUMBER` function can be used only in the *`model_clause`* of the `SELECT` statement and then only when `ITERATE(`*`number`*`)` is specified in the *`model_rules_clause`*. It returns an integer representing the completed iteration through the model rules. The `ITERATION_NUMBER` function returns 0 during the first iteration. For each subsequent iteration, the `ITERATION_NUMBER` function returns the equivalent of *`iteration_number`* plus one.

> **See Also**
>
> *model_clause* and "Model Expressions" for the syntax and semantics

Examples

The following example assigns the sales of the Mouse Pad for the years 1998 and 1999 to the sales of the Mouse Pad for the years 2001 and 2002 respectively:

```
SELECT country, prod, year, s
  FROM sales_view_ref
  MODEL
    PARTITION BY (country)
    DIMENSION BY (prod, year)
    MEASURES (sale s)
    IGNORE NAV
    UNIQUE DIMENSION
    RULES UPSERT SEQUENTIAL ORDER ITERATE(2)
      (
        s['Mouse Pad', 2001 + ITERATION_NUMBER] =
          s['Mouse Pad', 1998 + ITERATION_NUMBER]
      )
  ORDER BY country, prod, year;

COUNTRY       PROD                                    YEAR          S
----------    ----------------------------------    --------   ---------
France        Mouse Pad                                1998     2509.42
France        Mouse Pad                                1999     3678.69

Germany       Standard Mouse                           1999     6263.14
Germany       Standard Mouse                           2000     2637.31
Germany       Standard Mouse                           2001     6456.13

18 rows selected.
```

The preceding example requires the view `sales_view_ref`. Refer to "The MODEL clause: Examples" to create this view.

Copyright © 1996, 2026, Oracle and/or its affiliates.

IS_UUID

Syntax

`IS_UUID` checks if the input argment is a valid UUID string of one of the following formats:

- `xxxxxxxxxxxx4xxxBxxxxxxxxxxxxxxx`,
- `xxxxxxxx-xxxx-4xxx-Bxxx-xxxxxxxxxxxx`,
- `{xxxxxxxxxxxx4xxxBxxxxxxxxxxxxxxx}`,
- `{xxxxxxxx-xxxx-4xxx-Bxxx-xxxxxxxxxxxx}`,

A string consisting of 32 '0's (zero) denoting a Nil UUID, or 32 'f's denoting a Universal UUID where `x` is is a valid hexadecimal digit in upper or lower case. If the input is a string literal, then it must be quoted just like any string literal.

If the input string conforms to these formats it returns `TRUE`, otherwise it returns `FALSE`.

It returns NULL if the input is NULL.

Example 1

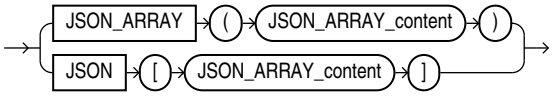
```
SELECT IS_UUID('{e24e8de0-d663-428f-baaa-1be5f019cd25}') FROM DUAL;
```

The output is:

```
IS_UUID('{E
-----------
TRUE
```

Example 2

```
SELECT IS_UUID('{d20f8c3cde134b958d25eff3fbdb7e71}') FROM DUAL;
```



The output is:

```
IS_UUID('{D
-----------
FALSE
```

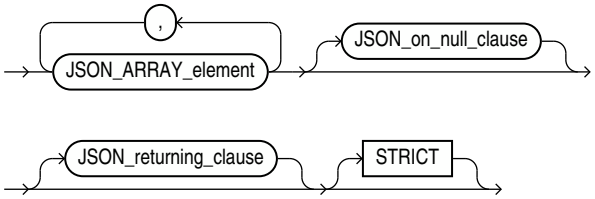
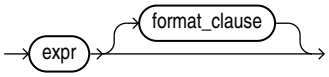
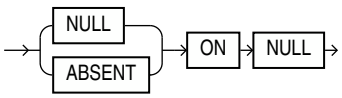
JSON_ARRAY



Syntax

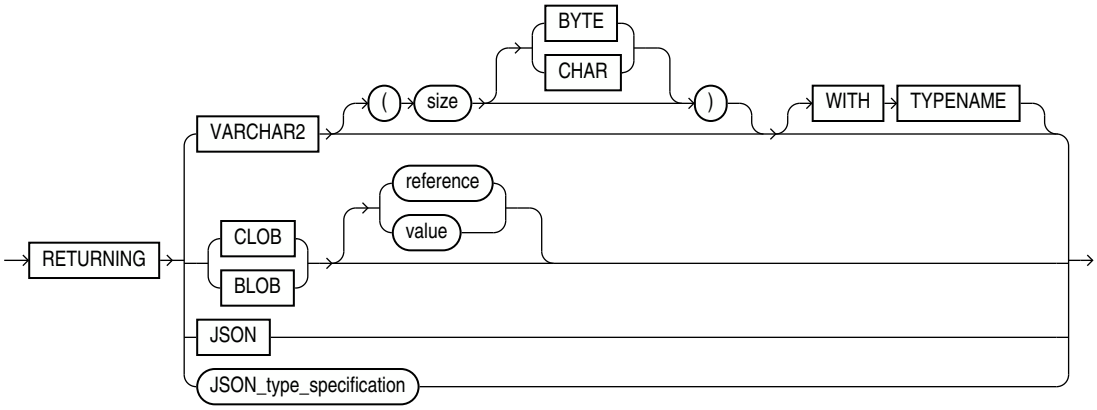


JSON_ARRAY_content

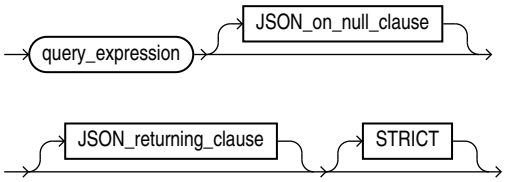


JSON_ARRAY_enumeration_content::=

JSON_ARRAY_element



JSON_on_null_clause::=



Copyright © 1996, 2026, Oracle and/or its affiliates.

***JSON_returning_clause*::=**

***JSON_ARRAY_query_content*::=**

Purpose

The SQL/JSON function `JSON_ARRAY` takes as its input a sequence of SQL scalar expressions or *one* collection type instance, `VARRAY` or `NESTED TABLE`.

It converts each expression to a JSON value, and returns a JSON array that contains those JSON values.

If an ADT has a member which is a collection than the type mapping creates a JSON object for the ADT with a nested JSON array for the collection member.

If a collection contains ADT instances then the type mapping will create a JSON array of JSON objects.

> **Note**
>
> *Generation of JSON Data Using SQL* of the *JSON Developer's Guide*.

JSON_ARRAY_content

Use this clause to define the input to the `JSON_ARRAY` function.

JSON_ARRAY_element

- ***expr***
  For *expr*, you can specify any SQL expression that evaluates to a JSON object, a JSON array, a numeric literal, a text literal, date, timestamp, or null. This function converts a

Copyright © 1996, 2026, Oracle and/or its affiliates.

numeric literal to a JSON number value, and a text literal to a JSON string value. The date and timestamp data types are printed in the generated JSON object or array as JSON Strings following the ISO 8601 date format.

- ***format_clause***
  You can specify `FORMAT JSON` to indicate that the input string is JSON, and will therefore not be quoted in the output.

JSON_on_null_clause

Use this clause to specify the behavior of this function when *expr* evaluates to null.

- `NULL ON NULL` - If you specify this clause, then the function returns the JSON null value.
- `ABSENT ON NULL` - If you specify this clause, then the function omits the value from the JSON array. This is the default.

JSON_returning_clause

Use this clause to specify the type of return value. One of :

- `BLOB` to return a binary large object of the `AL32UTF8` character set.
- `CLOB` to return a character large object containing single-byte or multi-byte characters.
- `VARCHAR2` specifying the size as a number of bytes or characters. The default is bytes. If you omit this clause, or specify the clause without specifying the *size* value, then `JSON_ARRAY` returns a character string of type `VARCHAR2(4000)`. Refer to VARCHAR2 Data Type for more information. Note that when specifying the `VARCHAR2` data type elsewhere in SQL, you are required to specify a size. However, in the *JSON_returning_clause* you can omit the size.
- `BOOLEAN`
- `JSON`
- `VECTOR`

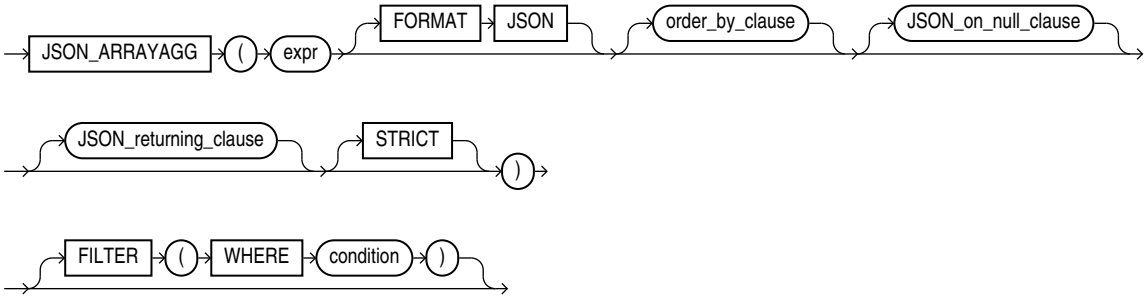
STRICT

Specify the `STRICT` clause to verify that the output of the JSON generation function is correct JSON. If the check fails, a syntax error is raised.

Refer to JSON_OBJECT for examples.

Examples

The following example constructs a JSON array from a JSON object, a JSON array, a numeric literal, a text literal, and null:

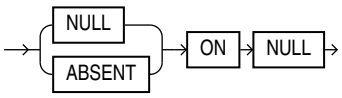


```
SELECT JSON_ARRAY (
    JSON_OBJECT('percentage' VALUE .50),
    JSON_ARRAY(1,2,3),
    100,
    'California',
    null
    NULL ON NULL
    ) "JSON Array Example"
  FROM DUAL;

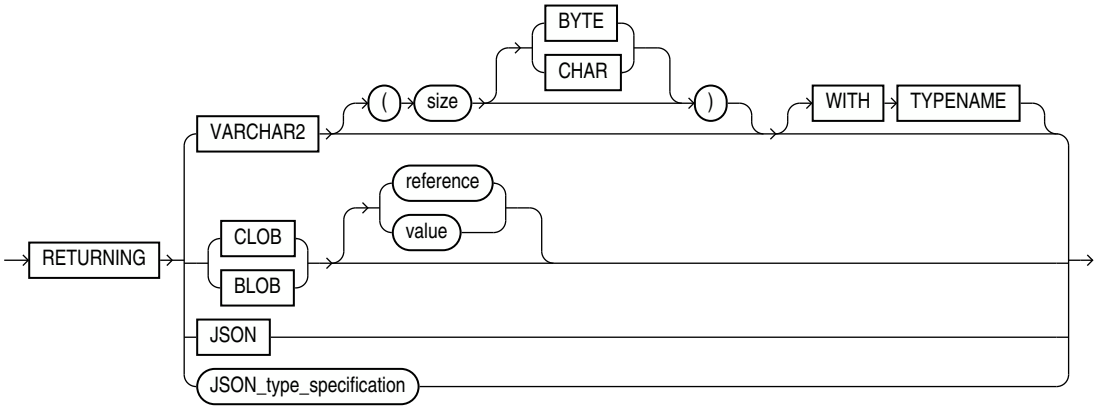
JSON Array Example
--------------------------------------------------------------------------------
[{"percentage":0.5},[1,2,3],100,"California",null]
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

JSON_ARRAYAGG



Syntax



(See *order_by_clause*::= in the documentation on SELECT for the syntax of this clause)

> **Note**
>
> For JSON_ARRAYAGG, the *order_by* clause must refer to columns. Positional orders are not supported.

***JSON_on_null_clause*::=**

***JSON_returning_clause*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

The SQL/JSON function `JSON_ARRAYAGG` is an aggregate function. It takes as its input a column of SQL expressions, converts each expression to a JSON value, and returns a single JSON array that contains those JSON values.

expr

For *expr*, you can specify any SQL expression that evaluates to a JSON object, a JSON array, a numeric literal, a text literal, or null. This function converts a numeric literal to a JSON number value and a text literal to a JSON string value.

FORMAT JSON

Use this optional clause to indicate that the input string is JSON, and will therefore not be quoted in the output.

order_by_clause

This clause allows you to order the JSON values within the JSON array returned by the statement. Refer to the *order_by_clause* in the documentation on `SELECT` for the full semantics of this clause.

JSON_on_null_clause

Use this clause to specify the behavior of this function when *expr* evaluates to null.

- `NULL ON NULL` - If you specify this clause, then the function returns the JSON null value.
- `ABSENT ON NULL` - If you specify this clause, then the function omits the value from the JSON array. This is the default.

JSON_returning_clause

Use this clause to specify the data type of the character string returned by this function. You can specify the following data types:

- `VARCHAR2[(`*size* `[BYTE,CHAR])]`

  When specifying the `VARCHAR2` data type elsewhere in SQL, you are required to specify a size. However, in this clause you can omit the size.
- `CLOB` to return a character large object containing single-byte or multi-byte characters.
- `BLOB` to return a binary large object of the `AL32UTF8` character set.
- `JSON` to return JSON data.

  You must set the database initialization parameter compatible to `20` or greater to use the `JSON` type.

If you omit this clause, or if you specify `VARCHAR2` but omit the *size* value, then `JSON_ARRAYAGG` returns a character string of type `VARCHAR2(4000)`.

Refer to "Data Types " for more information on the preceding data types.

STRICT

Specify the `STRICT` clause to verify that the output of the JSON generation function is correct JSON. If the check fails, a syntax error is raised.

Refer to JSON_OBJECT for examples.

Copyright © 1996, 2026, Oracle and/or its affiliates.

WITH UNIQUE KEYS

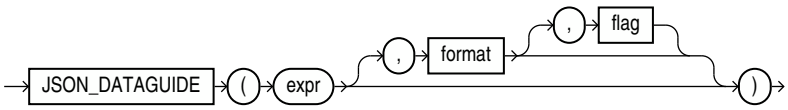
Specify `WITH UNIQUE KEYS` to guarantee that generated JSON objects have unique keys.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Examples

The following statements creates a table `id_table`, which contains ID numbers:

```
CREATE TABLE id_table (id NUMBER);
INSERT INTO id_table VALUES(624);
INSERT INTO id_table VALUES(null);
INSERT INTO id_table VALUES(925);
INSERT INTO id_table VALUES(585);
```



The following example constructs a JSON array from the ID numbers in table `id_table`:

```
SELECT JSON_ARRAYAGG(id ORDER BY id RETURNING VARCHAR2(100)) ID_NUMBERS
  FROM id_table;

ID_NUMBERS
-------------
[585,624,925]
```

JSON_DATAGUIDE

Syntax

Purpose

The aggregate function `JSON_DATAGUIDE` computes the data guide of a set of JSON data. The data guide is returned as a `CLOB` which can be in either flat or hierarchical format depending on the passing format parameter.

expr

`expr` is a SQL expression that evaluates to a JSON object or a JSON array. It can also be a JSON column in a table.

format options

Use the format options to specify the format of the data guide that will be returned. It must be one of the following values:

- `dbms_json.format_flat` for a flat format.
- `dbms_json.format_hierarchical` for a hierarchical format.
- `dbms_json.format_schema` for a data guide of a JSON schema that you can use to validate JSON documents.

Copyright © 1996, 2026, Oracle and/or its affiliates.

If the parameter is the absent, the default is `dbms_json.format_flat`.

See *Data-Guide Formats and Ways of Creating a Data Guide* of the *JSON Developer's Guide*.

flag options

`flag` can have the following values:

- Specify `DBMS_JSON.PRETTY` to improve readability of the returned data guide with appropriate indentation.
- Specify `DBMS_JSON.GEOJSON` for the data guide to auto detect the `GeoJSON` type. The corresponding view column created by the data guide will be of `sdo_geometry` type.
- Specify `DBMS_JSON.GATHER_STATS` for the data guide to collect statistical information. The data guide report generated with `DBMS_JSON.GATHER_STATS` has a new field *`o:sample_size`*, in addition to all of the other statistical fields that you get with `DBMS_JSON.get_index_dataguide` .
- Specify `DBMS_JSON.DETECT_DATETIME` for the data guide to detect temporal types. The data guide reports a JSON field value that conforms to the ISO 8601 format as a timestamp type, not a string type.
- All values `DBMS_JSON.PRETTY`, `DBMS_JSON.GEOJSON`, and `DBMS_JSON.GATHER_STATS`, and `DBMS_JSON.DETECT_DATETIME` can be combined with a plus sign. For example, `DBMS_JSON.GEOJSON+DBMS_JSON.PRETTY`, or `DBMS_JSON.GEOJSON+DBMS_JSON.PRETTY+DBMS_JSON.GATHER_STATS`.

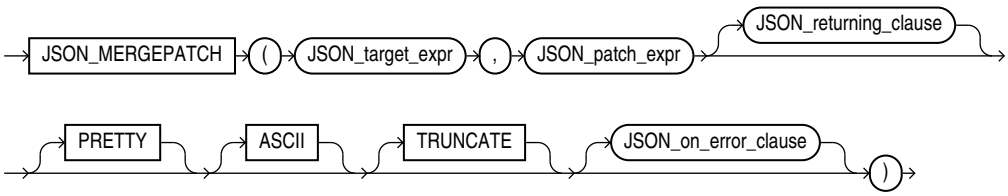
>
> *JSON Data Guide*

Examples

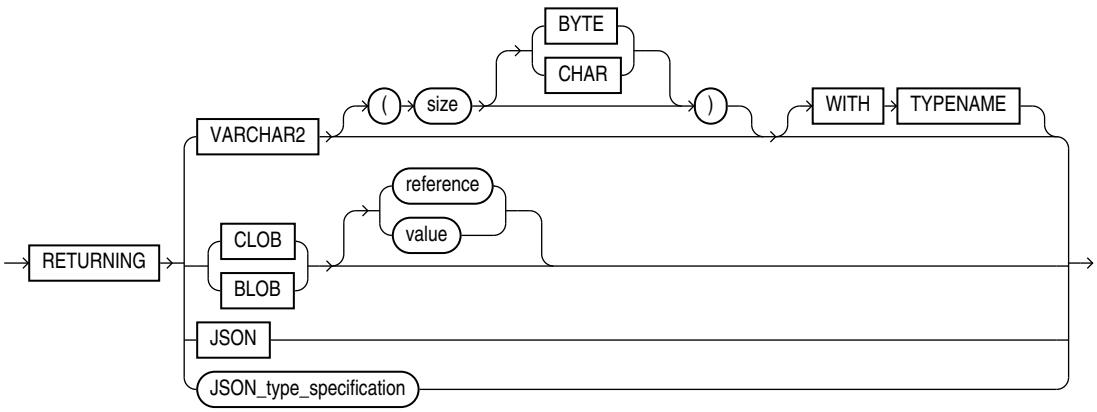
The following example uses the `j_purchaseorder` table, which is created in "Create a Table That Contains a JSON Document". This table contains a column of JSON data called `po_document`. This example returns a flat data guide for each year group.

```
SELECT EXTRACT(YEAR FROM date_loaded) YEAR,
       JSON_DATAGUIDE(po_document) "DATA GUIDE"
  FROM j_purchaseorder
  GROUP BY extract(YEAR FROM date_loaded)
  ORDER BY extract(YEAR FROM date_loaded) DESC;



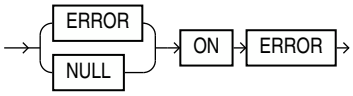
YEAR DATA GUIDE
---- ----------------------------------------
2016 [
       {
         "o:path" : "$.PO_ID",
         "type" : "number",
         "o:length" : 4
       },
       {
         "o:path" : "$.PO_Ref",
         "type" : "string",
         "o:length" : 16
       },
       {
```

Copyright © 1996, 2026, Oracle and/or its affiliates.



```
        "o:path" : "$.PO_Items",
        "type" : "array",
        "o:length" : 64
      },
      {
        "o:path" : "$.PO_Items.Part_No",
        "type" : "number",
        "o:length" : 16
      },
      {
        "o:path" : "$.PO_Items.Item_Quantity",
        "type" : "number",
        "o:length" : 2
      }
    ]
. . .
```

JSON_MERGEPATCH



Syntax

***JSON_returning_clause*::=**

***json_on_error_clause*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

You can use the `JSON_MERGEPATCH` function to update specific portions of a JSON document. You pass it a JSON Merge Patch document in `JSON_patch_expr`, which specifies the changes to make to a specified JSON document, the `JSON_target_expr`.

`JSON_MERGEPATCH` evaluates the patch document against the target document to produce the result document. If the target or the patch document is NULL, then the result is also NULL.

You can input any SQL data type that supports JSON data: `JSON`, `VARCHAR2`, `CLOB`, or `BLOB`. The function returns any of the SQL data types as output.

Data type `JSON` is available only if database initialization parameter compatible is `20` or greater.

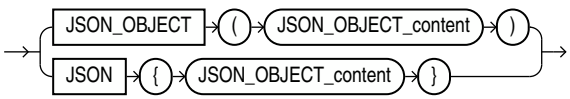
The default return type depends on the input data type. If the input type is `JSON`, then `JSON` is also the default return type. Otherwise, `VARCHAR2` is the default return type.

The *`JSON_returning_clause`* specifies the return type of the operator. The default return type is `VARCHAR2(4000)`.

The `PRETTY` keyword specifies that the result should be formatted for human readability.

The `ASCII` keyword specifies that non-ASCII characters should be output using JSON escape sequences.

The `TRUNCATE` keyword specifies that the result document should be truncated to fit in the specified return type.



The *`JSON_on_error_clause`* optionally controls the handling of errors that occur during the processing of the target and patch documents.

- `NULL ON ERROR` - Returns null when an error occurs. This is the default.
- `ERROR ON ERROR` - Returns the appropriate Oracle error when an error occurs.

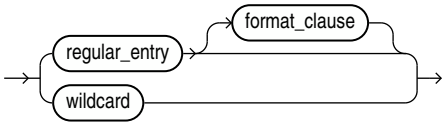
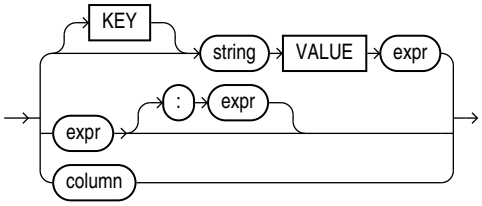
JSON_OBJECT

Syntax

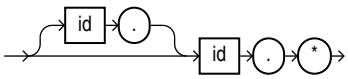


Copyright © 1996, 2026, Oracle and/or its affiliates.

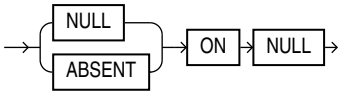


***json_object_content*::=**

***entry*::=**

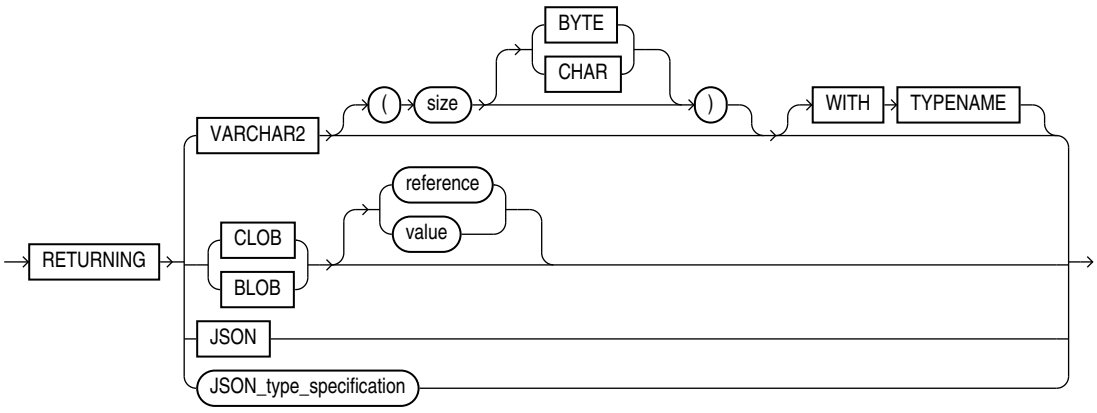


***regular_entry*::=**



***format_clause*::=**

***wildcard*::=**



***JSON_on_null_clause*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

***JSON_returning_clause*::=**

Purpose

The SQL/JSON function `JSON_OBJECT` takes as its input either a sequence of key-value pairs or one object type instance. A collection type cannot be passed to `JSON_OBJECT`.

It returns a JSON object that contains an object member for each of those key-value pairs.

entry

`regular_entry`: Use this clause to specify a property key-value pair.

regular_entry

- `KEY` is optional and is provided for semantic clarity.
- Use the optional *`expr`* to specify the property key name as a case-sensitive text literal.
- Use *`expr`* to specify the property value. For *`expr`*, you can specify any expression that evaluates to a SQL numeric literal, text literal, date, or timestamp. The date and timestamp data types are printed in the generated JSON object or array as JSON strings following the ISO date format. If *`expr`* evaluates to a numeric literal, then the resulting property value is a JSON number value; otherwise, the resulting property value is a case-sensitive JSON string value enclosed in double quotation marks.

  You can use the colon to separate `JSON_OBJECT` entries.

format_clause

Specify `FORMAT JSON` after an input expression to declare that the value that results from it represents JSON data, and will therefore not be quoted in the output.

wildcard

Wildcard entries select multiple columns and can take the form of *, table.*, view.*, or t_alias.*. Use wildcard entries to map all the columns from a table, subquery, or view to a JSON object without explicitly naming all of the columns in the query. In this case wildcard entries are used in the same way that they are used directly in a select_list.

Example 1

Copyright © 1996, 2026, Oracle and/or its affiliates.

In the resulting JSON object, the key names are equal to the names of the corresponding columns:

```
SELECT JSON_OBJECT(*)
  FROM employees
  WHERE employee_id = 140;
```

Result:

```
{"EMPLOYEE_ID":140,"FIRST_NAME":"Joshua","LAST_NAME":"Patel","EMAIL":"JPAT
EL","PHONE_NUMBER":"650.121.1834","HIRE_DATE":"2006-04-
06T00:00:00","JOB_ID":"ST_CLERK","SALARY":2500,"COMMISSION_PCT":null,"MAN
AGER_ID":123,"DEPARTMENT_ID":50}
```

Example 2

This query selects columns from a specific table in a join query:

```
SELECT JSON_OBJECT('NAME' VALUE first_name, d.*)
  FROM employees e, departments d
  WHERE e.department_id = d.department_id
  AND e.employee_id =140;
```

Result:

```
{"NAME":"Joshua","DEPARTMENT_ID":50,"DEPARTMENT_NAME":"Shipping","MANAGER_ID":121,
"LOCATION_ID":1500}
```

Example 3

This query converts the departments table to a single JSON array value.

```
SELECT JSON_ARRAYAGG(JSON_OBJECT(*))FROM departments;
```

JSON_on_null_clause

Use this clause to specify the behavior of this function when *expr* evaluates to null.

- `NULL ON NULL` - When `NULL ON NULL` is specified, then a JSON NULL value is used as a value for the given key.
- `ABSENT ON NULL` - If you specify this clause, then the function omits the property key-value pair from the JSON object.

JSON_returning_clause

Use this clause to specify the type of return value. One of :

- `VARCHAR2` specifying the size as a number of bytes or characters. The default is bytes. If you omit this clause, or specify the clause without specifying the *size* value, then `JSON_ARRAY` returns a character string of type `VARCHAR2(4000)`. Refer to VARCHAR2 Data Type for more information. Note that when specifying the `VARCHAR2` data type elsewhere in

Copyright © 1996, 2026, Oracle and/or its affiliates.

SQL, you are required to specify a size. However, in the *JSON_returning_clause* you can omit the size.

- `CLOB` to return a character large object containing single-byte or multi-byte characters.
- `BLOB` to return a binary large object of the `AL32UTF8` character set.
- `WITH TYPENAME`

STRICT

Specify the `STRICT` clause to verify that the output of the JSON generation function is correct JSON. If the check fails, a syntax error is raised.

Example 1: Output string appears within quotes, because `FORMAT JSON` is not used

```
SELECT JSON_OBJECT ('name' value 'Foo')
  FROM DUAL;
```

Result:

```
JSON_OBJECT('NAME'VALUE'FOO')
-----------------------------------------------
{"name":"Foo"}
```

Example 2: No quotes around output string when `FORMAT JSON` is used.

```
SELECT JSON_OBJECT ('name' value 'Foo' FORMAT JSON ) FROM DUAL;
```

Result:

```
JSON_OBJECT('NAME'VALUE'FOO'FORMATJSON)
--------------------------------------
{"name":Foo}
```

Example 3: JSON Syntax error when `FORMAT JSON STRICT` is used.

```
SELECT JSON_OBJECT ('name' value 'Foo' FORMAT JSON STRICT ) FROM DUAL
Output:
ORA-40441: JSON syntax error
```

WITH UNIQUE KEYS

Specify `WITH UNIQUE KEYS` to guarantee that generated JSON objects have unique keys.

Example

The following example returns JSON objects that each contain two property key-value pairs:

```
SELECT JSON_OBJECT (
    KEY 'deptno' VALUE d.department_id,
    KEY 'deptname' VALUE d.department_name
    ) "Department Objects"
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
  FROM departments d
  ORDER BY d.department_id;
```

Result:

```
Department Objects
--------------------------------------
{"deptno":10,"deptname":"Administration"}
{"deptno":20,"deptname":"Marketing"}
{"deptno":30,"deptname":"Purchasing"}
{"deptno":40,"deptname":"Human Resources"}
{"deptno":50,"deptname":"Shipping"}
. . .
```

JSON_OBJECT Column Entries

In some cases you might want to have JSON object key names match the names of the table columns to avoid repeating the column name in the key value expression. For example:

```
SELECT JSON_OBJECT(
'first_name' VALUE first_name,
'last_name' VALUE last_name,
'email' VALUE email,
'hire_date' VALUE hire_date
)
  FROM employees
  WHERE employee_id = 140;
```

Result:

```
{"first_name":"Joshua","last_name":"Patel","email":"JPATEL","hire_date":"2006-04-
06T00:00:00"}
```

In such cases you can use a shortcut, where a single column value may be specified as input and the corresponding object entry key is inferred from the name of the column. For example:

```
SELECT JSON_OBJECT(first_name, last_name, email, hire_date)
  FROM employees
  WHERE employee_id = 140;
```

Result:

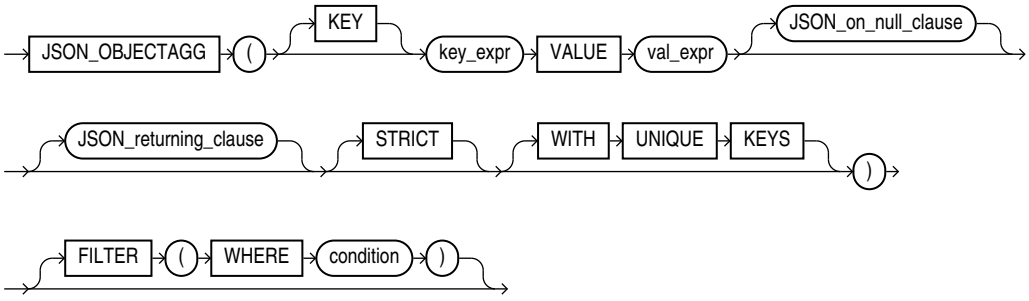
```
{"first_name":"Joshua","last_name":"Patel","email":"JPATEL","hire_date":"2016-04-
06T00:00:00"}
```

You can use quoted or non-quoted identifiers for column names. If you use non-quoted identifiers, then the case-sensitive value of the identifier, as written in the query, is used to

Copyright © 1996, 2026, Oracle and/or its affiliates.

generate the corresponding object key value. However for the purpose of referencing the column value, the identifier is still case-insensitive. For example:

```
SELECT JSON_OBJECT(eMail)
FROM employees
WHERE employee_id = 140;



{"eMail":"JPATEL"}
```

Notice that the capital 'M' as typed in the column name is preserved.

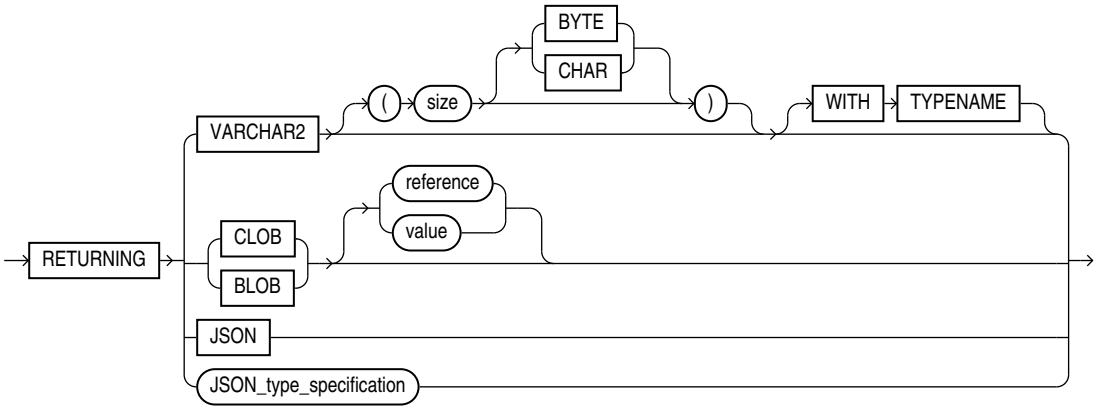
> Generation of JSON Data Using SQL

JSON_OBJECTAGG

Syntax



***JSON_on_null_clause*::=**

***JSON_returning_clause*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

The SQL/JSON function `JSON_OBJECTAGG` is an aggregate function. It takes as its input a property key-value pair. Typically, the property key, the property value, or both are columns of SQL expressions. This function constructs an object member for each key-value pair and returns a single JSON object that contains those object members.

[KEY] *string* VALUE *expr*

Use this clause to specify property key-value pairs.

- `KEY` is optional and is provided for semantic clarity.
- Use *`string`* to specify the property key name as a case-sensitive text literal.
- Use *`expr`* to specify the property value. For *`expr`*, you can specify any expression that evaluates to a SQL numeric literal, text literal, date, or timestamp. The date and timestamp data types are printed in the generated JSON object or array as JSON Strings following the ISO 8601 date format. If *`expr`* evaluates to a numeric literal, then the resulting property value is a JSON number value; otherwise, the resulting property value is a case-sensitive JSON string value enclosed in double quotation marks.

FORMAT JSON

Use this optional clause to indicate that the input string is JSON, and will therefore not be quoted in the output.

JSON_on_null_clause

Use this clause to specify the behavior of this function when *`expr`* evaluates to null.

- `NULL ON NULL` - When NULL ON NULL is specified, then a JSON NULL value is used as a value for the given key.
- `ABSENT ON NULL` - If you specify this clause, then the function omits the property key-value pair from the JSON object.

JSON_returning_clause

Use this clause to specify the data type of the character string returned by this function. You can specify the following data types:

- `VARCHAR2[(`*`size`* `[BYTE,CHAR])]`

  When specifying the `VARCHAR2` data type elsewhere in SQL, you are required to specify a size. However, in this clause you can omit the size.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- `CLOB` to return a character large object containing single-byte or multi-byte characters.
- `BLOB` to return a binary large object of the `AL32UTF8` character set.
- `JSON` to return JSON data.

  You must set the database initialization parameter compatible to `20` or greater to use the `JSON` data type.

If you omit this clause, or if you specify `VARCHAR2` but omit the *`size`* value, then `JSON_OBJECTAGG` returns a character string of type `VARCHAR2(4000)`.

Refer to "Data Types " for more information on the preceding data types.

STRICT

Specify the `STRICT` clause to verify that the output of the JSON generation function is correct JSON. If the check fails, a syntax error is raised.

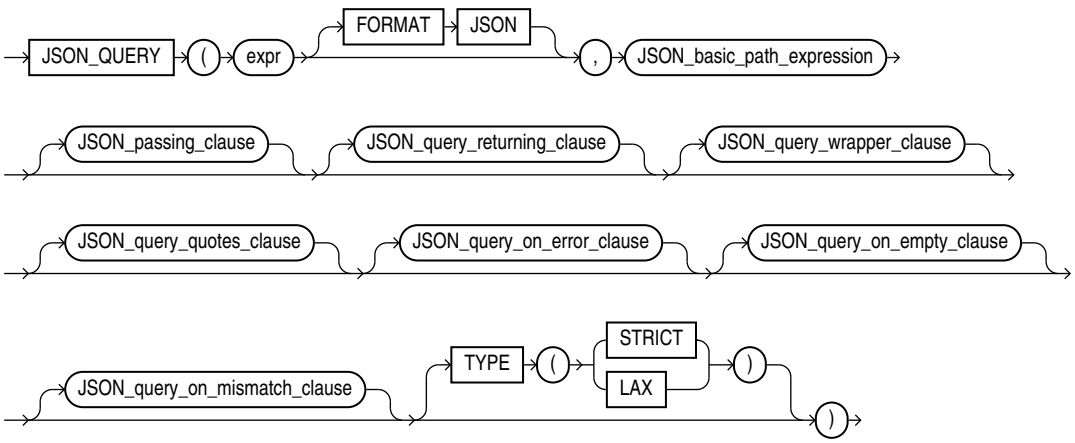
Refer to JSON_OBJECT for examples.

WITH UNIQUE KEYS

Specify `WITH UNIQUE KEYS` to guarantee that generated JSON objects have unique keys.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Examples



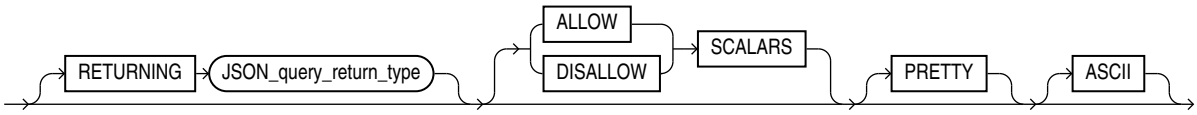
The following example constructs a JSON object whose members contain department names and department numbers:

```
SELECT JSON_OBJECTAGG(KEY department_name VALUE department_id) "Department Numbers"
  FROM departments
  WHERE department_id <= 30;

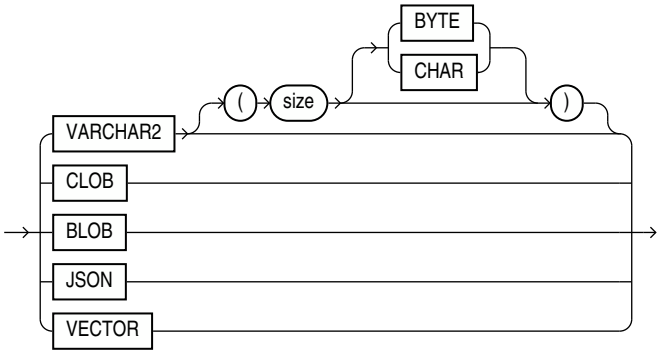
Department Numbers
----------------------------------------------------
{"Administration":10,"Marketing":20,"Purchasing":30}
```

JSON_QUERY

Syntax



Copyright © 1996, 2026, Oracle and/or its affiliates.



(*JSON_basic_path_expression*: See *Oracle Database JSON Developer's Guide*)

JSON_basic_path_expression: *Oracle Database JSON Developer's Guide*,

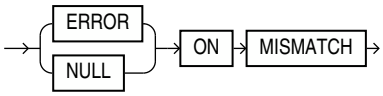
Copyright © 1996, 2026, Oracle and/or its affiliates.



***JSON_query_on_error_clause*::=**

***JSON_query_on_empty_clause*::=**

***JSON_query_on_mismatch_clause*::=**

Purpose

`JSON_QUERY` selects and returns one or more values from JSON data and returns those values. You can use `JSON_QUERY` to retrieve fragments of a JSON document.

> **See Also**
>
> - *Query JSON Data*
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character value returned by `JSON_QUERY`

expr

Use *expr* to specify the JSON data you want to query.

expr is a SQL expression that returns an instance of a SQL data type, one of `JSON`, `VARCHAR2`, `CLOB`, or `BLOB`. It can be a table or view column value, a PL/SQLvariable, or a bind variable with proper casting.

If *expr* is null, then the function returns null.

Copyright © 1996, 2026, Oracle and/or its affiliates.

If *expr* is not a text literal of well-formed JSON data using strict or lax syntax, then the function returns null by default. You can use the *JSON_query_on_error_clause* to override this default behavior. Refer to *JSON_query_on_error_clause*.

FORMAT JSON

You must specify FORMAT JSON if *expr* is a column of data type BLOB.

JSON_basic_path_expression

Use this clause to specify a SQL/JSON path expression. The function uses the path expression to evaluate *expr* and find one or more JSON values that match, or satisfy the path expression. The path expression must be a text literal. See *Oracle Database JSON Developer's Guide* for the full semantics of *JSON_basic_path_expression*.

JSON_query_returning_clause

Use this clause to specify the data type and format of the character string returned by this function.

RETURNING

You can use the RETURNING clause to specify the data type of the returned instance, one of JSON, VARCHAR2, CLOB, or BLOB.

The default return type depends on the input data type. If the input type is JSON, then JSON is also the default return type. Otherwise VARCHAR2(4000) is the default return type.

When specifying the VARCHAR2 data type elsewhere in SQL, you are required to specify a size. However, in this clause you can omit the size. In this case, JSON_QUERY returns a character string of type VARCHAR2(4000).

Refer to "VARCHAR2 Data Type " for more information.

If the data type is not large enough to hold the return character string, then JSON_QUERY returns null by default. You can use the *JSON_query_on_error_clause* to override this default behavior. Refer to the *JSON_query_on_error_clause*.

PRETTY

Specify PRETTY to pretty-print the return character string by inserting newline characters and indenting.

ASCII

Specify ASCII to automatically escape any non-ASCII Unicode characters in the return character string, using standard ASCII Unicode escape sequences.

JSON_query_wrapper_clause

Use this clause to control whether this function wraps the values matched by the path expression in an array wrapper—that is, encloses the sequence of values in square brackets ([]).

- Specify WITHOUT WRAPPER to omit the array wrapper. You can specify this clause only if the path expression matches a single JSON object, a JSON array, or beginning with database release 26ai, a JSON scalar. This is the default.
- Specify WITH WRAPPER to include the array wrapper. You must specify this clause if the path expression matches multiple values of any type.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- Specifying the `WITH UNCONDITIONAL WRAPPER` clause is equivalent to specifying the `WITH WRAPPER` clause. The `UNCONDITIONAL` keyword is provided for semantic clarity.
- Specify `WITH CONDITIONAL WRAPPER` to include the array wrapper only if the path expression matches multiple values of any type. If the path expression matches a single JSON value (object, array, or scalar), then the array wrapper is omitted.
- Since database release 26ai, `JSON_QUERY` can return a scalar value, conforming to the newer JSON RFC. For backwards compatibility with older RFC, the clause `DISALLOW SCALARS` will prevent scalar values to be returned without a wrapper.
- The `ARRAY` keyword is optional and is provided for semantic clarity.

If the path expression returns multiple values of any type and you do not specify `WITH [UNCONDITIONAL | CONDITIONAL] WRAPPER`, then the function returns null by default. You can use the *`JSON_query_on_error_clause`* to override this default behavior. Refer to the *JSON_query_on_error_clause*.

JSON_query_on_error_clause

Use this clause to specify the value returned by this function when the following errors occur:

- *`expr`* is not well-formed JSON data using strict or lax JSON syntax
- No match is found when the JSON data is evaluated using the SQL/JSON path expression. You can override the behavior for this type of error by specifying the *`JSON_query_on_empty_clause`*.
- The return value data type is not large enough to hold the return character string
- The function matches a single scalar value or, multiple values of any type, and the `WITH [UNCONDITIONAL | CONDITIONAL] WRAPPER` clause is not specified

You can specify the following clauses:

- `NULL ON ERROR` - Returns null when an error occurs. This is the default.
- `ERROR ON ERROR` - Returns the appropriate Oracle error when an error occurs.
- `EMPTY ON ERROR` - Specifying this clause is equivalent to specifying `EMPTY ARRAY ON ERROR`.
- `EMPTY ARRAY ON ERROR` - Returns an empty JSON array (`[]`) when an error occurs.
- `EMPTY OBJECT ON ERROR` - Returns an empty JSON object (`{}`) when an error occurs.

JSON_query_on_empty_clause

Use this clause to specify the value returned by this function if no match is found when the JSON data is evaluated using the SQL/JSON path expression. This clause allows you to specify a different outcome for this type of error than the outcome specified with the *`JSON_query_on_error_clause`*.

You can specify the following clauses:

- `NULL ON EMPTY` - Returns null when no match is found.
- `ERROR ON EMPTY` - Returns the appropriate Oracle error when no match is found.
- `EMPTY ON EMPTY` - Specifying this clause is equivalent to specifying `EMPTY ARRAY ON EMPTY`.
- `EMPTY ARRAY ON EMPTY` - Returns an empty JSON array (`[]`) when no match is found.
- `EMPTY OBJECT ON EMPTY` - Returns an empty JSON object (`{}`) when no match is found.

If you omit this clause, then the *`JSON_query_on_error_clause`* determines the value returned when no match is found.

Copyright © 1996, 2026, Oracle and/or its affiliates.

TYPE Clause

For a full discussion of `STRICT` and `LAX` syntax see *About Strict and Lax JSON Syntax*, and *TYPE Clause for SQL Functions and Conditions*

Examples

The following query returns the context item, or the specified string of JSON data. The path expression matches a single JSON object, which does not require an array wrapper. Note that the JSON data is converted to strict JSON syntax in the returned value—that is, the object property names are enclosed in double quotation marks.

```
SELECT JSON_QUERY('{a:100, b:200, c:300}', '$') AS value
  FROM DUAL;

VALUE
--------------------------------------------------------------------------------
{"a":100,"b":200,"c":300}
```

The following query returns the value of the member with property name `a`. The path expression matches a scalar value, which must be enclosed in an array wrapper. Therefore, the `WITH WRAPPER` clause is specified.

```
SELECT JSON_QUERY('{a:100, b:200, c:300}', '$.a' WITH WRAPPER) AS value
  FROM DUAL;

VALUE
--------------------------------------------------------------------------------
[100]
```

The following query returns the values of all object members. The path expression matches multiple values, which together must be enclosed in an array wrapper. Therefore, the `WITH WRAPPER` clause is specified.

```
SELECT JSON_QUERY('{a:100, b:200, c:300}', '$.*' WITH WRAPPER) AS value
  FROM DUAL;

VALUE
--------------------------------------------------------------------------------
[100,200,300]
```

The following query returns the context item, or the specified string of JSON data. The path expression matches a single JSON array, which does not require an array wrapper.

```
SELECT JSON_QUERY('[0,1,2,3,4]', '$') AS value
  FROM DUAL;

VALUE
--------------------------------------------------------------------------------
[0,1,2,3,4]
```

The following query is similar to the previous query, except the `WITH WRAPPER` clause is specified. Therefore, the JSON array is wrapped in an array wrapper.

```
SELECT JSON_QUERY('[0,1,2,3,4]', '$' WITH WRAPPER) AS value
  FROM DUAL;

VALUE
--------------------------------------------------------------------------------
[[0,1,2,3,4]]
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following query returns all elements in a JSON array. The path expression matches multiple values, which together must be enclosed in an array wrapper. Therefore, the `WITH WRAPPER` clause is specified.

```
SELECT JSON_QUERY('[0,1,2,3,4]', '$[*]' WITH WRAPPER) AS value
  FROM DUAL;

VALUE
--------------------------------------------------------------------------------
[0,1,2,3,4]
```

The following query returns the elements at indexes 0, 3 through 5, and 7 in a JSON array. The path expression matches multiple values, which together must be enclosed in an array wrapper. Therefore, the `WITH WRAPPER` clause is specified.

```
SELECT JSON_QUERY('[0,1,2,3,4,5,6,7,8]', '$[0, 3 to 5, 7]' WITH WRAPPER) AS value
  FROM DUAL;

VALUE
--------------------------------------------------------------------------------
[0,3,4,5,7]
```

The following query returns the fourth element in a JSON array. The path expression matches a scalar value, which must be enclosed in an array wrapper. Therefore, the `WITH WRAPPER` clause is specified.

```
SELECT JSON_QUERY('[0,1,2,3,4]', '$[3]' WITH WRAPPER) AS value
  FROM DUAL;

VALUE
--------------------------------------------------------------------------------
[3]
```

The following query returns the first element in a JSON array. The `WITH CONDITIONAL WRAPPER` clause is specified and the path expression matches a single JSON object. Therefore, the value returned is not wrapped in an array. Note that the JSON data is converted to strict JSON syntax in the returned value—that is, the object property name is enclosed in double quotation marks.

```
SELECT JSON_QUERY('[{a:100},{b:200},{c:300}]', '$[0]'
       WITH CONDITIONAL WRAPPER) AS value
  FROM DUAL;

VALUE
--------------------------------------------------------------------------------
{"a":100}
```

The following query returns all elements in a JSON array. The `WITH CONDITIONAL WRAPPER` clause is specified and the path expression matches multiple JSON objects. Therefore, the value returned is wrapped in an array.

```
SELECT JSON_QUERY('[{"a":100},{"b":200},{"c":300}]', '$[*]'
       WITH CONDITIONAL WRAPPER) AS value
  FROM DUAL;

VALUE
--------------------------------------------------------------------------------
[{"a":100},{"b":200},{"c":300}]
```

The following query is similar to the previous query, except that the value returned is of data type `VARCHAR2(100)`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT JSON_QUERY('[{"a":100},{"b":200},{"c":300}]', '$[*]'
       RETURNING VARCHAR2(100) WITH CONDITIONAL WRAPPER) AS value
  FROM DUAL;

VALUE
--------------------------------------------------------------------------------
[{"a":100},{"b":200},{"c":300}]
```

The following query returns the fourth element in a JSON array. However, the supplied JSON array does not contain a fourth element, which results in an error. The `EMPTY ON ERROR` clause is specified. Therefore, the query returns an empty JSON array.

```
SELECT JSON_QUERY('[{"a":100},{"b":200},{"c":300}]', '$[3]'
       EMPTY ON ERROR) AS value
  FROM DUAL;

VALUE
--------------------------------------------------------------------------------
[]
```

The scalar value 100 is returned by `JSON_QUERY` without a wrapper because newer JSON RFC 8259 allows top-level scalar values:

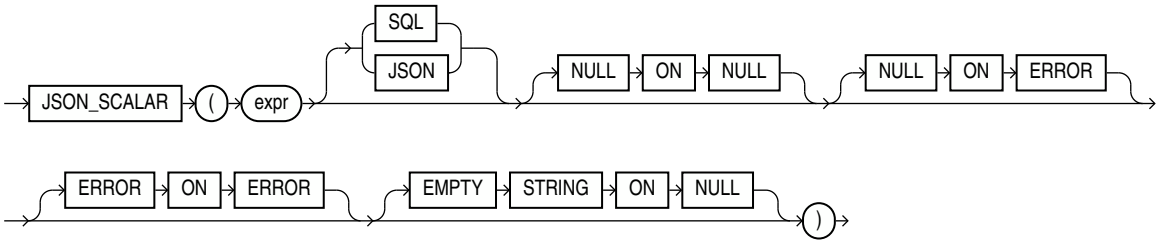
```
SELECT JSON_QUERY('{a:100, b:200, c:300}', '$.a' WITH CONDITIONAL WRAPPER)  AS value
  FROM DUAL;

VALUE
--------------------------------------------------------------------------------
100
```

The same query with the `DISALLOW SCALARS` clause prevents a top-level scalar to be returned and the wrapper clause applies:

```
SELECT JSON_QUERY('{a:100, b:200, c:300}', '$.a' DISALLOW SCALARS WITH CONDITIONAL
WRAPPER)  AS value
  FROM DUAL;

VALUE
--------------------------------------------------------------------------------
[100]
```



Without the wrapper clause, the value cannot be returned and the `ERROR ON ERROR` clause provides the reason:

```
SELECT JSON_QUERY('{a:100, b:200, c:300}', '$.a' DISALLOW SCALARS ERROR ON ERROR)  AS
value
  FROM DUAL;
  2    FROM DUAL
       *
ERROR at line 2:
ORA-40480: JSON array wrapper needed for result of JSON query '$.a'
JZN-00019: Cannot print without array wrapper
```

JSON_SCALAR

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

`JSON_SCALAR` accepts a SQL scalar value as input and returns a corresponding JSON scalar value as a `JSON` type instance. The value can be an Oracle-specific JSON-language type, such as a date, which is not part of the JSON standard.

To use `JSON_SCALAR` you must set the database initialization parameter `compatible` is at least `20`. Otherwise it raises an error.

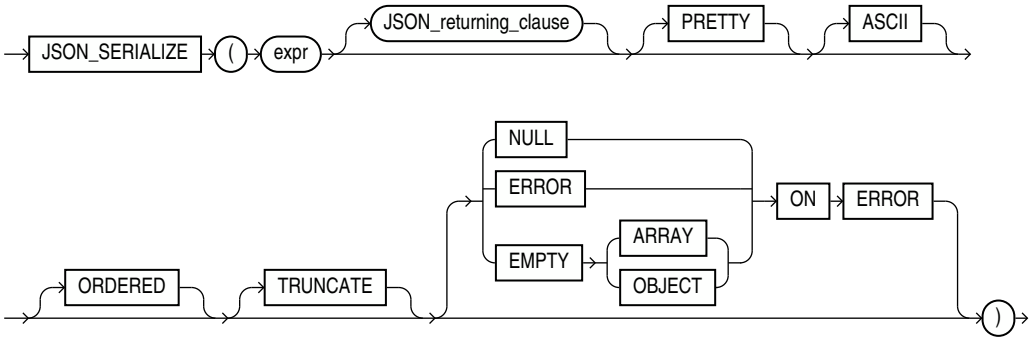
The argument to `JSON_SCALAR` can be an instance of any of these SQL data types: `BINARY_DOUBLE`, `BINARY_FLOAT`, `BLOB`, `CLOB`, `DATE`, `INTERVAL YEAR TO MONTH`, `INTERVAL DAY TO SECOND`, `JSON`, `NUMBER`, `RAW`, `TIMESTAMP`, `VARCHAR`, `VARCHAR2`, or `VECTOR`.

The returned `JSON` type instance is a JSON-language scalar value supported by Oracle.

If the argument to `JSON_SCALAR` is a SQL NULL value, then you can obtain a return value as follows:

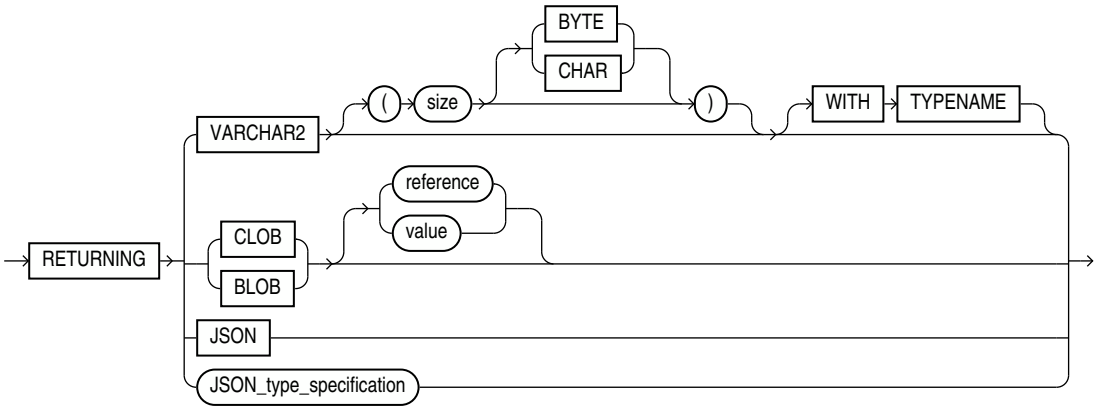
- SQL `NULL`, the default behavior
- JSON `null`, using keywords `NULL ON NULL`
- An empty JSON string, " ", using keywords `EMPTY STRING ON NULL`

The default behavior of returning SQL `NULL` is the only exception to the rule that a JSON scalar value is returned.



> **See Also**
>
> See Oracle SQL Function JSON_SCALAR of the *JSON Developer's Guide*.

JSON_SERIALIZE



Syntax

json_serialize

Copyright © 1996, 2026, Oracle and/or its affiliates.

json_returning_clause

Purpose

`json_serialize` takes JSON data of any SQL data type (`BLOB`,`CLOB`, `JSON`, or `VARCHAR2`) as input and returns a textual representation of it. You typically use it to transform the result of a query.

You can use `json_serialize` to convert binary JSON data to textual form (`CLOB` or `VARCHAR2`), or to transform textual JSON data by pretty-printing it or escaping non-ASCII Unicode characters in it.

When Oracle SQL function *`vector_serialize`* is applied to a JSON type instance, any non-standard Oracle scalar JSON value is returned as a standard JSON scalar value.

When you apply *`vector_serialize`* to a `VECTOR` type instance, it returns a textual JSON array of numbers.

> **Note**
>
> You can serialize a `VECTOR` instance to a textual JSON array of numbers using SQL function *`vector_serialize`*. (Function json_serialize serializes only JSON data.) See VECTOR_SERIALIZE

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> Oracle SQL Function JSON_SERIALIZE of the *JSON Developer's Guide.*

expr

expr is the input expression. Can be any one of type JSON, VARCHAR2, CLOB, or BLOB.

***JSON_returning_clause*::=**

You can use the *JSON_returning_clause* to specify the return type of the function. One of BOOLEAN, BLOB, CLOB, JSON, or VARCHAR2.

The default return type is VARCHAR2(4000).

If the return type is RAW or BLOB, it contains UTF8 encoded JSON text.

PRETTY

Specify PRETTY if you want the result to be formatted for human readability.

ASCII

Specify ASCII if you want non-ASCII characters to be output using JSON escape sequences.

ORDERED

Specify ORDERED if you want to reorder key-value pairs alphabetically in ascending order. You can combine ORDERED with PRETTY and ASCII.

Example

```
SELECT JSON_SERIALIZE('{price:20, currency:" €"}' ASCII PRETTY ORDERED) from dual;
{
  "currency" : "\u20AC",
  "price" : 20
}
```

TRUNCATE

Specify TRUNCATE, if you want the textual output in the result document to fit into the buffer of the specified return type .

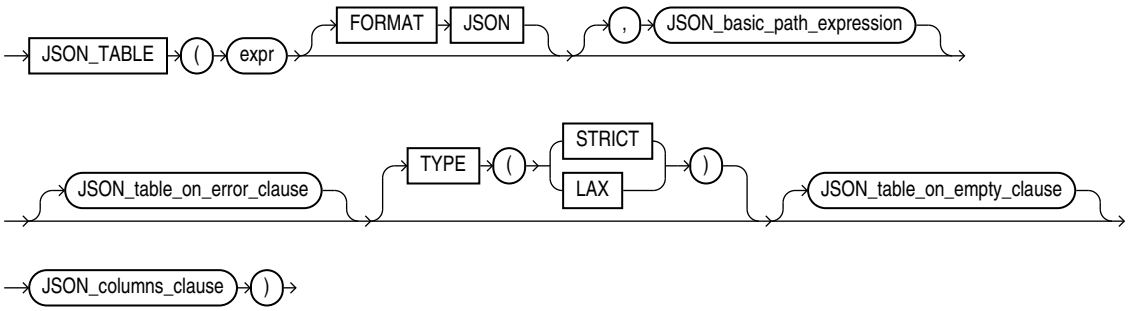
***JSON_on_error_clause*::=**

Specify *JSON_on_error_clause* to control the handling of processing errors.

ERROR ON ERROR is the default.

EMPTY ON ERROR is not supported.

If you specify TRUNCATE with JSON_on_error_clause, then a value too large for the return type will be truncated to fit into the buffer instead of raising an error.



Example

```
SELECT JSON_SERIALIZE ('{a:[1,2,3,4]}' RETURNING VARCHAR2(3) TRUNCATE ERROR ON ERROR)
from dual
--------
{"a
```

Purpose

The SQL/JSON function `JSON_TABLE` creates a relational view of JSON data. It maps the result of a JSON data evaluation into relational rows and columns. You can query the result returned by the function as a virtual relational table using SQL. The main purpose of `JSON_TABLE` is to create a row of relational data for each object inside a JSON array and output JSON values from within that object as individual SQL column values.

You must specify `JSON_TABLE` only in the `FROM` clause of a `SELECT` statement. The function first applies a path expression, called a **SQL/JSON row path expression**, to the supplied JSON data. The JSON value that matches the row path expression is called a **row source** in that it generates a row of relational data. The `COLUMNS` clause evaluates the row source, finds specific JSON values within the row source, and returns those JSON values as SQL values in individual columns of a row of relational data.

The `COLUMNS` clause enables you to search for JSON values in different ways by using the following clauses:

Copyright © 1996, 2026, Oracle and/or its affiliates.

- *JSON_exists_column* - Evaluates JSON data in the same manner as the JSON_EXISTS condition, that is, determines if a specified JSON value exists, and returns either a VARCHAR2 column of values 'true' or 'false', or a NUMBER column of values 1 or 0.
- *JSON_query_column* - Evaluates JSON data in the same manner as the JSON_QUERY function, that is, finds one or more specified JSON values, and returns a column of character strings that contain those JSON values.
- *JSON_value_column* - Evaluates JSON data in the same manner as the JSON_VALUE function, that is, finds a specified scalar JSON value, and returns a column of those JSON values as SQL values.
- *JSON_nested_path* - Allows you to flatten JSON values in a nested JSON object or JSON array into individual columns in a single row along with JSON values from the parent object or array. You can use this clause recursively to project data from multiple layers of nested objects or arrays into a single row.
- *ordinality_column* - Returns a column of generated row numbers.

The column definition clauses allow you to specify a name for each column of data that they return. You can reference these column names elsewhere in the SELECT statement, such as in the SELECT list and the WHERE clause.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to each character data type column in the table generated by JSON_TABLE

expr

Use this clause to specify the JSON data to be evaluated. For *expr*, specify an expression that evaluates to a text literal. If *expr* is a column, then the column must be of data type VARCHAR2, CLOB, or BLOB. If *expr* is null, then the function returns null.

If *expr* is not a text literal of well-formed JSON data using strict or lax syntax, then the function returns null by default. You can use the *JSON_table_on_error_clause* to override this default behavior. Refer to *JSON_table_on_error_clause*.

FORMAT JSON

You must specify FORMAT JSON if *expr* is a column of data type BLOB.

PATH

Use the PATH clause to delineate a portion of the row that you want to use as the column content. The absence of the PATH clause does not change the behavior with a path of *'$.<column-name>'*, where *<column-name>* is the column name. The name of the object field that is targeted is taken implicitly as the column name. See *Oracle Database JSON Developer's Guide* for the full semantics of PATH.

JSON_basic_path_expression

The *JSON_basic_path_expression* is a text literal. See *Oracle Database JSON Developer's Guide* for the full semantics of this clause.

Copyright © 1996, 2026, Oracle and/or its affiliates.

JSON_relative_object_access

Specify this row path expression to enable simple dot notation. The value of `JSON_relative_object_access` is evaluated as a JSON/Path expression relative to the current row item.

For more information on the *`JSON_object_key clause`*, refer to JSON Object Access Expressions .

JSON_table_on_error_clause

Use this clause to specify the value returned by the function when errors occur:

- *`NULL ON ERROR`*
  - If the input is not well-formed *`JSON`* text, no more rows will be returned as soon as the error is detected. Note that since *`JSON_TABLE`* supports streaming evaluation, rows may be returned prior to encountering the portion of the input with the error.
  - If no match is found when the row path expression is evaluated, no rows are returned.
  - Sets the default error behavior for all column expressions to *`NULL ON ERROR`*
- *`ERROR ON ERROR`*
  - If the input is not well-formed *`JSON`* text, an error will be raised.
  - If no match is found when the row path expression is evaluated, an error will be raised
  - Sets the default error behavior for all column expressions to *`ERROR ON ERROR`*

TYPE Clause

For a full discussion of `STRICT` and `LAX` syntax see *About Strict and Lax JSON Syntax*, and *TYPE Clause for SQL Functions and Conditions*

JSON_table_on_empty_clause

Use this clause to specify the value returned by this function if no match is found when the JSON data is evaluated using the SQL/JSON path expression. This clause allows you to specify a different outcome for this type of error than the outcome specified with the *`JSON_table_on_error_clause.`*

You can specify the following clauses:

- `NULL ON EMPTY` - Returns null when no match is found.
- `ERROR ON EMPTY` - Returns the appropriate Oracle error when no match is found.
- `DEFAULT` *`literal`* `ON EMPTY` - Returns *`literal`* when no match is found. The data type of *`literal`* must match the data type of the value returned by this function.

If you omit this clause, then the *`JSON_table_on_error_clause`* determines the value returned when no match is found.

JSON_columns_clause

Use the `COLUMNS` clause to define the columns in the virtual relational table returned by the `JSON_TABLE` function.

Copyright © 1996, 2026, Oracle and/or its affiliates.

JSON_exists_column

This clause evaluates JSON data in the same manner as the `JSON_EXISTS` condition, that is, it determines if a specified JSON value exists. It returns either a `VARCHAR2` column of values '`true`' or '`false`', or a `NUMBER` column of values 1 or 0.

A value of '`true`' or 1 indicates that the JSON value exists and a value of '`false`' or 0 indicates that the JSON value does not exist.

You can use the *`JSON_value_return_type`* clause to control the data type of the returned column. If you omit this clause, then the data type is `VARCHAR2(4000)`. Use *`column_name`* to specify the name of the returned column. The rest of the clauses of *`JSON_exists_column`* have the same semantics here as they have for the `JSON_EXISTS` condition. For full information on these clauses, refer to "JSON_EXISTS Condition". Also see "Example 6: Using JSON_exists_column" for an example.

JSON_query_column

This clause evaluates JSON data in the same manner as the `JSON_QUERY` function, that is, it finds one or more specified JSON values, and returns a column of character strings that contain those JSON values.

Use *`column_name`* to specify the name of the returned column. The rest of the clauses of *`JSON_query_column`* have the same semantics here as they have for the `JSON_QUERY` function. For full information on these clauses, refer to JSON_QUERY. Also see "Example 4: Using JSON_query_column" for an example.

JSON_value_column

This clause evaluates JSON data in the same manner as the `JSON_VALUE` function, that is, it finds a specified scalar JSON value, and returns a column of those JSON values as SQL values.

Use *`column_name`* to specify the name of the returned column. The rest of the clauses of *`JSON_value_column`* have the same semantics here as they have for the `JSON_VALUE` function. For full information on these clauses, refer to JSON_VALUE. Also see "Example 5: Using JSON_value_column" for an example.

JSON_nested_path

Use this clause to flatten JSON values in a nested JSON object or JSON array into individual columns in a single row along with JSON values from the parent object or array. You can use this clause recursively to project data from multiple layers of nested objects or arrays into a single row.

Specify the *`JSON_basic_path_expression`* clause to match the nested object or array. This path expression is relative to the SQL/JSON row path expression specified in the `JSON_TABLE` function.

Use the `COLUMNS` clause to define the columns of the nested object or array to be returned. This clause is recursive—you can specify the *`JSON_nested_path`* clause within another *`JSON_nested_path`* clause. Also see "Example 7: Using JSON_TABLE without JSON_nested_path" for an example.

Copyright © 1996, 2026, Oracle and/or its affiliates.

ordinality_column

This clause returns a column of generated row numbers of data type `NUMBER`. You can specify at most one *`ordinality_column`*. Also see "Example 5: Using JSON_value_column" for an example of using the *`ordinality_column`* clause.

nested_clause

Use the `nested_clause` as a short-hand syntax for mapping JSON values to relational columns. It reuses the syntax of the `JSON_TABLE` columns clause and is essentially equivalent to a left-outer ANSI join with `JSON_TABLE`.

Examples

Create a Table That Contains a JSON Document

This example shows how to create and populate table `j_purchaseorder`, which is used in the rest of the `JSON_TABLE` examples in this section.

The following two statements creates table `j_purchaseorder` and inserts one row, or one JSON document into it. Column `po_document` is for storing JSON data and, therefore, has an `IS JSON` check constraint to ensure that only well-formed JSON is stored in the column.

```
CREATE TABLE j_purchaseorder
  (id RAW (16) NOT NULL,
   date_loaded TIMESTAMP(6) WITH TIME ZONE,
   po_document CLOB CONSTRAINT ensure_json CHECK (po_document IS JSON));
INSERT INTO j_purchaseorder
  VALUES (
    SYS_GUID(),
    SYSTIMESTAMP,
    '{"PONumber"             : 1600,
      "Reference"            : "ABULL-20140421",
       "Requestor"           : "Alexis Bull",
       "User"                : "ABULL",
       "CostCenter"          : "A50",
       "ShippingInstructions" : {"name"   : "Alexis Bull",
                                 "Address": {"street"   : "200 Sporting
Green",
                                             "city"    : "South San
Francisco",
                                             "state"   : "CA",
                                             "zipCode" : 99236,
                                             "country" : "United States of
America"},
                                 "Phone" : [{"type" : "Office", "number" :
"909-555-7307"},
                                            {"type" : "Mobile", "number" :
"415-555-1234"}]},
       "Special Instructions" : null,
       "AllowPartialShipment" : true,
       "LineItems" : [{"ItemNumber" : 1,
                       "Part" : {"Description" : "One Magic Christmas",
                                 "UnitPrice"   : 19.95,
                                 "UPCCode"     : 13131092899},
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
 "Quantity" : 9.0},
{"ItemNumber" : 2,
 "Part" : {"Description" : "Lethal Weapon",
           "UnitPrice"   : 19.95,
           "UPCCode"     : 85391628927},
 "Quantity" : 5.0}]}');
```

Example 1: Nested Clause

Example 1 using the nested clause is equivalent to Example 2 using the left-outer join with `JSON_TABLE` .

```
SELECT t.*
FROM j_purchaseOrder
NESTED po_document COLUMNS(PONumber, Reference, Requestor) t;
```

Result:

```
PONUMBER REFERENCE REQUESTOR
-------------- ---------------------------- ----------------------------
1600 ABULL-20140421 Alexis Bull
```

Example 2: Left-Outer Join With JSON_TABLE

```
SELECT t.*
FROM j_purchaseOrder LEFT OUTER JOIN
JSON_TABLE(po_document COLUMNS(PONumber, Reference, Requestor)) t ON 1=1;
```

When using the `nested_clause`, the JSON column name following the `NESTED` keyword will not be included in `SELECT *` expansion. For example:

```
SELECT *
FROM j_purchaseOrder
NESTED po_document.LineItems[*]
COLUMNS(ItemNumber, Quantity NUMBER);
```

Result:

```
ID              DATE_LOADED                          ITEMNUMBER     QUANTITY
----------------------- -------------------------- ------------- --------
6C5589E9A9156… 16-MAY-18 08.40.30.397688 AM -07:00 1             9
6C5589E9A9156… 16-MAY-18 08.40.30.397688 AM -07:00 2             5
```

The result does not include the JSON column name `po_document` as one of the columns in the result.

When unnesting JSON column data, the recommendation is to use `LEFT OUTER JOIN` semantics, so that JSON columns that produce no rows will not filter other non-JSON data from the result. For example, a `j_purchaseOrder` row with a NULL `po_document` column will not filter the possibly non-null relational `columns id` and `date_loaded` from the result.

Example 3: Columns Clause with JSON_TABLE

Copyright © 1996, 2026, Oracle and/or its affiliates.

The columns clause supports all the same features defined for JSON_TABLE including nested columns.

```
SELECT t.*
FROM j_purchaseorder
NESTED po_document COLUMNS(PONumber, Reference,
NESTED LineItems[*] COLUMNS(ItemNumber, Quantity)
) t;
```

Result:

```
PONUMBER REFERENCE      ITEMN QUANTITY
-------- -------------- ----- --------
1600     ABULL-20140421 1     9
1600     ABULL-20140421 2     5
```

Example 4: Using JSON_query_column

The statement in this example queries JSON data for a specific JSON property using the *JSON_query_column* clause, and returns the property value in a column.

The statement first applies a SQL/JSON row path expression to column po_document, which results in a match to the ShippingInstructions property. The COLUMNS clause then uses the *JSON_query_column* clause to return the Phone property value in a VARCHAR2(100) column.

```
SELECT jt.phones
  FROM j_purchaseorder,
  JSON_TABLE(po_document, '$.ShippingInstructions'
  COLUMNS
  (phones VARCHAR2(100) FORMAT JSON PATH '$.Phone')) AS jt;
```

```
PHONES
--------------------------------------------------------------------------------
[{"type":"Office","number":"909-555-7307"},{"type":"Mobile","number":"415-555-1234"}]
```

Example 5: Using JSON_value_column

The statement in this example refines the statement in the previous example by querying JSON data for specific JSON values using the *JSON_value_column* clause, and returns the JSON values as SQL values in relational rows and columns.

The statement first applies a SQL/JSON row path expression to column po_document, which results in a match to the elements in the JSON array Phone. These elements are JSON objects that contain two members named type and number. The statement uses the COLUMNS clause to return the type value for each object in a VARCHAR2(10) column called phone_type, and the number value for each object in a VARCHAR2(20) column called phone_num. The statement also returns an ordinal column named row_number.

```
SELECT jt.*
  FROM j_purchaseorder,
  JSON_TABLE(po_document, '$.ShippingInstructions.Phone[*]'
  COLUMNS (row_number FOR ORDINALITY,
         phone_type VARCHAR2(10) PATH '$.type',
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
         phone_num VARCHAR2(20) PATH '$.number'))
AS jt;

ROW_NUMBER PHONE_TYPE PHONE_NUM
---------- ---------- --------------------
         1 Office     909-555-7307
         2 Mobile     415-555-1234
```

Example 6: Using JSON_exists_column

The statements in this example test whether a JSON value exists in JSON data using the *JSON_exists_column* clause. The first example returns the result of the test as a 'true' or 'false' value in a column. The second example uses the result of the test in the WHERE clause.

The following statement first applies a SQL/JSON row path expression to column po_document, which results in a match to the entire context item, or JSON document. It then uses the COLUMNS clause to return the requestor's name and a string value of 'true' or 'false' indicating whether the JSON data for that requestor contains a zip code. The COLUMNS clause first uses the *JSON_value_column* clause to return the Requestor value in a VARCHAR2(32) column called requestor. It then uses the *JSON_exists_column* clause to determine if the zipCode object exists and returns the result in a VARCHAR2(5) column called has_zip.

```
SELECT requestor, has_zip
FROM j_purchaseorder,
JSON_TABLE(po_document, '$'
COLUMNS
  (requestor VARCHAR2(32) PATH '$.Requestor',
   has_zip VARCHAR2(5) EXISTS PATH '$.ShippingInstructions.Address.zipCode'));

REQUESTOR                       HAS_ZIP
------------------------------- -------
Alexis Bull                     true
```

The following statement is similar to the previous statement, except that it uses the value of has_zip in the WHERE clause to determine whether to return the Requestor value:

```
SELECT requestor
FROM j_purchaseorder,
JSON_TABLE(po_document, '$'
COLUMNS
  (requestor VARCHAR2(32) PATH '$.Requestor',
   has_zip VARCHAR2(5) EXISTS PATH '$.ShippingInstructions.Address.zipCode'))
WHERE (has_zip = 'true');

REQUESTOR
-------------------------------
Alexis Bull
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Example 7: Using JSON_TABLE without JSON_nested_path

Examples 7 and 8 demonstrate the functionality of the *JSON_nested_path* clause. They operate on a simple JSON array that contains three elements. The first two elements are numbers. The third element is a nested JSON array that contains two string value elements.

The following statement does not use the *JSON_nested_path* clause. It returns all the three elements in the nested array in a single row:

```
SELECT *
FROM JSON_TABLE('[1,2,["a","b"]]', '$'
COLUMNS (outer_value_0 NUMBER PATH '$[0]',
         outer_value_1 NUMBER PATH '$[1]',
         outer_value_2 VARCHAR2(20) FORMAT JSON PATH '$[2]'));
```

Result:

```
OUTER_VALUE_0 OUTER_VALUE_1 OUTER_VALUE_2
------------- ------------- --------------------
            1             2 ["a","b"]
```

Example 8: Using JSON_TABLE with JSON_nested_path

The following example uses *JSON_nested_path* clause with a nested JSON array to return the individual elements of the nested array in individual columns in a single row along with the parent array elements:

```
SELECT *
FROM JSON_TABLE('[1,2,["a","b"]]', '$'
COLUMNS (outer_value_0 NUMBER PATH '$[0]',
         outer_value_1 NUMBER PATH '$[1]',
         NESTED PATH '$[2]'
         COLUMNS (nested_value_0 VARCHAR2(1) PATH '$[0]',
                  nested_value_1 VARCHAR2(1) PATH '$[1]')));
```

Result:

```
OUTER_VALUE_0 OUTER_VALUE_1 NESTED_VALUE_0 NESTED_VALUE_1
------------- ------------- -------------- --------------
            1             2 a              b
```

Example 9: Using JSON_nested_path with a Nested JSON Object

The following example shows how to use the *JSON_nested_path* clause with a nested JSON object by returning the individual elements of the nested object in individual columns in a single row along with the parent object elements.

```
SELECT *
FROM JSON_TABLE('{a:100, b:200, c:{d:300, e:400}}', '$'
COLUMNS (outer_value_0 NUMBER PATH '$.a',
         outer_value_1 NUMBER PATH '$.b',
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
          NESTED PATH '$.c'
          COLUMNS (nested_value_0 NUMBER PATH '$.d',
                   nested_value_1 NUMBER PATH '$.e')));

OUTER_VALUE_0 OUTER_VALUE_1 NESTED_VALUE_0 NESTED_VALUE_1
------------- ------------- -------------- --------------
          100           200            300            400
```

Example 10: Using JSON_nested_path to Query

The following example uses the *JSON_nested_path* clause when querying the `j_purchaseorder` table. It first applies a row path expression to column `po_document`, which results in a match to the entire context item, or JSON document. It then uses the `COLUMNS` clause to return the `Requestor` value in a `VARCHAR2(32)` column called `requestor`. It then uses the *JSON_nested_path* clause to return the property values of the individual objects in each member of the nested `Phone` array. Note that a row is generated for each member of the nested array, and each row contains the corresponding `Requestor` value.

```
SELECT jt.*
FROM j_purchaseorder,
JSON_TABLE(po_document, '$'
COLUMNS
  (requestor VARCHAR2(32) PATH '$.Requestor',
   NESTED PATH '$.ShippingInstructions.Phone[*]'
     COLUMNS (phone_type VARCHAR2(32) PATH '$.type',
              phone_num VARCHAR2(20) PATH '$.number')))
AS jt;

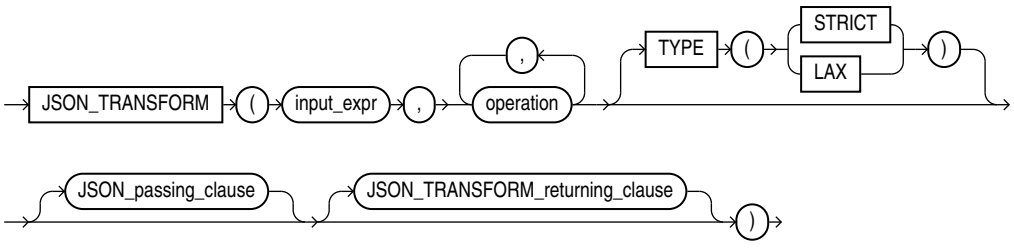
REQUESTOR            PHONE_TYPE           PHONE_NUM
-------------------- -------------------- ---------------
Alexis Bull          Office               909-555-7307
Alexis Bull          Mobile               415-555-1234
```

Example 11: JSON_nested_clause With Dot-Notation

The following two examples shows the use of simple dot-notation in `JSON_nested_path` and its equivalent without dot notation.

```
SELECT c.*
FROM customer t,
JSON_TABLE(t.json COLUMNS(
id, name, phone, address,
NESTED orders[*] COLUMNS(
updated, status,
NESTED lineitems[*] COLUMNS(
description, quantity NUMBER, price NUMBER
)
)
)) c;
```

Example 11: JSON_nested_clause Without Dot-Notation



The above statement in dot notation is equivalent to the following one without dot notation:

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT c.*
FROM customer t,
JSON_TABLE(t.json, '$' COLUMNS(
id PATH '$.id',
name PATH '$.name',
phone PATH '$.phone',
address PATH '$.address',
NESTED PATH '$.orders[*]' COLUMNS(
updated PATH '$.updated',
status PATH '$.status',
NESTED PATH '$.lineitems[*]' COLUMNS(
description PATH '$.description',
quantity NUMBER PATH '$.quantity',
price NUMBER PATH '$.price'
)
)
)) c;
```

Purpose

`JSON_TRANSFORM` modifies JSON documents. You specify operations to perform and SQL/JSON path expressions that target the places to modify. The operations are applied to the input data in the order specified: each operation acts on the data that results from applying all of the preceding operations.

`JSON_TRANSFORM` either succeeds completely or not at all. If any of the specified operations raises an error, then none of the operations take effect. `JSON_TRANSFORM` returns the original data changed according to the operations specified.

You can use the `JSON_TRANSFORM` within the `UPDATE` statement to modify documents in a JSON column.

You can use it in a `SELECT` list, to modify the selected documents. The modified documents can be returned or processed further.

`JSON_TRANSFORM` can accept as input, and return as output, any SQL data type that supports JSON data: `JSON`, `VARCHAR2`, `CLOB`, or `BLOB`. Note that data type `JSON` is available only if database initialization parameter compatible is 20 or greater.

The default return (output) data type is the same as the input data type.

> **See Also**
>
> *Oracle SQL Function JSON_TRANSFORM of the JSON Developer's Guide* for a full discussion with examples.

JSON_TRANSFORM Operations

- Use `ADD_SET` to add missing value to an array, as if adding an element to a set.
- Use `APPEND` to append the values that are specified by the RHS to the array that is targeted by the LHS path expression.

  `APPEND` has the effect of `INSERT` for an array position of last+1.

  An error is raised if the LHS path expression targets an existing field whose value is not an array.

  If the RHS targets an array then the LHS array is updated by appending the elements of the RHS array to it, in order.
- Use `CASE` to set conditions to perform a sequence of `JSON_TRANSFORM` operations.

  This is a control operation that conditionally applies other operations, which in turn can modify data.

  The syntax is keyword `CASE` followed by one or more `WHEN` clauses, followed optionally by an `ELSE` clause, followed by `END`.

  A `WHEN` clause is keyword `WHEN` followed by a path expression, followed by a `THEN` clause.

  The path expression contains a filter condition, which checks for the existence of some data.

  A `THEN` or an `ELSE` clause is keyword `THEN` or `ELSE`, respectively, followed by parentheses (()) containing zero or more `JSON_TRANSFORM` operations.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The operations of a THEN clause are performed if the condition of its WHEN clause is satisfied. The operations of the optional ELSE clause are performed if the condition of no WHEN clause is satisfied.

The syntax of the JSON_TRANSFORM CASE operation is thus essentially the same as an Oracle SQL searched CASE expression, except that it is the predicate that is tested and the resulting effect of each THEN/ELSE branch.

For SQL, the predicate tested is a SQL comparison. For JSON_TRANSFORM, the predicate is a path expression that checks for the existence of some data. (The check is essentially done using JSON_EXISTS.)

For SQL, each THEN/ELSE branch holds a SQL expression to evaluate, and its value is returned as the result of the CASE expression. For json_transform, each THEN/ELSE branch holds a (parenthesized) sequence of JSON_TRANSFORM operations, which are performed in order.

The conditional path expressions of the WHEN clauses are tested in order, until one succeeds (those that follow are not tested). The THEN operations for the successful WHEN test are then performed, in order.

- Use COPY to replace the elements of the array that is targeted by the LHS path expression with the values that are specified by the RHS. An error is raised if the LHS path expression does not target an array. The operation can accept a sequence of multiple values matched by the RHS path expression.
- INSERT Insert the value of the specified SQL expression at the location that's targeted by the specified path expression that follows the equal sign (=), which must be either the field of an object or an array position (otherwise, an error is raised). By default, an error is raised if a targeted object field already exists.

  INSERT for an object field has the effect of SET with clause CREATE ON MISSING (default for SET), except that the default behavior for ON EXISTING is ERROR, not REPLACE.)

  You can specify an array position past the current end of an array. In that case, the array is lengthened to accommodate insertion of the value at the indicated position, and the intervening positions are filled with JSON null values.

  For example, if the input JSON data is {"a":["b"]} then INSERT '$.a[3]'=42 returns {"a":["b", null, null 42]} as the modified data. The elements at array positions 1 and 2 are null.
- Use INTERSECT to remove all elements of the array that is targeted by the LHS path expression that are not equal to any value specified by the RHS. Remove any duplicate elements. Note that this is a set operation. The order of all array elements is undefined after the operation.
- Use MERGE to add specified fields (name and value) matched by the RHS path expression to the object that is targeted by the LHS path expression. Ignore any fields specified by the RHS that are already in the targeted LHS object. If the same field is specified more than once by the RHS then use only the last one in the sequence of matches.
- Use MINUS to remove all elements of the array that is targeted by the LHS path expression that are equal to a value specified by the RHS. Remove any duplicate elements. Note that this is a set operation. The order of all array elements is undefined after the operation.
- KEEP removes all parts of the input data that are not targeted by at least one of the specified path expressions. A topmost object or array is not removed, it is emptied and becomes an empty object ({}) or array ([]).
- Use NESTED PATH to define a scope (a particular part of your data) in which to apply a sequence of operations.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- Use `PREPEND` to prepend the values that are specified by the RHS to the array that is targeted by the LHS path expression. The operation can accept a sequence of multiple values matched by the RHS path expression.

  An error is raised if the LHS path expression targets an existing field whose value is not an array.

  When prepending a single value, `PREPEND` has the effect of `INSERT` for an array position of 0.

  If the RHS targets an array then the LHS array is updated by prepending the elements of the RHS array to it, in order.

- `REMOVE` Remove the input data that's targeted by the specified path expression. An error is raised if you try to remove all of the data, for example you cannot use `REMOVE '$'`. By default, no error is raised if the targeted data does not exist (`IGNORE ON MISSING`).

- Use `REMOVE_SET` to remove all occurrences of a value from an array, as if removing an element from a set.

- `RENAME` renames the field that is targeted by the specified path expression to the value of the SQL expression that follows the equal sign (=). By default, no error is raised if the targeted field does not exist (`IGNORE ON MISSING`).

- `REPLACE` replaces the data that's targeted by the specified path expression with the value of the specified SQL expression that follows the equal sign (=). By default, no error is raised if the targeted data does not exist (`IGNORE ON MISSING`).

  `REPLACE` has the effect of `SET` with clause `IGNORE ON MISSING`.

- `SET` Set what the LHS specifies to the value specified by what follows the equal sign (=). The LHS can be either a SQL/JSON variable or a path expression that targets data. If the RHS is a SQL expression then its value is assigned to the LHS variable. When the LHS specifies a path expression, the default behavior is to replace existing targeted data with the new value, or insert the new value at the targeted location if the path expression matches nothing. (See operator `INSERT` about inserting an array element past the end of the array.)

- When the LHS specifies a SQL/JSON variable, the variable is dynamically assigned to whatever is specified by the RHS. (The variable is created if it does not yet exist.) The variable continues to have that value until it is set to a different value by a subsequent `SET` operation (in the same `JSON_TRANSFORM` invocation).

  If the RHS is a path expression then its targeted data is assigned to the variable.

  Setting a variable is a control operation; it can affect how subsequent operations modify data, but it does not, itself, directly modify data.

  When the LHS specifies a path expression, the default behavior is like that of SQL `UPSERT`: replace existing targeted data with the new value, or insert the new value at the targeted location if the path expression matches nothing. (See operator `INSERT` about inserting an array element past the end of the array.)

- `SORT` sorts the elements of the array targeted by the specified path. The result includes all elements of the array (none are dropped); the only possible change is that they are reordered.

- Use `UNION` to add the values specified by the RHS to the array that is targeted by the LHS path expression. Remove any duplicate elements. The operation can accept a sequence of multiple values matched by the RHS path expression. Note that this is a set operation. The order of all array elements is undefined after the operation.

Copyright © 1996, 2026, Oracle and/or its affiliates.

TYPE Clause

For a full discussion of `STRICT` and `LAX` syntax see *About Strict and Lax JSON Syntax*, and *TYPE Clause for SQL Functions and Conditions*

JSON_passing_clause

You can use *`JSON_passing_clause`* to specify SQL bindings of bind variables to SQL/JSON variables similar to the `JSON_EXISTS` condition and the SQL/JSON query functions.

JSON_TRANSFORM_returning_clause

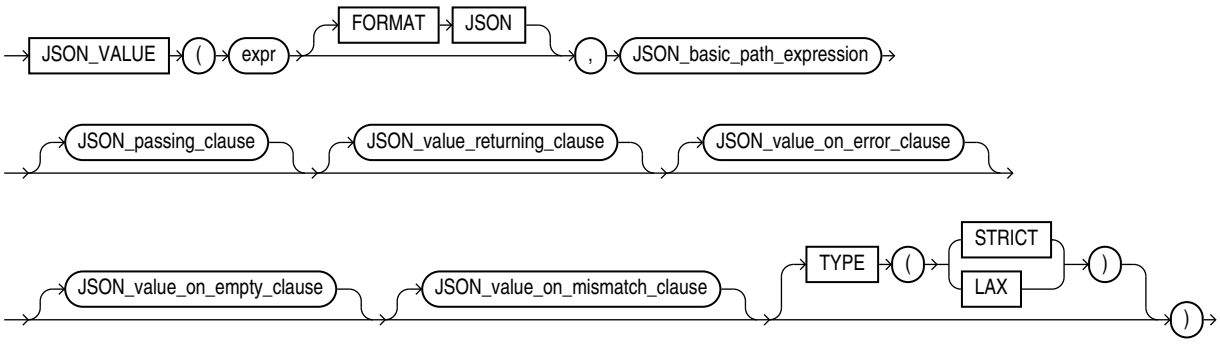
After you specify the operations you can use *`JSON_TRANSFORM_returning_clause`* to specify the return data type.

Examples

Example 1 : Update a JSON Column with a Timestamp

```
UPDATE t SET jcol = JSON_TRANSFORM(jcol, SET '$.lastUpdated' = SYSTIMESTAMP)
```

Example 2 : Remove a Social Security Number before Shipping JSON to a Client

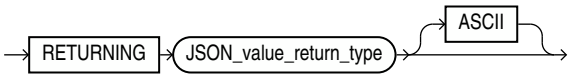


```
SELECT JSON_TRANSFORM (jcol, REMOVE '$.ssn') FROM t WHERE …
```

JSON_TRANSFORM_returning_clause

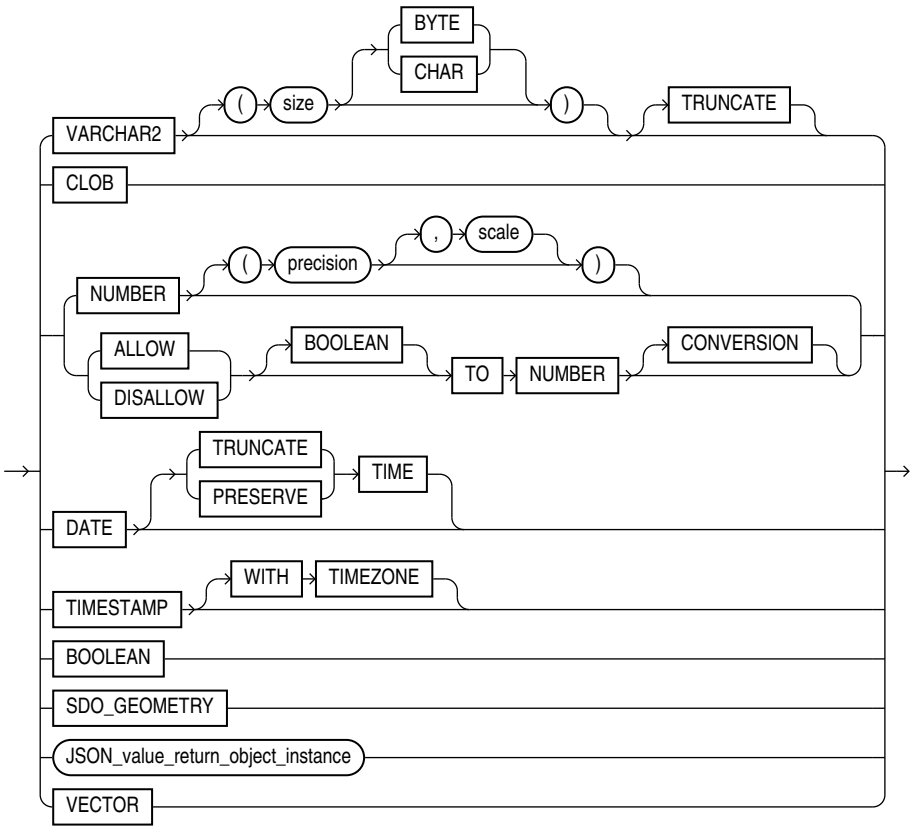
If the input data is JSON, then the output data type is also JSON. For all other input types, the default output data type is `VARCHAR2(4000)`.

JSON_VALUE



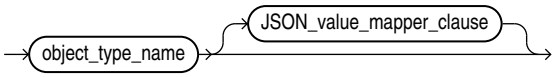
Syntax

JSON_basic_path_expression::=



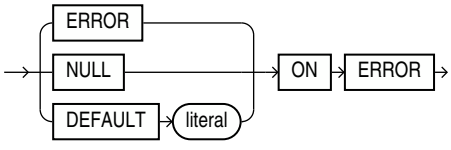
(*`JSON_basic_path_expression`*: See *SQL/JSON Path Expressions*)

JSON_value_returning_clause::=



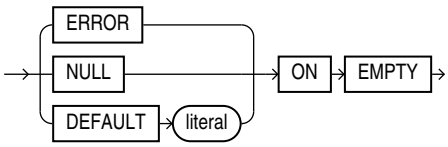
Copyright © 1996, 2026, Oracle and/or its affiliates.

***JSON_value_return_type*::=**

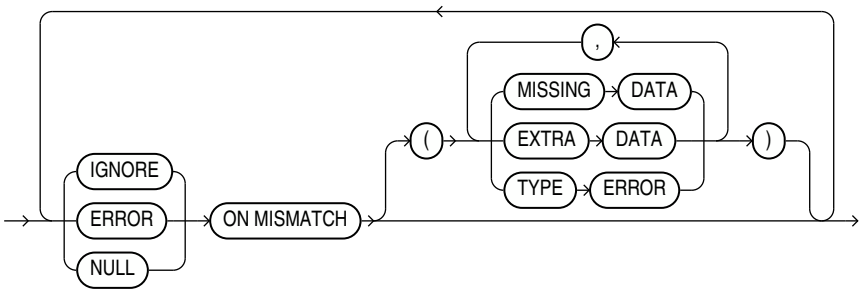


***JSON_value_return_object_instance* ::=**

***JSON_value_mapper_clause* ::=**



***JSON_value_on_error_clause*::=**



Copyright © 1996, 2026, Oracle and/or its affiliates.

***JSON_value_on_empty_clause*::=**

***JSON_value_on_mismatch_clause*::=**

Purpose

SQL/JSON function `JSON_VALUE` selects JSON data and returns a SQL scalar or an instance of a user-defined SQL object type or SQL collection type (varray, nested table)

> **See Also**
>
> - *JSON TRANSFORM* of the *JSON Developer's Guide.*
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the value returned by this function when it is a character value

expr

The first argument to `JSON_VALUE` *`expr`* is a SQL expression that returns an instance of a scalar SQL data type (that is, not an object or collection data type). A scalar value returned from`JSON_VALUE` can be of any of these data types: `BINARY_DOUBLE`, `BINARY_FLOAT`, `BOOLEAN`, `CHAR`, `CLOB`, `DATE`, `INTERVAL DAY TO SECOND`, `INTERVAL YEAR TO MONTH`, `NCHAR`, `NCLOB`, `NVARCHAR2`, `NUMBER`, `RAW1`, `SDO_GEOMETRY`, `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, `VARCHAR2`, and `VECTOR`.

If *`expr`* is not a text literal of well-formed JSON data using strict or lax syntax, then the function returns null by default. You can use the *`JSON_value_on_error_clause`* to override this default behavior. Refer to the *JSON_value_on_error_clause*.

FORMAT JSON

You must specify `FORMAT JSON` if *`expr`* is a column of data type `BLOB`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

JSON_basic_path_expression

Use this clause to specify a SQL/JSON path expression. The function uses the path expression to evaluate *expr* and find a scalar JSON value that matches, or satisfies, the path expression. The path expression must be a text literal. See *Oracle Database JSON Developer's Guide* for the full semantics of *JSON_basic_path_expression*.

JSON_value_returning_clause

Use this clause to specify the data type and format of the value returned by this function.

RETURNING

Use the RETURNING clause to specify the data type of the return value. If you omit this clause, then JSON_VALUE returns a value of type VARCHAR2(4000).

***JSON_value_return_type* ::=**

You can use *JSON_value_return_type* to specify the following data types:

- VARCHAR2[(*size* [BYTE,CHAR])]

  If you specify this data type, then the scalar value returned by this function can be a character or number value. A number value will be implicitly converted to a VARCHAR2. When specifying the VARCHAR2 data type elsewhere in SQL, you are required to specify a size. However, in this clause you can omit the size. In this case, JSON_VALUE returns a value of type VARCHAR2(4000).

  Specify the optional TRUNCATE clause immediately after VARCHAR2(N) to truncate the return value to N characters, if the return value is greater than N characters.

  Notes on the TRUNCATE clause :

  – If the string value is too long, then ORA-40478 is raised.
  – If TRUNCATE is present, and the return value is not a character type, then a compile time error is raised.
  – If TRUNCATE is present with FORMAT JSON, then the return value may contain data that is not syntactically correct JSON.
  – TRUNCATE does not work with EXISTS.

- CLOB

  Specify this data type to return a character large object containing single-byte or multi-byte characters.

- NUMBER[(*precision* [, *scale*])]

  If you specify this data type, then the scalar value returned by this function must be a number value. The scalar value returned can also be a JSON Boolean value. Note however, that returning NUMBER for a JSON Boolean value is deprecated.

- DATE

  If you specify this data type, then the scalar value returned by this function must be a character value that can be implicitly converted to a DATE data type. If the JSON input represents a date with a time component, specify DATE PRESERVE TIME to retain the time component. If you do not want to retain the time component, specify DATE TRUNCATE TIME.

  If you specify neither PRESERVE TIME nor TRUNCATE TIME, the time component is not preserved.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- `TIMESTAMP`

  If you specify this data type, then the scalar value returned by this function must be a character value that can be implicitly converted to a `TIMESTAMP` data type.

- `TIMESTAMP WITH TIME ZONE`

  If you specify this data type, then the scalar value returned by this function must be a character value that can be implicitly converted to a `TIMESTAMP WITH TIME ZONE` data type.

- `BOOLEAN`

  Specify `BOOLEAN` to return true, false, or unknown.

- `SDO_GEOMETRY`

  This data type is used for Oracle Spatial and Graph data. If you specify this data type, then *expr* must evaluate to a text literal containing GeoJSON data, which is a format for encoding geographic data in JSON. If you specify this data type, then the scalar value returned by this function must be an object of type `SDO_GEOMETRY`.

- *JSON_value_return_object_instance*

  If `JSON_VALUE` targets a JSON object, and you specify a user-defined SQL object type as the return type, then `JSON_VALUE` returns an instance of that object type in *object_type_name*.

  For examples see Using *JSON_VALUE To Instantiate a User-Defined Object Type Instance* of the *JSON Developer's Guide.*

> **See Also**
>
> - *SQL/JSON Function JSON_VALUE* for a conceptual understanding in the *JSON Developer's Guide.*
> - Refer to "Data Types " for more information on the preceding data types.
> - If the data type is not large enough to hold the return value, then this function returns null by default. You can use the *`JSON_value_on_error_clause`* to override this default behavior. Refer to the *JSON_value_on_error_clause*.

ASCII

Specify `ASCII` to automatically escape any non-ASCII Unicode characters in the return value, using standard ASCII Unicode escape sequences.

JSON_value_on_error_clause

Use this clause to specify the value returned by this function when the following errors occur:

- *expr* is not well-formed JSON data using strict or lax JSON syntax
- A nonscalar value is found when the JSON data is evaluated using the SQL/JSON path expression
- No match is found when the JSON data is evaluated using the SQL/JSON path expression. You can override the behavior for this type of error by specifying the *`JSON_value_on_empty_clause`*.
- The return value data type is not large enough to hold the return value

You can specify the following clauses:

Copyright © 1996, 2026, Oracle and/or its affiliates.

- `NULL ON ERROR` - Returns null when an error occurs. This is the default.
- `ERROR ON ERROR` - Returns the appropriate Oracle error when an error occurs.
- `DEFAULT literal ON ERROR` - Returns *literal* when an error occurs. The data type of *literal* must match the data type of the value returned by this function.

JSON_value_on_empty_clause

Use this clause to specify the value returned by this function if no match is found when the JSON data is evaluated using the SQL/JSON path expression. This clause allows you to specify a different outcome for this type of error than the outcome specified with the *JSON_value_on_error_clause*.

You can specify the following clauses:

- `NULL ON EMPTY` - Returns null when no match is found.
- `ERROR ON EMPTY` - Returns the appropriate Oracle error when no match is found.
- `DEFAULT literal ON EMPTY` - Returns *literal* when no match is found. The data type of *literal* must match the data type of the value returned by this function.

If you omit this clause, then the *JSON_value_on_error_clause* determines the value returned when no match is found.

JSON_value_on_mismatch_clause

The *JSON_value_on_mismatch_clause* applies when a type conversion fails, for example when you try to convert a JSON number to a SQL date.

If the return type of `JSON_VALUE` is a SQL scalar like `NUMBER` or `DATE` , then `ON MISMATCH` applies for all type conversion errors - no further specification is required. `ERROR` and `NULL` are valid options.

Example 1

```
select json_value( '{a:"cat"}','$.a.number()'  NULL ON
EMPTY
 ERROR ON  MISMATCH  DEFAULT -1 ON ERROR ) from dual;
 ORA-01722: invalid number
```

If the return type is an object type, then `ON MISMATCH` can be further specified with `MISSING DATA`, `EXTRA DATA` and `TYPE ERROR`. You can use it generally to apply to all error cases, or you can use it case by case by specifying different `ON MISMATCH` clauses for each case.

Example 2

```
IGNORE ON MISMATCH (EXTRA DATA)

ERROR ON MISMATCH ( MISSING DATA, TYPE ERROR)
```

The option `IGNORE` is only valid when the return type is an object type.

TYPE Clause

For a full discussion of `STRICT` and `LAX` syntax see *About Strict and Lax JSON Syntax*, and *TYPE Clause for SQL Functions and Conditions*

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

The following query returns the value of the member with property name `a`. Because the `RETURNING` clause is not specified, the value is returned as a `VARCHAR2(4000)` data type:

```
SELECT JSON_VALUE('{a:100}', '$.a') AS value
  FROM DUAL;

VALUE
-----
100
```

The following query returns the value of the member with property name `a`. Because the `RETURNING NUMBER` clause is specified, the value is returned as a `NUMBER` data type:

```
SELECT JSON_VALUE('{a:100}', '$.a' RETURNING NUMBER) AS value
  FROM DUAL;

     VALUE
----------
       100
```

The following query returns the value of the member with property name `b`, which is in the value of the member with property name `a`:

```
SELECT JSON_VALUE('{a:{b:100}}', '$.a.b') AS value
  FROM DUAL;

VALUE
-----
100
```

The following query returns the value of the member with property name `d` in any object:

```
SELECT JSON_VALUE('{a:{b:100}, c:{d:200}, e:{f:300}}', '$.*.d') AS value
  FROM DUAL;

VALUE
-----
200
```

The following query returns the value of the first element in an array:

```
SELECT JSON_VALUE('[0, 1, 2, 3]', '$[0]') AS value
  FROM DUAL;

VALUE
-----
0
```

The following query returns the value of the third element in an array. The array is the value of the member with property name `a`.

```
SELECT JSON_VALUE('{a:[5, 10, 15, 20]}', '$.a[2]') AS value
  FROM DUAL;

VALUE
-----
15
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following query returns the value of the member with property name a in the second object in an array:

```
SELECT JSON_VALUE('[{a:100}, {a:200}, {a:300}]', '$[1].a') AS value
  FROM DUAL;

VALUE
-----
200
```

The following query returns the value of the member with property name c in any object in an array:

```
SELECT JSON_VALUE('[{a:100}, {b:200}, {c:300}]', '$[*].c') AS value
  FROM DUAL;

VALUE
-----
300
```

The following query attempts to return the value of the member that has property name `lastname`. However, such a member does not exist in the specified JSON data, resulting in no match. Because the `ON ERROR` clause is not specified, the statement uses the default `NULL ON ERROR` and returns null.

```
SELECT JSON_VALUE('{firstname:"John"}', '$.lastname') AS "Last Name"
  FROM DUAL;

Last Name
---------
```

The following query results in an error because it attempts to return the value of the member with property name `lastname`, which does not exist in the specified JSON. Because the `ON ERROR` clause is specified, the statement returns the specified text literal.

```
SELECT JSON_VALUE('{firstname:"John"}', '$.lastname'
                  DEFAULT 'No last name found' ON ERROR) AS "Last Name"
  FROM DUAL;

Last Name
---------
No last name found
```

JSON Type Constructor

Syntax

Purpose

The JSON data type constructor, JSON, takes as input a textual JSON value (a scalar, object, or array), parses it, and returns the value as an instance of JSON type. Alternatively, the input can be an instance of SQL type VECTOR, a user-defined PL/SQL type, or a SQL aggregate type.

Copyright © 1996, 2026, Oracle and/or its affiliates.

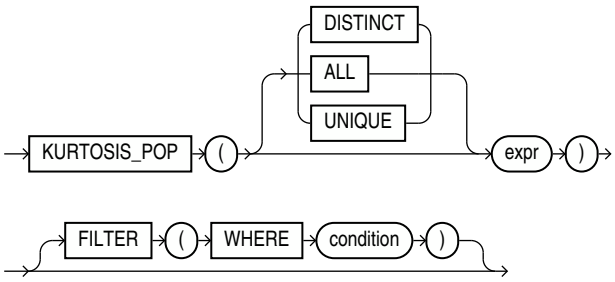
You can use the JSON data type constructor `JSON` to parse textual JSON input (a scalar, object, or array), and return it as an instance of type `JSON`.

Input values must pass the `IS JSON` test. Input values that fail the `IS JSON` test are rejected with a syntax error.

To filter out duplicate input values, you must run the `IS JSON (WITH UNIQUE KEYS)` check on the textual JSON input before using the `JSON` constructor.

Prerequisites

You can use the constructor `JSON` only if database initialization parameter `compatible` is atleast `20`.



> **See Also**
>
> JSON Data Type Constructor of the *JSON Developer's Guide*.

expr

The input in `expr` must be a syntactically valid textual representation of type `VARCHAR2`, `CLOB` and `BLOB`. It can also be a literal SQL string. A SQL `NULL` input value results in a JSON type instance of SQL `NULL`.

KURTOSIS_POP

Syntax

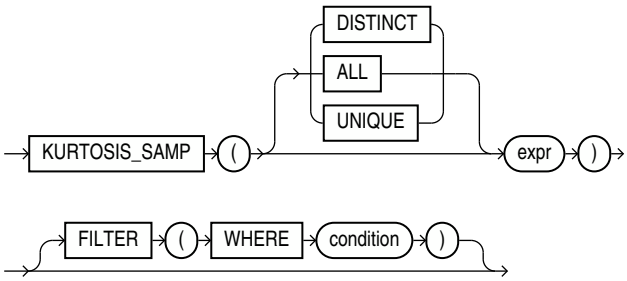
Purpose

The population kurtosis function `KURTOSIS_POP` is primarily used to determine the characteristics of outliers in a given distribution.

NULL values in `expr` are ignored.

Returns NULL if all rows in the group have NULL `expr` values.

Returns 0 if there are one or two rows in `expr`.



For a given set of values, the result of population kurtosis (`KURTOSIS_POP`) and sample kurtosis (`KURTOSIS_SAMP`) are always deterministic. However, the values of `KURTOSIS_POP` and `KURTOSIS_SAMP` differ. As the number of values in the data set increases, the difference between the computed values of `KURTOSIS_SAMP` and `KURTOSIS_POP` decreases.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Copyright © 1996, 2026, Oracle and/or its affiliates.

KURTOSIS_SAMP

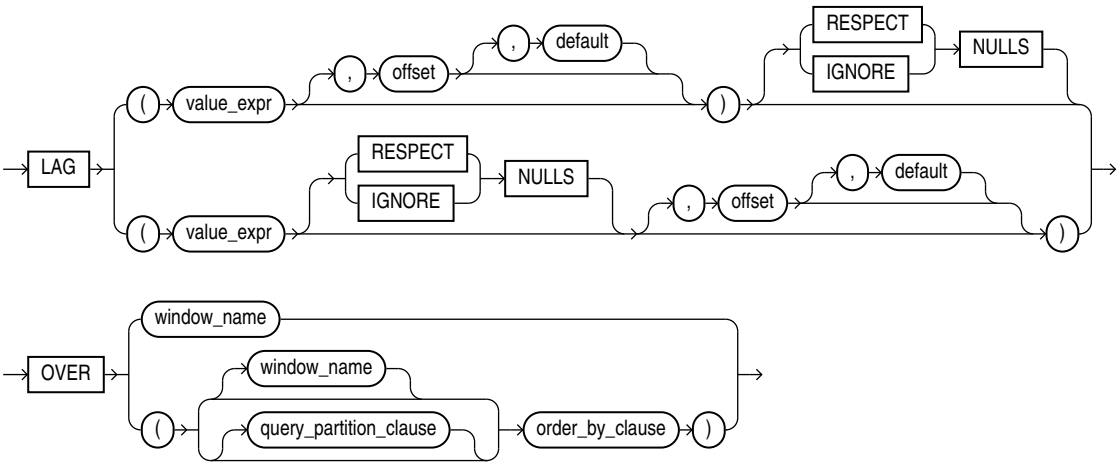
Syntax

Purpose

The sample kurtosis function `KURTOSIS_SAMP` is primarily used to determine the characteristics of outliers in a given distribution.

NULL values in `expr` are ignored.

Returns NULL if all rows in the group have NULL `expr` values.



Returns 0 if there are one or two rows in `expr`.

For a given set of values, the result of sample kurtosis (`KURTOSIS_SAMP`) and population kurtosis (`KURTOSIS_POP`) are always deterministic. However, the values of `KURTOSIS_SAMP` and `KURTOSIS_POP` differ. As the number of values in the data set increases, the difference between the computed values of `KURTOSIS_SAMP` and `KURTOSIS_POP` decreases.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

LAG

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions, including valid forms of *value_expr*

Purpose

LAG is an analytic function. It provides access to more than one row of a table at the same time without a self join. Given a series of rows returned from a query and a position of the cursor, LAG provides access to a row at a given physical offset prior to that position.

For the optional *offset* argument, specify an integer that is greater than zero. If you do not specify *offset*, then its default is 1. The optional *default* value is returned if the offset goes beyond the scope of the window. If you do not specify *default*, then its default is null.

{RESPECT | IGNORE} NULLS determines whether null values of *value_expr* are included in or eliminated from the calculation. The default is RESPECT NULLS.

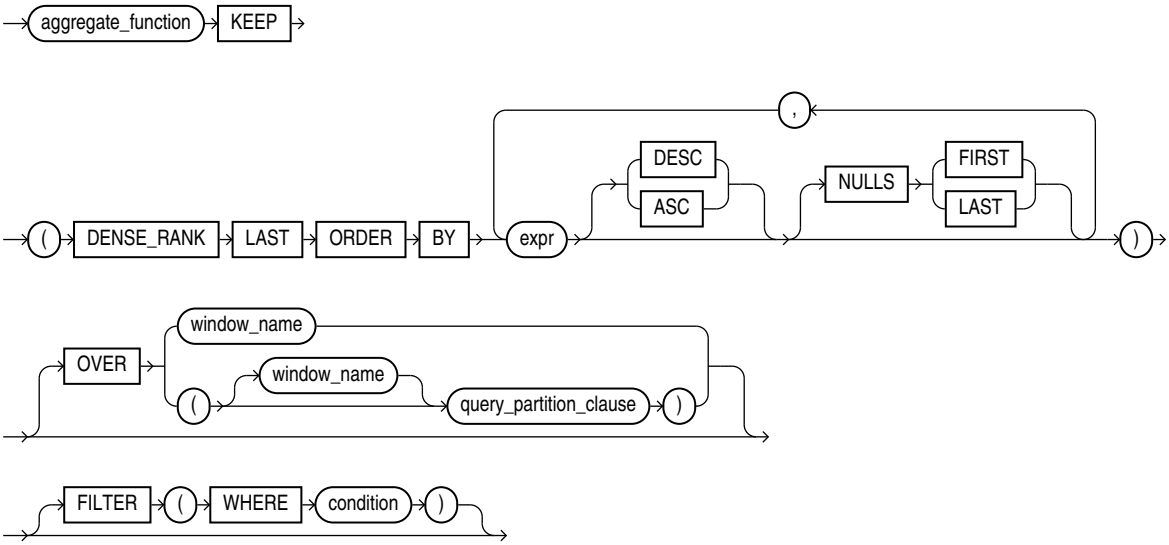
You cannot nest analytic functions by using LAG or any other analytic function for *value_expr*. However, you can use other built-in function expressions for *value_expr*.

> **See Also**
>
> - "About SQL Expressions " for information on valid forms of *expr* and LEAD
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of LAG when it is a character value

Examples

The following example provides, for each purchasing clerk in the employees table, the salary of the employee hired just before:

```
SELECT hire_date, last_name, salary,
       LAG(salary, 1, 0) OVER (ORDER BY hire_date) AS prev_sal
  FROM employees
  WHERE job_id = 'PU_CLERK'
  ORDER BY hire_date;



HIRE_DATE LAST_NAME                     SALARY   PREV_SAL
--------- ------------------------- ---------- ----------
18-MAY-03 Khoo                            3100          0
24-JUL-05 Tobias                          2800       3100
24-DEC-05 Baida                           2900       2800
15-NOV-06 Himuro                          2600       2900
10-AUG-07 Colmenares                      2500       2600
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

LAST

Syntax

***last*::=**

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions of the *query_partitioning_clause*

Purpose

`FIRST` and `LAST` are very similar functions. Both are aggregate and analytic functions that operate on a set of values from a set of rows that rank as the `FIRST` or `LAST` with respect to a given sorting specification. If only one row ranks as `FIRST` or `LAST`, then the aggregate operates on the set with only one element.

Refer to FIRST for complete information on this function and for examples of its use.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

LAST_DAY

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

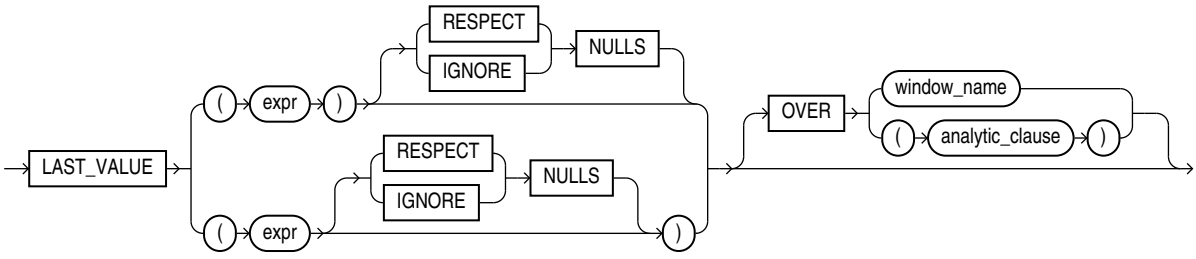
LAST_DAY returns the date of the last day of the month that contains *date*. The last day of the month is defined by the session parameter NLS_CALENDAR. The return type is always DATE, regardless of the data type of *date*.

Examples

The following statement determines how many days are left in the current month.

```
SELECT SYSDATE,
       LAST_DAY(SYSDATE) "Last",
       LAST_DAY(SYSDATE) - SYSDATE "Days Left"
  FROM DUAL;

SYSDATE   Last       Days Left
--------- --------- ----------
30-MAY-09 31-MAY-09          1
```



The following example adds 5 months to the hire date of each employee to give an evaluation date:

```
SELECT last_name, hire_date,
       TO_CHAR(ADD_MONTHS(LAST_DAY(hire_date), 5)) "Eval Date"
  FROM employees
  ORDER BY last_name, hire_date;

LAST_NAME                 HIRE_DATE Eval Date
------------------------- --------- ---------

LAST_VALUE

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions, including valid forms of *expr*

Purpose

LAST_VALUE is an analytic function that is useful for data densification. It returns the last value in an ordered set of values.

> **Note**
>
> The two forms of this syntax have the same behavior. The top branch is the ANSI format, which Oracle recommends for ANSI compatibility.

{RESPECT | IGNORE} NULLS determines whether null values of *expr* are included in or eliminated from the calculation. The default is RESPECT NULLS. If the last value in the set is null, then the function returns NULL unless you specify IGNORE NULLS. If you specify IGNORE NULLS, then LAST_VALUE returns the last non-null value in the set, or NULL if all values are null. Refer to "Using Partitioned Outer Joins: Examples" for an example of data densification.

You cannot nest analytic functions by using LAST_VALUE or any other analytic function for *expr*. However, you can use other built-in function expressions for *expr*. Refer to "About SQL Expressions " for information on valid forms of *expr*.

If you omit the *windowing_clause* of the *analytic_clause*, it defaults to RANGE BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW. This default sometimes returns an unexpected value, because the last value in the window is at the bottom of the window, which is not fixed. It keeps changing as the current row changes. For expected results, specify the *windowing_clause* as RANGE BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING. Alternatively, you can specify the *windowing_clause* as RANGE BETWEEN CURRENT ROW AND UNBOUNDED FOLLOWING.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value

Examples

The following example returns, for each row, the hire date of the employee earning the lowest salary:

```
SELECT employee_id, last_name, salary, hire_date,
       LAST_VALUE(hire_date)
         OVER (ORDER BY salary DESC ROWS BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED
               FOLLOWING) AS lv
  FROM (SELECT * FROM employees
          WHERE department_id = 90
          ORDER BY hire_date);
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
EMPLOYEE_ID LAST_NAME                 SALARY HIRE_DATE LV
----------- ------------------------- ---------- --------- ---------
        100 King                       24000 17-JUN-03 13-JAN-01
        101 Kochhar                    17000 21-SEP-05 13-JAN-01
        102 De Haan                    17000 13-JAN-01 13-JAN-01
```

This example illustrates the nondeterministic nature of the LAST_VALUE function. Kochhar and De Haan have the same salary, so they are in adjacent rows. Kochhar appears first because the rows in the subquery are ordered by hire_date. However, if the rows are ordered by hire_date in descending order, as in the next example, then the function returns a different value:

```
SELECT employee_id, last_name, salary, hire_date,
       LAST_VALUE(hire_date)
         OVER (ORDER BY salary DESC ROWS BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED
               FOLLOWING) AS lv
  FROM (SELECT * FROM employees
          WHERE department_id = 90
          ORDER BY hire_date DESC);

EMPLOYEE_ID LAST_NAME                 SALARY HIRE_DATE LV
----------- ------------------------- ---------- --------- ---------
        100 King                       24000 17-JUN-03 21-SEP-05
        102 De Haan                    17000 13-JAN-01 21-SEP-05
        101 Kochhar                    17000 21-SEP-05 21-SEP-05
```

The following two examples show how to make the LAST_VALUE function deterministic by ordering on a unique key. By ordering within the function by both salary and the unique key employee_id, you can ensure the same result regardless of the ordering in the subquery.

```
SELECT employee_id, last_name, salary, hire_date,
       LAST_VALUE(hire_date)
         OVER (ORDER BY salary DESC, employee_id ROWS BETWEEN UNBOUNDED PRECEDING
               AND UNBOUNDED FOLLOWING) AS lv
  FROM (SELECT * FROM employees
          WHERE department_id = 90
          ORDER BY hire_date);

EMPLOYEE_ID LAST_NAME                 SALARY HIRE_DATE LV
----------- ------------------------- ---------- --------- ---------
        100 King                       24000 17-JUN-03 13-JAN-01
        101 Kochhar                    17000 21-SEP-05 13-JAN-01
        102 De Haan                    17000 13-JAN-01 13-JAN-01

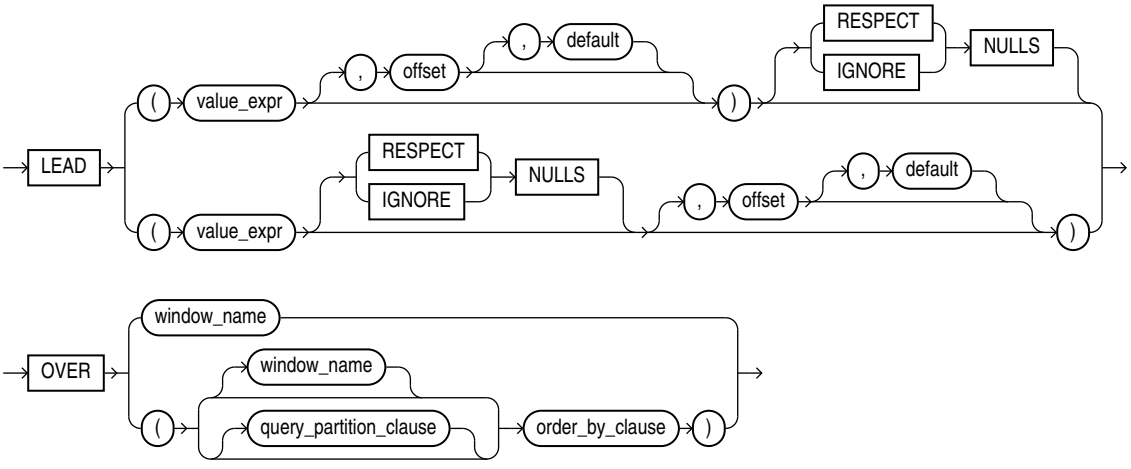
SELECT employee_id, last_name, salary, hire_date,
       LAST_VALUE(hire_date)
         OVER (ORDER BY salary DESC, employee_id ROWS BETWEEN UNBOUNDED PRECEDING
               AND UNBOUNDED FOLLOWING) AS lv
  FROM (SELECT * FROM employees
          WHERE department_id = 90
          ORDER BY hire_date DESC);

EMPLOYEE_ID LAST_NAME                 SALARY HIRE_DATE LV
----------- ------------------------- ---------- --------- ---------
        100 King                       24000 17-JUN-03 13-JAN-01
        101 Kochhar                    17000 21-SEP-05 13-JAN-01
        102 De Haan                    17000 13-JAN-01 13-JAN-01
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following two examples show that the LAST_VALUE function is deterministic when you use a logical offset (RANGE instead of ROWS). When duplicates are found for the ORDER BY expression, the LAST_VALUE is the highest value of *expr*:

```
SELECT employee_id, last_name, salary, hire_date,
       LAST_VALUE(hire_date)
         OVER (ORDER BY salary DESC RANGE BETWEEN UNBOUNDED PRECEDING AND
               UNBOUNDED FOLLOWING) AS lv
  FROM (SELECT * FROM employees
          WHERE department_id = 90
          ORDER BY hire_date);



EMPLOYEE_ID LAST_NAME                 SALARY HIRE_DATE LV
----------- ------------------------- ---------- --------- ---------
        100 King                       24000 17-JUN-03 21-SEP-05
        102 De Haan                    17000 13-JAN-01 21-SEP-05
        101 Kochhar                    17000 21-SEP-05 21-SEP-05

SELECT employee_id, last_name, salary, hire_date,
       LAST_VALUE(hire_date)
         OVER (ORDER BY salary DESC RANGE BETWEEN UNBOUNDED PRECEDING AND
               UNBOUNDED FOLLOWING) AS lv
  FROM (SELECT * FROM employees
          WHERE department_id = 90
          ORDER BY hire_date DESC);

EMPLOYEE_ID LAST_NAME                 SALARY HIRE_DATE LV
----------- ------------------------- ---------- --------- ---------
        100 King                       24000 17-JUN-03 21-SEP-05
        102 De Haan                    17000 13-JAN-01 21-SEP-05
        101 Kochhar                    17000 21-SEP-05 21-SEP-05
```

LEAD

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions, including valid forms of *value_expr*

Purpose

LEAD is an analytic function. It provides access to more than one row of a table at the same time without a self join. Given a series of rows returned from a query and a position of the cursor, LEAD provides access to a row at a given physical offset beyond that position.

If you do not specify *offset*, then its default is 1. The optional *default* value is returned if the offset goes beyond the scope of the table. If you do not specify *default*, then its default value is null.

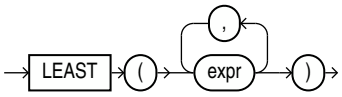
{RESPECT | IGNORE} NULLS determines whether null values of *value_expr* are included in or eliminated from the calculation. The default is RESPECT NULLS.

You cannot nest analytic functions by using LEAD or any other analytic function for *value_expr*. However, you can use other built-in function expressions for *value_expr*.

> **See Also**
>
> - "About SQL Expressions " for information on valid forms of *expr* and LAG
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of LEAD when it is a character value

Examples

The following example provides, for each employee in Department 30 in the employees table, the hire date of the employee hired just after:



```
SELECT hire_date, last_name,
       LEAD(hire_date, 1) OVER (ORDER BY hire_date) AS "NextHired"
  FROM employees
  WHERE department_id = 30
  ORDER BY hire_date;

HIRE_DATE LAST_NAME                Next Hired
--------- ------------------------ ----------
07-DEC-02 Raphaely                 18-MAY-03
18-MAY-03 Khoo                     24-JUL-05
24-JUL-05 Tobias                   24-DEC-05
24-DEC-05 Baida                    15-NOV-06
15-NOV-06 Himuro                   10-AUG-07
10-AUG-07 Colmenares
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

LEAST

Syntax

Purpose

`LEAST` returns the least of a list of one or more expressions. Oracle Database uses the first *expr* to determine the return type. If the first *expr* is numeric, then Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type before the comparison, and returns that data type. If the first *expr* is not numeric, then each *expr* after the first is implicitly converted to the data type of the first *expr* before the comparison.

Oracle Database compares each *expr* using nonpadded comparison semantics. The comparison is binary by default and is linguistic if the `NLS_COMP` parameter is set to `LINGUISTIC` and the `NLS_SORT` parameter has a setting other than `BINARY`. Character comparison is based on the numerical codes of the characters in the database character set and is performed on whole strings treated as one sequence of bytes, rather than character by character. If the value returned by this function is character data, then its data type is `VARCHAR2` if the first *expr* is a character data type and `NVARCHAR2` if the first *expr* is a national character data type.

See Also

- "Data Type Comparison Rules " for more information on character comparison
- Table 2-9 for more information on implicit conversion and "Floating-Point Numbers " for information on binary-float comparison semantics
- "GREATEST ", which returns the greatest of a list of one or more expressions
- Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation `LEAST` uses to compare character values for *expr*, and for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value

Examples

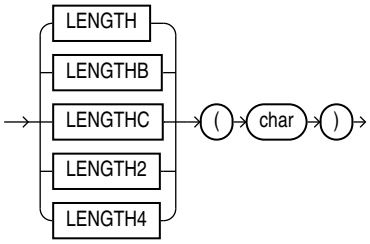
The following statement selects the string with the least value:

```
SELECT LEAST('HARRY','HARRIOT','HAROLD') "Least"
  FROM DUAL;

Least
------
HAROLD
```

In the following statement, the first argument is numeric. Oracle Database determines that the argument with the highest numeric precedence is the third argument, converts the remaining arguments to the data type of the third argument, and returns the least value as that data type:

Copyright © 1996, 2026, Oracle and/or its affiliates.



```
SELECT LEAST (1, '2.1', '.000832') "Least"
  FROM DUAL;

Least
-------
.000832
```

LENGTH

Syntax

***length*::=**

Purpose

The `LENGTH` functions return the length of *`char`*. `LENGTH` calculates length using characters as defined by the input character set. `LENGTHB` uses bytes instead of characters. `LENGTHC` uses Unicode complete characters. `LENGTH2` uses UCS2 code points. `LENGTH4` uses UCS4 code points.

`char` can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`. The exceptions are `LENGTHC`, `LENGTH2`, and `LENGTH4`, which do not allow *`char`* to be a `CLOB` or `NCLOB`. The return value is of data type `NUMBER`. If *`char`* has data type `CHAR`, then the length includes all trailing blanks. If *`char`* is null, then this function returns null.

For more on character length see the following:

- *Oracle Database Globalization Support Guide*
- *Oracle Database SecureFiles and Large Objects Developer's Guide*

Restriction on LENGTHB

The `LENGTHB` function is supported for single-byte LOBs only. It cannot be used with `CLOB` and `NCLOB` data in a multibyte character set.

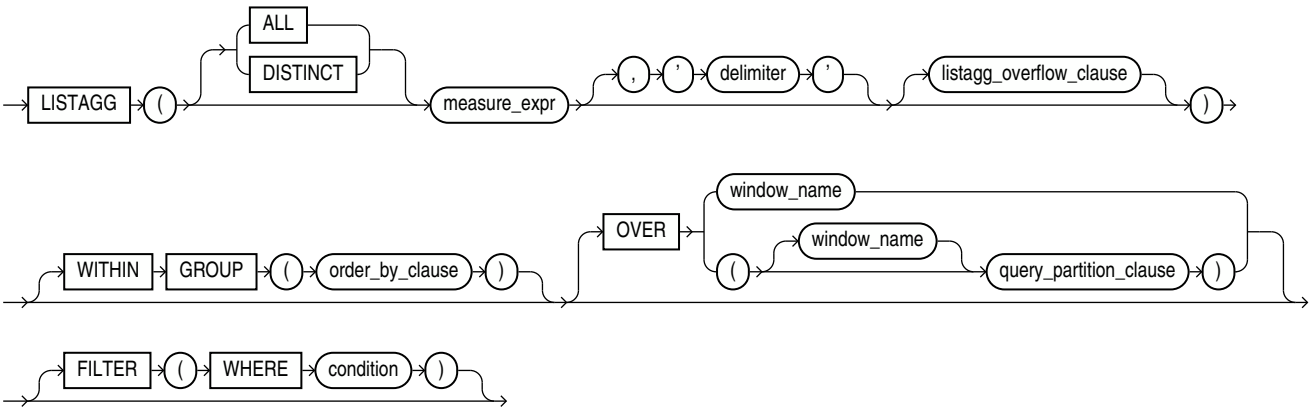
Examples

The following example uses the `LENGTH` function using a single-byte database character set:

```
SELECT LENGTH('CANDIDE') "Length in characters"
  FROM DUAL;

Length in characters
--------------------
                   7
```

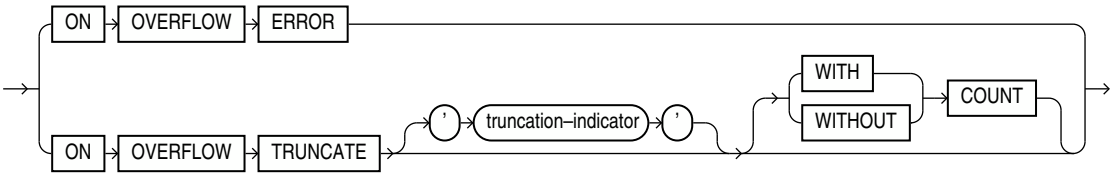
The next example assumes a double-byte database character set.



Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT LENGTHB ('CANDIDE') "Length in bytes"
  FROM DUAL;

Length in bytes
---------------
             14
```



LISTAGG

Syntax

(*listagg_overflow_clause*::=, *order_by_clause*::=, *query_partition_clause*::=)

***listagg_overflow_clause*::=**

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions of the `ORDER BY` clause and `OVER` clause

Purpose

For a specified measure, `LISTAGG` orders data within each group specified in the `ORDER BY` clause and then concatenates the values of the measure column.

- As a single-set aggregate function, `LISTAGG` operates on all rows and returns a single output row.
- As a group-set aggregate, the function operates on and returns an output row for each group defined by the `GROUP BY` clause.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- As an analytic function, LISTAGG partitions the query result set into groups based on one or more expression in the *query_partition_clause*.

The arguments to the function are subject to the following rules:

- The ALL keyword is optional and is provided for semantic clarity.
- The *measure_expr* is the measure column and can be any expression. Null values in the measure column are ignored.
- The *delimiter* designates the string that is to separate the measure column values. This clause is optional and defaults to NULL.

  If measure_expr is of type RAW, then the delimiter must be of type RAW. You can achieve this by specifying the delimiter as a character string that can be implicitly converted to RAW, or by explicitly converting the delimiter to RAW, for example, using the UTL_RAW.CAST_TO_RAW function.
- The *order_by_clause* determines the order in which the concatenated values are returned. The function is deterministic only if the ORDER BY column list achieved unique ordering.
- If you specify *order_by_clause*, you must also specify WITHIN GROUP and vice versa. These two clauses must be specified together or not at all.

The DISTINCT keyword removes duplicate values from the list.

If the measure column is of type RAW, then the return data type is RAW. Otherwise, the return data type is VARCHAR2.

The maximum length of the return data type depends on the value of the MAX_STRING_SIZE initialization parameter. If MAX_STRING_SIZE = EXTENDED, then the maximum length is 32767 bytes for the VARCHAR2 and RAW data types. If MAX_STRING_SIZE = STANDARD, then the maximum length is 4000 bytes for the VARCHAR2 data type and 2000 bytes for the RAW data type. A final delimiter is not included when determining if the return value fits in the return data type.

See Also

- Extended Data Types for more information on the MAX_STRING_SIZE initialization parameter
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of LISTAGG
- *Database Data Warehousing Guide* for details.

listagg_overflow_clause

This clause controls how the function behaves when the return value exceeds the maximum length of the return data type.

ON OVERFLOW ERROR If you specify this clause, then the function returns an ORA-01489 error. This is the default.

ON OVERFLOW TRUNCATE If you specify this clause, then the function returns a truncated list of measure values.

- The *truncation_indicator* designates the string that is to be appended to the truncated list of measure values. If you omit this clause, then the truncation indicator is an ellipsis (. . .).

Copyright © 1996, 2026, Oracle and/or its affiliates.

If *measure_expr* is of type RAW, then the truncation indicator must be of type RAW. You can achieve this by specifying the truncation indicator as a character string that can be implicitly converted to RAW, or by explicitly converting the truncation indicator to RAW, for example, using the UTL_RAW.CAST_TO_RAW function.

- If you specify WITH COUNT, then after the truncation indicator, the database appends the number of truncated values, enclosed in parentheses. In this case, the database truncates enough measure values to allow space in the return value for a final delimiter, the truncation indicator, and 24 characters for the number value enclosed in parentheses.
- If you specify WITHOUT COUNT, then the database omits the number of truncated values from the return value. In this case, the database truncates enough measure values to allow space in the return value for a final delimiter and the truncation indicator.

If you do not specify WITH COUNT or WITHOUT COUNT, then the default is WITH COUNT.

For the semantics of the FILTER clause, see FILTER Clause Semantics.

Aggregate Examples

The following single-set aggregate example lists all of the employees in Department 30 in the hr.employees table, ordered by hire date and last name:

```
SELECT LISTAGG(last_name, '; ')
         WITHIN GROUP (ORDER BY hire_date, last_name) "Emp_list",
       MIN(hire_date) "Earliest"
  FROM employees
  WHERE department_id = 30;

Emp_list                                                    Earliest
----------------------------------------------------------- ---------
Raphaely; Khoo; Tobias; Baida; Himuro; Colmenares           07-DEC-02
```

The following group-set aggregate example lists, for each department ID in the hr.employees table, the employees in that department in order of their hire date:

```
SELECT department_id "Dept.",
       LISTAGG(last_name, '; ') WITHIN GROUP (ORDER BY hire_date) "Employees"
  FROM employees
  GROUP BY department_id
  ORDER BY department_id;

Dept. Employees
------ ------------------------------------------------------------
    10 Whalen
    20 Hartstein; Fay
    30 Raphaely; Khoo; Tobias; Baida; Himuro; Colmenares
    40 Mavris
    50 Kaufling; Ladwig; Rajs; Sarchand; Bell; Mallin; Weiss; Davie
       s; Marlow; Bull; Everett; Fripp; Chung; Nayer; Dilly; Bissot
       ; Vollman; Stiles; Atkinson; Taylor; Seo; Fleaur; Matos; Pat
       el; Walsh; Feeney; Dellinger; McCain; Vargas; Gates; Rogers;
        Mikkilineni; Landry; Cabrio; Jones; Olson; OConnell; Sulliv
       an; Mourgos; Gee; Perkins; Grant; Geoni; Philtanker; Markle
    60 Austin; Hunold; Pataballa; Lorentz; Ernst
    70 Baer
. . .
```

The following example is identical to the previous example, except it contains the ON OVERFLOW TRUNCATE clause. For the purpose of this example, assume that the maximum length of the return value is an artificially small number of 200 bytes. Because the list of employees for

Copyright © 1996, 2026, Oracle and/or its affiliates.

department 50 exceeds 200 bytes, the list is truncated and appended with a final delimiter '; ', the specified truncation indicator '. . .', and the number of truncated values '(23)'.

```
SELECT department_id "Dept.",
       LISTAGG(last_name, '; ' ON OVERFLOW TRUNCATE '...')
               WITHIN GROUP (ORDER BY hire_date) "Employees"
  FROM employees
  GROUP BY department_id
  ORDER BY department_id;

Dept. Employees
------ ------------------------------------------------------------
    10 Whalen
    20 Hartstein; Fay
    30 Raphaely; Khoo; Tobias; Baida; Himuro; Colmenares
    40 Mavris
    50 Kaufling; Ladwig; Rajs; Sarchand; Bell; Mallin; Weiss; Davie
       s; Marlow; Bull; Everett; Fripp; Chung; Nayer; Dilly; Bissot
       ; Vollman; Stiles; Atkinson; Taylor; Seo; Fleaur; ... (23)
    70 Baer
. . .
```

Analytic Example

The following analytic example shows, for each employee hired earlier than September 1, 2003, the employee's department, hire date, and all other employees in that department also hired before September 1, 2003:

```
SELECT department_id "Dept", hire_date "Date", last_name "Name",
       LISTAGG(last_name, '; ') WITHIN GROUP (ORDER BY hire_date, last_name)
         OVER (PARTITION BY department_id) as "Emp_list"
  FROM employees
  WHERE hire_date < '01-SEP-2003'
  ORDER BY "Dept", "Date", "Name";

 Dept Date      Name            Emp_list
----- --------- --------------- --------------------------------------------
   30 07-DEC-02 Raphaely        Raphaely; Khoo
   30 18-MAY-03 Khoo            Raphaely; Khoo
   40 07-JUN-02 Mavris          Mavris
   50 01-MAY-03 Kaufling        Kaufling; Ladwig
   50 14-JUL-03 Ladwig          Kaufling; Ladwig
   70 07-JUN-02 Baer            Baer
   90 13-JAN-01 De Haan         De Haan; King
   90 17-JUN-03 King            De Haan; King
  100 16-AUG-02 Faviet          Faviet; Greenberg
  100 17-AUG-02 Greenberg       Faviet; Greenberg
  110 07-JUN-02 Gietz           Gietz; Higgins
  110 07-JUN-02 Higgins         Gietz; Higgins
```

LN

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

`LN` returns the natural logarithm of *n*, where *n* is greater than 0.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is `BINARY_FLOAT`, then the function returns `BINARY_DOUBLE`. Otherwise the function returns the same numeric data type as the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples

The following example returns the natural logarithm of 95:

```
SELECT LN(95) "Natural log of 95"
  FROM DUAL;

Natural log of 95
-----------------
       4.55387689
```

LNNVL

Syntax

Purpose

`LNNVL` provides a concise way to evaluate a condition when one or both operands of the condition may be null. The function can be used in the `WHERE` clause of a query, or as the `WHEN` condition in a searched `CASE` expression. It takes as an argument a condition and returns `TRUE` if the condition is `FALSE` or `UNKNOWN` and `FALSE` if the condition is `TRUE`. `LNNVL` can be used anywhere a scalar expression can appear, even in contexts where the `IS [NOT] NULL`, `AND`, or `OR` conditions are not valid but would otherwise be required to account for potential nulls.

Oracle Database sometimes uses the `LNNVL` function internally in this way to rewrite `NOT IN` conditions as `NOT EXISTS` conditions. In such cases, output from `EXPLAIN PLAN` shows this operation in the plan table output. The *`condition`* can evaluate any scalar values but cannot be a compound condition containing `AND`, `OR`, or `BETWEEN`.

The table that follows shows what `LNNVL` returns given that `a` = 2 and `b` is null.

Condition	Truth of Condition	LNNVL Return Value
a = 1	FALSE	TRUE
a = 2	TRUE	FALSE
a IS NULL	FALSE	TRUE

Copyright © 1996, 2026, Oracle and/or its affiliates.

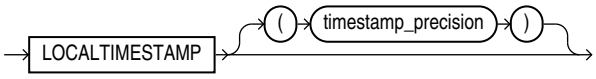
Condition	Truth of Condition	LNNVL Return Value
b = 1	UNKNOWN	TRUE
b IS NULL	TRUE	FALSE
a = b	UNKNOWN	TRUE

Examples

Suppose that you want to know the number of employees with commission rates of less than 20%, including employees who do not receive commissions. The following query returns only employees who actually receive a commission of less than 20%:

```
SELECT COUNT(*)
  FROM employees
  WHERE commission_pct < .2;

  COUNT(*)
----------
        11
```



To include the 72 employees who receive no commission at all, you could rewrite the query using the LNNVL function as follows:

```
SELECT COUNT(*)
  FROM employees
  WHERE LNNVL(commission_pct >= .2);

  COUNT(*)
----------
        83
```

LOCALTIMESTAMP

Syntax

Purpose

LOCALTIMESTAMP returns the current date and time in the session time zone in a value of data type TIMESTAMP. The difference between this function and CURRENT_TIMESTAMP is that LOCALTIMESTAMP returns a TIMESTAMP value while CURRENT_TIMESTAMP returns a TIMESTAMP WITH TIME ZONE value.

The optional argument *timestamp_precision* specifies the fractional second precision of the time value returned.

> **See Also**
>
> CURRENT_TIMESTAMP , "TIMESTAMP Data Type ", and "TIMESTAMP WITH TIME ZONE Data Type "

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

This example illustrates the difference between LOCALTIMESTAMP and CURRENT_TIMESTAMP:

```
ALTER SESSION SET TIME_ZONE = '-5:00';
SELECT CURRENT_TIMESTAMP, LOCALTIMESTAMP FROM DUAL;

CURRENT_TIMESTAMP                   LOCALTIMESTAMP
---------------------------------------------------------------------
04-APR-00 01.27.18.999220 PM -05:00  04-APR-00 01.27.19 PM

ALTER SESSION SET TIME_ZONE = '-8:00';
SELECT CURRENT_TIMESTAMP, LOCALTIMESTAMP FROM DUAL;

CURRENT_TIMESTAMP                   LOCALTIMESTAMP
----------------------------------  ----------------------------
04-APR-00 10.27.45.132474 AM -08:00  04-APR-00 10.27.451 AM
```

When you use the LOCALTIMESTAMP with a format mask, take care that the format mask matches the value returned by the function. For example, consider the following table:

```
CREATE TABLE local_test (col1 TIMESTAMP WITH LOCAL TIME ZONE);
```

The following statement fails because the mask does not include the TIME ZONE portion of the return type of the function:

```
INSERT INTO local_test
  VALUES (TO_TIMESTAMP(LOCALTIMESTAMP, 'DD-MON-RR HH.MI.SSXFF'));
```

The following statement uses the correct format mask to match the return type of LOCALTIMESTAMP:

```
INSERT INTO local_test
  VALUES (TO_TIMESTAMP(LOCALTIMESTAMP, 'DD-MON-RR HH.MI.SSXFF PM'));
```

LOG

Syntax

Purpose

LOG returns the logarithm, base *n2*, of *n1*. The base *n2* can be any positive value other than 0 or 1 and *n1* can be any positive value.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If any argument is BINARY_FLOAT or BINARY_DOUBLE, then the function returns BINARY_DOUBLE. Otherwise the function returns NUMBER.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

The following example returns the log of 100:

```
SELECT LOG(10,100) "Log base 10 of 100"
  FROM DUAL;

Log base 10 of 100
------------------
                 2
```

LOWER

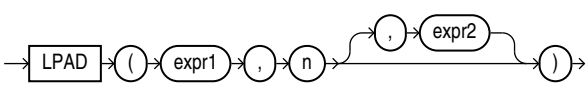
Syntax

Purpose

`LOWER` returns *`char`*, with all letters lowercase. *`char`* can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`. The return value is the same data type as *`char`*. The database sets the case of the characters based on the binary mapping defined for the underlying character set. For linguistic-sensitive lowercase, refer to NLS_LOWER .

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `LOWER`

Examples



The following example returns a string in lowercase:

```
SELECT LOWER('MR. SCOTT MCMILLAN') "Lowercase"
  FROM DUAL;

Lowercase
--------------------
mr. scott mcmillan
```

LPAD

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

LPAD returns *expr1*, left-padded to length *n* characters with the sequence of characters in *expr2*. This function is useful for formatting the output of a query.

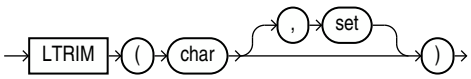
Both *expr1* and *expr2* can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The string returned is of VARCHAR2 data type if *expr1* is a character data type, NVARCHAR2 if *expr1* is a national character data type, and a LOB if *expr1* is a LOB data type. The string returned is in the same character set as *expr1*. The argument *n* must be a NUMBER integer or a value that can be implicitly converted to a NUMBER integer.

If you do not specify *expr2*, then the default is a single blank. If *expr1* is longer than *n*, then this function returns the portion of *expr1* that fits in *n*.

The argument *n* is the total length of the return value as it is displayed on your terminal screen. In most character sets, this is also the number of characters in the return value. However, in some multibyte character sets, the display length of a character string can differ from the number of characters in the string.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of LPAD

Examples



The following example left-pads a string with the asterisk (*) and period (.) characters:

```
SELECT LPAD('Page 1',15,'*.') "LPAD example"
  FROM DUAL;

LPAD example
---------------
*.*.*.*.*Page 1
```

LTRIM

Syntax

Purpose

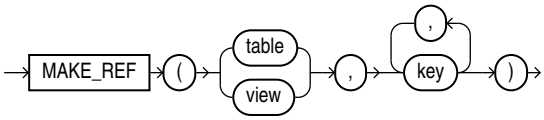
LTRIM removes from the left end of *char* all of the characters contained in *set*. If you do not specify *set*, then it defaults to a single blank. Oracle Database begins scanning *char* from its first character and removes all characters that appear in *set* until reaching a character not in *set* and then returns the result.

Both *char* and *set* can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The string returned is of VARCHAR2 data type if *char* is a character data type, NVARCHAR2 if *char* is a national character data type, and a LOB if *char* is a LOB data type.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> - RTRIM
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation `LTRIM` uses to compare characters from *`set`* with characters from *`char`*, and for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples



The following example trims all the left-most occurrences of less than sign (<), greater than sign (>) , and equal sign (=) from a string:

```
SELECT LTRIM('<=====>BROWNING<=====>', '<>=') "LTRIM Example"
  FROM DUAL;

LTRIM Example
---------------
BROWNING<=====>
```

MAKE_REF

Syntax

Purpose

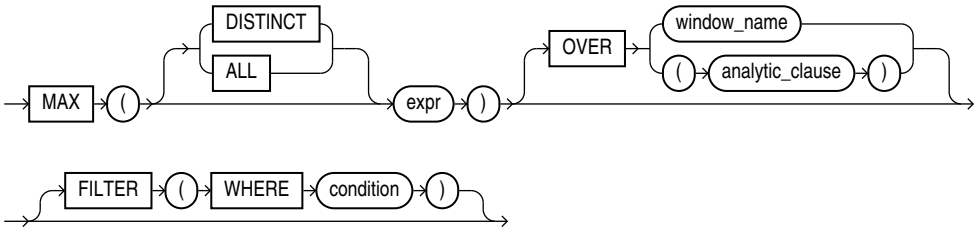
`MAKE_REF` creates a `REF` to a row of an object view or a row in an object table whose object identifier is primary key based. This function is useful, for example, if you are creating an object view

> **See Also**
>
> *Oracle Database Object-Relational Developer's Guide* for more information about object views and DEREF

Examples

The sample schema `oe` contains an object view `oc_inventories` based on `inventory_typ`. The object identifier is `product_id`. The following example creates a `REF` to the row in the `oc_inventories` object view with a `product_id` of 3003:

```
SELECT MAKE_REF (oc_inventories, 3003)
  FROM DUAL;



MAKE_REF(OC_INVENTORIES,3003)
--------------------------------------------------------------------
00004A038A0046857C14617141109EE034080020825436000000142601000100001
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
00290090606002A00078401FE0000000B03C21F040000000000000000000000000000
0000000000
```

MAX

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

`MAX` returns maximum value of *`expr`*. You can use it as an aggregate or analytic function.

> **See Also**
>
> - "About SQL Expressions " for information on valid forms of *`expr`*, "Floating-Point Numbers " for information on binary-float comparison semantics, and "Aggregate Functions "
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation `MAX` uses to compare character values for *`expr`*, and for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Aggregate Example

The following example determines the highest salary in the `hr.employees` table:

```
SELECT MAX(salary) "Maximum"
  FROM employees;

   Maximum
----------
     24000
```

Analytic Examples

The following example calculates, for each employee, the highest salary of the employees reporting to the same manager as the employee.

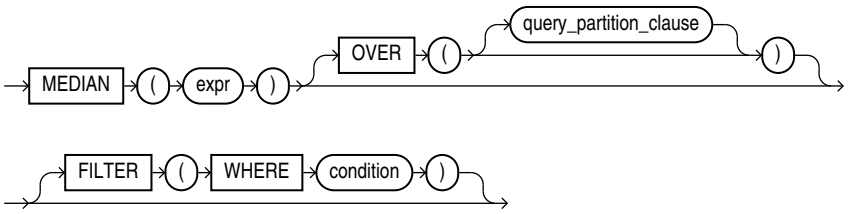
Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT manager_id, last_name, salary,
       MAX(salary) OVER (PARTITION BY manager_id) AS mgr_max
  FROM employees
  ORDER BY manager_id, last_name, salary;

MANAGER_ID LAST_NAME                    SALARY    MGR_MAX
---------- ------------------------ ---------- ----------
       100 Cambrault                     11000      17000
       100 De Haan                       17000      17000
       100 Errazuriz                     12000      17000
       100 Fripp                          8200      17000
       100 Hartstein                     13000      17000
       100 Kaufling                       7900      17000
       100 Kochhar                       17000      17000
. . .
```

If you enclose this query in the parent query with a predicate, then you can determine the employee who makes the highest salary in each department:

```
SELECT manager_id, last_name, salary
  FROM (SELECT manager_id, last_name, salary,
               MAX(salary) OVER (PARTITION BY manager_id) AS rmax_sal
          FROM employees)
  WHERE salary = rmax_sal
  ORDER BY manager_id, last_name, salary;



MANAGER_ID LAST_NAME                    SALARY
---------- ------------------------ ----------
       100 De Haan                       17000
       100 Kochhar                       17000
       101 Greenberg                     12008
       101 Higgins                       12008
       102 Hunold                         9000
       103 Ernst                          6000
       108 Faviet                         9000
       114 Khoo                           3100
       120 Nayer                          3200
       120 Taylor                         3200
       121 Sarchand                       4200
       122 Chung                          3800
       123 Bell                           4000
       124 Rajs                           3500
       145 Tucker                        10000
       146 King                          10000
       147 Vishney                       10500
       148 Ozer                          11500
       149 Abel                          11000
       201 Fay                            6000
       205 Gietz                          8300
           King                          24000

22 rows selected.

MEDIAN

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

`MEDIAN` is an inverse distribution function that assumes a continuous distribution model. It takes a numeric or datetime value and returns the middle value or an interpolated value that would be the middle value once the values are sorted. Nulls are ignored in the calculation.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If you specify only *expr*, then the function returns the same data type as the numeric data type of the argument. If you specify the `OVER` clause, then Oracle Database determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

> **See Also**
>
> Table 2-9 for more information on implicit conversion and "Numeric Precedence " for information on numeric precedence

The result of `MEDIAN` is computed by first ordering the rows. Using `N` as the number of rows in the group, Oracle calculates the row number (`RN`) of interest with the formula `RN = (1 + (0.5*(N-1))`. The final result of the aggregate function is computed by linear interpolation between the values from rows at row numbers `CRN = CEILING(RN)` and `FRN = FLOOR(RN)`.

The final result will be:

```
if (CRN = FRN = RN) then
   (value of expression from row at RN)
else
   (CRN - RN) * (value of expression for row at FRN) +
   (RN - FRN) * (value of expression for row at CRN)
```

You can use `MEDIAN` as an analytic function. You can specify only the *query_partition_clause* in its `OVER` clause. It returns, for each row, the value that would fall in the middle among a set of values within each partition.

Compare this function with these functions:

Copyright © 1996, 2026, Oracle and/or its affiliates.

- PERCENTILE_CONT , which returns, for a given percentile, the value that corresponds to that percentile by way of interpolation. MEDIAN is the specific case of PERCENTILE_CONT where the percentile value defaults to 0.5.
- PERCENTILE_DISC , which is useful for finding values for a given percentile without interpolation.

For the semantics of the FILTER clause, see FILTER Clause Semantics.

Aggregate Example

The following query returns the median salary for each department in the hr.employees table:

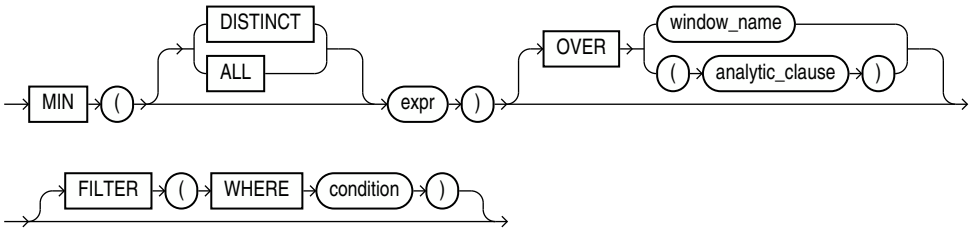
```
SELECT department_id, MEDIAN(salary)
  FROM employees
  GROUP BY department_id
  ORDER BY department_id;

DEPARTMENT_ID MEDIAN(SALARY)
------------- --------------
           10           4400
           20           9500
           30           2850
           40           6500
           50           3100
           60           4800
           70          10000
           80           8900
           90          17000
          100           8000
          110          10154
                        7000
```

Analytic Example

The following query returns the median salary for each manager in a subset of departments in the hr.employees table:

```
SELECT manager_id, employee_id, salary,
       MEDIAN(salary) OVER (PARTITION BY manager_id) "Median by Mgr"
  FROM employees
  WHERE department_id > 60
  ORDER BY manager_id, employee_id;



MANAGER_ID EMPLOYEE_ID     SALARY Median by Mgr
---------- ----------- ---------- -------------
       100         101      17000         13500
       100         102      17000         13500
       100         145      14000         13500
       100         146      13500         13500
       100         147      12000         13500
       100         148      11000         13500
       100         149      10500         13500
       101         108      12008         12008
       101         204      10000         12008
       101         205      12008         12008
       108         109       9000          7800
       108         110       8200          7800
       108         111       7700          7800
       108         112       7800          7800
       108         113       6900          7800
       145         150      10000          8500
       145         151       9500          8500
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
       145         152        9000          8500
. . .
```

MIN

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

`MIN` returns minimum value of *expr*. You can use it as an aggregate or analytic function.

> **See Also**
>
> - "About SQL Expressions " for information on valid forms of *expr*, "Floating-Point Numbers " for information on binary-float comparison semantics, and "Aggregate Functions "
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation `MIN` uses to compare character values for *expr*, and for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Aggregate Example

The following statement returns the earliest hire date in the `hr.employees` table:

```
SELECT MIN(hire_date) "Earliest"
  FROM employees;

Earliest
---------
13-JAN-01
```

Analytic Example

The following example determines, for each employee, the employees who were hired on or before the same date as the employee. It then determines the subset of employees reporting to the same manager as the employee, and returns the lowest salary in that subset.

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT manager_id, last_name, hire_date, salary,
       MIN(salary) OVER(PARTITION BY manager_id ORDER BY hire_date
         RANGE UNBOUNDED PRECEDING) AS p_cmin
  FROM employees
  ORDER BY manager_id, last_name, hire_date, salary;

MANAGER_ID LAST_NAME                 HIRE_DATE     SALARY     P_CMIN
---------- ------------------------- --------- ---------- ----------
       100 Cambrault                 15-OCT-07      11000       6500
       100 De Haan                   13-JAN-01      17000      17000
       100 Errazuriz                 10-MAR-05      12000       7900
       100 Fripp                     10-APR-05       8200       7900
       100 Hartstein                 17-FEB-04      13000       7900
       100 Kaufling                  01-MAY-03       7900       7900
       100 Kochhar                   21-SEP-05      17000       7900
       100 Mourgos                   16-NOV-07       5800       5800
       100 Partners                  05-JAN-05      13500       7900
       100 Raphaely                  07-DEC-02      11000      11000
       100 Russell                   01-OCT-04      14000       7900

. . .
```

MOD

Syntax

Purpose

`MOD` returns the remainder of *n2* divided by *n1*. Returns *n2* if *n1* is 0.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

> **See Also**
>
> Table 2-9 for more information on implicit conversion and "Numeric Precedence " for information on numeric precedence

Examples

The following example returns the remainder of 11 divided by 4:

```
SELECT MOD(11,4) "Modulus"
  FROM DUAL;

   Modulus
----------
         3
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

This function behaves differently from the classical mathematical modulus function, if the product of *n1* and *n2* is negative. The classical modulus can be expressed using the MOD function with this formula:

```
n2 - n1 * FLOOR(n2/n1)
```

The following table illustrates the difference between the MOD function and the classical modulus:

n2	n1	MOD(n2,n1)	Classical Modulus
11	4	3	3
11	-4	3	-1
-11	4	-3	1
-11	-4	-3	-3

See Also

FLOOR (number) and REMAINDER , which is similar to MOD, but uses ROUND in its formula instead of FLOOR

MONTHS_BETWEEN

Syntax

Purpose

MONTHS_BETWEEN returns number of months between dates *date1* and *date2*. The month and the last day of the month are defined by the parameter NLS_CALENDAR. If *date1* is later than *date2*, then the result is positive. If *date1* is earlier than *date2*, then the result is negative. If *date1* and *date2* are either the same days of the month or both last days of months, then the result is always an integer. Otherwise Oracle Database calculates the fractional portion of the result based on a 31-day month and considers the difference in time components *date1* and *date2*.

Examples

The following example calculates the months between two dates:

```
SELECT MONTHS_BETWEEN
       (TO_DATE('02-02-1995','MM-DD-YYYY'),
        TO_DATE('01-01-1995','MM-DD-YYYY') ) "Months"
  FROM DUAL;

    Months
----------
1.03225806
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

NANVL

Syntax

Purpose

The `NANVL` function is useful only for floating-point numbers of type `BINARY_FLOAT` or `BINARY_DOUBLE`. It instructs Oracle Database to return an alternative value *n1* if the input value *n2* is `NaN` (not a number). If *n2* is **not** `NaN`, then Oracle returns *n2*.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

> **See Also**
>
> Table 2-9 for more information on implicit conversion, "Floating-Point Numbers " for information on binary-float comparison semantics, and "Numeric Precedence " for information on numeric precedence

Examples

Using table `float_point_demo` created for TO_BINARY_DOUBLE , insert a second entry into the table:

```
INSERT INTO float_point_demo
  VALUES (0,'NaN','NaN');

SELECT *
  FROM float_point_demo;

   DEC_NUM BIN_DOUBLE  BIN_FLOAT
---------- ---------- ----------
   1234.56 1.235E+003 1.235E+003
         0        Nan        Nan
```

The following example returns *bin_float* if it is a number. Otherwise, 0 is returned.

```
SELECT bin_float, NANVL(bin_float,0)
  FROM float_point_demo;

 BIN_FLOAT NANVL(BIN_FLOAT,0)
---------- ------------------
1.235E+003         1.235E+003
       Nan                  0
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

NCHR

Syntax

Purpose

`NCHR` returns the character having the binary equivalent to *`number`* in the national character set. The value returned is always `NVARCHAR2`. This function is equivalent to using the `CHR` function with the `USING NCHAR_CS` clause.

This function takes as an argument a `NUMBER` value, or any value that can be implicitly converted to `NUMBER`, and returns a character.

> **See Also**
>
> - CHR
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `NCHR`

Examples

The following examples return the nchar character 187:

```
SELECT NCHR(187)
  FROM DUAL;

N
-
>

SELECT CHR(187 USING NCHAR_CS)
  FROM DUAL;

C
-
>
```

NEW_TIME

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

`NEW_TIME` returns the date and time in time zone *`timezone2`* when date and time in time zone *`timezone1`* are *`date`*. Before using this function, you must set the `NLS_DATE_FORMAT` parameter to display 24-hour time. The return type is always `DATE`, regardless of the data type of *`date`*.

> **Note**
>
> This function takes as input only a limited number of time zones. You can have access to a much greater number of time zones by combining the `FROM_TZ` function and the datetime expression. See FROM_TZ and the example for "Datetime Expressions ".

The arguments *`timezone1`* and *`timezone2`* can be any of these text strings:

- AST, ADT: Atlantic Standard or Daylight Time
- BST, BDT: Bering Standard or Daylight Time
- CST, CDT: Central Standard or Daylight Time
- EST, EDT: Eastern Standard or Daylight Time
- GMT: Greenwich Mean Time
- HST, HDT: Alaska-Hawaii Standard Time or Daylight Time.
- MST, MDT: Mountain Standard or Daylight Time
- NST: Newfoundland Standard Time
- PST, PDT: Pacific Standard or Daylight Time
- YST, YDT: Yukon Standard or Daylight Time

Examples

The following example returns an Atlantic Standard time, given the Pacific Standard time equivalent:

```
ALTER SESSION SET NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';

SELECT NEW_TIME(TO_DATE('11-10-09 01:23:45', 'MM-DD-YY HH24:MI:SS'), 'AST', 'PST')
         "New Date and Time"
  FROM DUAL;

New Date and Time
--------------------
09-NOV-2009 21:23:45
```

NEXT_DAY

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

`NEXT_DAY` returns the date of the first weekday named by *`char`* that is later than the date *`date`*. The return type is always `DATE`, regardless of the data type of *`date`*. The argument *`char`* must be a day of the week in the date language of your session, either the full name or the abbreviation. The minimum number of letters required is the number of letters in the abbreviated version. Any characters immediately following the valid abbreviation are ignored. The return value has the same hours, minutes, and seconds component as the argument *`date`*.

Examples

This example returns the date of the next Tuesday after October 15, 2009:

```
SELECT NEXT_DAY('15-OCT-2009','TUESDAY') "NEXT DAY"
  FROM DUAL;

NEXT DAY
--------------------
20-OCT-2009 00:00:00
```

NLS_CHARSET_DECL_LEN

Syntax

Purpose

`NLS_CHARSET_DECL_LEN` returns the declaration length (in number of characters) of an `NCHAR` column. The *`byte_count`* argument is the width of the column. The *`char_set_id`* argument is the character set ID of the column.

Examples

The following example returns the number of characters that are in a 200-byte column when you are using a multibyte character set:

```
SELECT NLS_CHARSET_DECL_LEN(200, nls_charset_id('ja16eucfixed'))
  FROM DUAL;

NLS_CHARSET_DECL_LEN(200,NLS_CHARSET_ID('JA16EUCFIXED'))
-------------------------------------------------------
                                                    100
```

NLS_CHARSET_ID

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

`NLS_CHARSET_ID` returns the character set ID number corresponding to character set name *`string`*. The *`string`* argument is a run-time `VARCHAR2` value. The *`string`* value `'CHAR_CS'` returns the database character set ID number of the server. The *`string`* value `'NCHAR_CS'` returns the national character set ID number of the server.

Invalid character set names return null.

> **See Also**
>
> *Oracle Database Globalization Support Guide* for a list of character sets

Examples

The following example returns the character set ID of a character set:

```
SELECT NLS_CHARSET_ID('ja16euc')
  FROM DUAL;

NLS_CHARSET_ID('JA16EUC')
-------------------------
                      830
```

NLS_CHARSET_NAME

Syntax

Purpose

`NLS_CHARSET_NAME` returns the name of the character set corresponding to ID number *`number`*. The character set name is returned as a `VARCHAR2` value in the database character set. If *`number`* is not recognized as a valid character set ID, then this function returns null.

This function returns a `VARCHAR2` value.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `NLS_CHARSET_NAME`

Examples

The following example returns the character set corresponding to character set ID number 2:

```
SELECT NLS_CHARSET_NAME(2)
  FROM DUAL;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
NLS_CH
------
WE8DEC
```

NLS_COLLATION_ID

Syntax

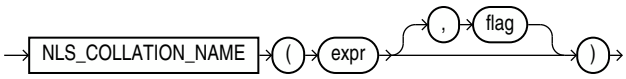
Purpose

`NLS_COLLATION_ID` takes as its argument a collation name and returns the corresponding collation ID number. Collation IDs are used in the data dictionary tables and in Oracle Call Interface (OCI). Collation names are used in SQL statements and data dictionary views

For *expr*, specify the collation name as a `VARCHAR2` value. You can specify a valid named collation or a pseudo-collation, in any combination of uppercase and lowercase letters.

This function returns a `NUMBER` value. If you specify an invalid collation name, then this function returns null.

Examples



The following example returns the collation ID of collation `BINARY_CI`:

```
SELECT NLS_COLLATION_ID('BINARY_CI')
  FROM DUAL;

NLS_COLLATION_ID('BINARY_CI')
-----------------------------
                       147455
```

NLS_COLLATION_NAME

Syntax

Purpose

`NLS_COLLATION_NAME` takes as its argument a collation ID number and returns the corresponding collation name. Collation IDs are used in the data dictionary tables and in Oracle Call Interface (OCI). Collation names are used in SQL statements and data dictionary views

For *expr*, specify the collation ID as a `NUMBER` value.

This function returns a `VARCHAR2` value. If you specify an invalid collation ID, then this function returns null.

The optional *flag* parameter applies only to Unicode Collation Algorithm (UCA) collations. This parameter determines whether the function returns the short form or long form of the collation

Copyright © 1996, 2026, Oracle and/or its affiliates.

name. The parameter must be a character expression evaluating to the value `'S'`, `'s'`, `'L'`, or `'l'`, with the following meaning:

- `'S'` or `'s'` – Returns the short form of the collation name
- `'L'` or `'l'` – Returns the long form of the collation name

If you omit *`flag`*, then the default is `'L'`.

> **See Also**
>
> - *Oracle Database Globalization Support Guide* for more information on UCA collations
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `NLS_COLLATION_NAME`

Examples

The following example returns the name of the collation corresponding to collation ID number 81919:

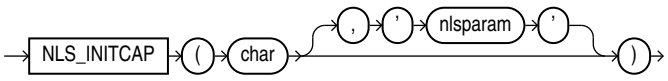
```
SELECT NLS_COLLATION_NAME(81919)
  FROM DUAL;

NLS_COLLA
---------
BINARY_AI
```

The following example returns the short form of the name of the UCA collation corresponding to collation ID number 208897:

```
SELECT NLS_COLLATION_NAME(208897,'S')
  FROM DUAL;

NLS_COLLATION
-------------
UCA0610_DUCET
```



The following example returns the long form of the name of the UCA collation corresponding to collation ID number 208897:

```
SELECT NLS_COLLATION_NAME(208897,'L')
  FROM DUAL;

NLS_COLLATION_NAME(208897,'L')
--------------------------------------
UCA0610_DUCET_S4_VS_BN_NY_EN_FN_HN_DN_MN
```

NLS_INITCAP

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

NLS_INITCAP returns *char*, with the first letter of each word in uppercase, all other letters in lowercase. Words are delimited by white space or characters that are not alphanumeric.

Both *char* and *'nlsparam'* can be any of the data types CHAR, VARCHAR2, NCHAR, or NVARCHAR2. The string returned is of VARCHAR2 data type and is in the same character set as *char*.

The value of *'nlsparam'* can have this form:

```
'NLS_SORT = sort'
```

where *sort* is a named collation. The collation handles special linguistic requirements for case conversions. These requirements can result in a return value of a different length than the *char*. If you omit 'nlsparam', then this function uses the determined collation of the function.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.

> **See Also**
>
> - "Data Type Comparison Rules " for more information.
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules for NLS_INITCAP , and for the collation derivation rules, which define the collation assigned to the character return value of this function

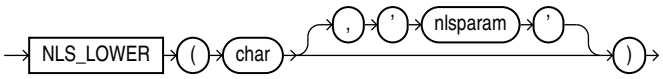
Examples

The following examples show how the linguistic sort sequence results in a different return value from the function:

```
SELECT NLS_INITCAP('ijsland') "InitCap"
  FROM DUAL;

InitCap
-------
Ijsland

SELECT NLS_INITCAP('ijsland', 'NLS_SORT = XDutch') "InitCap"
  FROM DUAL;



InitCap
-------
IJsland
```

> **See Also**
>
> *Oracle Database Globalization Support Guide* for information on collations

Copyright © 1996, 2026, Oracle and/or its affiliates.

NLS_LOWER

Syntax

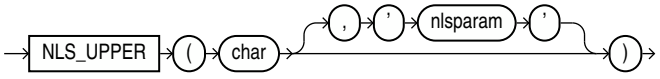
Purpose

`NLS_LOWER` returns *`char`*, with all letters lowercase.

Both *`char`* and *`'nlsparam'`* can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`. The string returned is of `VARCHAR2` data type if *`char`* is a character data type and a LOB if *`char`* is a LOB data type. The return string is in the same character set as *`char`*.

The *`'nlsparam'`* can have the same form and serve the same purpose as in the `NLS_INITCAP` function.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules for `NLS_LOWER`, and for the collation derivation rules, which define the collation assigned to the character return value of this function



Examples

The following statement returns the lowercase form of the character string 'NOKTASINDA' using the XTurkish linguistic sort sequence. The Turkish uppercase I becoming a small, dotless i.

```
SELECT NLS_LOWER('NOKTASINDA', 'NLS_SORT = XTurkish') "Lowercase"
  FROM DUAL;
```

NLS_UPPER

Syntax

Purpose

`NLS_UPPER` returns *`char`*, with all letters uppercase.

Both *`char`* and *`'nlsparam'`* can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`. The string returned is of `VARCHAR2` data type if *`char`* is a character data type and a LOB if *`char`* is a LOB data type. The return string is in the same character set as *`char`*.

The *`'nlsparam'`* can have the same form and serve the same purpose as in the `NLS_INITCAP` function.

Copyright © 1996, 2026, Oracle and/or its affiliates.

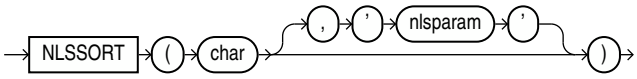
> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules for `NLS_UPPER`, and for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following example returns a string with all the letters converted to uppercase:

```
SELECT NLS_UPPER('große') "Uppercase"
  FROM DUAL;

Upper
-----
GROßE



SELECT NLS_UPPER('große', 'NLS_SORT = XGerman') "Uppercase"
  FROM DUAL;

Upperc
------
GROSSE
```

> **See Also**
>
> NLS_INITCAP

NLSSORT

Syntax

Purpose

`NLSSORT` returns a collation key for the character value *`char`* and an explicitly or implicitly specified collation. A collation key is a string of bytes used to sort *`char`* according to the specified collation. The property of the collation keys is that mutual ordering of two such keys generated for the given collation when compared according to their binary order is the same as mutual ordering of the source character values when compared according to the given collation.

Both *`char`* and '*`nlsparam`*' can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`.

The value of '*`nlsparam`*' must have the form

```
'NLS_SORT = collation'
```

where *`collation`* is the name of a linguistic collation or `BINARY`. `NLSSORT` uses the specified collation to generate the collation key. If you omit '*`nlsparam`*', then this function uses the

Copyright © 1996, 2026, Oracle and/or its affiliates.

derived collation of the argument *char*. If you specify BINARY, then this function returns the *char* value itself cast to RAW and possibly truncated as described below.

If you specify '*nlsparam*', then you can append to the linguistic collation name the suffix _ai to request an accent-insensitive collation or _ci to request a case-insensitive collation. Refer to *Oracle Database Globalization Support Guide* for more information on accent- and case-insensitive sorting. Using accent-insensitive or case-insensitive collations with the ORDER BY query clause is not recommended as it leads to a nondeterministic sort order.

The returned collation key is of RAW data type. The length of the collation key resulting from a given *char* value for a given collation may exceed the maximum length of the RAW value returned by NLSSORT. In this case, the behavior of NLSSORT depends on the value of the initialization parameter MAX_STRING_SIZE. If MAX_STRING_SIZE = EXTENDED, then the maximum length of the return value is 32767 bytes. If the collation key exceeds this limit, then the function fails with the error "ORA-12742: unable to create the collation key". This error may also be reported for short input strings if they contain a high percentage of Unicode characters with very high decomposition ratios.

See Also

Oracle Database Globalization Support Guide for details of when the ORA-12742 error is reported and how to prevent application availability issues that the error could cause

If MAX_STRING_SIZE = STANDARD, then the maximum length of the return value is 2000 bytes. If the value to be returned exceeds the limit, then NLSSORT calculates the collation key for a maximum prefix, or initial substring, of *char* so that the calculated result does not exceed the maximum length. For monolingual collations, for example FRENCH, the prefix length is typically 1000 characters. For multilingual collations, for example GENERIC_M, the prefix is typically 500 characters. For Unicode Collation Algorithm (UCA) collations, for example UCA0610_DUCET, the prefix is typically 285 characters. The exact length may be lower or higher depending on the collation and the characters contained in *char*.

The behavior when MAX_STRING_SIZE = STANDARD implies that two character values whose collation keys (NLSSORT results) are compared to find the linguistic ordering are considered equal if they do not differ in the prefix even though they may differ at some further character position. Because the NLSSORT function is used implicitly to find linguistic ordering for comparison conditions, the BETWEEN condition, the IN condition, ORDER BY, GROUP BY, and COUNT(DISTINCT), those operations may return results that are only approximate for long character values. If you want guarantee that the results of those operations are exact, then migrate your database to use MAX_STRING_SIZE = EXTENDED.

Refer to "Extended Data Types" for more information on the MAX_STRING_SIZE initialization parameter.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.

See Also

- "Data Type Comparison Rules " for more information.
- Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules for NLSSORT

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

This function can be used to specify sorting and comparison operations based on a linguistic sort sequence rather than on the binary value of a string. The following example creates a test table containing two values and shows how the values returned can be ordered by the NLSSORT function:

```
CREATE TABLE test (name VARCHAR2(15));
INSERT INTO test VALUES ('Gaardiner');
INSERT INTO test VALUES ('Gaberd');
INSERT INTO test VALUES ('Gaasten');

SELECT *
  FROM test
  ORDER BY name;

NAME
---------------
Gaardiner
Gaasten
Gaberd

SELECT *
  FROM test
  ORDER BY NLSSORT(name, 'NLS_SORT = XDanish');

NAME
---------------
Gaberd
Gaardiner
Gaasten
```

The following example shows how to use the NLSSORT function in comparison operations:

```
SELECT *
  FROM test
  WHERE name > 'Gaberd'
  ORDER BY name;

no rows selected

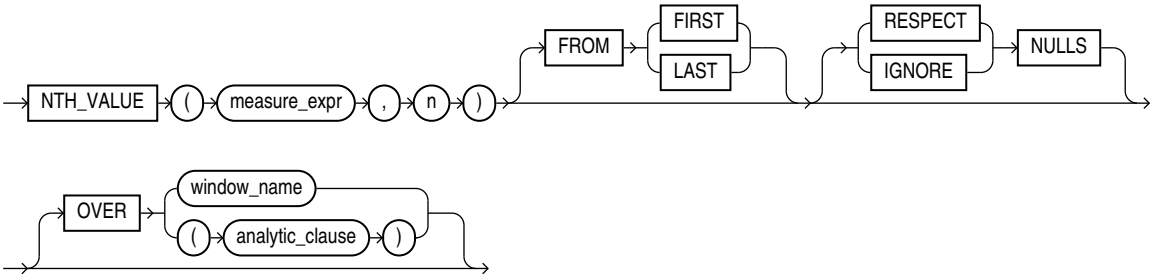
SELECT *
  FROM test
  WHERE NLSSORT(name, 'NLS_SORT = XDanish') >
        NLSSORT('Gaberd', 'NLS_SORT = XDanish')
  ORDER BY name;

NAME
---------------
Gaardiner
Gaasten
```

If you frequently use NLSSORT in comparison operations with the same linguistic sort sequence, then consider this more efficient alternative: Set the NLS_COMP parameter (either for the database or for the current session) to LINGUISTIC, and set the NLS_SORT parameter for the session to the desired sort sequence. Oracle Database will use that sort sequence by default for all sorting and comparison operations during the current session:

```
ALTER SESSION SET NLS_COMP = 'LINGUISTIC';
ALTER SESSION SET NLS_SORT = 'XDanish';
```

Copyright © 1996, 2026, Oracle and/or its affiliates.



```
SELECT *
  FROM test
  WHERE name > 'Gaberd'
  ORDER BY name;

NAME
---------------
Gaardiner
Gaasten
```

> **See Also**
>
> *Oracle Database Globalization Support Guide* for information on sort sequences

NTH_VALUE

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions of the *analytic_clause*

Purpose

`NTH_VALUE` returns the *measure_expr* value of the *n*th row in the window defined by the *analytic_clause*. The returned value has the data type of the *measure_expr*.

- {`RESPECT` | `IGNORE`} `NULLS` determines whether null values of *measure_expr* are included in or eliminated from the calculation. The default is `RESPECT NULLS`.
- *n* determines the *n*th row for which the measure value is to be returned. *n* can be a constant, bind variable, column, or an expression involving them, as long as it resolves to a positive integer. The function returns `NULL` if the data source window has fewer than *n* rows. If *n* is null, then the function returns an error.
- `FROM` {`FIRST` | `LAST`} determines whether the calculation begins at the first or last row of the window. The default is `FROM FIRST`.

If you omit the *windowing_clause* of the *analytic_clause*, it defaults to `RANGE BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW`. This default sometimes returns an unexpected value for `NTH_VALUE ... FROM LAST ...` , because the last value in the window is at the bottom of the

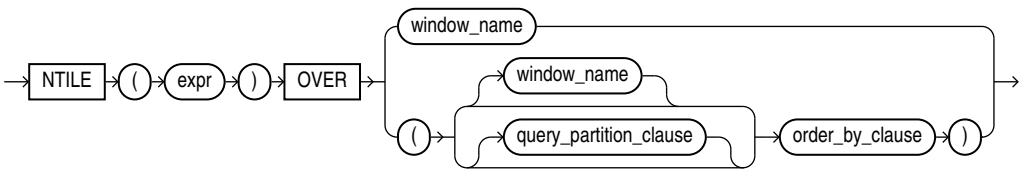
Copyright © 1996, 2026, Oracle and/or its affiliates.

window, which is not fixed. It keeps changing as the current row changes. For expected results, specify the *windowing_clause* as RANGE BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING. Alternatively, you can specify the *windowing_clause* as RANGE BETWEEN CURRENT ROW AND UNBOUNDED FOLLOWING.

> **See Also**
>
> - *Oracle Database Data Warehousing Guide* for more information on the use of this function
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of NTH_VALUE when it is a character value

Examples

The following example shows the minimum *amount_sold* value for the second *channel_id* in ascending order for each *prod_id* between 13 and 16:



```
SELECT prod_id, channel_id, MIN(amount_sold),
    NTH_VALUE(MIN(amount_sold), 2) OVER (PARTITION BY prod_id ORDER BY channel_id
    ROWS BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING) nv
  FROM sales
  WHERE prod_id BETWEEN 13 and 16
  GROUP BY prod_id, channel_id;

   PROD_ID CHANNEL_ID MIN(AMOUNT_SOLD)         NV
---------- ---------- ---------------- ----------
        13          2           907.34      906.2
        13          3            906.2      906.2
        13          4           842.21      906.2
        14          2          1015.94    1036.72
        14          3          1036.72    1036.72
        14          4           935.79    1036.72
        15          2           871.19     871.19
        15          3           871.19     871.19
        15          4           871.19     871.19
        16          2           266.84     266.84
        16          3           266.84     266.84
        16          4           266.84     266.84
        16          9            11.99     266.84

13 rows selected.
```

NTILE

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions, including valid forms of *expr*

Purpose

`NTILE` is an analytic function. It divides an ordered data set into a number of buckets indicated by *expr* and assigns the appropriate bucket number to each row. The buckets are numbered 1 through *expr*. The *expr* value must resolve to a positive constant for each partition. Oracle Database expects an integer, and if *expr* is a noninteger constant, then Oracle truncates the value to an integer. The return value is `NUMBER`.

The number of rows in the buckets can differ by at most 1. The remainder values (the remainder of number of rows divided by buckets) are distributed one for each bucket, starting with bucket 1.

If *expr* is greater than the number of rows, then a number of buckets equal to the number of rows will be filled, and the remaining buckets will be empty.

You cannot nest analytic functions by using `NTILE` or any other analytic function for *expr*. However, you can use other built-in function expressions for *expr*.

> **See Also**
>
> "About SQL Expressions " for information on valid forms of *expr* and Table 2-9 for more information on implicit conversion

Examples

The following example divides into 4 buckets the values in the `salary` column of the `oe.employees` table from Department 100. The `salary` column has 6 values in this department, so the two extra values (the remainder of 6 / 4) are allocated to buckets 1 and 2, which therefore have one more value than buckets 3 or 4.

```
SELECT last_name, salary, NTILE(4) OVER (ORDER BY salary DESC) AS quartile
  FROM employees
  WHERE department_id = 100
  ORDER BY last_name, salary, quartile;

LAST_NAME                 SALARY   QUARTILE
------------------------- ---------- ----------
Chen                        8200          2
Faviet                      9000          1
Greenberg                  12008          1
Popp                        6900          4
Sciarra                     7700          3
Urman                       7800          2
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

NULLIF

Syntax

Purpose

`NULLIF` compares *`expr1`* and *`expr2`*. If they are equal, then the function returns null. If they are not equal, then the function returns *`expr1`*. You cannot specify the literal `NULL` for *`expr1`*.

If both arguments are numeric data types, then Oracle Database determines the argument with the higher numeric precedence, implicitly converts the other argument to that data type, and returns that data type. If the arguments are not numeric, then they must be of the same data type, or Oracle returns an error.

The `NULLIF` function is logically equivalent to the following `CASE` expression:

```
CASE WHEN expr1 = expr2 THEN NULL ELSE expr1 END
```

See Also

- "CASE Expressions "
- Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation `NULLIF` uses to compare characters from *`expr1`* with characters from *`expr2`*, and for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value

Examples

The following example selects those employees from the sample schema `hr` who have changed jobs since they were hired, as indicated by a `job_id` in the `job_history` table different from the current `job_id` in the `employees` table:

```
SELECT e.last_name, NULLIF(j.job_id, e.job_id) "Old Job ID"
  FROM employees e, job_history j
  WHERE e.employee_id = j.employee_id
  ORDER BY last_name, "Old Job ID";

LAST_NAME                 Old Job ID
------------------------- ----------
De Haan                   IT_PROG
Hartstein                 MK_REP
Kaufling                  ST_CLERK
Kochhar                   AC_ACCOUNT
Kochhar                   AC_MGR
Raphaely                  ST_CLERK
Taylor                    SA_MAN
Taylor
Whalen                    AC_ACCOUNT
Whalen
```

NUMTODSINTERVAL

Syntax

Purpose

`NUMTODSINTERVAL` converts *n* to an `INTERVAL DAY TO SECOND` literal. The argument *n* can be any `NUMBER` value or an expression that can be implicitly converted to a `NUMBER` value. The argument *interval_unit* can be of `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2` data type. The value for *interval_unit* specifies the unit of *n* and must resolve to one of the following string values:

- 'DAY'
- 'HOUR'
- 'MINUTE'
- 'SECOND'

interval_unit is case insensitive. Leading and trailing values within the parentheses are ignored. By default, the precision of the return is 9.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples

The following example uses `NUMTODSINTERVAL` in a `COUNT` analytic function to calculate, for each employee, the number of employees hired by the same manager within the past 100 days from his or her hire date. Refer to "Analytic Functions " for more information on the syntax of the analytic functions.

```
SELECT manager_id, last_name, hire_date,
       COUNT(*) OVER (PARTITION BY manager_id ORDER BY hire_date
       RANGE NUMTODSINTERVAL(100, 'day') PRECEDING) AS t_count
  FROM employees
  ORDER BY last_name, hire_date;

MANAGER_ID LAST_NAME                 HIRE_DATE    T_COUNT
---------- ------------------------- --------- ----------
       149 Abel                      11-MAY-04          1
       147 Ande                      24-MAR-08          3
       121 Atkinson                  30-OCT-05          2
       103 Austin                    25-JUN-05          1
. . .
       124 Walsh                     24-APR-06          2
       100 Weiss                     18-JUL-04          1
       101 Whalen                    17-SEP-03          1
       100 Zlotkey                   29-JAN-08          2
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

NUMTOYMINTERVAL

Syntax

Purpose

`NUMTOYMINTERVAL` converts number *n* to an `INTERVAL YEAR TO MONTH` literal. The argument *n* can be any `NUMBER` value or an expression that can be implicitly converted to a `NUMBER` value. The argument *interval_unit* can be of `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2` data type. The value for *interval_unit* specifies the unit of *n* and must resolve to one of the following string values:

- 'YEAR'
- 'MONTH'

interval_unit is case insensitive. Leading and trailing values within the parentheses are ignored. By default, the precision of the return is 9.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples

The following example uses `NUMTOYMINTERVAL` in a `SUM` analytic function to calculate, for each employee, the total salary of employees hired in the past one year from his or her hire date. Refer to "Analytic Functions " for more information on the syntax of the analytic functions.

```
SELECT last_name, hire_date, salary,
       SUM(salary) OVER (ORDER BY hire_date
       RANGE NUMTOYMINTERVAL(1,'year') PRECEDING) AS t_sal
  FROM employees
  ORDER BY last_name, hire_date;

LAST_NAME                 HIRE_DATE     SALARY      T_SAL
------------------------- --------- ---------- ----------
Abel                      11-MAY-04      11000      90300
Ande                      24-MAR-08       6400     112500
Atkinson                  30-OCT-05       2800     177000
Austin                    25-JUN-05       4800     134700
. . .
Walsh                     24-APR-06       3100     186200
Weiss                     18-JUL-04       8000      70900
Whalen                    17-SEP-03       4400      54000
Zlotkey                   29-JAN-08      10500     119000
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

NVL

Syntax

Purpose

`NVL` lets you replace null (returned as a blank) with a string in the results of a query. If *`expr1`* is null, then `NVL` returns *`expr2`*. If *`expr1`* is not null, then `NVL` returns *`expr1`*.

The arguments *`expr1`* and *`expr2`* can have any data type. If their data types are different, then Oracle Database implicitly converts one to the other. If they cannot be converted implicitly, then the database returns an error. The implicit conversion is implemented as follows:

- If *`expr1`* is character data, then Oracle Database converts *`expr2`* to the data type of *`expr1`* before comparing them and returns `VARCHAR2` in the character set of *`expr1`*.
- If *`expr1`* is numeric, then Oracle Database determines which argument has the highest numeric precedence, implicitly converts the other argument to that data type, and returns that data type.

> **See Also**
>
> - Table 2-9 for more information on implicit conversion and "Numeric Precedence " for information on numeric precedence
> - "COALESCE " and "CASE Expressions ", which provide functionality similar to that of `NVL`
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of `NVL` when it is a character value

Examples

The following example returns a list of employee names and commissions, substituting "Not Applicable" if the employee receives no commission:

```
SELECT last_name, NVL(TO_CHAR(commission_pct), 'Not Applicable') commission
  FROM employees
  WHERE last_name LIKE 'B%'
  ORDER BY last_name;

LAST_NAME                 COMMISSION
------------------------- ----------------------------------------
Baer                      Not Applicable
Baida                     Not Applicable
Banda                     .1
Bates                     .15
Bell                      Not Applicable
Bernstein                 .25
Bissot                    Not Applicable
Bloom                     .2
Bull                      Not Applicable
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

NVL2

Syntax

Purpose

`NVL2` lets you determine the value returned by a query based on whether a specified expression is null or not null. If *`expr1`* is not null, then `NVL2` returns *`expr2`*. If *`expr1`* is null, then `NVL2` returns *`expr3`*.

The argument *`expr1`* can have any data type. The arguments *`expr2`* and *`expr3`* can have any data types except `LONG`.

If the data types of *`expr2`* and *`expr3`* are different, then Oracle Database implicitly converts one to the other. If they cannot be converted implicitly, then the database returns an error. If *`expr2`* is character or numeric data, then the implicit conversion is implemented as follows:

- If *`expr2`* is character data, then Oracle Database converts *`expr3`* to the data type of *`expr2`* before returning a value unless *`expr3`* is a null constant. In that case, a data type conversion is not necessary, and the database returns `VARCHAR2` in the character set of *`expr2`*.
- If *`expr2`* is numeric data, then Oracle Database determines which argument has the highest numeric precedence, implicitly converts the other argument to that data type, and returns that data type.

> **See Also**
>
> - Table 2-9 for more information on implicit conversion and "Numeric Precedence " for information on numeric precedence
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of `NVL2` when it is a character value

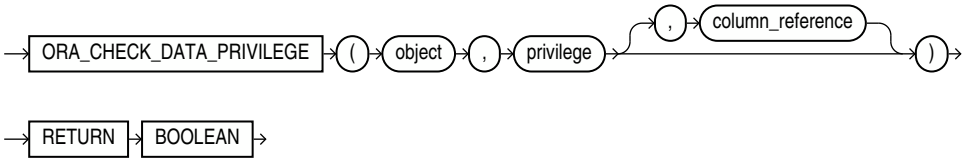
Examples

The following example shows whether the income of some employees is made up of salary plus commission, or just salary, depending on whether the `commission_pct` column of `employees` is null or not.

```
SELECT last_name, salary,
       NVL2(commission_pct, salary + (salary * commission_pct), salary) income
  FROM employees
  WHERE last_name like 'B%'
  ORDER BY last_name;

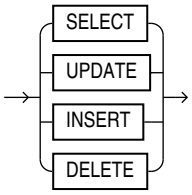
LAST_NAME                     SALARY     INCOME
------------------------- ---------- ----------
Baer                           10000      10000
Baida                           2900       2900
Banda                           6200       6820
```

Copyright © 1996, 2026, Oracle and/or its affiliates.



```
Bates                          7300       8395
Bell                           4000       4000
Bernstein                      9500      11875
Bissot                         3300       3300
Bloom                         10000      12000
Bull                           4100       4100
```

ORA_CHECK_DATA_PRIVILEGE



Purpose

`ORA_CHECK_DATA_PRIVILEGE` returns `TRUE` for rows and column values where the specified *`privilege`* is granted on the table or view specified by *`object`*.

Syntax

privilege

- *`object`*: can be a schema-qualified object or an object alias.
- *`privilege`*: specifies the privilege that object or *`column_reference`* must be authorized for. It can be one of : `SELECT`, `INSERT`, `UPDATE`, `DELETE`.

  You cannot specify `DELETE` with *`column_reference`*.

Example

In the following example, we can check which operations Marvin (an employee and a manager) can perform on `hr.employees`:

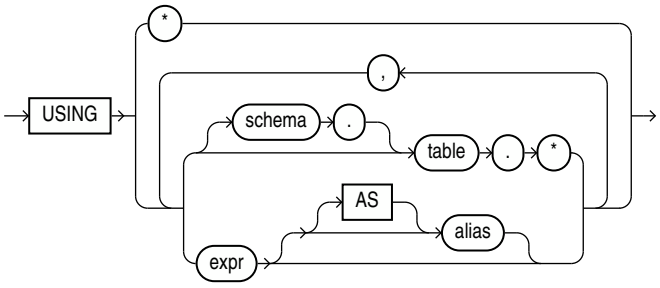
```
SELECT name, manager,
    ORA_CHECK_DATA_PRIVILEGE (emp, 'SELECT') AS list,
    ORA_CHECK_DATA_PRIVILEGE (emp, 'UPDATE', phone)
                                    AS update_phone
FROM hr.employees emp;
```

The result is:

```
NAME      MANAGER       LIST       UPDATE_PHONE
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
-------- ------------ --------- ------------
Marvin   Neena        TRUE      TRUE
John     Marvin       TRUE      FALSE
Daniel   John         TRUE      FALSE
…
n rows selected
```



The results show that Marvin can view all employee records and update only his own phone number.

ORA_DM_PARTITION_NAME

Syntax

***mining_attribute_clause*::=**

Purpose

`ORA_DM_PARTITION_NAME` is a single row function that works along with other existing functions. This function returns the name of the partition associated with the input row. When `ORA_DM_PARTITION_NAME` is used on a non-partitioned model, the result is `NULL`.

The syntax of the `ORA_DM_PARTITION_NAME` function can use an optional `GROUPING` hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

The *`mining_attribute_clause`* identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The *`mining_attribute_clause`* behaves as described for the `PREDICTION` function. See mining_attribute_clause.

> **Note**
>
> The following examples are excerpted from the Oracle Machine Learning for SQL sample programs. For more information about the sample programs, see Appendix A in *Oracle Machine Learning for SQL User's Guide*.

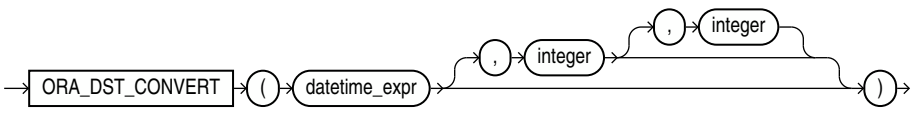
Example

```
SELECT prediction(mymodel using *) pred, ora_dm_partition_name(mymodel USING
*) pname FROM customers;
```

ORA_DST_AFFECTED

Syntax

Purpose



`ORA_DST_AFFECTED` is useful when you are changing the time zone data file for your database. The function takes as an argument a datetime expression that resolves to a `TIMESTAMP WITH TIME ZONE` value or a `VARRAY` object that contains `TIMESTAMP WITH TIME ZONE` values. The function returns `1` if the datetime value is affected by or will result in a "nonexisting time" or "duplicate time" error with the new time zone data. Otherwise, it returns 0.

This function can be issued only when changing the time zone data file of the database and upgrading the timestamp with the time zone data, and only between the execution of the `DBMS_DST.BEGIN_PREPARE` and the `DBMS_DST.END_PREPARE` procedures or between the execution of the `DBMS_DST.BEGIN_UPGRADE` and the `DBMS_DST.END_UPGRADE` procedures.

> **See Also**
>
> *Oracle Database Globalization Support Guide* for more information on time zone data files and on how Oracle Database handles daylight saving time, and *Oracle Database PL/SQL Packages and Types Reference* for information on the `DBMS_DST` package

ORA_DST_CONVERT

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

`ORA_DST_CONVERT` is useful when you are changing the time zone data file for your database. The function lets you specify error handling for a specified datetime expression.

- For *`datetime_expr`*, specify a datetime expression that resolves to a `TIMESTAMP WITH TIME ZONE` value or a `VARRAY` object that contains `TIMESTAMP WITH TIME ZONE` values.
- The optional second argument specifies handling of "duplicate time" errors. Specify `0` (false) to suppress the error by returning the source datetime value. This is the default. Specify `1` (true) to allow the database to return the duplicate time error.
- The optional third argument specifies handling of "nonexisting time" errors. Specify `0` (false) to suppress the error by returning the source datetime value. This is the default. Specify `1` (true) to allow the database to return the nonexisting time error.

If no error occurs, this function returns a value of the same data type as *`datetime_expr`* (a `TIMESTAMP WITH TIME ZONE` value or a `VARRAY` object that contains `TIMESTAMP WITH TIME ZONE` values). The returned datetime value when interpreted with the new time zone file corresponds to *`datetime_expr`* interpreted with the old time zone file.

This function can be issued only when changing the time zone data file of the database and upgrading the timestamp with the time zone data, and only between the execution of the `DBMS_DST.BEGIN_UPGRADE` and the `DBMS_DST.END_UPGRADE` procedures.

> **See Also**
>
> *Oracle Database Globalization Support Guide* for more information on time zone data files and on how Oracle Database handles daylight saving time, and *Oracle Database PL/SQL Packages and Types Reference* for information on the `DBMS_DST` package

ORA_DST_ERROR

Syntax

Purpose

`ORA_DST_ERROR` is useful when you are changing the time zone data file for your database. The function takes as an argument a datetime expression that resolves to a `TIMESTAMP WITH TIME ZONE` value or a `VARRAY` object that contains `TIMESTAMP WITH TIME ZONE` values, and indicates whether the datetime value will result in an error with the new time zone data. The return values are:

- `0`: the datetime value does not result in an error with the new time zone data.
- `1878`: the datetime value results in a "nonexisting time" error.
- `1883`: the datetime value results in a "duplicate time" error.

This function can be issued only when changing the time zone data file of the database and upgrading the timestamp with the time zone data, and only between the execution of the

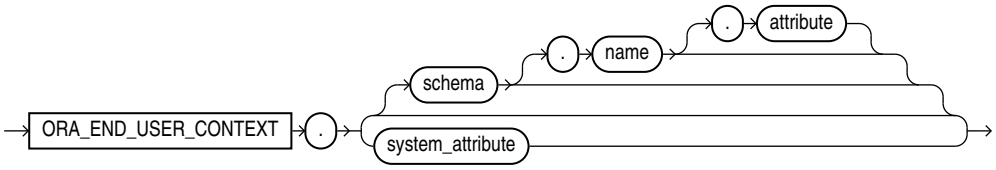
Copyright © 1996, 2026, Oracle and/or its affiliates.

DBMS_DST.BEGIN_PREPARE and the DBMS_DST.END_PREPARE procedures or between the execution of the DBMS_DST.BEGIN_UPGRADE and the DBMS_DST.END_UPGRADE procedures.

> **See Also**
>
> *Oracle Database Globalization Support Guide* for more information on time zone data files and on how Oracle Database handles daylight saving time, and *Oracle Database PL/SQL Packages and Types Reference* for information on the DBMS_DST package

ORA_END_USER_CONTEXT

Purpose



Use ORA_END_USER_CONTEXT operator to refer to a context attribute as a variable (or expression). You can retrieve the following:

- A specific attribute within a specified context.
- All the attributes and values for one specified context. The returned data is in JSON format.
- All the attributes and values for all the contexts that are accessible to the user. The returned data is in JSON format.

Prerequisites

Calling ORA_END_USER_CONTEXT operator to access the pre-defined, system-managed contexts do not require any specific privilege. To access custom (user-defined) contexts, you must have either SELECT ANY END USER CONTEXT system privilege, or, have the SELECT privilege granted through a data grant on SYS.END_USER_CONTEXT view for the specific context.

Syntax

Semantics

- *schema*: The owner of the context. Omit for USER.DEFAULT system attributes (which are elevated to the top level).
- *name*: The name of the context. If omitted, all the contexts under the schema are returned.
- *attribute*: The specific attribute within the context. If omitted, the entire context is returned as a JSON object.
- *system_attribute*: Includes the following: USERNAME, LOGON_END_USER, CURRENT_END_USER, and all the predefined attributes in USERENV namespace from SYS_CONTEXT.

Note that ORA_END_USER_CONTEXT does not take any arguments. It returns a complete list of pre-defined system attributes along with all instantiated contexts and their associated attributes.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The dot-annotation is supported because this function returns data in JSON type.

If HR.HCM context has been created and instantiated in the session, SELECT ORA_END_USER_CONTEXT from dual; returns the following:

```
{
  “USERNAME” : “SCOTT”,
  “LOGON_END_USER”: “SCOTT”,
  “CURRENT_END_USER”: “SCOTT”,
  “USER” : {
      “TOKEN” : {
          “TOKEN_ID” : xxx
          …
      }
   },
  “HR” : {
    "HCM" : {
      "emp_id": 3
      "service_center_id": 5
     }
  }
}
```

Note that the top-level attributes as shown in above example, USERNAME, LOGON_END_USER, CURRENT_END_USER, and the context USER.TOKEN, are the pre-defined system attributes. They are by default available to all end users.

There are two pre-defined, system-managed contexts available in every end-user security context and do not requre explicit instantiation. You cannot modify attributes in these contexts directly, they are initialized by the database server based on the user identity propagated from IAM.

- USER.DEFAULT: Contains system attributes that identify the end user, such as USERNAME, LOGON_END_USER, and CURRENT_END_USER. It also includes all predefined database session attributes from the SYS_CONTEXT namespace USERENV, such as AUTHENTICATED_IDENTITY and DB_NAME. For ease of use, USER.DEFAULT attributes are elevated to the top level of the ORA_END_USER_CONTEXT namespace, so you can reference them directly without specifying USER.DEFAULT in the path. For example, ORA_END_USER_CONTEXT.username returns the end user's name.
- USER.TOKEN: Contains claims extracted directly from the end user's OAuth 2.0 access token. Only the following claims are available: iss [issuer], sub [subject], and aud [audience]. You must prefix these attributes with the full path in the operator, for example, ORA_END_USER_CONTEXT.USER.TOKEN.iss.

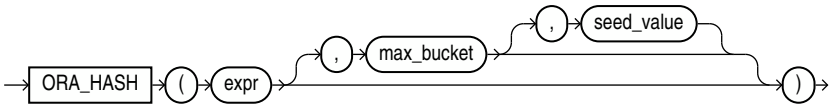
You can reference the attributes of context USER.DEFAULT directly using ORA_END_USER_CONTEXT .

The syntax follows the standard JSON dot path notation, so, SELECT ORA_END_USER_CONTEXT.HR.HCM FROM dual returns:

```
{
  "emp_id": 3,
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
  "service_center_id": 5
}
```



`SELECT ORA_END_USER_CONTEXT.HR FROM dual` returns:

```
{
      "HCM" :    {
      "emp_id": 3
      "service_center_id": 5
   }
}
```

To reference a particular attribute, owner, name, and attribute all need to exist. For example, `SELECT ORA_END_USER_CONTEX.HR.HCM.emp_id FROM dual` returns 3.

ORA_HASH

Syntax

Purpose

`ORA_HASH` is a function that computes a hash value for a given expression. Use this function to analyze a subset of data and generate a random sample.

- The *expr* argument determines the data for which you want Oracle Database to compute a hash value. There are no restrictions on the length of data represented by *expr*, which commonly resolves to a column name. The *expr* cannot be a `LONG` or LOB type. It cannot be a user-defined object type unless it is a nested table type. The hash value for nested table types does not depend on the order of elements in the collection. All other data types are supported for *expr*.
- The optional *max_bucket* argument determines the maximum bucket value returned by the hash function. You can specify any value between 0 and 4294967295. The default is 4294967295.

  Note that the default hash value is a 32 bit unsigned number. The default *max_bucket* of `2^32-1` simply returns this value.

  Bucketing is done using a `MOD` function to the default value. If *max_bucket* = N, then the bucket value is computed by (default hash value) `MOD` (N + 1), which results in a bucket value between 0 and N.

  Note that this technique does not result in a statistically uniform distribution of values across buckets and is somewhat biased towards smaller bucket numbers, except when N + 1 is a power of 2. This is not noticeable when *max_bucket* (i.e N) is small relative to the default (4294967295) but may be noticeable for *max_bucket* values that are very large, especially within an order of magnitude of the default, say > 100M.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- The optional *seed_value* argument enables Oracle to produce many different results for the same set of data. Oracle applies the hash function to the combination of *expr* and *seed_value*. You can specify any value between 0 and 4294967295. The default is 0.

The function returns a NUMBER value.

Examples

The following example creates a hash value for each combination of customer ID and product ID in the sh.sales table, divides the hash values into a maximum of 100 buckets, and returns the sum of the amount_sold values in the first bucket (bucket 0). The third argument (5) provides a seed value for the hash function. You can obtain different hash results for the same query by changing the seed value.

```
SELECT SUM(amount_sold)
  FROM sales
  WHERE ORA_HASH(CONCAT(cust_id, prod_id), 99, 5) = 0;

SUM(AMOUNT_SOLD)
----------------
       989431.14
```

ORA_INVOKING_USER

Syntax

Purpose

ORA_INVOKING_USER returns the name of the database user who invoked the current statement or view. This function takes into account the BEQUEATH property of intervening views referenced in the statement. If this function is invoked from within a definer's rights context, then it returns the name of the owner of the definer's rights object. If the invoking user is a Real Application Security user, then it returns user XS$NULL.

This function returns a VARCHAR2 value.

> **See Also**
>
> - BEQUEATH clause of the CREATE VIEW statement
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of ORA_INVOKING_USER

Examples

The following example returns the name of the database user who invoked the statement:

```
SELECT ORA_INVOKING_USER FROM DUAL;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

ORA_INVOKING_USERID

Syntax

Purpose

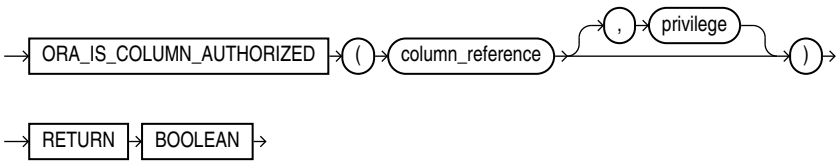
`ORA_INVOKING_USERID` returns the identifier of the database user who invoked the current statement or view. This function takes into account the `BEQUEATH` property of intervening views referenced in the statement.

This function returns a `NUMBER` value.

> **See Also**
>
> - ORA_INVOKING_USER to learn how Oracle Database determines the database user who invoked the current statement or view
> - BEQUEATH clause of the `CREATE VIEW` statement

Examples

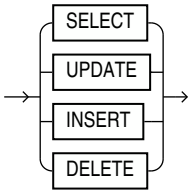
The following example returns the identifier of the database user who invoked the statement:



```
SELECT ORA_INVOKING_USERID FROM DUAL;
```

ORA_IS_COLUMN_AUTHORIZED

Purpose



`ORA_IS_COLUMN_AUTHORIZED` differentiates an actual NULL cell value from an unauthorized NULL cell value for a specified column reference. If the Deep Sec end user is authorized to access the column value in the current row, or if the column is not protected by Deep Sec, then the function returns `TRUE`. Otherwise, it returns `FALSE`.

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

privilege

- *column_reference*: specifies a column reference in a table or view that needs to be checked for authorization on a particular row. This parameter does not accept expressions. *column_reference* can be qualified with schema and object name (schema.object.column). Schema and object are both optional.

  Note that if there is more than one object in the query where the function is used and more than one object has the same column name, then *column_reference* needs to be qualified to prevent failure.
- *privilege*: specifies the privilege that *column_reference* must be authorized for. It can be one of SELECT, INSERT, UPDATE, DELETE. SELECT is the default.

  Note: You cannot specify DELETE with ORA_IS_COLUMN_AUTHORIZED.

Example

The following example shows how ORA_IS_COLUMN_AUTHORIZED (with the default SELECT privilege) is used inside the SQL select list to replace unauthorized NULL SSN values with 000-00-0000:

```
SELECT name,
       DECODE (ORA_IS_COLUMN_AUTHORIZED(ssn), false,
                 '000-00-0000', true, ssn) ssn, email, manager
FROM hr.employees;

NAME       SSN           EMAIL          MANAGER
---------  ------------  -----------    ---------
Marvin     108-51-4569   msmith         Neena
John       000-00-0000   japplebee      Marvin
Daniel     000-00-0000   dradcliff      Marvin
3 rows selected.
```

PATH

Syntax

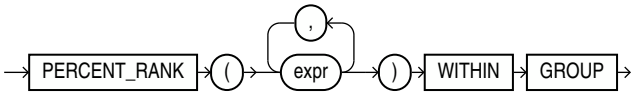
Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

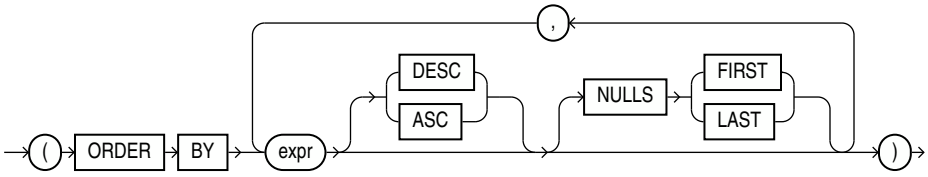
`PATH` is an ancillary function used only with the `UNDER_PATH` and `EQUALS_PATH` conditions. It returns the relative path that leads to the resource specified in the parent condition.

The *`correlation_integer`* can be any `NUMBER` integer and is used to correlate this ancillary function with its primary condition. Values less than 1 are treated as 1.

> **See Also**
>
> - EQUALS_PATH Condition and UNDER_PATH Condition
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `PATH`



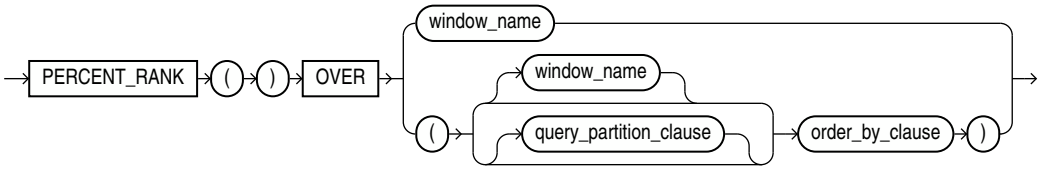
Examples



Refer to the related function DEPTH for an example using both of these ancillary functions of the `EQUALS_PATH` and `UNDER_PATH` conditions.

PERCENT_RANK

Aggregate Syntax



***percent_rank_aggregate*::=**

Analytic Syntax

***percent_rank_analytic*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

`PERCENT_RANK` is similar to the `CUME_DIST` (cumulative distribution) function. The range of values returned by `PERCENT_RANK` is 0 to 1, inclusive. The first row in any set has a `PERCENT_RANK` of 0. The return value is `NUMBER`.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

- As an aggregate function, `PERCENT_RANK` calculates, for a hypothetical row *r* identified by the arguments of the function and a corresponding sort specification, the rank of row *r* minus 1 divided by the number of rows in the aggregate group. This calculation is made as if the hypothetical row *r* were inserted into the group of rows over which Oracle Database is to aggregate.

  The arguments of the function identify a single hypothetical row within each aggregate group. Therefore, they must all evaluate to constant expressions within each aggregate group. The constant argument expressions and the expressions in the `ORDER BY` clause of the aggregate match by position. Therefore the number of arguments must be the same and their types must be compatible.
- As an analytic function, for a row *r*, `PERCENT_RANK` calculates the rank of *r* minus 1, divided by 1 less than the number of rows being evaluated (the entire query result set or a partition).

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation `PERCENT_RANK` uses to compare character values for the `ORDER BY` clause

Aggregate Example

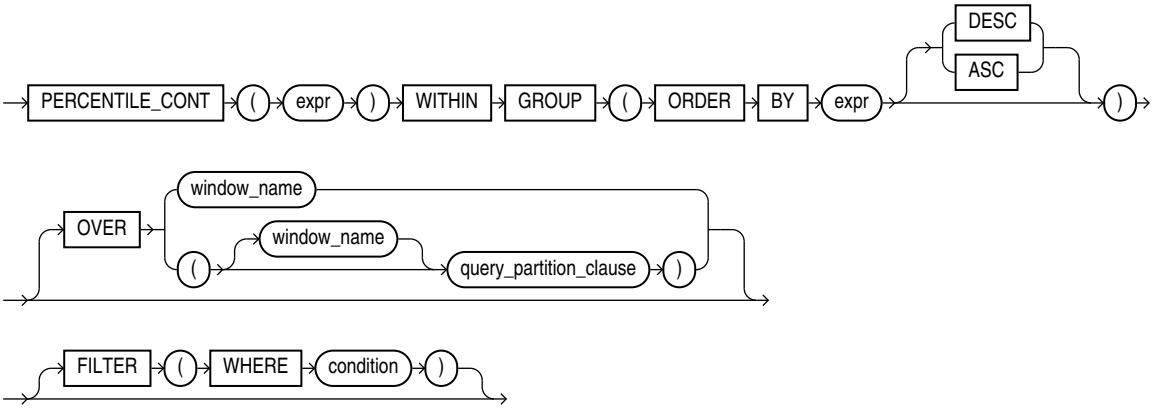
The following example calculates the percent rank of a hypothetical employee in the sample table `hr.employees` with a salary of $15,500 and a commission of 5%:

```
SELECT PERCENT_RANK(15000, .05) WITHIN GROUP
       (ORDER BY salary, commission_pct) "Percent-Rank"
  FROM employees;

Percent-Rank
------------
  .971962617
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Analytic Example



The following example calculates, for each employee, the percent rank of the employee's salary within the department:

```
SELECT department_id, last_name, salary, PERCENT_RANK()
       OVER (PARTITION BY department_id ORDER BY salary DESC) AS pr
  FROM employees
  ORDER BY pr, salary, last_name;

DEPARTMENT_ID LAST_NAME                 SALARY         PR
------------- ------------------------- ---------- ----------
           10 Whalen                          4400          0
           40 Mavris                          6500          0
              Grant                           7000          0
. . .
           80 Vishney                        10500 .181818182
           80 Zlotkey                        10500 .181818182
           30 Khoo                            3100         .2
. . .
           50 Markle                          2200 .954545455
           50 Philtanker                      2200 .954545455
           50 Olson                           2100          1
. . .
```

PERCENTILE_CONT

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions of the `OVER` clause

Purpose

`PERCENTILE_CONT` is an inverse distribution function that assumes a continuous distribution model. It takes a percentile value and a sort specification, and returns an interpolated value that would fall into that percentile value with respect to the sort specification. Nulls are ignored in the calculation.

Copyright © 1996, 2026, Oracle and/or its affiliates.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

The first *expr* must evaluate to a numeric value between 0 and 1, because it is a percentile value. This *expr* must be constant within each aggregation group. The `ORDER BY` clause takes a single expression that must be a numeric or datetime value, as these are the types over which Oracle can perform interpolation.

The result of `PERCENTILE_CONT` is computed by linear interpolation between values after ordering them. Using the percentile value (P) and the number of rows (N) in the aggregation group, you can compute the row number you are interested in after ordering the rows with respect to the sort specification. This row number (RN) is computed according to the formula `RN = (1+(P*(N-1))`. The final result of the aggregate function is computed by linear interpolation between the values from rows at row numbers `CRN = CEILING(RN)` and `FRN = FLOOR(RN)`.

The final result will be:

```
If (CRN = FRN = RN) then the result is
  (value of expression from row at RN)
Otherwise the result is
  (CRN - RN) * (value of expression for row at FRN) +
  (RN - FRN) * (value of expression for row at CRN)
```

You can use the `PERCENTILE_CONT` function as an analytic function. You can specify only the *query_partitioning_clause* in its `OVER` clause. It returns, for each row, the value that would fall into the specified percentile among a set of values within each partition.

The `MEDIAN` function is a specific case of `PERCENTILE_CONT` where the percentile value defaults to 0.5. For more information, refer to MEDIAN .

> **Note**
>
> Before processing a large amount of data with the `PERCENTILE_CONT` function, consider using one of the following methods to obtain approximate results more quickly than exact results:
>
> - Set the `APPROX_FOR_PERCENTILE` initialization parameter to `PERCENTILE_CONT` or `ALL` before using the `PERCENTILE_CONT` function. Refer to *Oracle Database Reference* for more information on this parameter.
> - Use the `APPROX_PERCENTILE` function instead of the `PERCENTILE_CONT` function. Refer to APPROX_PERCENTILE.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Aggregate Example

The following example computes the median salary in each department:

Copyright © 1996, 2026, Oracle and/or its affiliates.

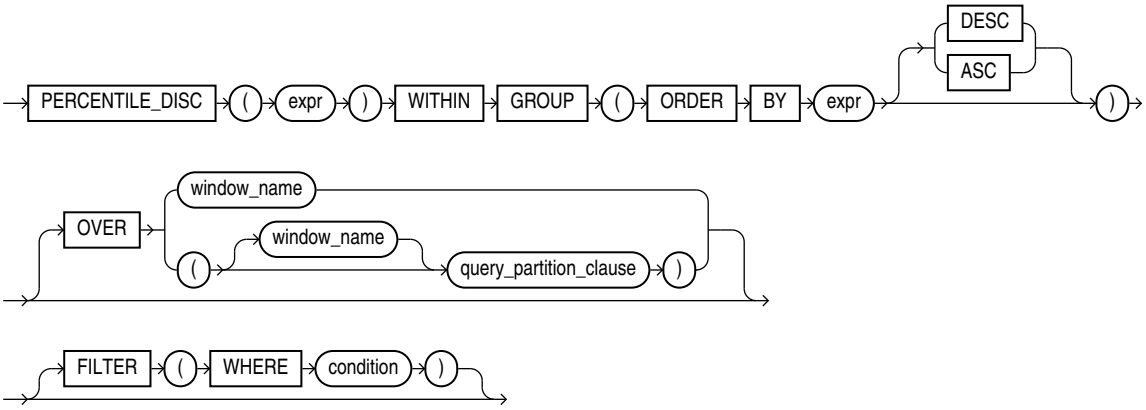
```
SELECT department_id,
       PERCENTILE_CONT(0.5) WITHIN GROUP (ORDER BY salary DESC) "Median cont",
       PERCENTILE_DISC(0.5) WITHIN GROUP (ORDER BY salary DESC) "Median disc"
  FROM employees
  GROUP BY department_id
  ORDER BY department_id;

DEPARTMENT_ID Median cont Median disc
------------- ----------- -----------
           10        4400        4400
           20        9500       13000
           30        2850        2900
           40        6500        6500
           50        3100        3100
           60        4800        4800
           70       10000       10000
           80        8900        9000
           90       17000       17000
          100        8000        8200
          110       10154       12008
                     7000        7000
```

PERCENTILE_CONT and PERCENTILE_DISC may return different results. PERCENTILE_CONT returns a computed result after doing linear interpolation. PERCENTILE_DISC simply returns a value from the set of values that are aggregated over. When the percentile value is 0.5, as in this example, PERCENTILE_CONT returns the average of the two middle values for groups with even number of elements, whereas PERCENTILE_DISC returns the value of the first one among the two middle values. For aggregate groups with an odd number of elements, both functions return the value of the middle element.

Analytic Example

In the following example, the median for Department 60 is 4800, which has a corresponding percentile (Percent_Rank) of 0.5. None of the salaries in Department 30 have a percentile of 0.5, so the median value must be interpolated between 2900 (percentile 0.4) and 2800 (percentile 0.6), which evaluates to 2850.



```
SELECT last_name, salary, department_id,
       PERCENTILE_CONT(0.5) WITHIN GROUP (ORDER BY salary DESC)
         OVER (PARTITION BY department_id) "Percentile_Cont",
       PERCENT_RANK()
        OVER (PARTITION BY department_id ORDER BY salary DESC) "Percent_Rank"
  FROM employees
  WHERE department_id IN (30, 60)
  ORDER BY last_name, salary, department_id;

LAST_NAME                 SALARY DEPARTMENT_ID Percentile_Cont Percent_Rank
------------------------- ---------- ------------- --------------- ------------
Austin                          4800            60            4800           .5
Baida                           2900            30            2850           .4
Colmenares                      2500            30            2850            1
Ernst                           6000            60            4800          .25
Himuro                          2600            30            2850           .8
Hunold                          9000            60            4800            0
Khoo                            3100            30            2850           .2
Lorentz                         4200            60            4800            1
Pataballa                       4800            60            4800           .5
Raphaely                       11000            30            2850            0
Tobias                          2800            30            2850           .6
```

PERCENTILE_DISC

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions of the `OVER` clause

Purpose

`PERCENTILE_DISC` is an inverse distribution function that assumes a discrete distribution model. It takes a percentile value and a sort specification and returns an element from the set. Nulls are ignored in the calculation.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

The first *expr* must evaluate to a numeric value between 0 and 1, because it is a percentile value. This expression must be constant within each aggregate group. The `ORDER BY` clause takes a single expression that can be of any type that can be sorted.

For a given percentile value `P`, `PERCENTILE_DISC` sorts the values of the expression in the `ORDER BY` clause and returns the value with the smallest `CUME_DIST` value (with respect to the same sort specification) that is greater than or equal to `P`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **Note**
>
> Before processing a large amount of data with the PERCENTILE_DISC function, consider using one of the following methods to obtain approximate results more quickly than exact results:
>
> - Set the APPROX_FOR_PERCENTILE initialization parameter to PERCENTILE_DISC or ALL before using the PERCENTILE_DISC function. Refer to *Oracle Database Reference* for more information on this parameter.
> - Use the APPROX_PERCENTILE function instead of the PERCENTILE_DISC function. Refer to APPROX_PERCENTILE.

For the semantics of the FILTER clause, see FILTER Clause Semantics.

Aggregate Example

See aggregate example for PERCENTILE_CONT .

Analytic Example

The following example calculates the median discrete percentile of the salary of each employee in the sample table hr.employees:

```
SELECT last_name, salary, department_id,
       PERCENTILE_DISC(0.5) WITHIN GROUP (ORDER BY salary DESC)
         OVER (PARTITION BY department_id) "Percentile_Disc",
       CUME_DIST() OVER (PARTITION BY department_id
         ORDER BY salary DESC) "Cume_Dist"
  FROM employees
  WHERE department_id in (30, 60)
  ORDER BY last_name, salary, department_id;

LAST_NAME                 SALARY DEPARTMENT_ID Percentile_Disc  Cume_Dist
------------------------- ---------- ------------- --------------- ----------
Austin                      4800            60            4800         .8
Baida                       2900            30            2900         .5
Colmenares                  2500            30            2900          1
Ernst                       6000            60            4800         .4
Himuro                      2600            30            2900 .833333333
Hunold                      9000            60            4800         .2
Khoo                        3100            30            2900 .333333333
Lorentz                     4200            60            4800          1
Pataballa                   4800            60            4800         .8
Raphaely                   11000            30            2900 .166666667
Tobias                      2800            30            2900 .666666667
```

The median value for Department 30 is 2900, which is the value whose corresponding percentile (Cume_Dist) is the smallest value greater than or equal to 0.5. The median value for Department 60 is 4800, which is the value whose corresponding percentile is the smallest value greater than or equal to 0.5.

POWER

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

`POWER` returns *n2* raised to the *n1* power. The base *n2* and the exponent *n1* can be any numbers, but if *n2* is negative, then *n1* must be an integer.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If any argument is `BINARY_FLOAT` or `BINARY_DOUBLE`, then the function returns `BINARY_DOUBLE`. Otherwise, the function returns `NUMBER`.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples

The following example returns 3 squared:

```
SELECT POWER(3,2) "Raised"
  FROM DUAL;

    Raised
----------
         9
```

POWERMULTISET

Syntax

Purpose

`POWERMULTISET` takes as input a nested table and returns a nested table of nested tables containing all nonempty subsets (called submultisets) of the input nested table.

- *expr* can be any expression that evaluates to a nested table.
- If *expr* resolves to null, then Oracle Database returns `NULL`.
- If *expr* resolves to a nested table that is empty, then Oracle returns an error.
- The element types of the nested table must be comparable. Refer to "Comparison Conditions " for information on the comparability of nonscalar types.

> **Note**
>
> This function is not supported in PL/SQL.

Examples

First, create a data type that is a nested table of the `cust_address_tab_type` data type:

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
CREATE TYPE cust_address_tab_tab_typ
  AS TABLE OF cust_address_tab_typ;
/
```

Now, select the nested table column `cust_address_ntab` from the `customers_demo` table using the `POWERMULTISET` function:

```
SELECT CAST(POWERMULTISET(cust_address_ntab) AS cust_address_tab_tab_typ)
  FROM customers_demo;

CAST(POWERMULTISET(CUST_ADDRESS_NTAB) AS CUST_ADDRESS_TAB_TAB_TYP)
  (STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID)
--------------------------------------------------------------------
CUST_ADDRESS_TAB_TAB_TYP(CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP
  ('514 W Superior St', '46901', 'Kokomo', 'IN', 'US')))
CUST_ADDRESS_TAB_TAB_TYP(CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP
  ('2515 Bloyd Ave', '46218', 'Indianapolis', 'IN', 'US')))
CUST_ADDRESS_TAB_TAB_TYP(CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP
  ('8768 N State Rd 37', '47404', 'Bloomington', 'IN', 'US')))
CUST_ADDRESS_TAB_TAB_TYP(CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP
  ('6445 Bay Harbor Ln', '46254', 'Indianapolis', 'IN', 'US')))
. . .
```

The preceding example requires the `customers_demo` table and a nested table column containing data. Refer to "Multiset Operators " to create this table and nested table columns.

POWERMULTISET_BY_CARDINALITY

Syntax

Purpose

`POWERMULTISET_BY_CARDINALITY` takes as input a nested table and a cardinality and returns a nested table of nested tables containing all nonempty subsets (called submultisets) of the nested table of the specified cardinality.

- *`expr`* can be any expression that evaluates to a nested table.
- *`cardinality`* can be any positive integer.
- If *`expr`* resolves to null, then Oracle Database returns `NULL`.
- If *`expr`* resolves to a nested table that is empty, then Oracle returns an error.
- The element types of the nested table must be comparable. Refer to "Comparison Conditions " for information on the comparability of nonscalar types.

> **Note**
>
> This function is not supported in PL/SQL.

Examples

First, create a data type that is a nested table of the `cust_address_tab_type` data type:

Copyright © 1996, 2026, Oracle and/or its affiliates.

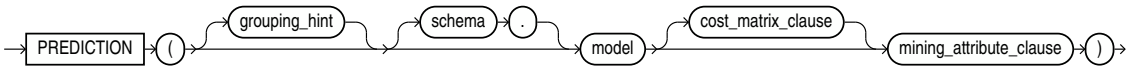
```
CREATE TYPE cust_address_tab_tab_typ
  AS TABLE OF cust_address_tab_typ;
/
```

Next, duplicate the elements in all the nested table rows to increase the cardinality of the nested table rows to 2:

```
UPDATE customers_demo
  SET cust_address_ntab = cust_address_ntab MULTISET UNION cust_address_ntab;
```

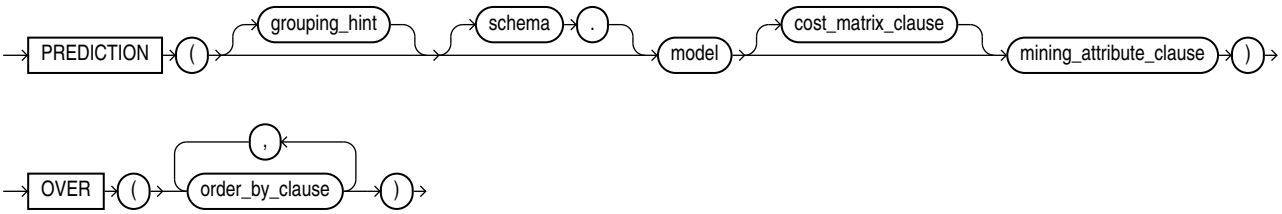
Now, select the nested table column `cust_address_ntab` from the `customers_demo` table using the `POWERMULTISET_BY_CARDINALITY` function:

```
SELECT CAST(POWERMULTISET_BY_CARDINALITY(cust_address_ntab, 2)
         AS cust_address_tab_tab_typ)
  FROM customers_demo;



CAST(POWERMULTISET_BY_CARDINALITY(CUST_ADDRESS_NTAB,2) AS CUST_ADDRESS_TAB_TAB_TYP)
  (STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID)
--------------------------------------------------------------------------------
CUST_ADDRESS_TAB_TAB_TYP(CUST_ADDRESS_TAB_TYP
  (CUST_ADDRESS_TYP('514 W Superior St', '46901', 'Kokomo', 'IN', 'US'),
   CUST_ADDRESS_TYP('514 W Superior St', '46901', 'Kokomo', 'IN', 'US')))
CUST_ADDRESS_TAB_TAB_TYP(CUST_ADDRESS_TAB_TYP
  (CUST_ADDRESS_TYP('2515 Bloyd Ave', '46218', 'Indianapolis', 'IN', 'US'),
   CUST_ADDRESS_TYP('2515 Bloyd Ave', '46218', 'Indianapolis', 'IN', 'US')))
CUST_ADDRESS_TAB_TAB_TYP(CUST_ADDRESS_TAB_TYP
  (CUST_ADDRESS_TYP('8768 N State Rd 37', '47404', 'Bloomington', 'IN', 'US'),
   CUST_ADDRESS_TYP('8768 N State Rd 37', '47404', 'Bloomington', 'IN', 'US')))
. . .
```

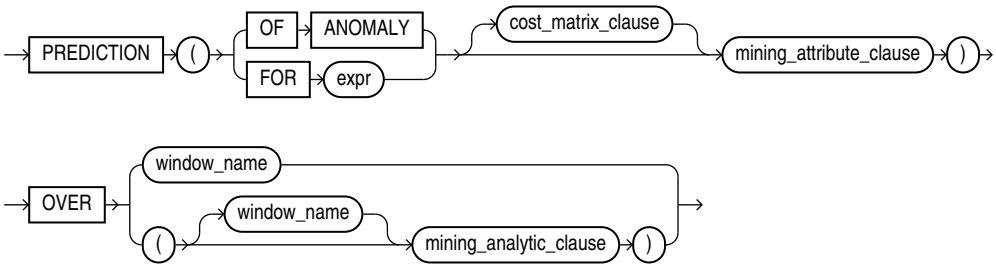
The preceding example requires the `customers_demo` table and a nested table column containing data. Refer to "Multiset Operators " to create this table and nested table columns.



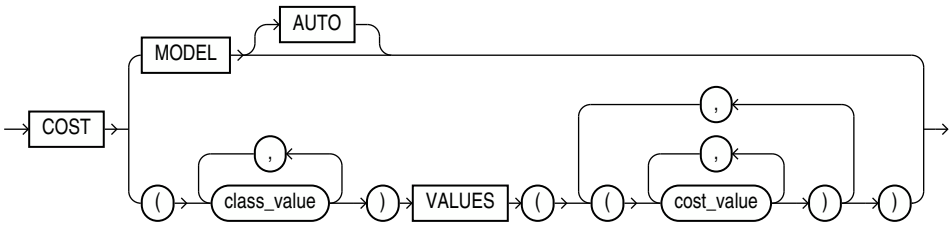
PREDICTION

Syntax

***prediction*::=**

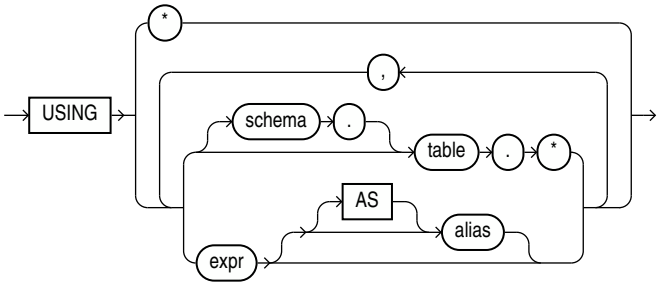


***prediction_ordered*::=**

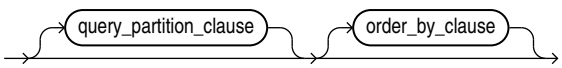


Copyright © 1996, 2026, Oracle and/or its affiliates.

Analytic Syntax



***prediction_analytic*::=**



***cost_matrix_clause*::=**

***mining_attribute_clause*::=**

***mining_analytic_clause*::=**

> **See Also**
>
> "Analytic Functions " for information on the syntax, semantics, and restrictions of *mining_analytic_clause*

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

`PREDICTION` returns a prediction for each row in the selection. The data type of the returned prediction depends on whether the function performs Regression, Classification, or Anomaly Detection.

- **Regression**: Returns the expected target value for each row. The data type of the return value is the data type of the target.
- **Classification**: Returns the most probable target class (or lowest cost target class, if costs are specified) for each row. The data type of the return value is the data type of the target.
- **Anomaly Detection**: Returns `1` or `0` for each row. Typical rows are classified as 1. Rows that differ significantly from the rest of the data are classified as 0.

cost_matrix_clause

Costs are a biasing factor for minimizing the most harmful kinds of misclassifications. You can specify *`cost_matrix_clause`* for Classification or Anomaly Detection. Costs are not relevant for Regression. The *`cost_matrix_clause`* behaves as described for "PREDICTION_COST ".

Syntax Choice

`PREDICTION` can score data by applying a mining model object to the data, or it can dynamically score the data by executing an analytic clause that builds and applies one or more transient mining models. Choose **Syntax** or **Analytic Syntax**:

- **Syntax**: Use the *`prediction`* syntax to score the data with a pre-defined model. Supply the name of a model that performs classification, regression, or anomaly detection.

  Use the *`prediction_ordered`* syntax for a model that requires ordered data, such as an MSET-SPRT model. The *`prediction_ordered`* syntax requires an *`order_by_clause`* clause.

  Restrictions on the *`prediction_ordered`* syntax are that you cannot use it in the `WHERE` clause of a query. Also, you cannot use a *`query_partition_clause`* or a *`windowing_clause`* with the *`prediction_ordered`* syntax.

  For details about the *`order_by_clause`*, see "Analytic Functions ".
- **Analytic Syntax**: Use the analytic syntax to score the data without a pre-defined model. The analytic syntax uses *`mining_analytic_clause`* , which specifies if the data should be partitioned for multiple model builds. The *`mining_analytic_clause`* supports a *`query_partition_clause`* and an *`order_by_clause`*. (See "*analytic_clause*::=".)
  - For Regression, specify `FOR` *`expr`*, where *`expr`* is an expression that identifies a target column that has a numeric data type.
  - For Classification, specify `FOR` *`expr`*, where *`expr`* is an expression that identifies a target column that has a character data type.
  - For Anomaly Detection, specify the keywords `OF ANOMALY`.

The syntax of the `PREDICTION` function can use an optional `GROUPING` hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

`mining_attribute_clause` identifies the column attributes to use as predictors for scoring.

- If you specify `USING *`, all the relevant attributes present in the input row are used.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- If you invoke the function with the analytic syntax, the *mining_attribute_clause* is used both for building the transient models and for scoring.
- It you invoke the function with a pre-defined model, the *mining_attribute_clause* should include all or some of the attributes that were used to create the model. The following conditions apply:
  - If *mining_attribute_clause* includes an attribute with the same name but a different data type from the one that was used to create the model, then the data type is converted to the type expected by the model.
  - If you specify more attributes for scoring than were used to create the model, then the extra attributes are silently ignored.
  - If you specify fewer attributes for scoring than were used to create the model, then scoring is performed on a best-effort basis.

Note

The following examples are excerpted from the Oracle Machine Learning for SQL sample programs. For more information about the sample programs, see Appendix A in *Oracle Machine Learning for SQL User's Guide*.

Example

In this example, the model `dt_sh_clas_sample` predicts the gender and age of customers who are most likely to use an affinity card (target = 1). The `PREDICTION` function takes into account the cost matrix associated with the model and uses marital status, education, and household size as predictors.

```
SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
   FROM mining_data_apply_v
   WHERE PREDICTION(dt_sh_clas_sample COST MODEL
      USING cust_marital_status, education, household_size) = 1
   GROUP BY cust_gender
   ORDER BY cust_gender;

CUST_GENDER         CNT    AVG_AGE
------------ ---------- ----------
F                   170         38
M                   685         42
```

The cost matrix associated with the model `dt_sh_clas_sample` is stored in the table `dt_sh_sample_costs`. The cost matrix specifies that the misclassification of 1 is 8 times more costly than the misclassification of 0.

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SQL> select * from dt_sh_sample_cost;

ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE         COST
------------------- ---------------------- ------------
                  0                      0   .000000000
                  0                      1  1.000000000
                  1                      0  8.000000000
                  1                      1   .000000000
```

Analytic Example

In this example, dynamic regression is used to predict the age of customers who are likely to use an affinity card. The query returns the 3 customers whose predicted age is most different from the actual. The query includes information about the predictors that have the greatest influence on the prediction.

```
SELECT cust_id, age, pred_age, age-pred_age age_diff, pred_det FROM
   (SELECT cust_id, age, pred_age, pred_det,
          RANK() OVER (ORDER BY ABS(age-pred_age) desc) rnk FROM
   (SELECT cust_id, age,
           PREDICTION(FOR age USING *) OVER () pred_age,
           PREDICTION_DETAILS(FOR age ABS USING *) OVER () pred_det
    FROM mining_data_apply_v))
  WHERE rnk <= 3;

PREDICTION_BOUNDS

Syntax

***mining_attribute_clause*::=**

Purpose

`PREDICTION_BOUNDS` applies a Generalized Linear Model (GLM) to predict a class or a value for each row in the selection. The function returns the upper and lower bounds of each prediction in a varray of objects with fields `UPPER` and `LOWER`.

GLM can perform either regression or binary classification:

- The bounds for regression refer to the predicted target value. The data type of `UPPER` and `LOWER` is the data type of the target.
- The bounds for binary classification refer to the probability of either the predicted target class or the specified *`class_value`*. The data type of `UPPER` and `LOWER` is `BINARY_DOUBLE`.

If the model was built using ridge regression, or if the covariance matrix is found to be singular during the build, then `PREDICTION_BOUNDS` returns `NULL` for both bounds.

`confidence_level` is a number in the range (0,1). The default value is 0.95. You can specify *`class_value`* while leaving *`confidence_level`* at its default by specifying `NULL` for *`confidence_level`*.

The syntax of the `PREDICTION_BOUNDS` function can use an optional `GROUPING` hint when scoring a partitioned model. See GROUPING Hint.

Copyright © 1996, 2026, Oracle and/or its affiliates.

mining_attribute_clause

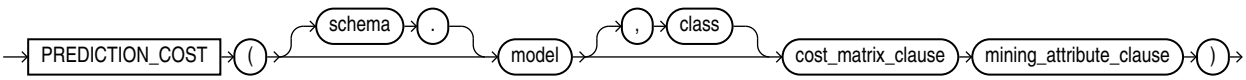
mining_attribute_clause identifies the column attributes to use as predictors for scoring. This clause behaves as described for the PREDICTION function. (Note that the reference to analytic syntax does not apply.) See "*mining_attribute_clause*::=".

> **See Also**
>
> - *Oracle Machine Learning for SQL User's Guide* for information about scoring
> - *Oracle Machine Learning for SQL Concepts* for information about Generalized Linear Models

> **Note**
>
> The following example is excerpted from the Oracle Machine Learning for SQL sample programs. For more information about the sample programs, see Appendix A in *Oracle Machine Learning for SQL User's Guide*.

Example

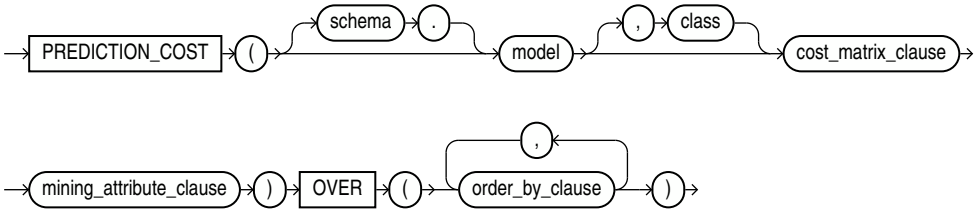
The following example returns the distribution of customers whose ages are predicted with 98% confidence to be greater than 24 and less than 46.



```
SELECT count(cust_id) cust_count, cust_marital_status
  FROM (SELECT cust_id, cust_marital_status
    FROM mining_data_apply_v
    WHERE PREDICTION_BOUNDS(glmr_sh_regr_sample,0.98 USING *).LOWER > 24 AND
          PREDICTION_BOUNDS(glmr_sh_regr_sample,0.98 USING *).UPPER < 46)
    GROUP BY cust_marital_status;

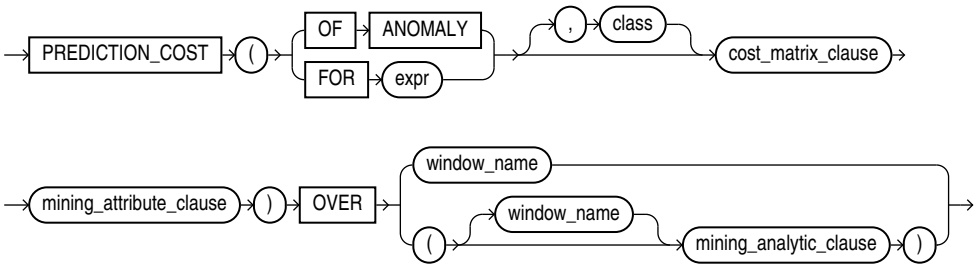
    CUST_COUNT CUST_MARITAL_STATUS
-------------- --------------------
            46 NeverM
             7 Mabsent
             5 Separ.
            35 Divorc.
            72 Married
```

PREDICTION_COST



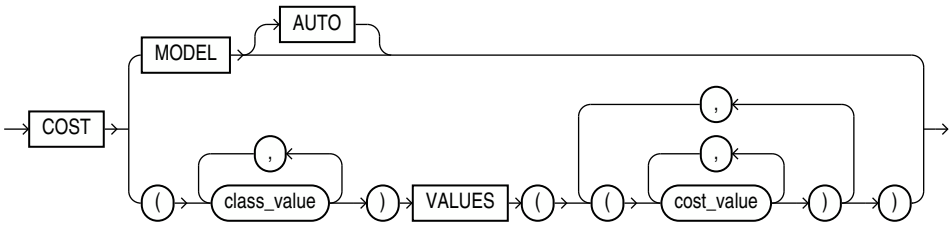
Syntax

***prediction_cost*::=**

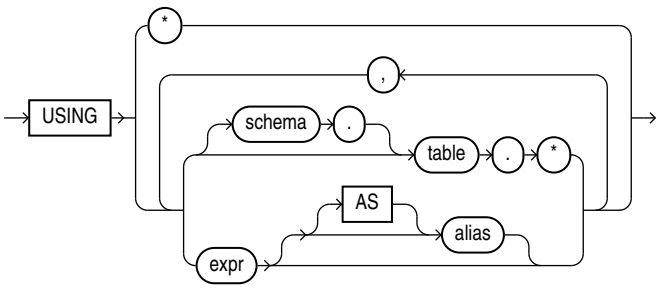


Copyright © 1996, 2026, Oracle and/or its affiliates.

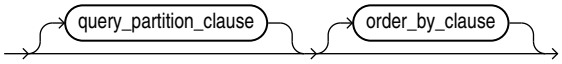
***prediction_cost_ordered*::=**



Analytic Syntax



***prediction_cost_analytic*::=**



***cost_matrix_clause*::=**

***mining_attribute_clause*::=**

***mining_analytic_clause*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> "Analytic Functions " for information on the syntax, semantics, and restrictions of *mining_analytic_clause*

Purpose

PREDICTION_COST returns a cost for each row in the selection. The cost refers to the lowest cost class or to the specified *class*. The cost is returned as BINARY_DOUBLE.

PREDICTION_COST can perform classification or anomaly detection. For classification, the returned cost refers to a predicted target class. For anomaly detection, the returned cost refers to a classification of 1 (for typical rows) or 0 (for anomalous rows).

You can use PREDICTION_COST in conjunction with the PREDICTION function to obtain the prediction and the cost of the prediction.

cost_matrix_clause

Costs are a biasing factor for minimizing the most harmful kinds of misclassifications. For example, false positives might be considered more costly than false negatives. Costs are specified in a cost matrix that can be associated with the model or defined inline in a VALUES clause. All classification algorithms can use costs to influence scoring.

Decision Tree is the only algorithm that can use costs to influence the model build. The cost matrix used to build a Decision Tree model is also the default scoring cost matrix for the model.

The following cost matrix table specifies that the misclassification of 1 is five times more costly than the misclassification of 0.

```
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE       COST
------------------- ---------------------- ----------
                  0                      0          0
                  0                      1          1
                  1                      0          5
                  1                      1          0
```

In *cost_matrix_clause*:

- COST MODEL indicates that scoring should be performed by taking into account the scoring cost matrix associated with the model. If the cost matrix does not exist, then the function returns an error.
- COST MODEL AUTO indicates that the existence of a cost matrix is unknown. If a cost matrix exists, then the function uses it to return the lowest cost prediction. Otherwise the function returns the highest probability prediction.
- The VALUES clause specifies an inline cost matrix for *class_value*. For example, you could specify that the misclassification of 1 is five times more costly than the misclassification of 0 as follows:

  ```
  PREDICTION (nb_model COST (0,1) VALUES ((0, 1),(1, 5)) USING *)
  ```

  If a model that has a scoring cost matrix is invoked with an inline cost matrix, then the inline costs are used.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> *Oracle Machine Learning for SQL User's Guide* for more information about cost-sensitive prediction.

Syntax Choice

`PREDICTION_COST` can score the data by applying a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose **Syntax** or **Analytic Syntax**:

- **Syntax**: Use the *`prediction_cost`* syntax to score the data with a pre-defined model. Supply the name of a model that performs classification or anomaly detection.

  Use the *`prediction_cost_ordered`* syntax for a model that requires ordered data, such as an MSET-SPRT model. The *`prediction_cost_ordered`* syntax requires an *`order_by_clause`* clause.

  Restrictions on the *`prediction_cost_ordered`* syntax are that you cannot use it in the `WHERE` clause of a query. Also, you cannot use a *`query_partition_clause`* or a *`windowing_clause`* with the *`prediction_ordered`* syntax.

- **Analytic Syntax**: Use the analytic syntax to score the data without a pre-defined model. The analytic syntax uses *`mining_analytic_clause`* , which specifies if the data should be partitioned for multiple model builds. The *`mining_analytic_clause`* supports a *`query_partition_clause`* and an *`order_by_clause`*. (See "*analytic_clause::=*".)

  – For classification, specify `FOR` *`expr`*, where *`expr`* is an expression that identifies a target column that has a character data type.

  – For anomaly detection, specify the keywords `OF ANOMALY`.

The syntax of the `PREDICTION_COST` function can use an optional `GROUPING` hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

`mining_attribute_clause` identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The *`mining_attribute_clause`* behaves as described for the `PREDICTION` function. (See "*mining_attribute_clause::=*".)

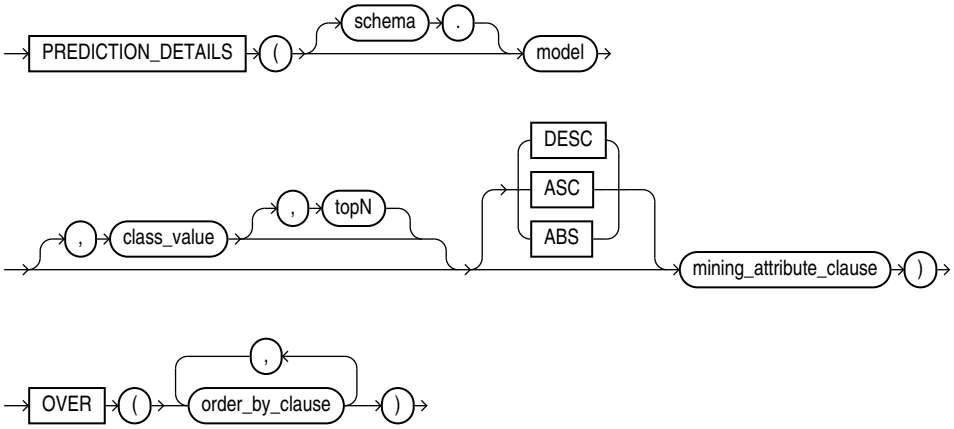
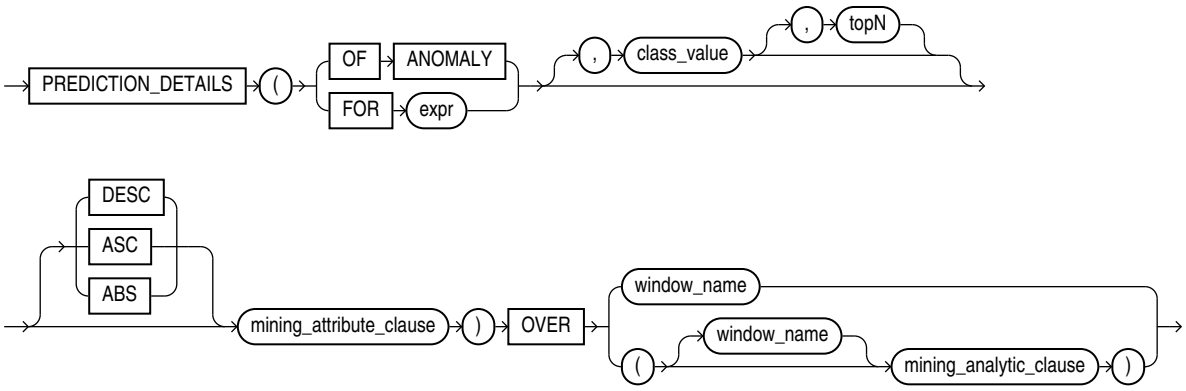
    101250
    101306
```

PREDICTION_DETAILS



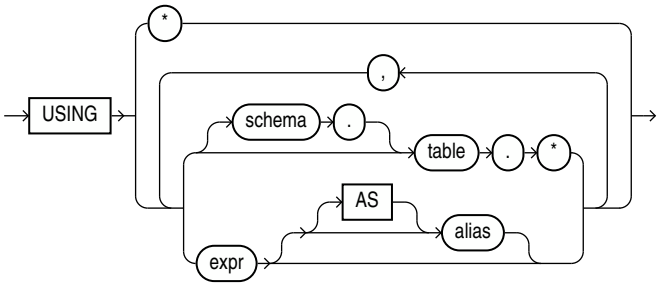
Syntax

***prediction_details*::=**

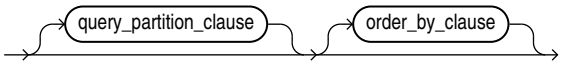


Copyright © 1996, 2026, Oracle and/or its affiliates.

***prediction_details_ordered*::=**



Analytic Syntax



***prediction_details_analytic*::=**

***mining_attribute_clause*::=**

***mining_analytic_clause*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> "Analytic Functions " for information on the syntax, semantics, and restrictions of *mining_analytic_clause*

Purpose

PREDICTION_DETAILS returns prediction details for each row in the selection. The return value is an XML string that describes the attributes of the prediction.

For regression, the returned details refer to the predicted target value. For classification and anomaly detection, the returned details refer to the highest probability class or the specified *class_value*.

topN

If you specify a value for *topN*, the function returns the *N* attributes that have the most influence on the prediction (the score). If you do not specify *topN*, the function returns the 5 most influential attributes.

DESC, ASC, or ABS

The returned attributes are ordered by weight. The weight of an attribute expresses its positive or negative impact on the prediction. For regression, a positive weight indicates a higher value prediction; a negative weight indicates a lower value prediction. For classification and anomaly detection, a positive weight indicates a higher probability prediction; a negative weight indicates a lower probability prediction.

By default, PREDICTION_DETAILS returns the attributes with the highest positive weight (DESC). If you specify ASC, the attributes with the highest negative weight are returned. If you specify ABS, the attributes with the greatest weight, whether negative or positive, are returned. The results are ordered by absolute value from highest to lowest. Attributes with a zero weight are not included in the output.

Syntax Choice

PREDICTION_DETAILS can score the data by applying a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose **Syntax** or **Analytic Syntax**:

- **Syntax**: Use the *prediction_details* syntax to score the data with a pre-defined model. Supply the name of a model that performs classification, regression, or anomaly detection.

  Use the *prediction_details_ordered* syntax for a model that requires ordered data, such as an MSET-SPRT model. The *prediction_details_ordered* syntax requires an *order_by_clause* clause.

  Restrictions on the *prediction_details_ordered* syntax are that you cannot use it in the WHERE clause of a query. Also, you cannot use a *query_partition_clause* or a *windowing_clause* with the *prediction_details_ordered* syntax.

- **Analytic Syntax**: Use the analytic syntax to score the data without a pre-defined model. The analytic syntax uses *mining_analytic_clause*, which specifies if the data should be partitioned for multiple model builds. The *mining_analytic_clause* supports a *query_partition_clause* and an *order_by_clause*. (See "*analytic_clause*::=".)

  – For classification, specify FOR *expr*, where *expr* is an expression that identifies a target column that has a character data type.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- For regression, specify `FOR expr`, where *expr* is an expression that identifies a target column that has a numeric data type.
- For anomaly detection, specify the keywords `OF ANOMALY`.

The syntax of the `PREDICTION_DETAILS` function can use an optional `GROUPING` hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

mining_attribute_clause identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The *mining_attribute_clause* behaves as described for the `PREDICTION` function. (See "*mining_attribute_clause*::=".)

> **Note**
>
> The following examples are excerpted from the Oracle Machine Learning for SQL sample programs. For more information about the sample programs, see Appendix A in *Oracle Machine Learning for SQL User's Guide*.

Example

This example uses the model `svmr_sh_regr_sample` to score the data. The query returns the three attributes that have the greatest influence on predicting a higher value for customer age.

```
SELECT PREDICTION_DETAILS(svmr_sh_regr_sample, null, 3 USING *) prediction_details
    FROM mining_data_apply_v
    WHERE cust_id = 100001;

PREDICTION_DETAILS
--------------------------------------------------------------------------------
<Details algorithm="Support Vector Machines">
<Attribute name="CUST_MARITAL_STATUS" actualValue="Widowed" weight=".361" rank="1"/>
<Attribute name="CUST_GENDER" actualValue="F" weight=".14" rank="2"/>
<Attribute name="HOME_THEATER_PACKAGE" actualValue="1" weight=".135" rank="3"/>
</Details>
```

Analytic Syntax

This example dynamically identifies customers whose age is not typical for the data. The query returns the attributes that predict or detract from a typical age.

```
SELECT cust_id, age, pred_age, age-pred_age age_diff, pred_det
    FROM (SELECT cust_id, age, pred_age, pred_det,
          RANK() OVER (ORDER BY ABS(age-pred_age) DESC) rnk
          FROM (SELECT cust_id, age,
             PREDICTION(FOR age USING *) OVER () pred_age,
             PREDICTION_DETAILS(FOR age ABS USING *) OVER () pred_det
             FROM mining_data_apply_v))
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
    WHERE rnk <= 5;

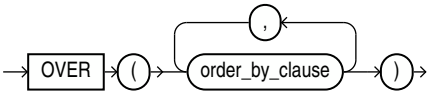
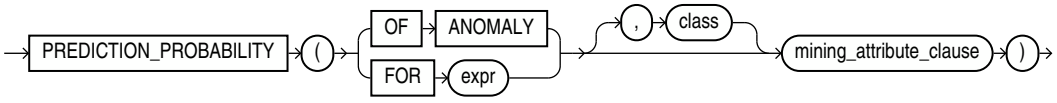
PREDICTION_PROBABILITY

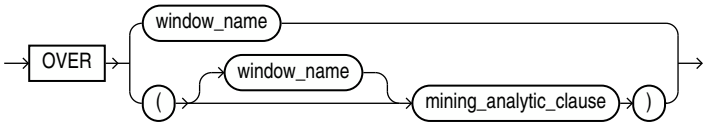


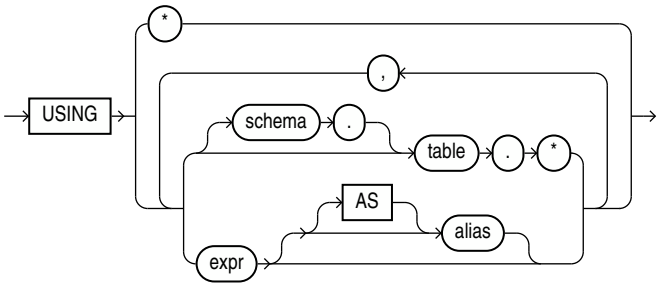
Syntax

***prediction_probability*::=**



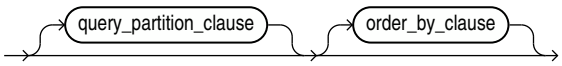
***prediction_probability_ordered*::=**





Analytic Syntax

***prediction_probability_analytic*::=**



***mining_attribute_clause*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

***mining_analytic_clause*::=**

> **See Also**
>
> "Analytic Functions " for information on the syntax, semantics, and restrictions of *mining_analytic_clause*

Purpose

PREDICTION_PROBABILITY returns a probability for each row in the selection. The probability refers to the highest probability class or to the specified *class*. The data type of the returned probability is BINARY_DOUBLE.

PREDICTION_PROBABILITY can perform classification or anomaly detection. For classification, the returned probability refers to a predicted target class. For anomaly detection, the returned probability refers to a classification of 1 (for typical rows) or 0 (for anomalous rows).

You can use PREDICTION_PROBABILITY in conjunction with the PREDICTION function to obtain the prediction and the probability of the prediction.

Syntax Choice

PREDICTION_PROBABILITY can score the data by applying a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose **Syntax** or **Analytic Syntax**:

- **Syntax**: Use the *prediction_probability* syntax to score the data with a pre-defined model. Supply the name of a model that performs classification or anomaly detection.

  Use the *prediction_probability_ordered* syntax for a model that requires ordered data, such as an MSET-SPRT model. The *prediction_probability_ordered* syntax requires an *order_by_clause* clause.

  Restrictions on the *prediction_probability_ordered* syntax are that you cannot use it in the WHERE clause of a query. Also, you cannot use a *query_partition_clause* or a *windowing_clause* with the *prediction_probability_ordered* syntax.

- **Analytic Syntax**: Use the analytic syntax to score the data without a pre-defined model. The analytic syntax uses *mining_analytic_clause*, which specifies if the data should be partitioned for multiple model builds. The *mining_analytic_clause* supports a *query_partition_clause* and an *order_by_clause*. (See "*analytic_clause*::=".)

  – For classification, specify FOR *expr*, where *expr* is an expression that identifies a target column that has a character data type.

  – For anomaly detection, specify the keywords OF ANOMALY.

The syntax of the PREDICTION_PROBABILITY function can use an optional GROUPING hint when scoring a partitioned model. See GROUPING Hint.

Copyright © 1996, 2026, Oracle and/or its affiliates.

mining_attribute_clause

mining_attribute_clause identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The *mining_attribute_clause* behaves as described for the PREDICTION function. (See "*mining_attribute_clause*::=".)

> **Note**
>
> The following examples are excerpted from the Oracle Machine Learning for SQL sample programs. For information about the sample programs, see Appendix A in *Oracle Machine Learning for SQL User's Guide*.

Example

The following example returns the 10 customers living in Italy who are most likely to use an affinity card.

```
SELECT cust_id FROM (
   SELECT cust_id
   FROM mining_data_apply_v
   WHERE country_name = 'Italy'
   ORDER BY PREDICTION_PROBABILITY(DT_SH_Clas_sample, 1 USING *)
      DESC, cust_id)
   WHERE rownum < 11;

   CUST_ID
----------
    100081
    100179
    100185
    100324
    100344
    100554
    100662
    100733
    101250
    101306
```

Analytic Example

This example identifies rows that are most atypical in the data in mining_data_one_class_v. Each type of marital status is considered separately so that the most anomalous rows per marital status group are returned.

The query returns three attributes that have the most influence on the determination of anomalous rows. The PARTITION BY clause causes separate models to be built and applied for

Copyright © 1996, 2026, Oracle and/or its affiliates.

each marital status. Because there is only one record with status Mabsent, no model is created for that partition (and no details are provided).

```
SELECT cust_id, cust_marital_status, rank_anom, anom_det FROM
    (SELECT cust_id, cust_marital_status, anom_det,
            rank() OVER (PARTITION BY CUST_MARITAL_STATUS
                         ORDER BY ANOM_PROB DESC,cust_id) rank_anom FROM
     (SELECT cust_id, cust_marital_status,
            PREDICTION_PROBABILITY(OF ANOMALY, 0 USING *)
              OVER (PARTITION BY CUST_MARITAL_STATUS) anom_prob,
            PREDICTION_DETAILS(OF ANOMALY, 0, 3 USING *)
              OVER (PARTITION BY CUST_MARITAL_STATUS) anom_det
     FROM mining_data_one_class_v
    ))
   WHERE rank_anom < 3 order by 2, 3;

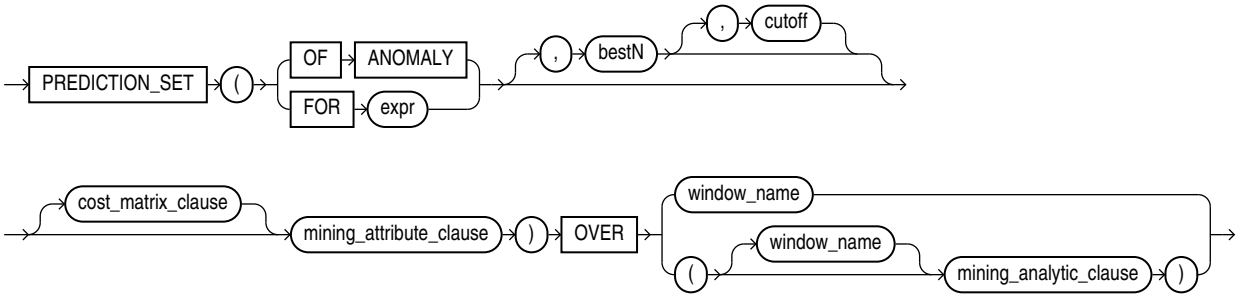
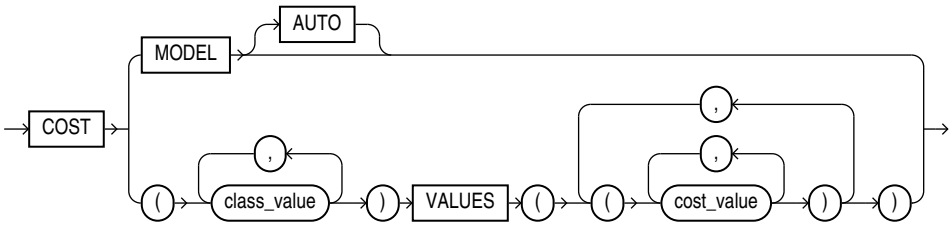
PREDICTION_SET

Syntax

***prediction_set*::=**

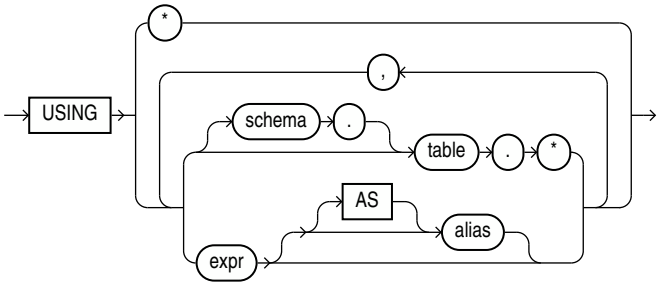


***prediction_set_ordered*::=**

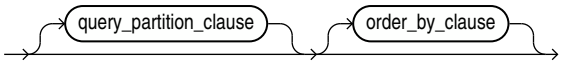


Analytic Syntax

***prediction_set_analytic*::=**



***cost_matrix_clause*::=**



Copyright © 1996, 2026, Oracle and/or its affiliates.

***mining_attribute_clause*::=**

***mining_analytic_clause*::-**

> **See Also**
>
> "Analytic Functions " for information on the syntax, semantics, and restrictions of *mining_analytic_clause*

Purpose

`PREDICTION_SET` returns a set of predictions with either probabilities or costs for each row in the selection. The return value is a varray of objects with field names `PREDICTION_ID` and `PROBABILITY` or `COST`. The prediction identifier has the data type of the target; the probability and cost fields are `BINARY_DOUBLE`.

`PREDICTION_SET` can perform classification or anomaly detection. For classification, the return value refers to a predicted target class. For anomaly detection, the return value refers to a classification of `1` (for typical rows) or `0` (for anomalous rows).

bestN and cutoff

You can specify *bestN* and *cutoff* to limit the number of predictions returned by the function. By default, both *bestN* and *cutoff* are null and all predictions are returned.

- *bestN* is the *N* predictions that are either the most probable or the least costly. If multiple predictions share the *N*th probability or cost, then the function chooses one of them.
- *cutoff* is a value threshold. Only predictions with probability greater than or equal to *cutoff*, or with cost less than or equal to *cutoff*, are returned. To filter by *cutoff* only, specify `NULL` for *bestN*. If the function uses a *cost_matrix_clause* with `COST MODEL AUTO`, then *cutoff* is ignored.

You can specify *bestN* with *cutoff* to return up to the *N* most probable predictions that are greater than or equal to *cutoff*. If costs are used, specify *bestN* with *cutoff* to return up to the *N* least costly predictions that are less than or equal to cutoff.

Copyright © 1996, 2026, Oracle and/or its affiliates.

cost_matrix_clause

You can specify *cost_matrix_clause* as a biasing factor for minimizing the most harmful kinds of misclassifications. *cost_matrix_clause* behaves as described for "PREDICTION_COST ".

Syntax Choice

PREDICTION_SET can score the data by applying a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose **Syntax** or **Analytic Syntax**:

- **Syntax**: Use the *prediction_set* syntax to score the data with a pre-defined model. Supply the name of a model that performs classification or anomaly detection.

  Use the *prediction_set_ordered* syntax for a model that requires ordered data, such as an MSET-SPRT model. The *prediction_set_ordered* syntax requires an *order_by_clause* clause.

  Restrictions on the *prediction_set_ordered* syntax are that you cannot use it in the WHERE clause of a query. Also, you cannot use a *query_partition_clause* or a *windowing_clause* with the *prediction_set_ordered* syntax.

- **Analytic Syntax**: Use the analytic syntax to score the data without a pre-defined model. The analytic syntax uses *mining_analytic_clause*, which specifies if the data should be partitioned for multiple model builds. The *mining_analytic_clause* supports a *query_partition_clause* and an *order_by_clause*. (See "*analytic_clause*::=".)

  – For classification, specify FOR *expr*, where *expr* is an expression that identifies a target column that has a character data type.

  – For anomaly detection, specify the keywords OF ANOMALY.

The syntax of the PREDICTION_SET function can use an optional GROUPING hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

mining_attribute_clause identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The *mining_attribute_clause* behaves as described for the PREDICTION function. (See "*mining_attribute_clause*::=".)

```

PRESENTNNV

Syntax

Purpose

The `PRESENTNNV` function can be used only in the *`model_clause`* of the `SELECT` statement and then only on the right-hand side of a model rule. It returns *`expr1`* when *`cell_reference`* exists prior to the execution of the *`model_clause`* and is not null when `PRESENTNNV` is evaluated. Otherwise it returns *`expr2`*. This function differs from `NVL2` in that `NVL2` evaluates the data at the time it is executed, rather than evaluating the data as it was prior to the execution of the *`model_clause`*.

See Also

- *model_clause* and "Model Expressions" for the syntax and semantics
- NVL2 for comparison
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of `PRESENTNNV` when it is a character value

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

In the following example, if a row containing sales for the Mouse Pad for the year 2002 exists, and the sales value is not null, then the sales value remains unchanged. If the row exists and the sales value is null, then the sales value is set to 10. If the row does not exist, then the row is created with the sales value set to 10.

```
SELECT country, prod, year, s
  FROM sales_view_ref

Purpose

The PRESENTV function can be used only within the *model_clause* of the SELECT statement and then only on the right-hand side of a model rule. It returns *expr1* when, prior to the execution of the *model_clause*, *cell_reference* exists. Otherwise it returns *expr2*.

> **See Also**
>
> - *model_clause* and "Model Expressions" for the syntax and semantics
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of PRESENTV when it is a character value

Examples

In the following example, if a row containing sales for the Mouse Pad for the year 2000 exists, then the sales value for the Mouse Pad for the year 2001 is set to the sales value for the Mouse Pad for the year 2000. If the row does not exist, then a row is created with the sales value for the Mouse Pad for year 20001 set to 0.

```
SELECT country, prod, year, s
  FROM sales_view_ref
  MODEL
    PARTITION BY (country)
    DIMENSION BY (prod, year)
    MEASURES (sale s)
    IGNORE NAV
    UNIQUE DIMENSION
    RULES UPSERT SEQUENTIAL ORDER
    (
      s['Mouse Pad', 2001] =
        PRESENTV(s['Mouse Pad', 2000], s['Mouse Pad', 2000], 0)
    )
  ORDER BY country, prod, year;

COUNTRY       PROD                                    YEAR          S
----------    ----------------------------------      --------   ---------
France        Mouse Pad                                  1998     2509.42
France        Mouse Pad                                  1999     3678.69

The preceding example requires the view `sales_view_ref`. Refer to "The MODEL clause: Examples" to create this view.

PREVIOUS

Syntax

Purpose

The `PREVIOUS` function can be used only in the *`model_clause`* of the `SELECT` statement and then only in the `ITERATE` ... [`UNTIL`] clause of the *`model_rules_clause`*. It returns the value of *`cell_reference`* at the beginning of each iteration.

> **See Also**
>
> - *model_clause* and "Model Expressions" for the syntax and semantics
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of `PREVIOUS` when it is a character value

Examples

The following example repeats the rules, up to 1000 times, until the difference between the values of `cur_val` at the beginning and at the end of an iteration is less than one:

```
SELECT dim_col, cur_val, num_of_iterations
  FROM (SELECT 1 AS dim_col, 10 AS cur_val FROM dual)
  MODEL
    DIMENSION BY (dim_col)
    MEASURES (cur_val, 0 num_of_iterations)
    IGNORE NAV
    UNIQUE DIMENSION
    RULES ITERATE (1000) UNTIL (PREVIOUS(cur_val[1]) - cur_val[1] < 1)
    (
      cur_val[1] = cur_val[1]/2,
      num_of_iterations[1] = num_of_iterations[1] + 1
    );

   DIM_COL    CUR_VAL NUM_OF_ITERATIONS
---------- ---------- -----------------
         1       .625                 4
```

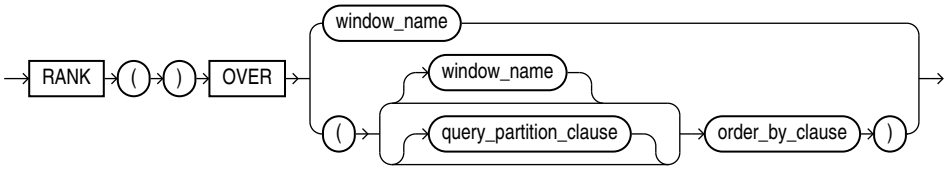
RANK



Aggregate Syntax

***rank_aggregate*::=**

Analytic Syntax

***rank_analytic*::=**

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

`RANK` calculates the rank of a value in a group of values. The return type is `NUMBER`.

> **See Also**
>
> Table 2-9 for more information on implicit conversion and "Numeric Precedence " for information on numeric precedence

Rows with equal values for the ranking criteria receive the same rank. Oracle Database then adds the number of tied rows to the tied rank to calculate the next rank. Therefore, the ranks may not be consecutive numbers. This function is useful for top-N and bottom-N reporting.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- As an aggregate function, RANK calculates the rank of a hypothetical row identified by the arguments of the function with respect to a given sort specification. The arguments of the function must all evaluate to constant expressions within each aggregate group, because they identify a single row within each group. The constant argument expressions and the expressions in the ORDER BY clause of the aggregate match by position. Therefore, the number of arguments must be the same and their types must be compatible.
- As an analytic function, RANK computes the rank of each row returned from a query with respect to the other rows returned by the query, based on the values of the *value_exprs* in the *order_by_clause*.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation RANK uses to compare character values for the ORDER BY clause

For the semantics of the FILTER clause, see FILTER Clause Semantics.

Aggregate Example

The following example calculates the rank of a hypothetical employee in the sample table hr.employees with a salary of $15,500 and a commission of 5%:

```
SELECT RANK(15500, .05) WITHIN GROUP
   (ORDER BY salary, commission_pct) "Rank"
   FROM employees;

      Rank
----------
       105
```

Similarly, the following query returns the rank for a $15,500 salary among the employee salaries:

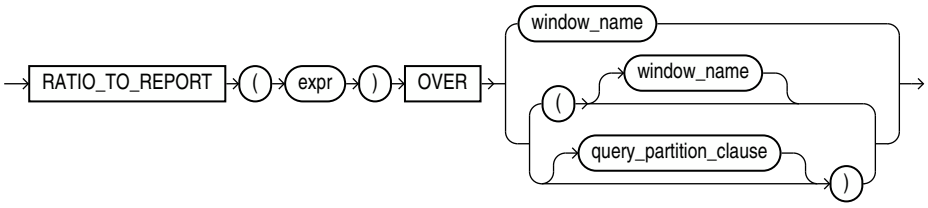
```
SELECT RANK(15500) WITHIN GROUP
   (ORDER BY salary DESC) "Rank of 15500"
   FROM employees;

Rank of 15500
--------------
             4
```

Analytic Example

The following statement ranks the employees in the sample hr schema in department 60 based on their salaries. Identical salary values receive the same rank and cause nonconsecutive ranks. Compare this example with the analytic example for DENSE_RANK .

```
SELECT department_id, last_name, salary,
       RANK() OVER (PARTITION BY department_id ORDER BY salary) RANK
  FROM employees WHERE department_id = 60
  ORDER BY RANK, last_name;



DEPARTMENT_ID LAST_NAME                     SALARY       RANK
------------- ------------------------- ---------- ----------
           60 Lorentz                         4200          1
           60 Austin                          4800          2
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
60 Pataballa                    4800          2
60 Ernst                        6000          4
60 Hunold                       9000          5
```

RATIO_TO_REPORT

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions, including valid forms of *expr*

Purpose

`RATIO_TO_REPORT` is an analytic function. It computes the ratio of a value to the sum of a set of values. If *expr* evaluates to null, then the ratio-to-report value also evaluates to null.

The set of values is determined by the *query_partition_clause*. If you omit that clause, then the ratio-to-report is computed over all rows returned by the query.

You cannot nest analytic functions by using `RATIO_TO_REPORT` or any other analytic function for *expr*. However, you can use other built-in function expressions for *expr*. Refer to "About SQL Expressions " for information on valid forms of *expr*.

Examples

The following example calculates the ratio-to-report value of each purchasing clerk's salary to the total of all purchasing clerks' salaries:

```
SELECT last_name, salary, RATIO_TO_REPORT(salary) OVER () AS rr
   FROM employees
   WHERE job_id = 'PU_CLERK'
   ORDER BY last_name, salary, rr;

LAST_NAME                 SALARY         RR
------------------------- ---------- ----------
Baida                           2900 .208633094
Colmenares                      2500 .179856115
Himuro                          2600  .18705036
Khoo                            3100 .223021583
Tobias                          2800 .201438849
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

RAWTOHEX

Syntax

Purpose

`RAWTOHEX` converts *raw* to a character value containing its hexadecimal representation.

As a SQL built-in function, `RAWTOHEX` accepts an argument of any scalar data type other than `LONG`, `LONG RAW`, `CLOB`, `NCLOB`, `BLOB`, or `BFILE`. If the argument is of a data type other than `RAW`, then this function converts the argument value, which is represented using some number of data bytes, into a `RAW` value with the same number of data bytes. The data itself is not modified in any way, but the data type is recast to a `RAW` data type.

This function returns a `VARCHAR2` value with the hexadecimal representation of bytes that make up the value of *raw*. Each byte is represented by two hexadecimal digits.

> **Note**
>
> `RAWTOHEX` functions differently when used as a PL/SQL built-in function. Refer to *Oracle Database Development Guide* for more information.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `RAWTOHEX`

Examples

The following hypothetical example returns the hexadecimal equivalent of a `RAW` column value:

```
SELECT RAWTOHEX(raw_column) "Graphics"
   FROM graphics;

Graphics
--------
7D
```

> **See Also**
>
> "RAW and LONG RAW Data Types " and HEXTORAW

Copyright © 1996, 2026, Oracle and/or its affiliates.

RAWTONHEX

Syntax

Purpose

`RAWTONHEX` converts *raw* to a character value containing its hexadecimal representation. `RAWTONHEX(`*raw*`)` is equivalent to `TO_NCHAR(RAWTOHEX(`*raw*`))`. The value returned is always in the national character set.

> **Note**
>
> `RAWTONHEX` functions differently when used as a PL/SQL built-in function. Refer to *Oracle Database Development Guide* for more information.

Examples

The following hypothetical example returns the hexadecimal equivalent of a `RAW` column value:

```
SELECT RAWTONHEX(raw_column),
   DUMP ( RAWTONHEX (raw_column) ) "DUMP"
   FROM graphics;

RAWTONHEX(RA)           DUMP
----------------------- ------------------------------
7D                      Typ=1 Len=4: 0,55,0,68
```

RAW_TO_UUID

Syntax

`RAW_TO_UUID` converts the input argument *uuid_string* into canonical format of 36 bytes which consists of 32 hexadecimal bytes and 4 hyphens. *uuid_string* must be of datatype `RAW(16)`.

If the input is NULL, it returns NULL.

Example

```
 SELECT RAW_TO_UUID(UUID()) FROM DUAL;
```

The output is:

```
RAW_TO_UUID(UUID())
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
----------------------------------
81f9b934-5028-4f8c-bf05-f082e9b72e0f
```

REF

Syntax

Purpose

`REF` takes as its argument a correlation variable (table alias) associated with a row of an object table or an object view. A `REF` value is returned for the object instance that is bound to the variable or row.

Examples

The sample schema `oe` contains a type called `cust_address_typ`, described as follows:

```
Attribute                      Type
------------------------------ ---------------
STREET_ADDRESS                 VARCHAR2(40)
POSTAL_CODE                    VARCHAR2(10)
CITY                           VARCHAR2(30)
STATE_PROVINCE                 VARCHAR2(10)
COUNTRY_ID                     CHAR(2)
```

The following example creates a table based on the sample type `oe.cust_address_typ`, inserts a row into the table, and retrieves a `REF` value for the object instance of the type in the addresses table:

```
CREATE TABLE addresses OF cust_address_typ;

INSERT INTO addresses VALUES (
   '123 First Street', '4GF H1J', 'Our Town', 'Ourcounty', 'US');

SELECT REF(e) FROM addresses e;

REF(E)
--------------------------------------------------------------------------------
00002802097CD1261E51925B60E0340800208254367CD1261E51905B60E0340800208254360101018200000
```

> **See Also**
>
> *Oracle Database Object-Relational Developer's Guide* for information on `REF`s

REFTOHEX

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

REFTOHEX converts argument *expr* to a character value containing its hexadecimal equivalent. *expr* must return a REF.

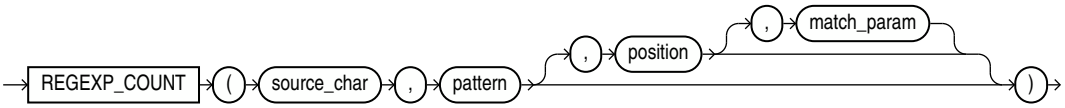
Examples

The sample schema oe contains a warehouse_typ. The following example builds on that type to illustrate how to convert the REF value of a column to a character value containing its hexadecimal equivalent:

```
CREATE TABLE warehouse_table OF warehouse_typ
   (PRIMARY KEY (warehouse_id));

CREATE TABLE location_table
   (location_number NUMBER, building REF warehouse_typ
   SCOPE IS warehouse_table);

INSERT INTO warehouse_table VALUES (1, 'Downtown', 99);



INSERT INTO location_table SELECT 10, REF(w) FROM warehouse_table w;

SELECT REFTOHEX(building) FROM location_table;

REFTOHEX(BUILDING)
--------------------------------------------------------------------------------
0000220208859B5E9255C31760E034080020825436859B5E9255C21760E034080020825436
```

REGEXP_COUNT

Syntax

Purpose

REGEXP_COUNT complements the functionality of the REGEXP_INSTR function by returning the number of times a pattern occurs in a source string. The function evaluates strings using characters as defined by the input character set. It returns an integer indicating the number of occurrences of *pattern*. If no match is found, then the function returns 0.

- *source_char* is a character expression that serves as the search value. It is commonly a character column and can be of any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB.
- *pattern* is the regular expression. It is usually a text literal and can be of any of the data types CHAR, VARCHAR2, NCHAR, or NVARCHAR2. It can contain up to 512 bytes. If the data type of *pattern* is different from the data type of *source_char*, then Oracle Database converts *pattern* to the data type of *source_char*.

  REGEXP_COUNT ignores subexpression parentheses in *pattern*. For example, the pattern '(123(45))' is equivalent to '12345'. For a listing of the operators you can specify in *pattern*, refer to Oracle Regular Expression Support.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- *position* is a positive integer indicating the character of *source_char* where Oracle should begin the search. The default is 1, meaning that Oracle begins the search at the first character of *source_char*. After finding the first occurrence of *pattern*, the database searches for a second occurrence beginning with the first character following the first occurrence.
- *match_param* is a character expression of the data type VARCHAR2 or CHAR that lets you change the default matching behavior of the function.

  The value of *match_param* can include one or more of the following characters:

  – 'i' specifies case-insensitive matching, even if the determined collation of the condition is case-sensitive.

  – 'c' specifies case-sensitive and accent-sensitive matching, even if the determined collation of the condition is case-insensitive or accent-insensitive.

  – 'n' allows the period (.), which is the match-any-character character, to match the newline character. If you omit this parameter, then the period does not match the newline character.

  – 'm' treats the source string as multiple lines. Oracle interprets the caret (^) and dollar sign ($) as the start and end, respectively, of any line anywhere in the source string, rather than only at the start or end of the entire source string. If you omit this parameter, then Oracle treats the source string as a single line.

  – 'x' ignores whitespace characters. By default, whitespace characters match themselves.

  If the value of *match_param* contains multiple contradictory characters, then Oracle uses the last character. For example, if you specify 'ic', then Oracle uses case-sensitive and accent-sensitive matching. If the value contains a character other than those shown above, then Oracle returns an error.

  If you omit *match_param*, then:

  – The default case and accent sensitivity are determined by the determined collation of the REGEXP_COUNT function.

  – A period (.) does not match the newline character.

  – The source string is treated as a single line.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation REGEXP_COUNT uses to compare characters from *source_char* with characters from *pattern*

Examples

The following example shows that subexpressions parentheses in pattern are ignored:

```
SELECT REGEXP_COUNT('123123123123123', '(12)3', 1, 'i') REGEXP_COUNT
   FROM DUAL;

REGEXP_COUNT
------------
           5
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

In the following example, the function begins to evaluate the source string at the third character, so skips over the first occurrence of pattern:

```
SELECT REGEXP_COUNT('123123123123', '123', 3, 'i') COUNT FROM DUAL;

     COUNT
----------
         3
```

REGEXP_COUNT simple matching: Examples

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters:

```
select regexp_count('ABC123', '[A-Z]'), regexp_count('A1B2C3', '[A-Z]') from dual;

REGEXP_COUNT('ABC123','[A-Z]') REGEXP_COUNT('A1B2C3','[A-Z]')
------------------------------ ------------------------------
                             3                              3
```

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters followed by a single digit number:

```
select regexp_count('ABC123', '[A-Z][0-9]'), regexp_count('A1B2C3', '[A-Z][0-9]') from
dual;

REGEXP_COUNT('ABC123','[A-Z][0-9]') REGEXP_COUNT('A1B2C3','[A-Z][0-9]')
----------------------------------- -----------------------------------
                                  1                                   3
```

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters followed by a single digit number only at the beginning of the string:

```
select regexp_count('ABC123', '[A-Z][0-9]'), regexp_count('A1B2C3', '[A-Z][0-9]') from
dual;

REGEXP_COUNT('ABC123','^[A-Z][0-9]') REGEXP_COUNT('A1B2C3','^[A-Z][0-9]')
------------------------------------ ------------------------------------
                                   0                                   1
```

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters followed by two digits of number only contained within the string:

```
select regexp_count('ABC123', '[A-Z][0-9]{2}'), regexp_count('A1B2C3', '[A-Z][0-9]{2}')
from dual;

REGEXP_COUNT('ABC123','[A-Z][0-9]{2}') REGEXP_COUNT('A1B2C3','[A-Z][0-9]{2}')
-------------------------------------- --------------------------------------
                                     1                                     0
```

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters followed by a single digit number within the first two occurrences from the beginning of the string:

```
select regexp_count('ABC123', '([A-Z][0-9]){2}'), regexp_count('A1B2C3', '([A-Z][0-9])
{2}') from dual;

REGEXP_COUNT('ABC123','([A-Z][0-9]){2}') REGEXP_COUNT('A1B2C3','([A-Z][0-9]){2}')
---------------------------------------- ----------------------------------------
                                       0                                        1
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

REGEXP_COUNT advanced matching: Examples

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters:

```
select regexp_count('ABC123', '[A-Z]') Match_char_ABC_count,
regexp_count('A1B2C3', '[A-Z]') Match_char_ABC_count from dual;

MATCH_CHAR_ABC_COUNT MATCH_CHAR_ABC_COUNT
-------------------- --------------------
           3                    3
```

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters followed by a single digit number:

```
select regexp_count('ABC123', '[A-Z][0-9]') Match_string_C1_count,
regexp_count('A1B2C3', '[A-Z][0-9]')  Match_strings_A1_B2_C3_count from dual;

MATCH_STRING_C1_COUNT MATCH_STRINGS_A1_B2_C3_COUNT
--------------------- ----------------------------
            1                     3
```

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters followed by a single digit number only at the beginning of the string:

```
select regexp_count('ABC123A5', '^[A-Z][0-9]') Char_num_like_A1_at_start,
regexp_count('A1B2C3', '^[A-Z][0-9]') Char_num_like_A1_at_start from dual;

CHAR_NUM_LIKE_A1_AT_START CHAR_NUM_LIKE_A1_AT_START
------------------------- -------------------------
            0                         1
```

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters followed by two digits of number only contained within the string:

```
select regexp_count('ABC123', '[A-Z][0-9]{2}') Char_num_like_A12_anywhere,
regexp_count('A1B2C34', '[A-Z][0-9]{2}') Char_num_like_A12_anywhere from dual;

CHAR_NUM_LIKE_A12_ANYWHERE CHAR_NUM_LIKE_A12_ANYWHERE
-------------------------- --------------------------
             1                          1
```

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters followed by a single digit number within the first two occurrences from the beginning of the string:

```
select regexp_count('ABC12D3', '([A-Z][0-9]){2}') Char_num_within_2_places,
regexp_count('A1B2C3', '([A-Z][0-9]){2}') Char_num_within_2_places from dual;

CHAR_NUM_WITHIN_2_PLACES CHAR_NUM_WITHIN_2_PLACES
------------------------ ------------------------
               0                        1
```

REGEXP_COUNT case-sensitive matching: Examples

The following statements create a table regexp_temp and insert values into it:

```
CREATE TABLE regexp_temp(empName varchar2(20));

INSERT INTO regexp_temp (empName) VALUES ('John Doe');
INSERT INTO regexp_temp (empName) VALUES ('Jane Doe');
```

In the following example, the statement queries the employee name column and searches for the lowercase of character 'E':

```
SELECT empName, REGEXP_COUNT(empName, 'e', 1, 'c') "CASE_SENSITIVE_E" From regexp_temp;

EMPNAME          CASE_SENSITIVE_E
-------------------- ---------------
John Doe               1
Jane Doe               2
```

In the following example, the statement queries the employee name column and searches for the lowercase of character 'O':

```
SELECT empName, REGEXP_COUNT(empName, 'o', 1, 'c') "CASE_SENSITIVE_O" From regexp_temp;

EMPNAME          CASE_SENSITIVE_O
-------------------- ---------------
John Doe               2
Jane Doe               1
```

In the following example, the statement queries the employee name column and searches for the lowercase or uppercase of character 'E':

```
SELECT empName, REGEXP_COUNT(empName, 'E', 1, 'i') "CASE_INSENSITIVE_E" From regexp_temp;

EMPNAME          CASE_INSENSITIVE_E
-------------------- ------------------
John Doe                 1
Jane Doe                 2
```

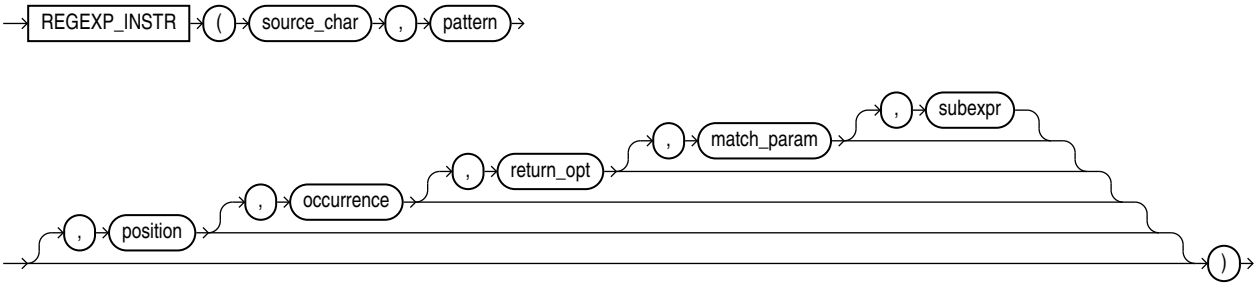
In the following example, the statement queries the employee name column and searches for the lowercase of string 'DO':

```
SELECT empName, REGEXP_COUNT(empName, 'do', 1, 'i') "CASE_INSENSITIVE_STRING" From
regexp_temp;

EMPNAME          CASE_INSENSITIVE_STRING
-------------------- ----------------------
John Doe                  1
Jane Doe                  1
```

In the following example, the statement queries the employee name column and searches for the lowercase or uppercase of string 'AN':

```
SELECT empName, REGEXP_COUNT(empName, 'an', 1, 'c') "CASE_SENSITIVE_STRING" From
regexp_temp;
```



Copyright © 1996, 2026, Oracle and/or its affiliates.

```
EMPNAME          CASE_SENSITIVE_STRING
-------------------- --------------------
John Doe                    0
Jane Doe                    1
```

REGEXP_INSTR

Syntax

Purpose

`REGEXP_INSTR` extends the functionality of the `INSTR` function by letting you search a string for a regular expression pattern. The function evaluates strings using characters as defined by the input character set. It returns an integer indicating the beginning or ending position of the matched substring, depending on the value of the *`return_option`* argument. If no match is found, then the function returns 0.

This function complies with the POSIX regular expression standard and the Unicode Regular Expression Guidelines. For more information, refer to Oracle Regular Expression Support.

- *`source_char`* is a character expression that serves as the search value. It is commonly a character column and can be of any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`.
- *`pattern`* is the regular expression. It is usually a text literal and can be of any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. It can contain up to 512 bytes. If the data type of *`pattern`* is different from the data type of *`source_char`*, then Oracle Database converts *`pattern`* to the data type of *`source_char`*. For a listing of the operators you can specify in *`pattern`*, refer to Oracle Regular Expression Support.
- *`position`* is a positive integer indicating the character of *`source_char`* where Oracle should begin the search. The default is 1, meaning that Oracle begins the search at the first character of *`source_char`*.
- *`occurrence`* is a positive integer indicating which occurrence of *`pattern`* in *`source_char`* Oracle should search for. The default is 1, meaning that Oracle searches for the first occurrence of *`pattern`*. If *`occurrence`* is greater than 1, then the database searches for the second occurrence beginning with the first character following the first occurrence of

Copyright © 1996, 2026, Oracle and/or its affiliates.

pattern, and so forth. This behavior is different from the INSTR function, which begins its search for the second occurrence at the second character of the first occurrence.

- *return_option* lets you specify what Oracle should return in relation to the occurrence:
  - If you specify 0, then Oracle returns the position of the first character of the occurrence. This is the default.
  - If you specify 1, then Oracle returns the position of the character following the occurrence.
- *match_param* is a character expression of the data type VARCHAR2 or CHAR that lets you change the default matching behavior of the function. The behavior of this parameter is the same for this function as for REGEXP_COUNT. Refer to REGEXP_COUNT for detailed information.
- For a *pattern* with subexpressions, *subexpr* is an integer from 0 to 9 indicating which subexpression in *pattern* is the target of the function. The *subexpr* is a fragment of pattern enclosed in parentheses. Subexpressions can be nested. Subexpressions are numbered in order in which their left parentheses appear in pattern. For example, consider the following expression:

  ```
  0123(((abc)(de)f)ghi)45(678)
  ```

  This expression has five subexpressions in the following order: "abcdefghi" followed by "abcdef", "abc", "de" and "678".

  If *subexpr* is zero, then the position of the entire substring that matches the *pattern* is returned. If *subexpr* is greater than zero, then the position of the substring fragment that corresponds to subexpression number *subexpr* in the matched substring is returned. If *pattern* does not have at least *subexpr* subexpressions, the function returns zero. A null *subexpr* value returns NULL. The default value for *subexpr* is zero.

See Also

- INSTR and REGEXP_SUBSTR
- REGEXP_REPLACE and REGEXP_LIKE Condition
- Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation REGEXP_INSTR uses to compare characters from *source_char* with characters from *pattern*

Examples

The following example examines the string, looking for occurrences of one or more non-blank characters. Oracle begins searching at the first character in the string and returns the starting position (default) of the sixth occurrence of one or more non-blank characters.

```
SELECT
  REGEXP_INSTR('500 Oracle Parkway, Redwood Shores, CA',
               '[^ ]+', 1, 6) "REGEXP_INSTR"
  FROM DUAL;

REGEXP_INSTR
------------
          37
```

The following example examines the string, looking for occurrences of words beginning with s, r, or p, regardless of case, followed by any six alphabetic characters. Oracle begins searching

Copyright © 1996, 2026, Oracle and/or its affiliates.

at the third character in the string and returns the position in the string of the character following the second occurrence of a seven-letter word beginning with `s`, `r`, or `p`, regardless of case.

```
SELECT
  REGEXP_INSTR('500 Oracle Parkway, Redwood Shores, CA',
               '[s|r|p][[:alpha:]]{6}', 3, 2, 1, 'i') "REGEXP_INSTR"
  FROM DUAL;

REGEXP_INSTR
------------
          28
```

The following examples use the *subexpr* argument to search for a particular subexpression in *pattern*. The first statement returns the position in the source string of the first character in the first subexpression, which is '123':

```
SELECT REGEXP_INSTR('1234567890', '(123)(4(56)(78))', 1, 1, 0, 'i', 1)
"REGEXP_INSTR" FROM DUAL;

REGEXP_INSTR
--------------------
1
```

The next statement returns the position in the source string of the first character in the second subexpression, which is '45678':

```
SELECT REGEXP_INSTR('1234567890', '(123)(4(56)(78))', 1, 1, 0, 'i', 2)
"REGEXP_INSTR" FROM DUAL;

REGEXP_INSTR
--------------------
4
```

The next statement returns the position in the source string of the first character in the fourth subexpression, which is '78':

```
SELECT REGEXP_INSTR('1234567890', '(123)(4(56)(78))', 1, 1, 0, 'i', 4)
"REGEXP_INSTR" FROM DUAL;

REGEXP_INSTR
--------------------
7
```

REGEXP_INSTR pattern matching: Examples

The following statements create a table regexp_temp and insert values into it:

```
CREATE TABLE regexp_temp(empName varchar2(20), emailID varchar2(20));

INSERT INTO regexp_temp (empName, emailID) VALUES ('John Doe', 'johndoe@example.com');
INSERT INTO regexp_temp (empName, emailID) VALUES ('Jane Doe', 'janedoe');
```

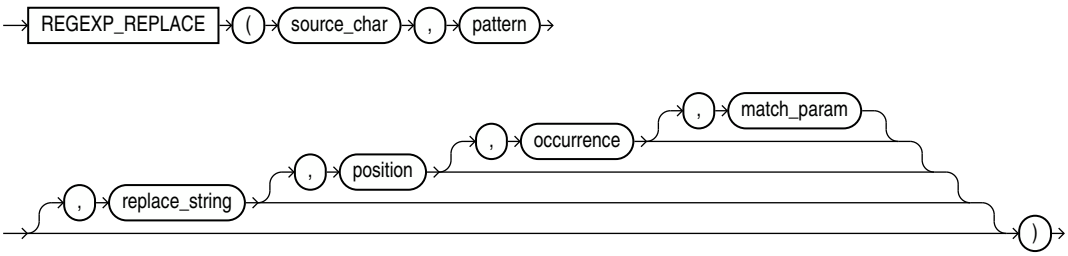
In the following example, the statement queries the email column and searches for valid email addresses:

```
SELECT emailID, REGEXP_INSTR(emailID, '\w+@\w+(\.\w+)+') "IS_A_VALID_EMAIL" FROM
regexp_temp;

EMAILID          IS_A_VALID_EMAIL
-------------------- ----------------
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
johndoe@example.com            1
example.com                0
```



In the following example, the statement queries the email column and returns the count of valid email addresses:

```
EMPNAME        Valid Email            FIELD_WITH_VALID_EMAIL
--------    ------------------    ----------------------
John Doe    johndoe@example.com    1
Jane Doe
```

REGEXP_REPLACE

Syntax

Purpose

`REGEXP_REPLACE` extends the functionality of the `REPLACE` function by letting you search a string for a regular expression pattern. By default, the function returns *`source_char`* with every occurrence of the regular expression pattern replaced with *`replace_string`*. The string returned is in the same character set as *`source_char`*. The function returns `VARCHAR2` if the first argument is not a LOB and returns `CLOB` if the first argument is a LOB.

This function complies with the POSIX regular expression standard and the Unicode Regular Expression Guidelines. For more information, refer to Oracle Regular Expression Support.

- *`source_char`* is a character expression that serves as the search value. It is commonly a character column and can be of any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB` or `NCLOB`.
- *`pattern`* is the regular expression. It is usually a text literal and can be of any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. It can contain up to 512 bytes. If the data type of *`pattern`* is different from the data type of *`source_char`*, then Oracle Database converts *`pattern`* to the data type of *`source_char`*. For a listing of the operators you can specify in *`pattern`*, refer to Oracle Regular Expression Support.
- *`replace_string`* can be of any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`. If *`replace_string`* is a `CLOB` or `NCLOB`, then Oracle truncates *`replace_string`* to 32K. The *`replace_string`* can contain up to 500 backreferences to subexpressions in the form `\n`, where `n` is a number from 1 to 9. If you want to include a backslash (`\`) in

Copyright © 1996, 2026, Oracle and/or its affiliates.

replace_string, then you must precede it with the escape character, which is also a backslash. For example, to replace \2 you would enter \\2. For more information on backreference expressions, refer to the notes to " Oracle Regular Expression Support", Table D-1.

- *position* is a positive integer indicating the character of *source_char* where Oracle should begin the search. The default is 1, meaning that Oracle begins the search at the first character of *source_char*.
- *occurrence* is a nonnegative integer indicating the occurrence of the replace operation:
  - If you specify 0, then Oracle replaces all occurrences of the match.
  - If you specify a positive integer *n*, then Oracle replaces the *n*th occurrence.

  If *occurrence* is greater than 1, then the database searches for the second occurrence beginning with the first character following the first occurrence of *pattern*, and so forth. This behavior is different from the INSTR function, which begins its search for the second occurrence at the second character of the first occurrence.
- *match_param* is a character expression of the data type VARCHAR2 or CHAR that lets you change the default matching behavior of the function. The behavior of this parameter is the same for this function as for REGEXP_COUNT. Refer to REGEXP_COUNT for detailed information.

See Also

- REPLACE
- REGEXP_INSTR , REGEXP_SUBSTR , and REGEXP_LIKE Condition
- Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation REGEXP_REPLACE uses to compare characters from *source_char* with characters from *pattern*, and for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following example examines phone_number, looking for the pattern *xxx*.*xxx*.*xxxx*. Oracle reformats this pattern with (*xxx*) *xxx*-*xxxx*.

```
SELECT
  REGEXP_REPLACE(phone_number,
                 '([[:digit:]]{3})\.([[:digit:]]{3})\.([[:digit:]]{4})',
                 '(\1) \2-\3') "REGEXP_REPLACE"
  FROM employees
  ORDER BY "REGEXP_REPLACE";

REGEXP_REPLACE
--------------------------------------------------------------------------------
(515) 123-4444
(515) 123-4567
(515) 123-4568
(515) 123-4569
(515) 123-5555
. . .
```

The following example examines country_name. Oracle puts a space after each non-null character in the string.

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT
  REGEXP_REPLACE(country_name, '(.)', '\1 ') "REGEXP_REPLACE"
  FROM countries;

REGEXP_REPLACE
--------------------------------------------------------------------------------
A r g e n t i n a
A u s t r a l i a
B e l g i u m
B r a z i l
C a n a d a
. . .
```

The following example examines the string, looking for two or more spaces. Oracle replaces each occurrence of two or more spaces with a single space.

```
SELECT
  REGEXP_REPLACE('500   Oracle     Parkway,    Redwood  Shores, CA',
                 '( ){2,}', ' ') "REGEXP_REPLACE"
  FROM DUAL;

REGEXP_REPLACE
-------------------------------------
500 Oracle Parkway, Redwood Shores, CA
```

REGEXP_REPLACE pattern matching: Examples

The following statements create a table regexp_temp and insert values into it:

```
CREATE TABLE regexp_temp(empName varchar2(20), emailID varchar2(20));

INSERT INTO regexp_temp (empName, emailID) VALUES ('John Doe', 'johndoe@example.com');
INSERT INTO regexp_temp (empName, emailID) VALUES ('Jane Doe', 'janedoe@example.com');
```

The following statement replaces the string ‘Jane’ with ‘John’:

```
SELECT empName, REGEXP_REPLACE (empName, 'Jane', 'John') "STRING_REPLACE" FROM
regexp_temp;

EMPNAME        STRING_REPLACE
--------    --------------
John Doe    John Doe
Jane Doe    John Doe
```

The following statement replaces the string ‘John’ with ‘Jane’:

```
SELECT empName, REGEXP_REPLACE (empName, 'Jane', 'John') "STRING_REPLACE" FROM
regexp_temp;

EMPNAME        STRING_REPLACE
--------    --------------
John Doe    Jane Doe
Jane Doe    Jane Doe
```

>
> View and run a related example on Oracle Live SQL at *REGEXP_REPLACE - Pattern Matching*

REGEXP_REPLACE: Examples

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following statement replaces all the numbers in a string:

```
WITH strings AS (
  SELECT 'abc123' s FROM dual union all
  SELECT '123abc' s FROM dual union all
  SELECT 'a1b2c3' s FROM dual
)
  SELECT s "STRING", regexp_replace(s, '[0-9]', '') "MODIFIED_STRING"
  FROM strings;

  STRING               MODIFIED_STRING
-------------------- --------------------
abc123               abc
123abc               abc
a1b2c3               abc
```

The following statement replaces the first numeric occurrence in a string:

```
WITH strings AS (
  SELECT 'abc123' s from DUAL union all
  SELECT '123abc' s from DUAL union all
  SELECT 'a1b2c3' s from DUAL
)
  SELECT s "STRING", REGEXP_REPLACE(s, '[0-9]', '', 1, 1) "MODIFIED_STRING"
  FROM   strings;

 STRING               MODIFIED_STRING
-------------------- --------------------
abc123               abc23
123abc               23abc
a1b2c3               ab2c3
```

The following statement replaces the second numeric occurrence in a string:

```
WITH strings AS (
  SELECT 'abc123' s from DUAL union all
  SELECT '123abc' s from DUAL union all
  SELECT 'a1b2c3' s from DUAL
)
  SELECT s "STRING", REGEXP_REPLACE(s, '[0-9]', '', 1, 2) "MODIFIED_STRING"
  FROM   strings;

STRING               MODIFIED_STRING
-------------------- --------------------
abc123               abc13
123abc               13abc
a1b2c3               a1bc3
```

The following statement replaces multiple spaces in a string with a single space:

```
WITH strings AS (
  SELECT 'Hello  World' s FROM dual union all
  SELECT 'Hello        World' s FROM dual union all
  SELECT 'Hello,   World  !' s FROM dual
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
)
  SELECT s "STRING", regexp_replace(s, ' {2,}', ' ') "MODIFIED_STRING"
  FROM   strings;

 STRING               MODIFIED_STRING
-------------------- --------------------
Hello  World         Hello World
Hello        World   Hello World
Hello,   World  !    Hello, World !
```

The following statement converts camel case strings to a string containing lower case words separated by an underscore:

```
WITH strings as (
  SELECT 'AddressLine1' s FROM dual union all
  SELECT 'ZipCode' s FROM dual union all
  SELECT 'Country' s FROM dual
)
  SELECT s "STRING",
         lower(regexp_replace(s, '([A-Z0-9])', '_\1', 2)) "MODIFIED_STRING"
  FROM strings;

  STRING               MODIFIED_STRING
-------------------- --------------------
AddressLine1         address_line_1
ZipCode              zip_code
Country              country
```

The following statement converts the format of a date:

```
WITH date_strings AS (
  SELECT  '2015-01-01' d from dual union all
  SELECT '2000-12-31' d from dual union all
  SELECT '900-01-01' d from dual
)
  SELECT d "STRING",
         regexp_replace(d, '([[:digit:]]+)-([[:digit:]]{2})-([[:digit:]]
{2})', '\3.\2.\1') "MODIFIED_STRING"
  FROM date_strings;

  STRING               MODIFIED_STRING
-------------------- --------------------
2015-01-01           01.01.2015
2000-12-31           31.12.2000
900-01-01            01.01.900
```

The following statement replaces all the letters in a string with ‘1’:

```
WITH strings as (
  SELECT 'NEW YORK' s FROM dual union all
  SELECT 'New York' s FROM dual union all
  SELECT 'new york' s FROM dual
)
  SELECT s "STRING",
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
       regexp_replace(s, '[a-z]', '1', 1, 0, 'i') "CASE_INSENSITIVE",
       regexp_replace(s, '[a-z]', '1', 1, 0, 'c') "CASE_SENSITIVE",
       regexp_replace(s, '[a-zA-Z]', '1', 1, 0, 'c')
"CASE_SENSITIVE_MATCHING"
  FROM  strings;

  STRING     CASE_INSEN CASE_SENSI CASE_SENSI
---------- ---------- ---------- ----------
NEW YORK   111 1111   NEW YORK   111 1111
New York   111 1111   N11 Y111   111 1111
new york   111 1111   111 1111   111 1111
```

Live SQL

View and run a related example on Oracle Live SQL at *REGEXP_REPLACE*

REGEXP_SUBSTR

Syntax

Purpose

`REGEXP_SUBSTR` extends the functionality of the `SUBSTR` function by letting you search a string for a regular expression pattern. It is also similar to `REGEXP_INSTR`, but instead of returning the position of the substring, it returns the substring itself. This function is useful if you need the contents of a match string but not its position in the source string. The function returns the string as `VARCHAR2` or `CLOB` data in the same character set as *`source_char`*.

This function complies with the POSIX regular expression standard and the Unicode Regular Expression Guidelines. For more information, refer to Oracle Regular Expression Support.

- *`source_char`* is a character expression that serves as the search value. It is commonly a character column and can be of any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`.
- *`pattern`* is the regular expression. It is usually a text literal and can be of any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. It can contain up to 512 bytes. If the data type of *`pattern`* is different from the data type of *`source_char`*, then Oracle Database converts *`pattern`* to the data type of *`source_char`*. For a listing of the operators you can specify in *`pattern`*, refer to Oracle Regular Expression Support.
- *`position`* is a positive integer indicating the character of *`source_char`* where Oracle should begin the search. The default is 1, meaning that Oracle begins the search at the first character of *`source_char`*.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- *occurrence* is a positive integer indicating which occurrence of *pattern* in *source_char* Oracle should search for. The default is 1, meaning that Oracle searches for the first occurrence of *pattern*.

  If *occurrence* is greater than 1, then the database searches for the second occurrence beginning with the first character following the first occurrence of *pattern*, and so forth. This behavior is different from the SUBSTR function, which begins its search for the second occurrence at the second character of the first occurrence.
- *match_param* is a character expression of the data type VARCHAR2 or CHAR that lets you change the default matching behavior of the function. The behavior of this parameter is the same for this function as for REGEXP_COUNT. Refer to REGEXP_COUNT for detailed information.
- For a *pattern* with subexpressions, *subexpr* is a nonnegative integer from 0 to 9 indicating which subexpression in *pattern* is to be returned by the function. This parameter has the same semantics that it has for the REGEXP_INSTR function. Refer to REGEXP_INSTR for more information.

See Also

- SUBSTR and REGEXP_INSTR
- REGEXP_REPLACE , and REGEXP_LIKE Condition
- Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation REGEXP_SUBSTR uses to compare characters from *source_char* with characters from *pattern*, and for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following example examines the string, looking for the first substring bounded by commas. Oracle Database searches for a comma followed by one or more occurrences of non-comma characters followed by a comma. Oracle returns the substring, including the leading and trailing commas.

```
SELECT
  REGEXP_SUBSTR('500 Oracle Parkway, Redwood Shores, CA',
                ',[^,]+,') "REGEXPR_SUBSTR"
  FROM DUAL;

REGEXPR_SUBSTR
-----------------
, Redwood Shores,
```

The following example examines the string, looking for `http://` followed by a substring of one or more alphanumeric characters and optionally, a period (`.`). Oracle searches for a minimum of three and a maximum of four occurrences of this substring between `http://` and either a slash (`/`) or the end of the string.

```
SELECT
  REGEXP_SUBSTR('http://www.example.com/products',
                'http://([[:alnum:]]+\.?){3,4}/?') "REGEXP_SUBSTR"
  FROM DUAL;

REGEXP_SUBSTR
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
---------------------
http://www.example.com/
```

The next two examples use the *subexpr* argument to return a specific subexpression of *pattern*. The first statement returns the first subexpression in *pattern*:

```
SELECT REGEXP_SUBSTR('1234567890', '(123)(4(56)(78))', 1, 1, 'i', 1)
"REGEXP_SUBSTR" FROM DUAL;

REGEXP_SUBSTR
-------------------
123
```

The next statement returns the fourth subexpression in *pattern*:

```
SELECT REGEXP_SUBSTR('1234567890', '(123)(4(56)(78))', 1, 1, 'i', 4)
"REGEXP_SUBSTR" FROM DUAL;

REGEXP_SUBSTR
-------------------
78
```

REGEXP_SUBSTR pattern matching: Examples

The following statements create a table regexp_temp and insert values into it:

```
CREATE TABLE regexp_temp(empName varchar2(20), emailID varchar2(20));

INSERT INTO regexp_temp (empName, emailID) VALUES ('John Doe', 'johndoe@example.com');
INSERT INTO regexp_temp (empName, emailID) VALUES ('Jane Doe', 'janedoe');
```

In the following example, the statement queries the email column and searches for valid email addresses:

```
SELECT empName, REGEXP_SUBSTR(emailID, '[[:alnum:]]+\@[[:alnum:]]+\.[[:alnum:]]+')
"Valid Email" FROM regexp_temp;

EMPNAME  Valid Email
-------- -------------------
John Doe johndoe@example.com
Jane Doe
```

In the following example, the statement queries the email column and returns the count of valid email addresses:

```
SELECT empName, REGEXP_SUBSTR(emailID, '[[:alnum:]]+\@[[:alnum:]]+\.[[:alnum:]]+')
"Valid Email", REGEXP_INSTR(emailID, '\w+@\w+(\.\w+)+') "FIELD_WITH_VALID_EMAIL" FROM
regexp_temp;

EMPNAME        Valid Email           FIELD_WITH_VALID_EMAIL
--------    -------------------    ----------------------
John Doe    johndoe@example.com    1
Jane Doe
```

REGR_ (Linear Regression) Functions

The linear regression functions are:

- REGR_SLOPE
- REGR_INTERCEPT
- REGR_COUNT
- REGR_R2
- REGR_AVGX
- REGR_AVGY
- REGR_SXX
- REGR_SYY
- REGR_SXY

Syntax

***linear_regr*::=**

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

The linear regression functions fit an ordinary-least-squares regression line to a set of number pairs. You can use them as both aggregate and analytic functions.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> "Aggregate Functions " and "About SQL Expressions " for information on valid forms of *expr*

These functions take as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

> **See Also**
>
> Table 2-9 for more information on implicit conversion and "Numeric Precedence " for information on numeric precedence

Oracle applies the function to the set of (*expr1*, *expr2*) pairs after eliminating all pairs for which either *expr1* or *expr2* is null. Oracle computes all the regression functions simultaneously during a single pass through the data.

expr1 is interpreted as a value of the dependent variable (a y value), and *expr2* is interpreted as a value of the independent variable (an x value).

- `REGR_SLOPE` returns the slope of the line. The return value is a numeric data type and can be null. After the elimination of null (*expr1*, *expr2*) pairs, it makes the following computation:

  ```
  COVAR_POP(expr1, expr2) / VAR_POP(expr2)
  ```

- `REGR_INTERCEPT` returns the y-intercept of the regression line. The return value is a numeric data type and can be null. After the elimination of null (*expr1*, *expr2*) pairs, it makes the following computation:

  ```
  AVG(expr1) - REGR_SLOPE(expr1, expr2) * AVG(expr2)
  ```

- `REGR_COUNT` returns an integer that is the number of non-null number pairs used to fit the regression line.
- `REGR_R2` returns the coefficient of determination (also called R-squared or goodness of fit) for the regression. The return value is a numeric data type and can be null. `VAR_POP`(*expr1*) and `VAR_POP`(*expr2*) are evaluated after the elimination of null pairs. The return values are:

  ```
                      NULL if VAR_POP(expr2)  = 0

                         1 if VAR_POP(expr1)  = 0 and
                              VAR_POP(expr2) != 0

  POWER(CORR(expr1,expr),2) if VAR_POP(expr1)  > 0 and
                               VAR_POP(expr2  != 0
  ```

All of the remaining regression functions return a numeric data type and can be null:

- `REGR_AVGX` evaluates the average of the independent variable (*expr2*) of the regression line. It makes the following computation after the elimination of null (*expr1*, *expr2*) pairs:

  ```
  AVG(expr2)
  ```

Copyright © 1996, 2026, Oracle and/or its affiliates.

- REGR_AVGY evaluates the average of the dependent variable (*expr1*) of the regression line. It makes the following computation after the elimination of null (*expr1*, *expr2*) pairs:

  ```
  AVG(expr1)
  ```

REGR_SXY, REGR_SXX, REGR_SYY are auxiliary functions that are used to compute various diagnostic statistics.

- REGR_SXX makes the following computation after the elimination of null (*expr1*, *expr2*) pairs:

  ```
  REGR_COUNT(expr1, expr2) * VAR_POP(expr2)
  ```

- REGR_SYY makes the following computation after the elimination of null (*expr1*, *expr2*) pairs:

  ```
  REGR_COUNT(expr1, expr2) * VAR_POP(expr1)
  ```

- REGR_SXY makes the following computation after the elimination of null (*expr1*, *expr2*) pairs:

  ```
  REGR_COUNT(expr1, expr2) * COVAR_POP(expr1, expr2)
  ```

The following examples are based on the sample tables sh.sales and sh.products.

For the semantics of the FILTER clause, see FILTER Clause Semantics.

General Linear Regression Example

The following example provides a comparison of the various linear regression functions used in their analytic form. The analytic form of these functions can be useful when you want to use regression statistics for calculations such as finding the salary predicted for each employee by the model. The sections that follow on the individual linear regression functions contain examples of the aggregate form of these functions.

```
SELECT job_id, employee_id ID, salary,
REGR_SLOPE(SYSDATE-hire_date, salary)
   OVER (PARTITION BY job_id) slope,

REGR_SLOPE and REGR_INTERCEPT Examples

The following example calculates the slope and regression of the linear regression model for time employed (SYSDATE - hire_date) and salary using the sample table hr.employees. Results are grouped by job_id.

```
SELECT job_id,
REGR_SLOPE(SYSDATE-hire_date, salary) slope,
REGR_INTERCEPT(SYSDATE-hire_date, salary) intercept
   FROM employees
   WHERE department_id in (50,80)
   GROUP BY job_id
   ORDER BY job_id;

JOB_ID     SLOPE    INTERCEPT
---------- ----- ------------
SA_MAN      .355 -1707.030762
SA_REP      .257   404.767151
SH_CLERK    .745   159.015293
ST_CLERK    .904   134.409050
ST_MAN      .479  -570.077291
```

REGR_COUNT Examples

The following example calculates the count of by job_id for time employed (SYSDATE - hire_date) and salary using the sample table hr.employees. Results are grouped by job_id.

```
SELECT job_id,
REGR_COUNT(SYSDATE-hire_date, salary) count
   FROM employees
   WHERE department_id in (30, 50)
   GROUP BY job_id
   ORDER BY job_id, count;

JOB_ID          COUNT
---------- ----------
PU_CLERK             5
PU_MAN               1
SH_CLERK            20
ST_CLERK            20
ST_MAN               5
```

REGR_R2 Examples

The following example calculates the coefficient of determination the linear regression of time employed (SYSDATE - hire_date) and salary using the sample table hr.employees:

```
SELECT job_id,
REGR_R2(SYSDATE-hire_date, salary) Regr_R2
   FROM employees
   WHERE department_id in (80, 50)
   GROUP by job_id
  ORDER BY job_id, Regr_R2;

JOB_ID        REGR_R2
---------- ----------
SA_MAN      .83244748
SA_REP     .647007156
SH_CLERK   .879799698
ST_CLERK   .742808493
ST_MAN      .69418508
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

REGR_AVGY and REGR_AVGX Examples

The following example calculates the average values for time employed (`SYSDATE` - `hire_date`) and salary using the sample table `hr.employees`. Results are grouped by `job_id`:

```
SELECT job_id,
REGR_AVGY(SYSDATE-hire_date, salary) avgy,
REGR_AVGX(SYSDATE-hire_date, salary) avgx
   FROM employees
   WHERE department_id in (30,50)
   GROUP BY job_id
   ORDER BY job_id, avgy, avgx;

JOB_ID           AVGY       AVGX
---------- ---------- ----------
PU_CLERK    2950.3778       2780
PU_MAN      4026.5778      11000
SH_CLERK    2773.0778       3215
ST_CLERK    2872.7278       2785
ST_MAN      3140.1778       7280
```

REGR_SXY, REGR_SXX, and REGR_SYY Examples

The following example calculates three types of diagnostic statistics for the linear regression of time employed (`SYSDATE` - `hire_date`) and salary using the sample table `hr.employees`:

```
SELECT job_id,
REGR_SXY(SYSDATE-hire_date, salary) regr_sxy,
REGR_SXX(SYSDATE-hire_date, salary) regr_sxx,
REGR_SYY(SYSDATE-hire_date, salary) regr_syy
   FROM employees
   WHERE department_id in (80, 50)
   GROUP BY job_id
   ORDER BY job_id;

JOB_ID       REGR_SXY    REGR_SXX   REGR_SYY
---------- ---------- ----------- ----------
SA_MAN        3303500   9300000.0    1409642
SA_REP     16819665.5  65489655.2 6676562.55
SH_CLERK      4248650   5705500.0    3596039
ST_CLERK      3531545   3905500.0 4299084.55
ST_MAN        2180460   4548000.0  1505915.2
```

REMAINDER

Syntax

Purpose

`REMAINDER` returns the remainder of *n2* divided by *n1*.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

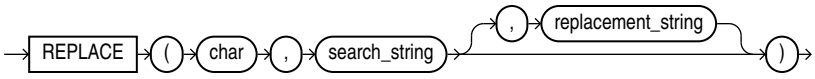
Copyright © 1996, 2026, Oracle and/or its affiliates.

The MOD function is similar to REMAINDER except that it uses FLOOR in its formula, whereas REMAINDER uses ROUND. Refer to MOD .

> **See Also**
>
> Table 2-9 for more information on implicit conversion and "Numeric Precedence " for information on numeric precedence

- If *n1* = 0 or *n2* = infinity, then Oracle returns
  - An error if the arguments are of type NUMBER
  - NaN if the arguments are BINARY_FLOAT or BINARY_DOUBLE.
- If *n1* != 0, then the remainder is *n2* - (*n1***N*) where *N* is the integer nearest *n2*/*n1*. If *n2*/*n1* equals x.5, then *N* is the nearest *even* integer.
- If *n2* is a floating-point number, and if the remainder is 0, then the sign of the remainder is the sign of *n2*. Remainders of 0 are unsigned for NUMBER values.

Examples



Using table float_point_demo, created for the TO_BINARY_DOUBLE "Examples", the following example divides two floating-point numbers and returns the remainder of that operation:

```
SELECT bin_float, bin_double, REMAINDER(bin_float, bin_double)
  FROM float_point_demo;

 BIN_FLOAT BIN_DOUBLE REMAINDER(BIN_FLOAT,BIN_DOUBLE)
---------- ---------- ------------------------------
1.235E+003 1.235E+003                      5.859E-005
```

REPLACE

Syntax

Purpose

REPLACE returns *char* with every occurrence of *search_string* replaced with *replacement_string*. If *replacement_string* is omitted or null, then all occurrences of *search_string* are removed. If *search_string* is null, then *char* is returned.

Both *search_string* and *replacement_string*, as well as *char*, can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The string returned is in the same character set as *char*. The function returns VARCHAR2 if the first argument is not a LOB and returns CLOB if the first argument is a LOB.

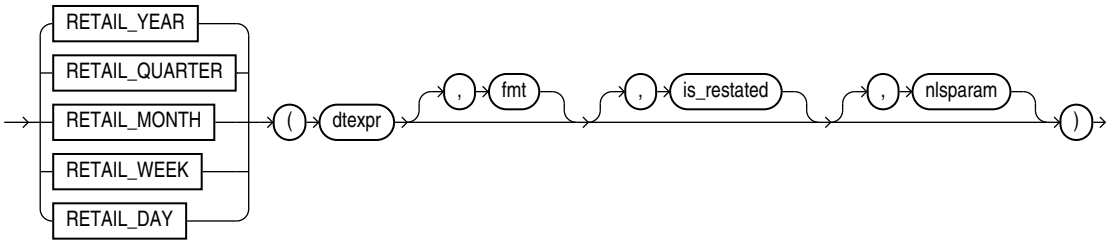
REPLACE provides functionality related to that provided by the TRANSLATE function. TRANSLATE provides single-character, one-to-one substitution. REPLACE lets you substitute one string for another as well as to remove character strings.

Copyright © 1996, 2026, Oracle and/or its affiliates.

See Also

- TRANSLATE
- Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation `REPLACE` uses to compare characters from *`char`* with characters from *`search_string`*, and for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples



The following example replaces occurrences of `J` with `BL`:

```
SELECT REPLACE('JACK and JUE','J','BL') "Changes"
     FROM DUAL;

Changes
--------------
BLACK and BLUE
```

RETAIL

Syntax

Purpose

These functions return a `VARCHAR2` value that uniquely identifies a member in the specified level using the 4-5-4 calendar of the National Retail Federation (NRF).

Each of the retail functions returns a `VARCHAR2` value that uniquely identifies a member in an implicit hierarchy at a particular level. For this reason, the `NLS_DATE_FORMAT`, `NLS_TIMESTAMP_FORMAT`, and `NLS_TIMESTAMP_TZ_FORMAT` do not apply to these functions. They each have their own default formats. These functions respect the setting of `NLS_DATE_LANGUAGE`.

- *`dtexpr`* is a datetime expression with one of the following types (or any value that can be implicitly converted to `DATE`): `DATE`, `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, `TIMESTAMP WITH LOCAL TIME ZONE` .
- *`fmt`* is a text expression representing a format string. In all cases, the case-sensitivity of the format specifiers follows the same behavior as `TO_CHAR`. For example, `MON` specifies an abbreviated month in upper-case (e.g. `JAN`), `mon` specifies an abbreviated month name in lower-case (e.g. `jan`), and `Mon` specifies an abbreviated month name in title-case (e.g. `Jan`).

Copyright © 1996, 2026, Oracle and/or its affiliates.

- All retail functions take an optional *is_restated* parameter that controls how years that require 53 weeks are handled.

  The *is_restated* parameter is a text expression that must resolve to either RESTATED or NOT RESTATED (case-insensitive). A retail year typically contains exactly 52 weeks, which is 364 days. Therefore, every 5 or 6 years an extra 53rd week is added. This is a non-restated calendar and is what is produced when the *is_restated* parameter is NOT RESTATED (the default). Some users prefer to have all years contain 52 weeks for comparison purposes. Such calendars are called restated calendars, and is what is produced when the *is_restated* parameter is RESTATED.

- *nlsparam* is a text expression representing an NLS parameter setting. The only currently supported parameter is NLS_DATE_LANGUAGE, and is specified in the same manner as for TO_CHAR and TO_DATE.

Formats for Retail Functions

The following table describes the format strings for each of the functions. The required formats must appear somewhere in the format string, and an error will be raised if not present. The optional formats may appear in the format string. All other format specifiers are prohibited and an error will be raised if included. The default format strings are similar to the ones for the calendar hierarchies, with years prefixed with RY. Since the retail calendar is deliberately defined by weeks starting on a Sunday, the default day format uses the day of the week and week number rather than the day and month.

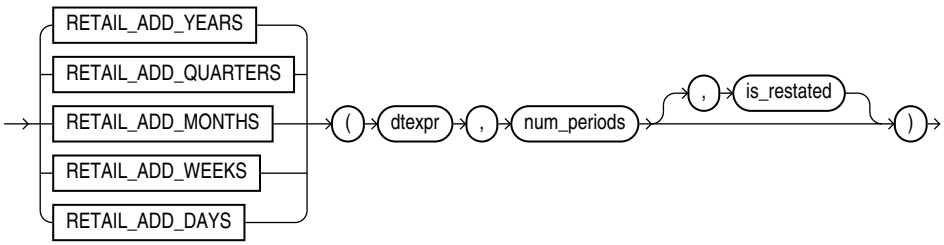
Table 7-8 Formats for Retail Functions

Function	Required Formats	Optional Formats	Default Format String
RETAIL_YEAR	YYYYor SYYYY	None	"RY"SYYYY Example: RY2024
RETAIL_QUARTER	YYYYor SYYYY Q	None	"Q"Q-"RY"SYYYY Example: Q1-RY2024
RETAIL_MONTH	YYYYor SYYYY One of MM, mon, MONTH	Q	MON-"RY"SYYYY Example: JAN-RY2024
RETAIL_WEEK	YYYYor SYYYY WW	None	"W"WW-"RY"SYYYY Example: W01-RY2024
RETAIL_DAY	YYYYor SYYYY • WW and one of and one of : – DY – DAY • DD and one of – MM – MON – MONTH • DDD	Q	DY-"W"WW-"RY"SYYYY Example: SUN-W01-RY2024

Format Descriptions for Retail Functions

The following table describes the interpretation of the format specifiers for retail hierarchies. Note that all numeric formats are relative within the retail year. The year and month are as defined by the NRF 4-5-4 calendar. The capitalization rules for MON, MONTH, DY, and DAY all

Copyright © 1996, 2026, Oracle and/or its affiliates.



follow the usage elsewhere (i.e. TO_CHAR) with regard to lower-case (e.g. month => june), upper-case (e.g. MONTH => JUNE), and title-case (e.g. Month => June).

Table 7-9 Format descriptions for retail functions

Format Specifier	Description
YYYY	4-digit retail year (only positive years supported)
SYYYY	4-digit retail year, with BC years as negative
Q	Quarter of retail year (1-4)
MM	Month of retail year (1-12), corresponding to the calendar year of the retail month. For example, in the retail year 2025 the month of Feb (the 1st month in the retail year) begins on Feb 2 and ends on March 1. The MON/MONTH for all days in that month are FEB/FEBRUARY, and thus the MM is 02 corresponding to Feb. Please consult the NRF for more information on the calendar.
MON	Abbreviated name of month
MONTH	Name of month
WW	Week number (1-53), 2-digits. Note that because the 4-5-4 calendar results in a year with 7*52=364 days, it's occasionally necessary to add a 53rd week. Please consult the NRF for more information on the calendar.
DY	Abbreviated name of day
DAY	Name of day
D	Day of week (1-7). Depends on the NLS_TERRITORY
DD	Day of month (1-31), 2-digits, within the retail month. For example, retail year 2025 begins on Feb 2. Since that's the first day of the month, the DD value for that day would be 01.
DDD	Day of year (1-371), 3-digits, within the retail year

RETAIL_ADD_X_PERIODS

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

These functions add (or subtract if interval is negative) a given number of periods from the given date based on the Gregorian calendar.

- *dtexpr* is a datetime expression with one of the following types (or any value that can be implicitly converted to DATE): DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE .
- The *num_periods* parameter is an integer that when positive will add periods and when negative will subtract periods.
- All retail functions take an optional *is_restated* parameter that controls how years that require 53 weeks are handled.

  The *is_restated* parameter is a text expression that must resolve to either RESTATED or NOT RESTATED (case-insensitive). A retail year typically contains exactly 52 weeks, which is 364 days. Therefore, every 5 or 6 years an extra 53rd week is added. This is a non-restated calendar and is what is produced when the *is_restated* parameter is NOT RESTATED (the default). Some users prefer to have all years contain 52 weeks for comparison purposes. Such calendars are called restated calendars, and is what is produced when the *is_restated* parameter is RESTATED.

RETAIL_ADD_YEARS adds or subtracts the given number of years, where a year is always defined as a period of 12 months.

RETAIL_ADD_QUARTERS adds or subtracts the given number of quarters, where a quarter is always defined as a period of 3 months.

RETAIL_ADD_MONTHS This is defined similarly as the FISCAL_ADD_MONTHS . This will return the corresponding day (by position) within the target month, and follow the same rule as above where if the given date is the last day of the month or if the resulting month has fewer days, the last day of the resulting month is used.

RETAIL_ADD_WEEKS adds or subtracts the given number of weeks, where a week is always defined as a period of 7 days.

RETAIL_ADD_DAYS simply adds or subtracts the given number of days.

RETAIL_DAY_EXISTS

Syntax

Purpose

The RETAIL_DAY_EXISTS function determines whether the *dtexpr* exists in the retail calendar, returning a boolean TRUE if it does exist and FALSE if it does not. When *is_restated* (which is mandatory for this function) is RESTATED, the function will return FALSE for any days that fall in the week removed from a restated retail year and TRUE for other days. When is_restated is NOT RESTATED, the function will always return TRUE. This function is because all of the other functions will raise an error when *is_restated* is RESTATED and the input is one of the days not in the calendar. The RETAIL_DAY_EXISTS function allows a user to either filter out such rows in a WHERE clause, or to protect calls to the other functions with a CASE expression.

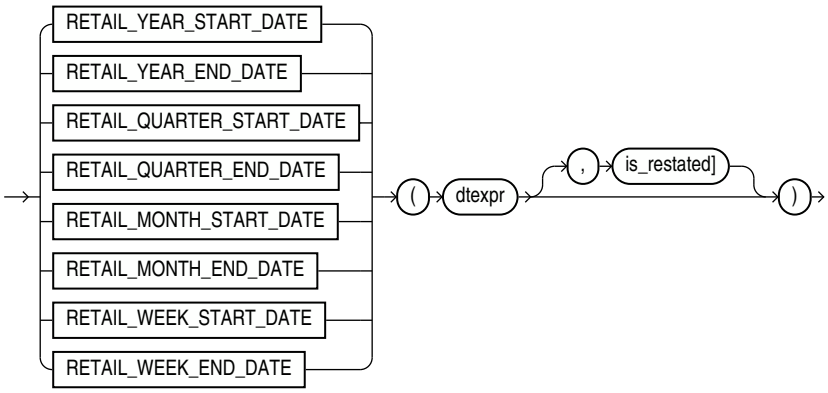
Copyright © 1996, 2026, Oracle and/or its affiliates.

Example 1: Filter Invalid Rows Using WHERE Clause

In the following example, RETAIL_DAY_EXISTS allows the user to filter out invalid rows using the WHERE clause :

```
SELECT
RETAIL_MONTH(order_date, 'DEFAULT', 'RESTATED') month,
SUM(sales) sales
FROM fact
WHERE RETAIL_DAY_EXISTS(order_date, 'RESTATED') = TRUE
GROUP BY ALL
ORDER BY 1;

MONTH SALES
---------- -----
FEB-RY2023 123
```



Example 2: Protect Calls Using CASE Expression

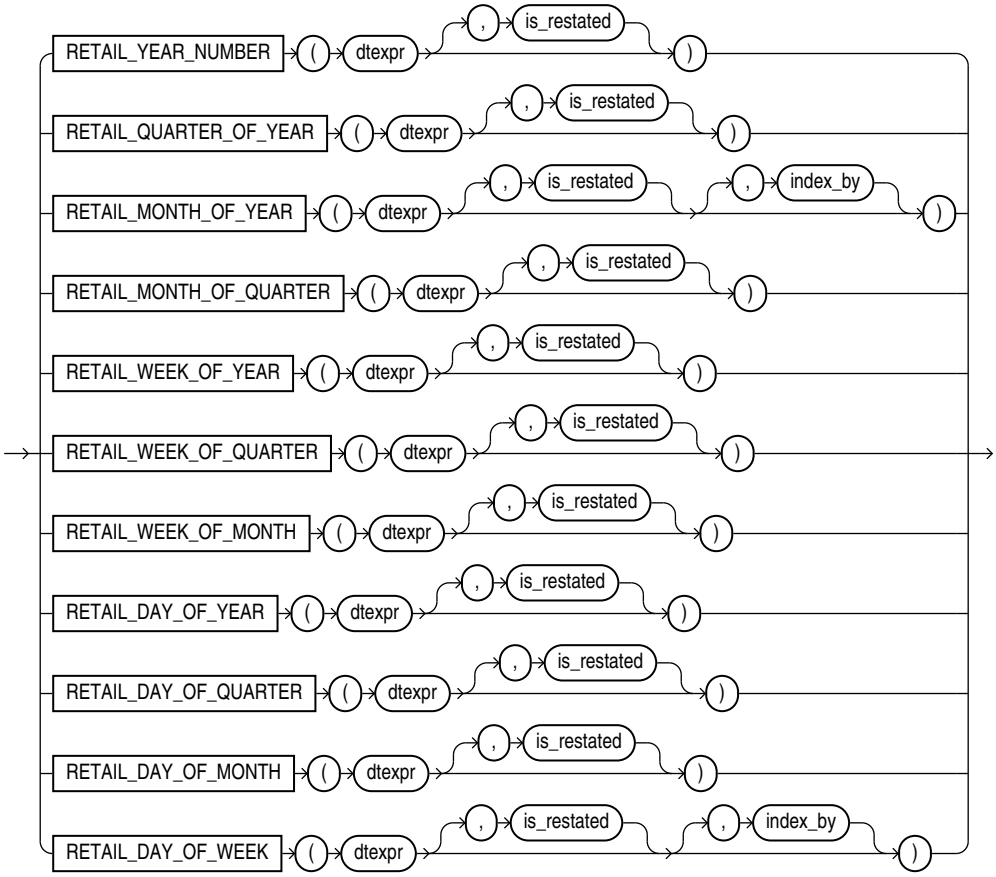
```
SELECT
CASE
WHEN RETAIL_DAY_EXISTS(order_date, 'RESTATED') = TRUE
THEN RETAIL_MONTH(order_date, 'DEFAULT', 'RESTATED')
ELSE '#INVALID_DAY#'
END month,
SUM(sales) sales
FROM fact
GROUP BY ALL
ORDER BY 1;

MONTH SALES
------------ -----
FEB-RY2023 123
#INVALID_DAY# 456
```

RETAIL_START_END

Syntax

- *dtexpr* is a datetime expression with one of the following types (or any value that can be implicitly converted to DATE): DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE .



Copyright © 1996, 2026, Oracle and/or its affiliates.

- All retail functions take an optional *is_restated* parameter that controls how years that require 53 weeks are handled.

  The *is_restated* parameter is a text expression that must resolve to either RESTATED or NOT RESTATED (case-insensitive). A retail year typically contains exactly 52 weeks, which is 364 days. Therefore, every 5 or 6 years an extra 53rd week is added. This is a non-restated calendar and is what is produced when the *is_restated* parameter is NOT RESTATED (the default). Some users prefer to have all years contain 52 weeks for comparison purposes. Such calendars are called restated calendars, and is what is produced when the *is_restated* parameter is RESTATED.

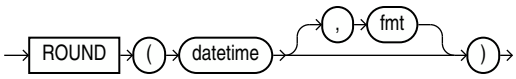
RETAIL_X_OF_Y

Syntax

- *dtexpr* is a datetime expression with one of the following types (or any value that can be implicitly converted to DATE): DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE .
- All retail functions take an optional *is_restated* parameter that controls how years that require 53 weeks are handled.

  The *is_restated* parameter is a text expression that must resolve to either RESTATED or NOT RESTATED (case-insensitive). A retail year typically contains exactly 52 weeks, which is 364 days. Therefore, every 5 or 6 years an extra 53rd week is added. This is a non-restated calendar and is what is produced when the *is_restated* parameter is NOT

Copyright © 1996, 2026, Oracle and/or its affiliates.



RESTATED (the default). Some users prefer to have all years contain 52 weeks for comparison purposes. Such calendars are called restated calendars, and is what is produced when the *is_restated* parameter is RESTATED.

- The *index_by* parameter is a text value that must resolve to either POSITION or DATE (case-insensitive, defaults to DATE). It is used to distinguish between absolute and position-based numbers for the following cases:
  - CALENDAR_DAY_OF_WEEK
  - FISCAL_DAY_OF_WEEK
  - RETAIL_DAY_OF_WEEK
  - FISCAL_MONTH_OF_YEAR
  - RETAIL_MONTH_OF_YEAR

ROUND (datetime)

Syntax

***round_datetime*::=**

Purpose

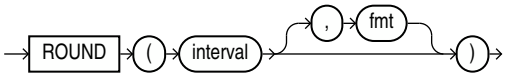
ROUND returns *datetime* rounded to the unit specified by the format model *fmt*.

This function is not sensitive to the NLS_CALENDAR session parameter. It operates according to the rules of the Gregorian calendar. The value returned is always of data type DATE, even if you specify a different datetime data type for *date*. If you omit *fmt*, then *date* is rounded to the nearest day. The *date* expression must resolve to a DATE value.

> **See Also**
>
> "CEIL, FLOOR, ROUND, and TRUNC Date Functions" for the permitted format models to use in *fmt*

Examples

The following example rounds a date to the first day of the following year:



```
SELECT ROUND (TO_DATE ('27-OCT-00'),'YEAR')
   "New Year" FROM DUAL;

New Year
---------
01-JAN-01
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

ROUND (interval)

Syntax

Purpose

`ROUND(interval)` returns the interval rounded up to the unit specified by the second argument *`fmt`*, the format model .

For `INTERVAL YEAR TO MONTH`, *`fmt`* can only be year. The default *`fmt`* is year.

For `INTERVAL DAY TO SECOND`, *`fmt`* can be day, hour and minute. The default *`fmt`* is day. Note that *`fmt`* does not support second.

`ROUND(interval)` rounds up on the mid value of next part of *`fmt`* as follows:

- If *`fmt`* is year, `ROUND(interval)` rounds up on the mid value of month which is 6.
- If *`fmt`* is day, `ROUND(interval)` rounds up on the mid value of hour which is 12.
- If *`fmt`* is hour, `ROUND(interval)` rounds up on the mid value of minute which is 30.
- If *`fmt`* is minute, `ROUND(interval)` rounds up on the mid value of second which is 30.

The result precision for year and day is the input precision for year plus one and day plus one respectively, since `ROUND(interval)` can have overflow. If an interval already has the maximum precision for year and day, the statement compiles but errors at runtime.

> **See Also**
>
> Refer to CEIL, FLOOR, ROUND, and TRUNC Date Functions for the permitted format models to use in *`fmt`*.

Examples

```
SELECT ROUND(INTERVAL '+123-06' YEAR(3) TO MONTH) AS year_round;

YEAR_ROUND
----------
+124-00

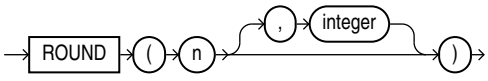
SELECT ROUND(INTERVAL '+99-11' YEAR(2) TO MONTH, 'YEAR') AS year_round;

YEAR_ROUND
----------
+100-00

SELECT ROUND(INTERVAL '-999999999-11' YEAR(9) TO MONTH, 'YEAR')AS year_round;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
ORA-01873: the leading precision of the interval is too small



SELECT ROUND(INTERVAL '+4 12:42:10.222' DAY(2) TO SECOND(3), 'DD') AS day_round;

DAY_ROUND
-------------------
+05 00:00:00.000000
```

ROUND (number)

Syntax

***round_number*::=**

Purpose

`ROUND` returns *n* rounded to *integer* places to the right of the decimal point. If you omit *integer*, then *n* is rounded to zero places. If *integer* is negative, then *n* is rounded off to the left of the decimal point.

n can be any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If you omit *integer*, then the function returns the value `ROUND`(n, 0) in the same data type as the numeric data type of *n*. If you include *integer*, then the function returns `NUMBER`.

`ROUND` is implemented using the following rules:

1. If *n* is 0, then `ROUND` always returns 0 regardless of *integer*.
2. If *n* is negative, then `ROUND`(n, integer) returns -`ROUND`(-n, integer).
3. If *n* is positive, then

   ```
   ROUND(n, integer) = FLOOR(n * POWER(10, integer) + 0.5) * POWER(10, -integer)
   ```

`ROUND` applied to a `NUMBER` value may give a slightly different result from `ROUND` applied to the same value expressed in floating-point. The different results arise from differences in internal representations of `NUMBER` and floating point values. The difference will be 1 in the rounded digit if a difference occurs.

> **See Also**
>
> - Table 2-9 for more information on implicit conversion
> - "Floating-Point Numbers " for more information on how Oracle Database handles `BINARY_FLOAT` and `BINARY_DOUBLE` values
> - FLOOR (number) and CEIL (number), TRUNC (number) and MOD for information on functions that perform related operations

Copyright © 1996, 2026, Oracle and/or its affiliates.

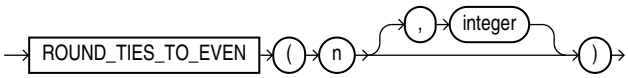
Examples

The following example rounds a number to one decimal point:

```
SELECT ROUND(15.193,1) "Round" FROM DUAL;

     Round
----------
      15.2
```

The following example rounds a number one digit to the left of the decimal point:



```
SELECT ROUND(15.193,-1) "Round" FROM DUAL;

     Round
----------
        20
```

ROUND_TIES_TO_EVEN (number)

Syntax

***round_ties_to_even* ::=**

Purpose

`ROUND_TIES_TO_EVEN` is a rounding function that takes two parameters: `n` and `integer`. The function returns `n` rounded to `integer` places according to the following rules:

1. If `integer` is positive, `n` is rounded to `integer` places to the right of the decimal point.
2. If `integer` is not specified, then `n` is rounded to 0 places.
3. If `integer` is negative, then `n` is rounded to `integer` places to the left of the decimal point.

Restrictions

The function does not support the following types: `BINARY_FLOAT` and `BINARY_DOUBLE`.

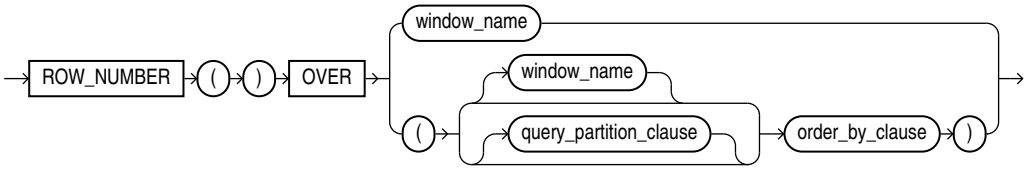
Examples

The following example rounds a number to one decimal point to the right:

```
SELECT ROUND_TIES_TO_EVEN (0.05, 1) from DUAL

ROUND_TIES_TO_EVEN(0.05,1)
--------------------------
                         0
```

The following example rounds a number to one decimal point to the left:



```
SELECT ROUND_TIES_TO_EVEN(45.177,-1) "ROUND_EVEN" FROM DUAL;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
ROUND_TIES_TO_EVEN(45.177,-1)
-----------------------------
                           50
```

ROW_NUMBER

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

`ROW_NUMBER` is an analytic function. It assigns a unique number to each row to which it is applied (either each row in the partition or each row returned by the query), in the ordered sequence of rows specified in the *`order_by_clause`*, beginning with 1.

By nesting a subquery using `ROW_NUMBER` inside a query that retrieves the `ROW_NUMBER` values for a specified range, you can find a precise subset of rows from the results of the inner query. This use of the function lets you implement top-N, bottom-N, and inner-N reporting. For consistent results, the query must ensure a deterministic sort order.

Examples

The following example finds the three highest paid employees in each department in the `hr.employees` table. Fewer than three rows are returned for departments with fewer than three employees.

```
SELECT department_id, first_name, last_name, salary
FROM
(
  SELECT
    department_id, first_name, last_name, salary,
    ROW_NUMBER() OVER (PARTITION BY department_id ORDER BY salary desc) rn
  FROM employees
)
WHERE rn <= 3
ORDER BY department_id, salary DESC, last_name;
```

The following example is a join query on the `sh.sales` table. It finds the sales amounts in 2000 of the five top-selling products in 1999 and compares the difference between 2000 and 1999. The ten top-selling products are calculated within each distribution channel.

```
SELECT sales_2000.channel_desc, sales_2000.prod_name,
       sales_2000.amt amt_2000,  top_5_prods_1999_year.amt amt_1999,
       sales_2000.amt  - top_5_prods_1999_year.amt amt_diff
FROM
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
/* The first subquery finds the 5 top-selling products per channel in year 1999. */
  (SELECT channel_desc, prod_name, amt
   FROM
   (
     SELECT channel_desc, prod_name, sum(amount_sold) amt,
       ROW_NUMBER () OVER (PARTITION BY channel_desc
                           ORDER BY SUM(amount_sold) DESC) rn
     FROM sales, times, channels, products
     WHERE sales.time_id = times.time_id
       AND times.calendar_year = 1999
       AND channels.channel_id = sales.channel_id
       AND products.prod_id = sales.prod_id
     GROUP BY channel_desc, prod_name
   )
   WHERE rn <= 5
  ) top_5_prods_1999_year,
/* The next subquery finds sales per product and per channel in 2000. */
  (SELECT channel_desc, prod_name, sum(amount_sold) amt
     FROM sales, times, channels, products
     WHERE sales.time_id = times.time_id
       AND times.calendar_year = 2000
       AND channels.channel_id = sales.channel_id
       AND products.prod_id = sales.prod_id
     GROUP BY channel_desc, prod_name
  ) sales_2000
WHERE sales_2000.channel_desc = top_5_prods_1999_year.channel_desc
  AND sales_2000.prod_name = top_5_prods_1999_year.prod_name

ROWIDTOCHAR

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

ROWIDTOCHAR converts a rowid value to VARCHAR2 data type. The result of this conversion is always 18 characters long.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of ROWIDTOCHAR

Examples

The following example converts a rowid value in the employees table to a character value. (Results vary for each build of the sample database.)

```
SELECT ROWID FROM employees
   WHERE ROWIDTOCHAR(ROWID) LIKE '%JAAB%'
   ORDER BY ROWID;

ROWID
------------------
AAAFfIAAFAAAABSAAb
```

ROWIDTONCHAR

Syntax

Purpose

ROWIDTONCHAR converts a rowid value to NVARCHAR2 data type. The result of this conversion is always in the national character set and is 18 characters long.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of ROWIDTONCHAR

Examples

The following example converts a rowid value to an NVARCHAR2 string:

```
SELECT LENGTHB( ROWIDTONCHAR(ROWID) ) Length, ROWIDTONCHAR(ROWID)
   FROM employees
   ORDER BY length;

    LENGTH ROWIDTONCHAR(ROWID
---------- ------------------
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
          36 AAAL52AAFAAAABSABD
          36 AAAL52AAFAAAABSABV
. . .
```

RPAD

Syntax

Purpose

`RPAD` returns *expr1*, right-padded to length *n* characters with *expr2*, replicated as many times as necessary. This function is useful for formatting the output of a query.

Both *expr1* and *expr2* can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`. The string returned is of `VARCHAR2` data type if *expr1* is a character data type, `NVARCHAR2` if *expr1* is a national character data type, and a LOB if *expr1* is a LOB data type. The string returned is in the same character set as *expr1*. The argument *n* must be a `NUMBER` integer or a value that can be implicitly converted to a `NUMBER` integer.

expr1 cannot be null. If you do not specify *expr2*, then it defaults to a single blank. If *expr1* is longer than *n*, then this function returns the portion of *expr1* that fits in *n*.

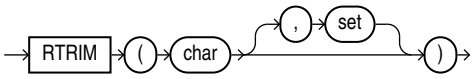
The argument *n* is the total length of the return value as it is displayed on your terminal screen. In most character sets, this is also the number of characters in the return value. However, in some multibyte character sets, the display length of a character string can differ from the number of characters in the string.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `RPAD`

Examples

The following example creates a simple chart of salary amounts by padding a single space with asterisks:

```
SELECT last_name, RPAD(' ', salary/1000/1, '*') "Salary"
   FROM employees
   WHERE department_id = 80
   ORDER BY last_name, "Salary";



LAST_NAME                 Salary
------------------------- ---------------
Abel                       **********
Ande                       *****
Banda                      *****
Bates                      ******
Bernstein                  ********

Fox                            ********
Greene                         ********
Hall                           ********
Hutton                         *******
Johnson                        *****
King                           *********
. . .
```

RTRIM

Syntax

Purpose

`RTRIM` removes from the right end of *`char`* all of the characters that appear in *`set`*. This function is useful for formatting the output of a query.

If you do not specify *`set`*, then it defaults to a single blank. `RTRIM` works similarly to `LTRIM`.

Both *`char`* and *`set`* can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`. The string returned is of `VARCHAR2` data type if *`char`* is a character data type, `NVARCHAR2` if *`char`* is a national character data type, and a LOB if *`char`* is a LOB data type.

See Also

- LTRIM
- Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation `RTRIM` uses to compare characters from *`set`* with characters from *`char`*, and for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following example trims all the right-most occurrences of less than sign (<), greater than sign (>) , and equal sign (=) from a string:

```
SELECT RTRIM('<=====>BROWNING<=====>', '<>=') "RTRIM Example"
  FROM DUAL;

RTRIM Example
---------------
<=====>BROWNING
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

SCN_TO_TIMESTAMP

Syntax

Purpose

`SCN_TO_TIMESTAMP` takes as an argument a number that evaluates to a system change number (SCN), and returns the approximate timestamp associated with that SCN. The returned value is of `TIMESTAMP` data type. This function is useful any time you want to know the timestamp associated with an SCN. For example, it can be used in conjunction with the `ORA_ROWSCN` pseudocolumn to associate a timestamp with the most recent change to a row.

Notes

- The usual precision of the result value is 3 seconds.
- The association between an SCN and a timestamp when the SCN is generated is remembered by the database for a limited period of time. This period is the maximum of the auto-tuned undo retention period, if the database runs in the Automatic Undo Management mode, and the retention times of all flashback archives in the database, but no less than 120 hours. The time for the association to become obsolete elapses only when the database is open. An error is returned if the SCN specified for the argument to `SCN_TO_TIMESTAMP` is too old.

See Also

ORA_ROWSCN Pseudocolumn and TIMESTAMP_TO_SCN

Examples

The following example uses the `ORA_ROWSCN` pseudocolumn to determine the system change number of the last update to a row and uses `SCN_TO_TIMESTAMP` to convert that SCN to a timestamp:

```
SELECT SCN_TO_TIMESTAMP(ORA_ROWSCN) FROM employees
   WHERE employee_id = 188;
```

You could use such a query to convert a system change number to a timestamp for use in an Oracle Flashback Query:

```
SELECT salary FROM employees WHERE employee_id = 188;
    SALARY
----------
      3800

UPDATE employees SET salary = salary*10 WHERE employee_id = 188;
COMMIT;

SELECT salary FROM employees WHERE employee_id = 188;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
    SALARY
----------
     38000

SELECT SCN_TO_TIMESTAMP(ORA_ROWSCN) FROM employees
   WHERE employee_id = 188;
SCN_TO_TIMESTAMP(ORA_ROWSCN)
---------------------------------------------------------------------------
28-AUG-03 01.58.01.000000000 PM

FLASHBACK TABLE employees TO TIMESTAMP
   TO_TIMESTAMP('28-AUG-03 01.00.00.000000000 PM');

SELECT salary FROM employees WHERE employee_id = 188;
    SALARY
----------
      3800
```

SESSIONTIMEZONE

Syntax

Purpose

`SESSIONTIMEZONE` returns the time zone of the current session. The return type is a time zone offset (a character type in the format `'[+|-]TZH:TZM'`) or a time zone region name, depending on how the user specified the session time zone value in the most recent `ALTER SESSION` statement.

> **Note**
>
> The default client session time zone is an offset even if the client operating system uses a named time zone. If you want the default session time zone to use a named time zone, then set the `ORA_SDTZ` variable in the client environment to an Oracle time zone region name. Refer to *Oracle Database Globalization Support Guide* for more information on this variable.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `SESSIONTIMEZONE`

Examples

The following example returns the time zone of the current session:

```
SELECT SESSIONTIMEZONE FROM DUAL;

SESSION
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
-------
-08:00
```

SET

Syntax

Purpose

`SET` converts a nested table into a set by eliminating duplicates. The function returns a nested table whose elements are distinct from one another. The returned nested table is of the same type as the input nested table.

The element types of the nested table must be comparable. Refer to "Comparison Conditions " for information on the comparability of nonscalar types.

Examples

The following example selects from the `customers_demo` table the unique elements of the `cust_address_ntab` nested table column:

```
SELECT customer_id, SET(cust_address_ntab) address
  FROM customers_demo
  ORDER BY customer_id;

CUSTOMER_ID ADDRESS(STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID)
----------- --------------------------------------------------------------------
        101 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('514 W Superior St', '46901', 'Kokomo', 'IN', 'US'))
        102 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('2515 Bloyd Ave', '46218', 'Indianapolis', 'IN', 'US'))
        103 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('8768 N State Rd 37', '47404', 'Bloomington', 'IN', 'US'))
        104 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('6445 Bay Harbor Ln', '46254', 'Indianapolis', 'IN', 'US'))
        105 CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('4019 W 3Rd St', '47404', 'Bloomington', 'IN', 'US'))
. . .
```

The preceding example requires the table `customers_demo` and a nested table column containing data. Refer to "Multiset Operators " to create this table and nested table column.

SIGN

Syntax

Purpose

`SIGN` returns the sign of *n*. This function takes as an argument any numeric data type, or any nonnumeric data type that can be implicitly converted to `NUMBER`, and returns `NUMBER`.

For value of `NUMBER` type, the sign is:

- -1 if *n*<0

Copyright © 1996, 2026, Oracle and/or its affiliates.

- 0 if *n*=0
- 1 if *n*>0

For binary floating-point numbers (`BINARY_FLOAT` and `BINARY_DOUBLE`), this function returns the sign bit of the number. The sign bit is:

- -1 if *n*<0
- +1 if *n*>=0 or *n*=`NaN`

Examples

The following example indicates that the argument of the function (`-15`) is <0:

```
SELECT SIGN(-15) "Sign" FROM DUAL;

      Sign
----------
        -1
```

SIN

Syntax

Purpose

`SIN` returns the sine of *n* (an angle expressed in radians).

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is `BINARY_FLOAT`, then the function returns `BINARY_DOUBLE`. Otherwise the function returns the same numeric data type as the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples

The following example returns the sine of 30 degrees:

```
SELECT SIN(30 * 3.14159265359/180)
 "Sine of 30 degrees" FROM DUAL;

Sine of 30 degrees
------------------
                .5
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

SINH

Syntax

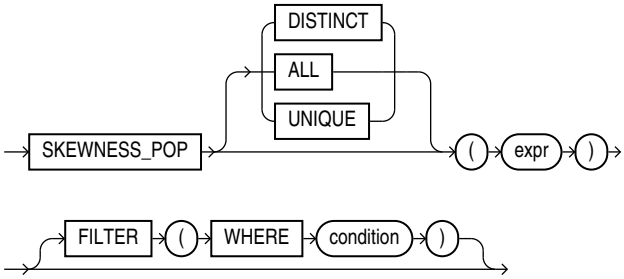
Purpose

`SINH` returns the hyperbolic sine of *n*.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is `BINARY_FLOAT`, then the function returns `BINARY_DOUBLE`. Otherwise the function returns the same numeric data type as the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples



The following example returns the hyperbolic sine of 1:

```
SELECT SINH(1) "Hyperbolic sine of 1" FROM DUAL;

Hyperbolic sine of 1
--------------------
          1.17520119
```

SKEWNESS_POP

Syntax

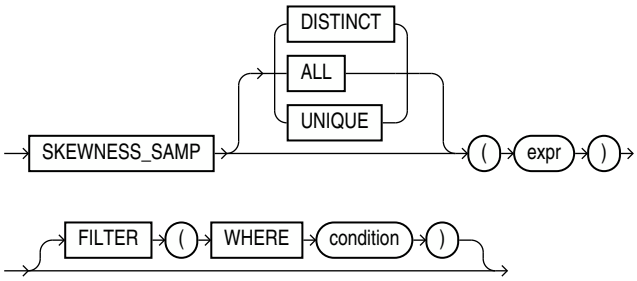
Purpose

`SKEWNESS_POP` is an aggregate function that is primarily used to determine symmetry in a given distribution.

NULL values in `expr` are ignored.

Returns NULL if all rows in the group have NULL `expr` values.

Copyright © 1996, 2026, Oracle and/or its affiliates.



Returns 0 if there are one or two rows in `expr`.

For a given set of values, the result of population skewness (`SKEWNESS_POP`) and sample skewness (`SKEWNESS_SAMP`) are always deterministic. However, the values of `SKEWNESS_POP` and `SKEWNESS_SAMP` differ. As the number of values in the data set increases, the difference between the computed values of `SKEWNESS_SAMP` and `SKEWNESS_POP` decreases.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

SKEWNESS_SAMP

Syntax

Purpose

`SKEWNESS_SAMP` is an aggregate function that is primarily used to determine symmetry in a given distribution.

NULL values in `expr` are ignored.

Returns NULL if all rows in the group have NULL `expr` values.

Returns 0 if there are one or two rows in `expr`.

For a given set of values, the result of population skewness (`SKEWNESS_POP`) and sample skewness (`SKEWNESS_SAMP`) are always deterministic. However, the values of `SKEWNESS_POP` and `SKEWNESS_SAMP` differ. As the number of values in the data set increases, the difference between the computed values of `SKEWNESS_SAMP` and `SKEWNESS_POP` decreases.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

SOUNDEX

Syntax

Purpose

`SOUNDEX` returns a character string containing the phonetic representation of *`char`*. This function lets you compare words that are spelled differently, but sound alike in English.

The phonetic representation is defined in *The Art of Computer Programming*, Volume 3: Sorting and Searching, by Donald E. Knuth, as follows:

Copyright © 1996, 2026, Oracle and/or its affiliates.

1. Retain the first letter of the string and remove all other occurrences of the following letters: a, e, h, i, o, u, w, y.
2. Assign numbers to the remaining letters (after the first) as follows:

```
b, f, p, v = 1
c, g, j, k, q, s, x, z = 2
d, t = 3
l = 4
m, n = 5
r = 6
```

3. If two or more letters with the same number were adjacent in the original name (before step 1), or adjacent except for any intervening h and w, then retain the first letter and omit rest of all the adjacent letters with same number.
4. Return the first four bytes padded with 0.

char can be of any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. The return value is the same data type as *char*.

This function does not support `CLOB` data directly. However, `CLOB`s can be passed in as arguments through implicit data conversion.

> **See Also**
>
> - "Data Type Comparison Rules " for more information.
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `SOUNDEX`

Examples

The following example returns the employees whose last names are a phonetic representation of "Smyth":

```
SELECT last_name, first_name
     FROM hr.employees
     WHERE SOUNDEX(last_name)
         = SOUNDEX('SMYTHE')
     ORDER BY last_name, first_name;

LAST_NAME  FIRST_NAME
---------- ----------
Smith      Lindsey
Smith      William
```

SQRT

Syntax

Purpose

`SQRT` returns the square root of *n*.

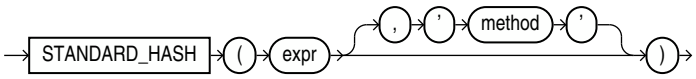
Copyright © 1996, 2026, Oracle and/or its affiliates.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

- If *n* resolves to a `NUMBER`, then the value *n* cannot be negative. `SQRT` returns a real number.
- If *n* resolves to a binary floating-point number (`BINARY_FLOAT` or `BINARY_DOUBLE`):
  - If *n* >= 0, then the result is positive.
  - If *n* = -0, then the result is -0.
  - If *n* < 0, then the result is `NaN`.

Examples



The following example returns the square root of 26:

```
SELECT SQRT(26) "Square root" FROM DUAL;

Square root
-----------
5.09901951
```

STANDARD_HASH

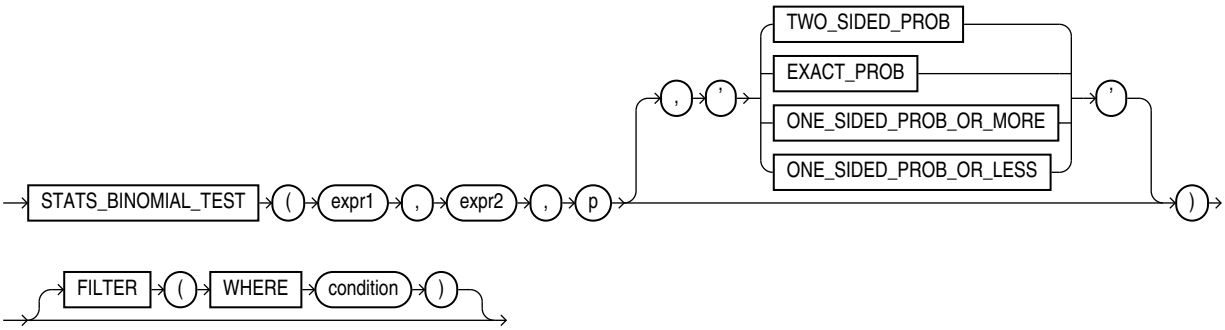
Syntax

Purpose

`STANDARD_HASH` computes a hash value for a given expression using one of several hash algorithms that are defined and standardized by the National Institute of Standards and Technology. This function is useful for performing authentication and maintaining data integrity in security applications such as digital signatures, checksums, and fingerprinting.

You can use the `STANDARD_HASH` function to create an index on an extended data type column. Refer to "Creating an Index on an Extended Data Type Column" for more information.

- The *expr* argument determines the data for which you want Oracle Database to compute a hash value. There are no restrictions on the length of data represented by *expr*, which commonly resolves to a column name. The *expr* cannot be a `LONG` or LOB type. It cannot be a user-defined object type. All other data types are supported for *expr*.
- The optional *method* argument lets you specify the name of the hash algorithm to be used. Valid algorithms are `SHA1`, `SHA256`, `SHA384`, `SHA512` and `MD5`. If you omit this argument, then `SHA1` is used.



The function returns a `RAW` value.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **Note**
>
> The STANDARD_HASH function is not identical to the one used internally by Oracle Database for hash partitioning.

STATS_BINOMIAL_TEST

Syntax

Purpose

STATS_BINOMIAL_TEST is an exact probability test used for dichotomous variables, where only two possible values exist. It tests the difference between a sample proportion and a given proportion. The sample size in such tests is usually small.

This function takes three required arguments: *expr1* is the sample being examined, *expr2* contains the values for which the proportion is expected to be, and *p* is a proportion to test against. The optional fourth argument lets you specify the meaning of the NUMBER value returned by this function, as shown in Table 7-10. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the fourth argument, then the default is 'TWO_SIDED_PROB'.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules for STATS_BINOMIAL_TEST

Table 7-10 STATS_BINOMIAL Return Values

Argument	Return Value Meaning
'TWO_SIDED_PROB'	The probability that the given population proportion, *p*, could result in the observed proportion or a more extreme one.
'EXACT_PROB'	The probability that the given population proportion, *p*, could result in exactly the observed proportion.
'ONE_SIDED_PROB_OR_MORE'	The probability that the given population proportion, *p*, could result in the observed proportion or a larger one.

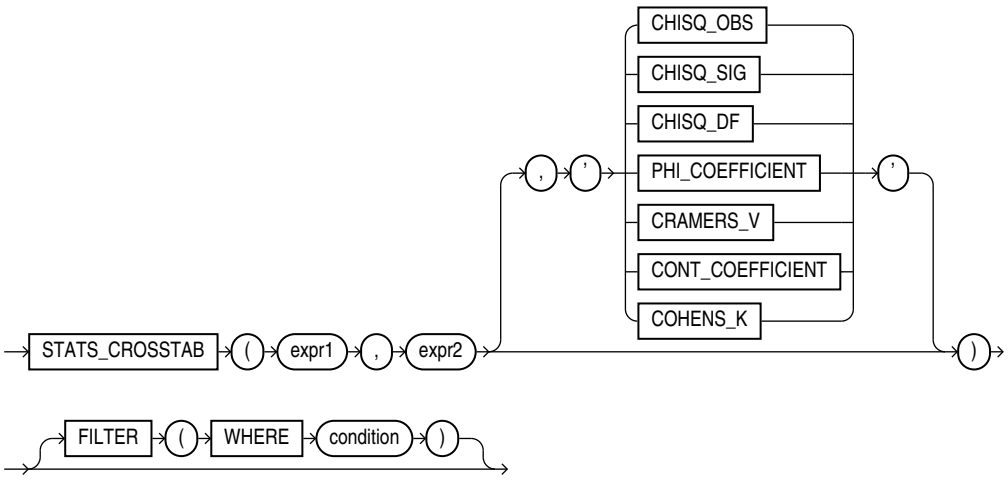
Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-10 (Cont.) STATS_BINOMIAL Return Values

Argument	Return Value Meaning
`'ONE_SIDED_PROB_OR_LESS'`	The probability that the given population proportion, *p*, could result in the observed proportion or a smaller one.

`'EXACT_PROB'` gives the probability of getting exactly proportion *p*. In cases where you want to test whether the proportion found in the sample is significantly different from a 50-50 split, *p* would normally be 0.50. If you want to test only whether the proportion is different, then use the return value `'TWO_SIDED_PROB'`. If your test is whether the proportion is more than the value of *expr2*, then use the return value `'ONE_SIDED_PROB_OR_MORE'`. If the test is to determine whether the proportion of *expr2* is less, then use the return value `'ONE_SIDED_PROB_OR_LESS'`.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.



STATS_BINOMIAL_TEST Example

The following example determines the probability that reality exactly matches the number of men observed under the assumption that 69% of the population is composed of men:

```
SELECT AVG(DECODE(cust_gender, 'M', 1, 0)) real_proportion,
       STATS_BINOMIAL_TEST
         (cust_gender, 'M', 0.68, 'EXACT_PROB') exact,
       STATS_BINOMIAL_TEST
         (cust_gender, 'M', 0.68, 'ONE_SIDED_PROB_OR_LESS') prob_or_less
  FROM sh.customers;
```

STATS_CROSSTAB

Syntax

Purpose

Crosstabulation (commonly called crosstab) is a method used to analyze two nominal variables. The `STATS_CROSSTAB` function takes two required arguments: *expr1* and *expr2* are the two variables being analyzed. The optional third argument lets you specify the meaning of the `NUMBER` value returned by this function, as shown in Table 7-11. For this argument, you can

Copyright © 1996, 2026, Oracle and/or its affiliates.

specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the third argument, then the default is `'CHISQ_SIG'`.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules for `STATS_CROSSTAB`

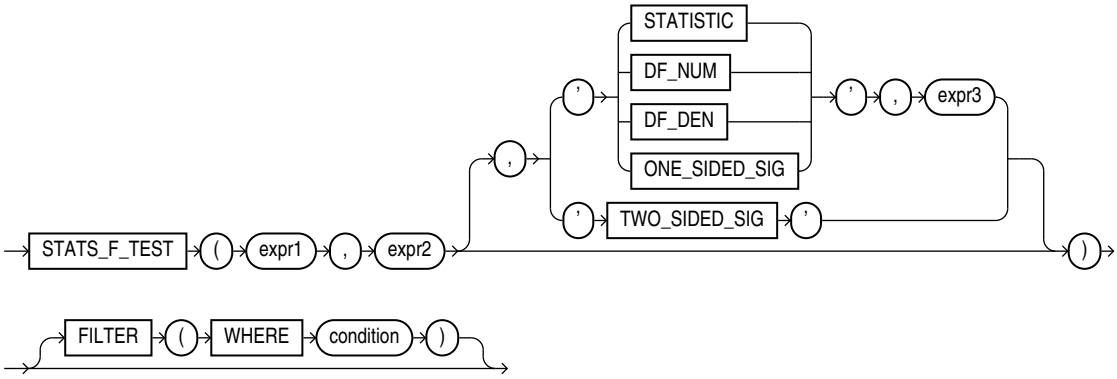
Table 7-11 STATS_CROSSTAB Return Values

Argument	Return Value Meaning
`'CHISQ_OBS'`	Observed value of chi-squared
`'CHISQ_SIG'`	Significance of observed chi-squared
`'CHISQ_DF'`	Degree of freedom for chi-squared
`'PHI_COEFFICIENT'`	Phi coefficient
`'CRAMERS_V'`	Cramer's V statistic
`'CONT_COEFFICIENT'`	Contingency coefficient
`'COHENS_K'`	Cohen's kappa

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

STATS_CROSSTAB Example

The following example determines the strength of the association between gender and income level:



```
SELECT STATS_CROSSTAB
         (cust_gender, cust_income_level, 'CHISQ_OBS') chi_squared,
       STATS_CROSSTAB
         (cust_gender, cust_income_level, 'CHISQ_SIG') p_value,
       STATS_CROSSTAB
         (cust_gender, cust_income_level, 'PHI_COEFFICIENT') phi_coefficient
  FROM sh.customers;

CHI_SQUARED    P_VALUE PHI_COEFFICIENT
----------- ---------- ---------------
 251.690705 1.2364E-47      .067367056
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

STATS_F_TEST

Syntax

Purpose

`STATS_F_TEST` tests whether two variances are significantly different. The observed value of *f* is the ratio of one variance to the other, so values very different from 1 usually indicate significant differences.

This function takes two required arguments: *expr1* is the grouping or independent variable and *expr2* is the sample of values. The optional third argument lets you specify the meaning of the `NUMBER` value returned by this function, as shown in Table 7-12. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the third argument, then the default is `'TWO_SIDED_SIG'`.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules for `STATS_F_TEST`

Table 7-12 STATS_F_TEST Return Values

Argument	Return Value Meaning
`'STATISTIC'`	The observed value of *f*
`'DF_NUM'`	Degree of freedom for the numerator
`'DF_DEN'`	Degree of freedom for the denominator
`'ONE_SIDED_SIG'`	One-tailed significance of *f*
`'TWO_SIDED_SIG'`	Two-tailed significance of *f*

The one-tailed significance is always in relation to the upper tail. The final argument, *expr3*, indicates which of the two groups specified by *expr1* is the high value or numerator (the value whose rejection region is the upper tail).

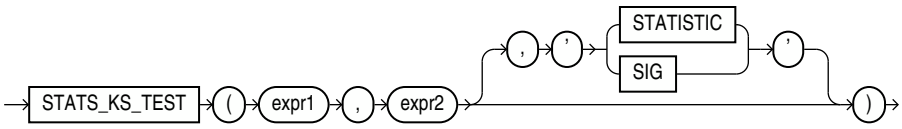
The observed value of *f* is the ratio of the variance of one group to the variance of the second group. The significance of the observed value of *f* is the probability that the variances are

Copyright © 1996, 2026, Oracle and/or its affiliates.

different just by chance—a number between 0 and 1. A small value for the significance indicates that the variances are significantly different. The degree of freedom for each of the variances is the number of observations in the sample minus 1.

For the semantics of the FILTER clause, see FILTER Clause Semantics.

STATS_F_TEST Example



The following example determines whether the variance in credit limit between men and women is significantly different. The results, a p_value not close to zero, and an f_statistic close to 1, indicate that the difference between credit limits for men and women are not significant.

```
SELECT VARIANCE(DECODE(cust_gender, 'M', cust_credit_limit, null)) var_men,
       VARIANCE(DECODE(cust_gender, 'F', cust_credit_limit, null)) var_women,
       STATS_F_TEST(cust_gender, cust_credit_limit, 'STATISTIC', 'F') f_statistic,
       STATS_F_TEST(cust_gender, cust_credit_limit) two_sided_p_value
  FROM sh.customers;

   VAR_MEN  VAR_WOMEN F_STATISTIC TWO_SIDED_P_VALUE
---------- ---------- ----------- -----------------
12879896.7   13046865  1.01296348        .311928071
```

STATS_KS_TEST

Syntax

Purpose

STATS_KS_TEST is a Kolmogorov-Smirnov function that compares two samples to test whether they are from the same population or from populations that have the same distribution. It does not assume that the population from which the samples were taken is normally distributed.

This function takes two required arguments: *expr1* classifies the data into the two samples and *expr2* contains the values for each of the samples. If *expr1* classifies the data into only one sample or into more than two samples, then an error is raised. The optional third argument lets you specify the meaning of the NUMBER value returned by this function, as shown in Table 7-13. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the third argument, then the default is 'SIG'.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules for STATS_KS_TEST

Copyright © 1996, 2026, Oracle and/or its affiliates.

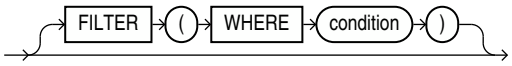
Table 7-13 STATS_KS_TEST Return Values

Argument	Return Value Meaning
'STATISTIC'	Observed value of *D*
'SIG'	Significance of *D*

For the semantics of the FILTER clause, see FILTER Clause Semantics.

STATS_KS_TEST Example

Using the Kolmogorov Smirnov test, the following example determines whether the distribution of sales between men and women is due to chance:



```
SELECT stats_ks_test(cust_gender, amount_sold, 'STATISTIC') ks_statistic,
       stats_ks_test(cust_gender, amount_sold) p_value
  FROM sh.customers c, sh.sales s
  WHERE c.cust_id = s.cust_id;

KS_STATISTIC    P_VALUE
------------ ----------
  .003841396 .004080006
```

STATS_MODE

Syntax

Purpose

STATS_MODE takes as its argument a set of values and returns the value that occurs with the greatest frequency. If more than one mode exists, then Oracle Database chooses one and returns only that one value.

To obtain multiple modes (if multiple modes exist), you must use a combination of other functions, as shown in the hypothetical query:

```
SELECT x FROM (SELECT x, COUNT(x) AS cnt1
   FROM t GROUP BY x)
   WHERE cnt1 =
      (SELECT MAX(cnt2) FROM (SELECT COUNT(x) AS cnt2 FROM t GROUP BY x));
```

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation STATS_MODE uses to compare character values for *expr* , and for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value

Copyright © 1996, 2026, Oracle and/or its affiliates.

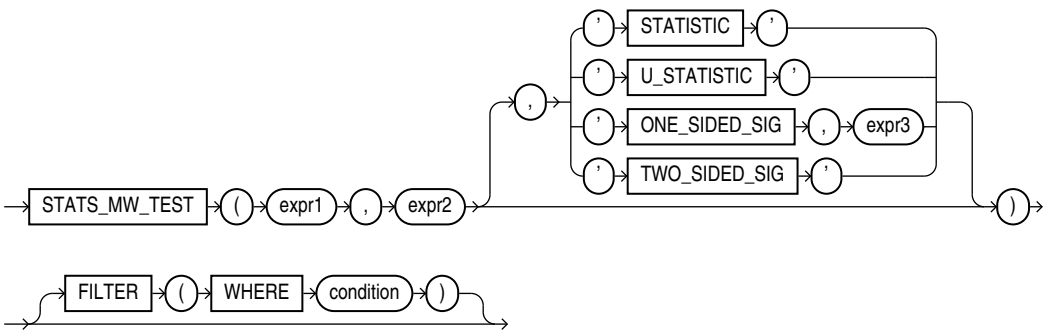
For the semantics of the FILTER clause, see FILTER Clause Semantics.

Examples

The following example returns the mode of salary per department in the hr.employees table:

```
SELECT department_id, STATS_MODE(salary) FROM employees
   GROUP BY department_id
   ORDER BY department_id, stats_mode(salary);

DEPARTMENT_ID STATS_MODE(SALARY)
------------- ------------------
           10               4400
           20               6000
           30               2500
           40               6500
           50               2500
           60               4800
           70              10000
           80               9500
           90              17000
          100               6900
          110               8300
                            7000
```



If you need to retrieve all of the modes (in cases with multiple modes), you can do so using a combination of other functions, as shown in the next example:

```
SELECT commission_pct FROM
   (SELECT commission_pct, COUNT(commission_pct) AS cnt1 FROM employees
      GROUP BY commission_pct)
   WHERE cnt1 =
      (SELECT MAX (cnt2) FROM
         (SELECT COUNT(commission_pct) AS cnt2
         FROM employees GROUP BY commission_pct))
   ORDER BY commission_pct;

COMMISSION_PCT
--------------
            .2
            .3
```

STATS_MW_TEST

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

A Mann Whitney test compares two independent samples to test the null hypothesis that two populations have the same distribution function against the alternative hypothesis that the two distribution functions are different.

The `STATS_MW_TEST` does not assume that the differences between the samples are normally distributed, as do the `STATS_T_TEST_*` functions. This function takes two required arguments: *expr1* classifies the data into groups and *expr2* contains the values for each of the groups. The optional third argument lets you specify the meaning of the `NUMBER` value returned by this function, as shown in Table 7-14. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the third argument, then the default is `'TWO_SIDED_SIG'`.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules for `STATS_MW_TEST`

Table 7-14 STATS_MW_TEST Return Values

Argument	Return Value Meaning
`'STATISTIC'`	The observed value of *Z*
`'U_STATISTIC'`	The observed value of *U*
`'ONE_SIDED_SIG'`	One-tailed significance of *Z*
`'TWO_SIDED_SIG'`	Two-tailed significance of *Z*

The significance of the observed value of *Z* or *U* is the probability that the variances are different just by chance—a number between 0 and 1. A small value for the significance indicates that the variances are significantly different. The degree of freedom for each of the variances is the number of observations in the sample minus 1.

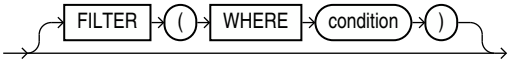
The one-tailed significance is always in relation to the upper tail. The final argument, *expr3*, indicates which of the two groups specified by expr1 is the high value (the value whose rejection region is the upper tail).

`STATS_MW_TEST` computes the probability that the samples are from the same distribution by checking the differences in the sums of the ranks of the values. If the samples come from the same distribution, then the sums should be close in value.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

STATS_MW_TEST Example

Using the Mann Whitney test, the following example determines whether the distribution of sales between men and women is due to chance:



```
SELECT STATS_MW_TEST
         (cust_gender, amount_sold, 'STATISTIC') z_statistic,
       STATS_MW_TEST
         (cust_gender, amount_sold, 'ONE_SIDED_SIG', 'F') one_sided_p_value
  FROM sh.customers c, sh.sales s
  WHERE c.cust_id = s.cust_id;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
Z_STATISTIC ONE_SIDED_P_VALUE
----------- -----------------
 -1.4011509        .080584471
```

STATS_ONE_WAY_ANOVA

Syntax

Purpose

The one-way analysis of variance function (`STATS_ONE_WAY_ANOVA`) tests differences in means (for groups or variables) for statistical significance by comparing two different estimates of variance. One estimate is based on the variances within each group or category. This is known as the **mean squares within** or **mean square error**. The other estimate is based on the variances among the means of the groups. This is known as the **mean squares between**. If the means of the groups are significantly different, then the mean squares between will be larger than expected and will not match the mean squares within. If the mean squares of the groups are consistent, then the two variance estimates will be about the same.

`STATS_ONE_WAY_ANOVA` takes two required arguments: *`expr1`* is an independent or grouping variable that divides the data into a set of groups and *`expr2`* is a dependent variable (a numeric expression) containing the values corresponding to each member of a group. The optional third argument lets you specify the meaning of the `NUMBER` value returned by this function, as shown in Table 7-15. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the third argument, then the default is `'SIG'`.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules for `STATS_ONE_WAY_ANOVA`

Table 7-15 STATS_ONE_WAY_ANOVA Return Values

Argument	Return Value Meaning
`'SUM_SQUARES_BETEEN'`	Sum of squares between groups
`'SUM_SQUARES_WITHIN'`	Sum of squares within groups
`'DF_BETWEEN'`	Degree of freedom between groups
`'DF_WITHIN'`	Degree of freedom within groups
`'MEAN_SQUARES_BETWEEN'`	Mean squares between groups
`'MEAN_SQUARES_WITHIN'`	Mean squares within groups
`'F_RATIO'`	Ratio of the mean squares between to the mean squares within (MSB/MSW)

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-15 (Cont.) STATS_ONE_WAY_ANOVA Return Values

Argument	Return Value Meaning
'SIG'	Significance

The significance of one-way analysis of variance is determined by obtaining the one-tailed significance of an *f*-test on the ratio of the mean squares between and the mean squares within. The *f*-test should use one-tailed significance, because the mean squares between can be only equal to or larger than the mean squares within. Therefore, the significance returned by STATS_ONE_WAY_ANOVA is the probability that the differences between the groups happened by chance—a number between 0 and 1. The smaller the number, the greater the significance of the difference between the groups. Refer to the STATS_F_TEST for information on performing an *f*-test.

For the semantics of the FILTER clause, see FILTER Clause Semantics.

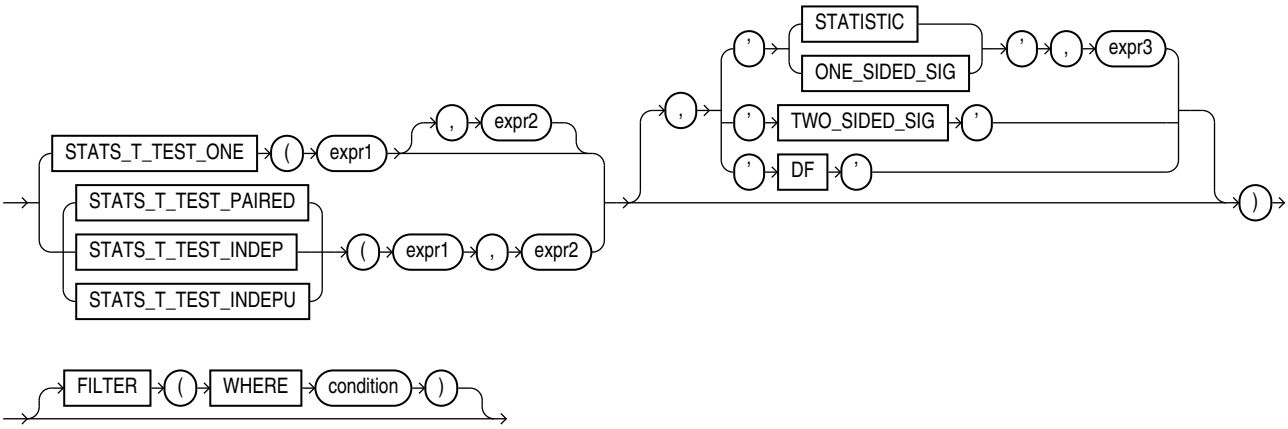
STATS_ONE_WAY_ANOVA Example

The following example determines the significance of the differences in mean sales within an income level and differences in mean sales between income levels. The results, p_values close to zero, indicate that, for both men and women, the difference in the amount of goods sold across different income levels is significant.

```
SELECT cust_gender,
       STATS_ONE_WAY_ANOVA(cust_income_level, amount_sold, 'F_RATIO') f_ratio,
       STATS_ONE_WAY_ANOVA(cust_income_level, amount_sold, 'SIG') p_value
  FROM sh.customers c, sh.sales s
  WHERE c.cust_id = s.cust_id
  GROUP BY cust_gender
  ORDER BY cust_gender;

C    F_RATIO    P_VALUE
- ---------- ----------
F 5.59536943 4.7840E-09
M  9.2865001 6.7139E-17
```

STATS_T_TEST_*



The *t*-test functions are:

- STATS_T_TEST_ONE: A one-sample *t*-test
- STATS_T_TEST_PAIRED: A two-sample, paired *t*-test (also known as a crossed *t*-test)
- STATS_T_TEST_INDEP: A *t*-test of two independent groups with the same variance (pooled variances)
- STATS_T_TEST_INDEPU: A *t*-test of two independent groups with unequal variance (unpooled variances)

Syntax

***stats_t_test*::=**

Purpose

The *t*-test measures the significance of a difference of means. You can use it to compare the means of two groups or the means of one group with a constant. Each *t*-test function takes two expression arguments, although the second expression is optional for the one-sample function (`STATS_T_TEST_ONE`). Each *t*-test function takes an optional third argument, which lets you specify the meaning of the `NUMBER` value returned by the function, as shown in Table 7-16. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the third argument, then the default is `'TWO_SIDED_SIG'`.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules for the `STATS_T_TEST_*` functions

Table 7-16 STATS_T_TEST_* Return Values

Argument	Return Value Meaning
`'STATISTIC'`	The observed value of *t*
`'DF'`	Degree of freedom
`'ONE_SIDED_SIG'`	One-tailed significance of *t*
`'TWO_SIDED_SIG'`	Two-tailed significance of *t*

The two independent `STATS_T_TEST_*` functions can take a fourth argument (*expr3*) if the third argument is specified as `'STATISTIC'` or `'ONE_SIDED_SIG'`. In this case, *expr3* indicates which value of *expr1* is the high value, or the value whose rejection region is the upper tail.

The significance of the observed value of *t* is the probability that the value of *t* would have been obtained by chance—a number between 0 and 1. The smaller the value, the more significant the difference between the means. One-sided significance is always respect to the upper tail.

Copyright © 1996, 2026, Oracle and/or its affiliates.

For one-sample and paired *t*-test, the high value is the first expression. For independent *t*-test, the high value is the one specified by *expr3*.

The degree of freedom depends on the type of *t*-test that resulted in the observed value of *t*. For example, for a one-sample *t*-test (STATS_T_TEST_ONE), the degree of freedom is the number of observations in the sample minus 1.

For the semantics of the FILTER clause, see FILTER Clause Semantics.

STATS_T_TEST_ONE

In the STATS_T_TEST_ONE function, *expr1* is the sample and *expr2* is the constant mean against which the sample mean is compared. For this *t*-test only, *expr2* is optional; the constant mean defaults to 0. This function obtains the value of *t* by dividing the difference between the sample mean and the known mean by the standard error of the mean (rather than the standard error of the difference of the means, as for STATS_T_TEST_PAIRED).

STATS_T_TEST_ONE Example

The following example determines the significance of the difference between the average list price and the constant value 60:

```
SELECT AVG(prod_list_price) group_mean,
       STATS_T_TEST_ONE(prod_list_price, 60, 'STATISTIC') t_observed,
       STATS_T_TEST_ONE(prod_list_price, 60) two_sided_p_value
  FROM sh.products;

GROUP_MEAN T_OBSERVED TWO_SIDED_P_VALUE
---------- ---------- -----------------
139.545556 2.32107746        .023158537
```

STATS_T_TEST_PAIRED

In the STATS_T_TEST_PAIRED function, *expr1* and *expr2* are the two samples whose means are being compared. This function obtains the value of *t* by dividing the difference between the sample means by the standard error of the difference of the means (rather than the standard error of the mean, as for STATS_T_TEST_ONE).

STATS_T_TEST_INDEP and STATS_T_TEST_INDEPU

In the STATS_T_TEST_INDEP and STATS_T_TEST_INDEPU functions, *expr1* is the grouping column and *expr2* is the sample of values. The pooled variances version (STATS_T_TEST_INDEP) tests whether the means are the same or different for two distributions that have similar variances. The unpooled variances version (STATS_T_TEST_INDEPU) tests whether the means are the same or different even if the two distributions are known to have significantly different variances.

Before using these functions, it is advisable to determine whether the variances of the samples are significantly different. If they are, then the data may come from distributions with different shapes, and the difference of the means may not be very useful. You can perform an *f*-test to determine the difference of the variances. If they are not significantly different, use STATS_T_TEST_INDEP. If they are significantly different, use STATS_T_TEST_INDEPU. Refer to STATS_F_TEST for information on performing an *f*-test.

Copyright © 1996, 2026, Oracle and/or its affiliates.

STATS_T_TEST_INDEP Example

The following example determines the significance of the difference between the average sales to men and women where the distributions are assumed to have similar (pooled) variances:

```
SELECT SUBSTR(cust_income_level, 1, 22) income_level,
      AVG(DECODE(cust_gender, 'M', amount_sold, null)) sold_to_men,
      AVG(DECODE(cust_gender, 'F', amount_sold, null)) sold_to_women,
      STATS_T_TEST_INDEP(cust_gender, amount_sold, 'STATISTIC', 'F') t_observed,
      STATS_T_TEST_INDEP(cust_gender, amount_sold) two_sided_p_value
  FROM sh.customers c, sh.sales s
  WHERE c.cust_id = s.cust_id
  GROUP BY ROLLUP(cust_income_level)
  ORDER BY income_level, sold_to_men, sold_to_women, t_observed;

INCOME_LEVEL           SOLD_TO_MEN SOLD_TO_WOMEN T_OBSERVED TWO_SIDED_P_VALUE

STATS_WSR_TEST

Syntax

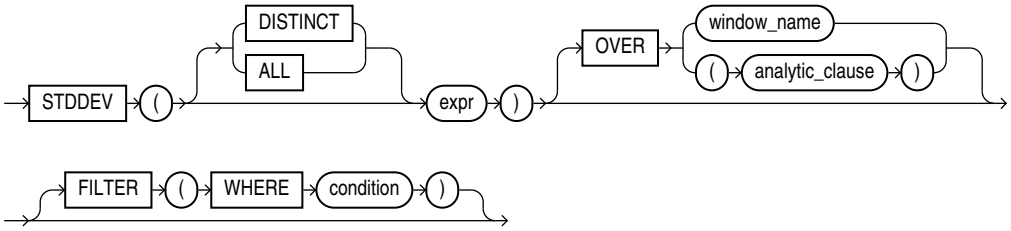
Purpose

`STATS_WSR_TEST` is a Wilcoxon Signed Ranks test of paired samples to determine whether the median of the differences between the samples is significantly different from zero. The absolute values of the differences are ordered and assigned ranks. Then the null hypothesis states that the sum of the ranks of the positive differences is equal to the sum of the ranks of the negative differences.

This function takes two required arguments: *expr1* and *expr2* are the two samples being analyzed. The optional third argument lets you specify the meaning of the `NUMBER` value returned by this function, as shown in Table 7-17. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the third argument, then the default is `'TWO_SIDED_SIG'`.

Table 7-17 STATS_WSR_TEST_* Return Values

Argument	Return Value Meaning
`'STATISTIC'`	The observed value of *Z*
`'ONE_SIDED_SIG'`	One-tailed significance of *Z*
`'TWO_SIDED_SIG'`	Two-tailed significance of *Z*



One-sided significance is always with respect to the upper tail. The high value (the value whose rejection region is the upper tail) is *expr1*.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Copyright © 1996, 2026, Oracle and/or its affiliates.

STDDEV

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

`STDDEV` returns the sample standard deviation of *`expr`*, a set of numbers. You can use it as both an aggregate and analytic function. It differs from `STDDEV_SAMP` in that `STDDEV` returns zero when it has only 1 row of input data, whereas `STDDEV_SAMP` returns null.

Oracle Database calculates the standard deviation as the square root of the variance defined for the `VARIANCE` aggregate function.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

If you specify `DISTINCT`, then you can specify only the *`query_partition_clause`* of the *`analytic_clause`*. The *`order_by_clause`* and *`windowing_clause`* are not allowed.

> **See Also**
>
> - "Aggregate Functions ", VARIANCE , and STDDEV_SAMP
> - "About SQL Expressions " for information on valid forms of *`expr`*

Aggregate Examples

The following example returns the standard deviation of the salaries in the sample `hr.employees` table:

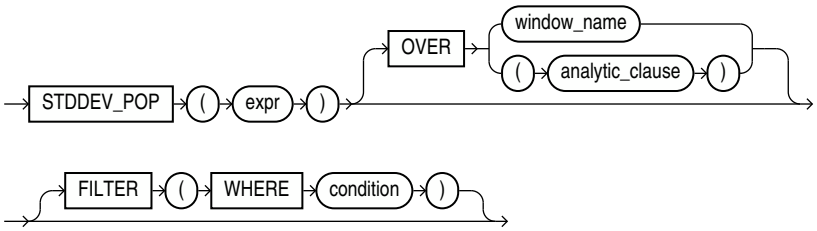
Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT STDDEV(salary) "Deviation"
   FROM employees;

 Deviation
----------
3909.36575
```

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Analytic Examples



The query in the following example returns the cumulative standard deviation of the salaries in Department 80 in the sample table `hr.employees`, ordered by `hire_date`:

```
SELECT last_name, salary,
   STDDEV(salary) OVER (ORDER BY hire_date) "StdDev"
   FROM employees
   WHERE department_id = 30
   ORDER BY last_name, salary, "StdDev";

LAST_NAME                     SALARY     StdDev
------------------------- ---------- ----------
Baida                           2900 4035.26125
Colmenares                      2500 3362.58829
Himuro                          2600  3649.2465
Khoo                            3100 5586.14357
Raphaely                       11000          0
Tobias                          2800  4650.0896
```

STDDEV_POP

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

`STDDEV_POP` computes the population standard deviation and returns the square root of the population variance. You can use it as both an aggregate and analytic function.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

This function is the same as the square root of the `VAR_POP` function. When `VAR_POP` returns null, this function returns null.

> **See Also**
>
> - "Aggregate Functions " and VAR_POP
> - "About SQL Expressions " for information on valid forms of *expr*

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Aggregate Example

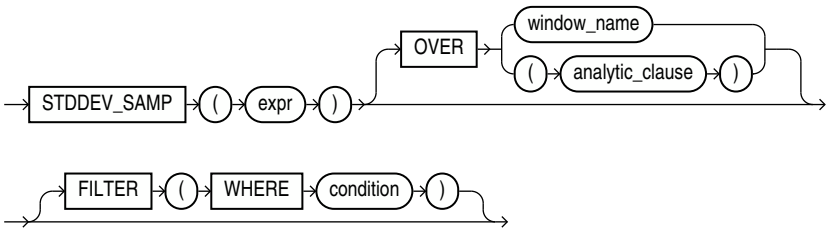
The following example returns the population and sample standard deviations of the amount of sales in the sample table `sh.sales`:

```
SELECT STDDEV_POP(amount_sold) "Pop",
   STDDEV_SAMP(amount_sold) "Samp"
   FROM sales;

       Pop       Samp
---------- ----------
896.355151 896.355592
```

Analytic Example

The following example returns the population standard deviations of salaries in the sample `hr.employees` table by department:



```
SELECT department_id, last_name, salary,
   STDDEV_POP(salary) OVER (PARTITION BY department_id) AS pop_std
   FROM employees
   ORDER BY department_id, last_name, salary, pop_std;

DEPARTMENT_ID LAST_NAME                 SALARY    POP_STD
------------- ------------------------- ---------- ----------
           10 Whalen                      4400          0
           20 Fay                         6000       3500
           20 Hartstein                  13000       3500
           30 Baida                       2900  3069.6091
. . .
          100 Urman                       7800 1644.18166
          110 Gietz                       8300       1850
          110 Higgins                    12000       1850
              Grant                       7000          0
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

STDDEV_SAMP

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

`STDDEV_SAMP` computes the cumulative sample standard deviation and returns the square root of the sample variance. You can use it as both an aggregate and analytic function.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

This function is same as the square root of the `VAR_SAMP` function. When `VAR_SAMP` returns null, this function returns null.

> **See Also**
>
> - "Aggregate Functions " and VAR_SAMP
> - "About SQL Expressions " for information on valid forms of *expr*

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

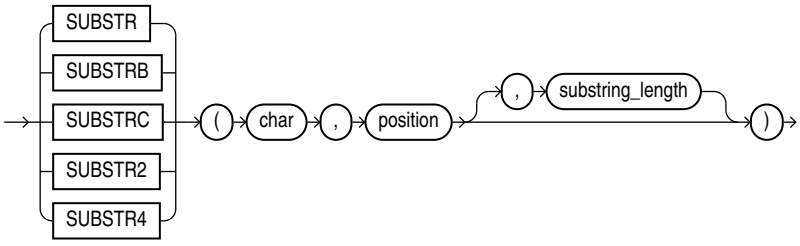
Aggregate Example

Refer to the aggregate example for STDDEV_POP .

Analytic Example

The following example returns the sample standard deviation of salaries in the `employees` table by department:

Copyright © 1996, 2026, Oracle and/or its affiliates.



```
SELECT department_id, last_name, hire_date, salary,
   STDDEV_SAMP(salary) OVER (PARTITION BY department_id
      ORDER BY hire_date
      ROWS BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW) AS cum_sdev
   FROM employees
   ORDER BY department_id, last_name, hire_date, salary, cum_sdev;

DEPARTMENT_ID LAST_NAME       HIRE_DATE     SALARY   CUM_SDEV
------------- --------------- --------- ---------- ----------

              Grant           24-MAY-07       7000
```

SUBSTR

Syntax

***substr*::=**

Purpose

The `SUBSTR` functions return a portion of *`char`*, beginning at character *`position`*, *`substring_length`* characters long. `SUBSTR` calculates lengths using characters as defined by the input character set. `SUBSTRB` uses bytes instead of characters. `SUBSTRC` uses Unicode complete characters. `SUBSTR2` uses UCS2 code points. `SUBSTR4` uses UCS4 code points.

- If *`position`* is 0, then it is treated as 1.
- If *`position`* is positive, then Oracle Database counts from the beginning of *`char`* to find the first character.
- If *`position`* is negative, then Oracle counts backward from the end of *`char`*.
- If *`substring_length`* is omitted, then Oracle returns all characters to the end of *`char`*. If *`substring_length`* is less than 1, then Oracle returns null.

Copyright © 1996, 2026, Oracle and/or its affiliates.

char can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The exceptions are SUBSTRC, SUBSTR2, and SUBSTR4, which do not allow *char* to be a CLOB or NCLOB. Both *position* and *substring_length* must be of data type NUMBER, or any data type that can be implicitly converted to NUMBER, and must resolve to an integer. The return value is the same data type as *char*, except that for a CHAR argument a VARCHAR2 value is returned, and for an NCHAR argument an NVARCHAR2 value is returned. Floating-point numbers passed as arguments to SUBSTR are automatically converted to integers.

See Also

- For a complete description of character length see *Oracle Database Globalization Support Guide* and *Oracle Database SecureFiles and Large Objects Developer's Guide*
- *Oracle Database Globalization Support Guide* for more information about SUBSTR functions and length semantics in different locales
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of SUBSTR

Examples

The following example returns several specified substrings of "ABCDEFG":

```
SELECT SUBSTR('ABCDEFG',3,4) "Substring"
     FROM DUAL;

Substring
---------
CDEF

SUM

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

`SUM` returns the sum of values of *`expr`*. You can use it as an aggregate or analytic function.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

Release 23 adds support for `INTERVAL` interval data types. However interval data types cannot be implicitly converted to a numeric data type. If the input is an `INTERVAL`, the function returns an `INTERVAL` with the same units as the input.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

If you specify `DISTINCT`, then you can specify only the *`query_partition_clause`* of the *`analytic_clause`*. The *`order_by_clause`* and *`windowing_clause`* are not allowed.

> **See Also**
>
> "About SQL Expressions " for information on valid forms of *`expr`* and "Aggregate Functions "

Vector Aggregate Operations

You can use `SUM` to perform vector addition operations on non-null inputs.

`expr` must evaluate to `VECTOR` and must not be `BINARY` vectors. The returned vector has the same number of dimensions as the input, and the format is always `FLOAT64`. For flexible

Copyright © 1996, 2026, Oracle and/or its affiliates.

number of dimensions, all inputs must have the same number of dimensions within each aggregation group.

NULL vectors are ignored. They are not counted when calculating the average vector. If all inputs within an aggregation group are NULL, the result is NULL for that group. If a certain dimension overflows when applying arithmetic operations, an error is raised.

Rules

- `DISTINCT` syntax is not allowed.
- Only `GROUP BY` and `GROUP BY ROLLUP` are supported.
- Analytic functions are not supported for input arguments of type `VECTOR`.

See *Arithmetic Operators*of the *AI Vector Search User's Guide* for examples.

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Aggregate Example

The following example calculates the sum of all salaries in the sample `hr.employees` table:

```
SELECT SUM(salary) "Total"
   FROM employees;

   Total
----------
    691400
```

Analytic Example

The following example calculates, for each manager in the sample table `hr.employees`, a cumulative total of salaries of employees who answer to that manager that are equal to or less than the current salary. You can see that Raphaely and Cambrault have the same cumulative total. This is because Raphaely and Cambrault have the identical salaries, so Oracle Database adds together their salary values and applies the same cumulative total to both rows.

```
SELECT manager_id, last_name, salary,
   SUM(salary) OVER (PARTITION BY manager_id ORDER BY salary
   RANGE UNBOUNDED PRECEDING) l_csum
   FROM employees
   ORDER BY manager_id, last_name, salary, l_csum;

MANAGER_ID LAST_NAME                 SALARY     L_CSUM
---------- ------------------------- ---------- ----------
       100 Cambrault                      11000      68900
       100 De Haan                        17000     155400
       100 Errazuriz                      12000      80900
       100 Fripp                           8200      36400
       100 Hartstein                      13000      93900
       100 Kaufling                        7900      20200
       100 Kochhar                        17000     155400
       100 Mourgos                         5800       5800
       100 Partners                       13500     107400
       100 Raphaely                       11000      68900
       100 Russell                        14000     121400
. . .
       149 Hutton                          8800      39000
       149 Johnson                         6200       6200
       149 Livingston                      8400      21600
       149 Taylor                          8600      30200
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
       201 Fay                            6000       6000
       205 Gietz                          8300       8300
           King                          24000      24000
```

SYS_CONNECT_BY_PATH

Syntax

Purpose

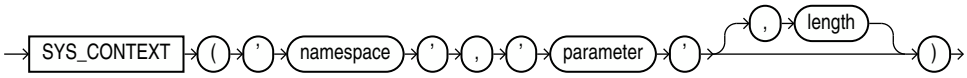
`SYS_CONNECT_BY_PATH` is valid only in hierarchical queries. It returns the path of a column value from root to node, with column values separated by *`char`* for each row returned by `CONNECT BY` condition.

Both *`column`* and *`char`* can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. The string returned is of `VARCHAR2` data type and is in the same character set as *`column`*.

> **See Also**
>
> - "Hierarchical Queries " for more information about hierarchical queries and `CONNECT BY` conditions
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `SYS_CONNECT_BY_PATH`

Examples

The following example returns the path of employee names from employee `Kochhar` to all employees of `Kochhar` (and their employees):



```
SELECT LPAD(' ', 2*level-1)||SYS_CONNECT_BY_PATH(last_name, '/') "Path"
   FROM employees
   START WITH last_name = 'Kochhar'
   CONNECT BY PRIOR employee_id = manager_id;

Path
------------------------------
     /Kochhar/Greenberg/Chen
     /Kochhar/Greenberg/Faviet
     /Kochhar/Greenberg/Popp
     /Kochhar/Greenberg/Sciarra
     /Kochhar/Greenberg/Urman
     /Kochhar/Higgins/Gietz
   /Kochhar/Baer
   /Kochhar/Greenberg
   /Kochhar/Higgins
   /Kochhar/Mavris
   /Kochhar/Whalen
 /Kochhar
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

SYS_CONTEXT

Syntax

Purpose

`SYS_CONTEXT` returns the value of *`parameter`* associated with the context *`namespace`* at the current instant. You can use this function in both SQL and PL/SQL statements. `SYS_CONTEXT` must be executed locally.

For *`namespace`* and *`parameter`*, you can specify either a string or an expression that resolves to a string designating a namespace or an attribute. If you specify literal arguments for *`namespace`* and *`parameter`*, and you are using `SYS_CONTEXT` explicitly in a SQL statement—rather than in a PL/SQL function that in turn is in mentioned in a SQL statement—then Oracle Database evaluates `SYS_CONTEXT` only once per SQL statement execution for each call site that invokes the `SYS_CONTEXT` function.

The context *`namespace`* must already have been created, and the associated *`parameter`* and its value must also have been set using the `DBMS_SESSION.set_context` procedure. The *`namespace`* must be a valid identifier. The *`parameter`* name can be any string. It is not case sensitive, but it cannot exceed 30 bytes in length.

The data type of the return value is `VARCHAR2`. The default maximum size of the return value is 256 bytes. You can override this default by specifying the optional *`length`* parameter, which must be a `NUMBER` or a value that can be implicitly converted to `NUMBER`. The valid range of values is 1 to 4000 bytes. If you specify an invalid value, then Oracle Database ignores it and uses the default.

Oracle provides the following built-in namespaces:

- `USERENV` - Describes the current session. The predefined parameters of namespace `USERENV` are listed in Table 7-18.
- `SYS_SESSION_ROLES` - Indicates whether a specified role is currently enabled for the session. Oracle Database evaluates the `SYS_SESSION_ROLES` context for the current user, and assumes the defining user's role when it evaluates `SYS_SESSION_ROLES` within a definer's rights procedure or function. An alternative to using `SYS_SESSION_ROLES` to find the login user's enabled roles in a definer's rights procedure is to use the `DBMS_SESSION:SESSION_IS_ROLE_ENABLED` function. Invoker's rights, procedures or functions, and/or code based access control (CBAC) are also alternatives.

Copyright © 1996, 2026, Oracle and/or its affiliates.

See Also

- Using Code Based Access Control for Definer's Rights and Invoker's Rights
- *Oracle Database Security Guide* for information on using the application context feature in your application development
- CREATE CONTEXT for information on creating user-defined context namespaces
- *Oracle Database PL/SQL Packages and Types Reference* for information on the `DBMS_SESSION.set_context` procedure
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `SYS_CONTEXT`

Examples

The following statement returns the name of the user who logged onto the database:

```
CONNECT OE
Enter password: password

SELECT SYS_CONTEXT ('USERENV', 'SESSION_USER')
   FROM DUAL;

SYS_CONTEXT ('USERENV', 'SESSION_USER')
---------------------------------------
OE
```

The following example queries the `SESSION_ROLES` data dictionary view to show that `RESOURCE` is the only role currently enabled for the session. It then uses the `SYS_CONTEXT` function to show that the `RESOURCE` role is currently enabled for the session and the `DBA` role is not.

```
CONNECT OE
Enter password: password

SELECT role FROM session_roles;

ROLE
--------
RESOURCE

SELECT SYS_CONTEXT('SYS_SESSION_ROLES', 'RESOURCE')
  FROM DUAL

SYS_CONTEXT('SYS_SESSION_ROLES','RESOURCE')
-------------------------------------
TRUE

SELECT SYS_CONTEXT('SYS_SESSION_ROLES', 'DBA')
  FROM DUAL;

SYS_CONTEXT('SYS_SESSION_ROLES','DBA')
-------------------------------------
FALSE
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **Note**
>
> For simplicity in demonstrating this feature, these examples do not perform the password management techniques that a deployed system normally uses. In a production environment, follow the Oracle Database password management guidelines, and disable any sample accounts. See *Oracle Database Security Guide* for password management guidelines and other security recommendations.

The following hypothetical example returns the group number that was set as the value for the attribute `group_no` in the PL/SQL package that was associated with the context `hr_apps` when `hr_apps` was created:

```
SELECT SYS_CONTEXT ('hr_apps', 'group_no') "User Group"
   FROM DUAL;
```

Starting with Oracle Database 26ai, users authenticating to the database using the legacy RADIUS API are not granted administrative privileges such as `SYSDBA` or `SYSBACKUP`.

In Oracle Database 26ai Oracle introduces a new RADIUS API that uses the latest standards to grant administrative privileges to users.

You must ensure that the database connection to the database uses the new RADIUS API and that you are using the Oracle Database 26ai client to connect to the Oracle Database 26ai server.

Table 7-18 Predefined Parameters of Namespace USERENV

Parameter	Return Value
`ACTION`	Identifies the position in the module (application name) and is set through the `DBMS_APPLICATION_INFO` package or OCI.
`AUDITED_CURSORID`	Returns the cursor ID of the SQL that triggered the audit. This parameter is not valid in a fine-grained auditing environment. If you specify it in such an environment, then Oracle Database always returns null.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-18 (Cont.) Predefined Parameters of Namespace USERENV

Parameter	Return Value
AUTHENTICATED_IDENTITY	Returns the identity used in authentication. In the list that follows, the type of user is followed by the value returned: • Kerberos-authenticated enterprise user: kerberos principal name • Kerberos-authenticated external user : kerberos principal name; same as the schema name • SSL-authenticated enterprise user: the DN in the user's PKI certificate • SSL-authenticated external user: the DN in the user's PKI certificate • Password-authenticated enterprise user: nickname; same as the login name • Password-authenticated database user: the database username; same as the schema name • OS-authenticated external user: the external operating system user name • Radius-authenticated external user: the schema name • Proxy with DN : Oracle Internet Directory DN of the client • Proxy with certificate: certificate DN of the client • For single session proxy or dual session proxy without client authentication: database user name if proxy is a local database user; nickname if proxy is an enterprise user. For dual session proxy with client authentication: database user name if client is a local database user; nickname if client is an enterprise user. • SYSDBA/SYSOPER using Password File: login name • SYSDBA/SYSOPER using OS authentication: operating system user name
AUTHENTICATION_DATA	Data being used to authenticate the login user. For X.503 certificate authenticated sessions, this field returns the context of the certificate in HEX2 format. **Note:** You can change the return value of the AUTHENTICATION_DATA attribute using the *length* parameter of the syntax. Values of up to 4000 are accepted. This is the only attribute of USERENV for which Oracle Database implements such a change.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-18 (Cont.) Predefined Parameters of Namespace USERENV

Parameter	Return Value
AUTHENTICATION_METHOD	Returns the method of authentication. In the list that follows, the type of user is followed by the method returned: • Password-authenticated enterprise user, local database user, or user with the SYSDBA or SYSOPER administrative privilege using a password file; proxy with username using password: PASSWORD • Password-authenticated enterprise user, local database user, or user with the SYSDBA or SYSOPER administrative privilege using a password file; proxy with username using password: PASSWORD_GLOBAL • Kerberos-authenticated enterprise user or external user (with no administrative privileges): KERBEROS • Kerberos-authenticated enterprise user (with administrative privileges): KERBEROS_GLOBAL • Kerberos-authenticated external user (with administrative privileges): KERBEROS_EXTERNAL • SSL-authenticated enterprise or external user (with no administrative privileges): SSL • SSL-authenticated enterprise user (with administrative privileges): SSL_GLOBAL • SSL-authenticated external user (with administrative privileges): SSL_EXTERNAL • Radius-authenticated external user: RADIUS • OS-authenticated external user or use with the SYSDBA or SYSOPER administrative privilege: OS • Proxy authentication: AUTHENTICATION_METHOD used during authentication of PROXY USER with "_PROXY" added at end. For example, if a proxy user uses PASSWORD to connect to the database, then the AUTHENTICATION_METHOD will be PASSWORD_PROXY. In the case of dual session proxy without client authentication: PROXYUSER_AUTHENTICATED_PROXY • Background process (job queue slave process): JOB • Parallel Query Slave process: PQ_SLAVE For non-administrative connections, you can use IDENTIFICATION_TYPE to distinguish between external and enterprise users when the authentication method is PASSWORD, KERBEROS, or SSL. For administrative connections, AUTHENTICATION_METHOD is sufficient for the PASSWORD, SSL_EXTERNAL, and SSL_GLOBAL authentication methods.
BG_JOB_ID	Job ID of the current session if it was established by an Oracle Database background process. Null if the session was not established by a background process.
CDB_DOMAIN	CDB_DOMAIN is the DB_DOMAIN of the CDB and is the same for all the PDBs associated with it.
CDB_NAME	If queried while connected to a multitenant container database (CDB), returns the name of the CDB. Otherwise, returns null.
CLIENT_IDENTIFIER	Returns an identifier that is set by the application through the DBMS_SESSION.SET_IDENTIFIER procedure, the OCI attribute OCI_ATTR_CLIENT_IDENTIFIER, or Oracle Dynamic Monitoring Service (DMS). This attribute is used by various database components to identify lightweight application users who authenticate as the same database user.
CLIENT_INFO	Returns up to 64 bytes of user session information that can be stored by an application using the DBMS_APPLICATION_INFO package.
CLIENT_PROGRAM_NAME	The name of the program used for the database session.
CLOUD_MIGRATION_MODE	The session parameter to specify ON when CLOUD_MIGRATION_MODE is TRUE, else OFF.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-18 (Cont.) Predefined Parameters of Namespace USERENV

Parameter	Return Value
CLOUD_SERVICE	Only valid for cloud implementations. Returns DWCS on autonomous database management systems (ADW), OLTP on autonomous transaction processing systems (ATP), and JDCS on autonomous JSON database systems.
CON_ID	Returns the current container ID that the session is connected to.
CON_NAME	Returns the current container name that the session is connected to.
CURRENT_BIND	The bind variables for fine-grained auditing. You can specify this attribute only inside the event handler for the fine-grained auditing feature.
CURRENT_EDITION_ID	The identifier of the current edition.
CURRENT_EDITION_NAME	The name of the current edition.
CURRENT_SCHEMA	The name of the currently active default schema. This value may change during the duration of a session through use of an ALTER SESSION SET CURRENT_SCHEMA statement. This may also change during the duration of a session to reflect the owner of any active definer's rights object. When used directly in the body of a view definition, this returns the default schema used when executing the cursor that is using the view; it does not respect views used in the cursor as being definer's rights. **Note**: Oracle recommends against issuing the SQL statement ALTER SESSION SET CURRENT_SCHEMA from within all types of stored PL/SQL units except logon triggers.
CURRENT_SCHEMAID	Identifier of the currently active default schema.
CURRENT_SQL CURRENT_SQL*n*	CURRENT_SQL returns the first 4K bytes of the current SQL that triggered the fine-grained auditing event. The CURRENT_SQL*n* attributes return subsequent 4K-byte increments, where *n* can be an integer from 1 to 7, inclusive. CURRENT_SQL1 returns bytes 4K to 8K; CURRENT_SQL2 returns bytes 8K to 12K, and so forth. You can specify these attributes only inside the event handler for the fine-grained auditing feature.
CURRENT_SQL_LENGTH	The length of the current SQL statement that triggers fine-grained audit or row-level security (RLS) policy functions or event handlers. You can specify this attribute only inside the event handler for the fine-grained auditing feature.
CURRENT_USER	The name of the database user whose privileges are currently active. This may change during the duration of a database session as Real Application Security sessions are attached or detached, or to reflect the owner of any active definer's rights object. When no definer's rights object is active, CURRENT_USER returns the same value as SESSION_USER. When used directly in the body of a view definition, this returns the user that is executing the cursor that is using the view; it does not respect views used in the cursor as being definer's rights. For enterprise users, returns schema. If a Real Application Security user is currently active, returns user XS$NULL.
CURRENT_USERID	The identifier of the database user whose privileges are currently active.
DATABASE_ROLE	The database role using the SYS_CONTEXT function with the USERENV namespace. The role is one of the following: PRIMARY, PHYSICAL STANDBY, LOGICAL STANDBY, SNAPSHOT STANDBY, TRUE CACHE .
DB_DOMAIN	Domain of the database as specified in the DB_DOMAIN initialization parameter.
DB_NAME	Name of the database as specified in the DB_NAME initialization parameter.
DB_SUPPLEMENTAL_LOG_LEVEL	If supplemental logging is enabled, returns a string containing the list of enabled supplemental logging levels. Possible values are: ALL_COLUMN, FOREIGN_KEY, MINIMAL, PRIMARY_KEY, PROCEDURAL, and UNIQUE_INDEX. If supplemental logging is not enabled, returns null.
DB_UNIQUE_NAME	Name of the database as specified in the DB_UNIQUE_NAME initialization parameter.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-18 (Cont.) Predefined Parameters of Namespace USERENV

Parameter	Return Value
DBLINK_INFO	Returns the source of a database link session. Specifically, it returns a string of the form: SOURCE_GLOBAL_NAME=*dblink_src_global_name*, DBLINK_NAME=*dblink_name*, SOURCE_AUDIT_SESSIONID=*dblink_src_audit_sessionid* For a multitenant database, it returns the string above with an additional field SOURCE_DB_NAME : SOURCE_GLOBAL_NAME=*dblink_src_global_name*, SOURCE_DB_NAME=*source_database_name*, DBLINK_NAME=*dblink_name*, SOURCE_AUDIT_SESSIONID=*dblink_src_audit_sessionid* where: • *dblink_src_global_name* is the unique global name of the source database • *dblink_name* is the name of the database link on the source database • *dblink_src_audit_sessionid* is the audit session ID of the session on the source database that initiated the connection to the remote database using *dblink_name* • SOURCE_DB_NAME is the database identifier of the source database
DRAIN_STATUS	Displays the draining status for the current session. Returns DRAINING if the session is a candidate for drain else returns NONE.
ENTRYID	The current audit entry number. The audit entryid sequence is shared between fine-grained audit records and regular audit records. You cannot use this attribute in distributed SQL statements. The correct auditing entry identifier can be seen only through an audit handler for standard or fine-grained audit.
ENTERPRISE_IDENTITY	Returns the user's enterprise-wide identity: • For enterprise users: the Oracle Internet Directory DN. • For external users: the external identity (Kerberos principal name, Radius schema names, OS user name, Certificate DN). • For local users and SYSDBA/SYSOPER logins: NULL. The value of the attribute differs by proxy method: • For a proxy with DN: the Oracle Internet Directory DN of the client • For a proxy with certificate: the certificate DN of the client for external users; the Oracle Internet Directory DN for global users • For a proxy with username: the Oracle Internet Directory DN if the client is an enterprise users; Null if the client is a local database user.
FG_JOB_ID	If queried from within a job that was created using the DBMS_JOB package: Returns the job ID of the current session if it was established by a client foreground process. Null if the session was not established by a foreground process. Otherwise: Returns 0.
GLOBAL_CONTEXT_MEMORY	Returns the number being used in the System Global Area by the globally accessed context.
GLOBAL_UID	Returns the global user ID (GUID) from Active Directory for Centrally Managed Users (CMU) logins, or from Oracle Internet Directory for Enterprise User Security (EUS) logins. Returns null for all other logins.
HOST	Name of the host machine from which the client has connected.

Copyright © 1996, 2026, Oracle and/or its affiliates.

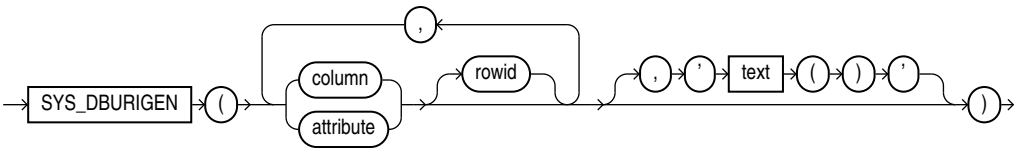
Table 7-18 (Cont.) Predefined Parameters of Namespace USERENV

Parameter	Return Value
IDENTIFICATION_TYPE	Returns the way the user's schema was created in the database. Specifically, it reflects the IDENTIFIED clause in the CREATE/ALTER USER syntax. In the list that follows, the syntax used during schema creation is followed by the identification type returned: • IDENTIFIED BY *password*: LOCAL • IDENTIFIED EXTERNALLY: EXTERNAL • IDENTIFIED GLOBALLY: GLOBAL SHARED • IDENTIFIED GLOBALLY AS *DN*: GLOBAL PRIVATE • GLOBAL EXCLUSIVE for exclusive global user mapping. • GLOBAL SHARED for shared user mapping. • NONE when the schema is created with no authentication.
INSTANCE	The instance identification number of the current instance.
INSTANCE_NAME	The name of the instance.
IP_ADDRESS	IP address of the machine from which the client is connected. If the client and server are on the same machine and the connection uses IPv6 addressing, then ::1 is returned.
IS_APPLY_SERVER	Returns TRUE if queried from within a SQL Apply server in a logical standby database. Otherwise, returns FALSE.
IS_DG_ROLLING_UPGRADE	Returns TRUE if a rolling upgrade of the database software in a Data Guard configuration, initiated by way of the DBMS_ROLLING package, is active. Otherwise, returns FALSE.
ISDBA	Returns TRUE if the user has been authenticated as having DBA privileges either through the operating system or through a password file.
LANG	The abbreviated name for the language, a shorter form than the existing 'LANGUAGE' parameter.
LANGUAGE	The language and territory currently used by your session, along with the database character set, in this form: language_territory.characterset
LDAP_SERVER_TYPE	Returns the configured LDAP server type, one of OID, AD(Active Directory), OID_G, OPENLDAP.
MODULE	The application name (module) set through the DBMS_APPLICATION_INFO package or OCI.
MULTIFACTOR_AUTHENTICATION_METHODS	Returns the methods of authentication used as additional factors. It can have the following values: • CERT_AUTH: If certificate-based authentication is configured. • OMA_PUSH: If Oracle Mobile Authenticator is configured. • NULL: If multi-factor authentication is not configured.
NETWORK_PROTOCOL	Network protocol being used for communication, as specified in the 'PROTOCOL=*protocol*' portion of the connect string.
NLS_CALENDAR	The current calendar of the current session.
NLS_CURRENCY	The currency of the current session.
NLS_DATE_FORMAT	The date format for the session.
NLS_DATE_LANGUAGE	The language used for expressing dates.
NLS_SORT	BINARY or the linguistic sort basis.
NLS_TERRITORY	The territory of the current session.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-18 (Cont.) Predefined Parameters of Namespace USERENV

Parameter	Return Value
ORACLE_HOME	The full path name for the Oracle home directory.
OS_USER	Operating system user name of the client process that initiated the database session.
PID	Oracle process ID.
PLATFORM_SLASH	The slash character that is used as the file path delimiter for your platform.
POLICY_INVOKER	The invoker of row-level security (RLS) policy functions.
PROXY_ENTERPRISE_IDENTITY	Returns the Oracle Internet Directory DN when the proxy user is an enterprise user.
PROXY_USER	Name of the database user who opened the current session on behalf of SESSION_USER.
PROXY_USERID	Identifier of the database user who opened the current session on behalf of SESSION_USER.
RESET_STATE	RESET_STATE can be set using DBMS_APP_CONT_ADMIN.ENABLE_RESET_STATE( ) procedure call and is related to Application Continuity.
SCHEDULER_JOB	Returns Y if the current session belongs to a foreground job or background job. Otherwise, returns N.
SERVER_HOST	The host name of the machine on which the instance is running.
SERVICE_NAME	The name of the service to which a given session is connected.
SERVICE_TAG	Returns the case sensitive character value specified by the SERVICE_TAG parameter in the CONNECT_DATA section of the connect string used to establish the session.
SESSION_DEFAULT_COLLATION	The default collation for the session, which is set by the ALTER SESSION SET DEFAULT_COLLATION ... statement.
SESSION_EDITION_ID	The identifier of the session edition.
SESSION_EDITION_NAME	The name of the session edition.
SESSION_USER	The name of the session user (the user who logged on). This may change during the duration of a database session as Real Application Security sessions are attached or detached. If a Real Application Security session is currently attached to the database session, returns user XS$NULL.
SESSION_USERID	The identifier of the session user (the user who logged on).
SESSIONID	The auditing session identifier. You cannot use this attribute in distributed SQL statements.
SID	The session ID.
STANDBY_MAX_DATA_DELAY	The session parameter to specify allowed time limit to elapse between when changes are committed on primary database and when those changes can be queried on the standby database. If not set, returns null.
STATEMENTID	The auditing statement identifier. STATEMENTID represents the number of SQL statements audited in a given session. You cannot use this attribute in distributed SQL statements. The correct auditing statement identifier can be seen only through an audit handler for standard or fine-grained audit.
TERMINAL	The operating system identifier for the client of the current session. In distributed SQL statements, this attribute returns the identifier for your local session. In a distributed environment, this is supported only for remote SELECT statements, not for remote INSERT, UPDATE, or DELETE operations. (The return length of this parameter may vary by operating system.)



Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-18 (Cont.) Predefined Parameters of Namespace USERENV

Parameter	Return Value
TLS_CIPHERSUITE	Used to retrieve the ciphersuite negotiated during the TLS. Valid ciphersuite values can be found in the TLS chapter of the Database Security Guide.
TLS_VERSION	Used to retrieve the TLS version negotiated during the TLS session.
UNIFIED_AUDIT_SESSIONID	If queried while connected to a database that uses unified auditing or mixed mode auditing, returns the unified audit session ID. If queried while connected to a database that uses traditional auditing, returns null.

SYS_DBURIGEN

Syntax

Purpose

`SYS_DBURIGen` takes as its argument one or more columns or attributes, and optionally a rowid, and generates a URL of data type `DBURIType` to a particular column or row object. You can then use the URL to retrieve an XML document from the database.

All columns or attributes referenced must reside in the same table. They must perform the function of a primary key. They need not actually match the primary key of the table, but they must reference a unique value. If you specify multiple columns, then all but the final column identify the row in the database, and the last column specified identifies the column within the row.

By default the URL points to a formatted XML document. If you want the URL to point only to the text of the document, then specify the optional '`text()`'.

> **Note**
>
> In this XML context, the lowercase `text` is a keyword, not a syntactic placeholder.

If the table or view containing the columns or attributes does not have a schema specified in the context of the query, then Oracle Database interprets the table or view name as a public synonym.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> *Oracle XML DB Developer's Guide* for information on the `DBURIType` data type and XML documents in the database

Examples

The following example uses the `SYS_DBURIGen` function to generate a URL of data type `DBURIType` to the `email` column of the row in the sample table `hr.employees` where the `employee_id` = 206:

```
SELECT SYS_DBURIGEN(employee_id, email)
   FROM employees
   WHERE employee_id = 206;

SYS_DBURIGEN(EMPLOYEE_ID,EMAIL)(URL, SPARE)
--------------------------------------------------------------------
DBURITYPE('/PUBLIC/EMPLOYEES/ROW[EMPLOYEE_ID=''206'']/EMAIL', NULL)
```

SYS_EXTRACT_UTC

Syntax

Purpose

`SYS_EXTRACT_UTC` extracts the UTC (Coordinated Universal Time—formerly Greenwich Mean Time) from a datetime value with time zone offset or time zone region name. If a time zone is not specified, then the datetime is associated with the session time zone.

Examples

The following example extracts the UTC from a specified datetime:

```
SELECT SYS_EXTRACT_UTC(TIMESTAMP '2000-03-28 11:30:00.00 -08:00')
   FROM DUAL;

SYS_EXTRACT_UTC(TIMESTAMP'2000-03-2811:30:00.00-08:00')
-------------------------------------------------------------
28-MAR-00 07.30.00 PM
```

SYS_GUID

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

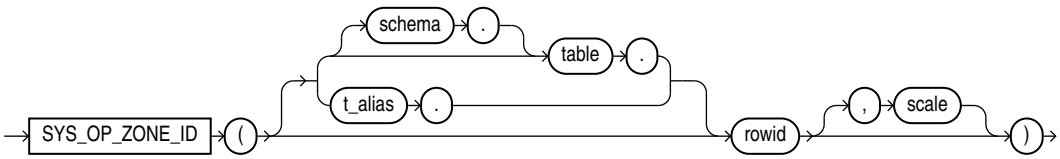
Purpose

`SYS_GUID` generates and returns a globally unique identifier (`RAW` value) made up of 16 bytes. On most platforms, the generated identifier consists of a host identifier, a process or thread identifier of the process or thread invoking the function, and a nonrepeating value (sequence of bytes) for that process or thread.

Examples

The following example adds a column to the sample table `hr.locations`, inserts unique identifiers into each row, and returns the 32-character hexadecimal representation of the 16-byte `RAW` value of the global unique identifier:

```
ALTER TABLE locations ADD (uid_col RAW(16));



UPDATE locations SET uid_col = SYS_GUID();

SELECT location_id, uid_col FROM locations
   ORDER BY location_id, uid_col;

LOCATION_ID UID_COL
----------- --------------------------------------------------------------------
       1000 09F686761827CF8AE040578CB20B7491
       1100 09F686761828CF8AE040578CB20B7491
       1200 09F686761829CF8AE040578CB20B7491
       1300 09F68676182ACF8AE040578CB20B7491
       1400 09F68676182BCF8AE040578CB20B7491
       1500 09F68676182CCF8AE040578CB20B7491
. . .
```

SYS_OP_ZONE_ID

Syntax

Purpose

`SYS_OP_ZONE_ID` takes as its argument a rowid and returns a zone ID. The rowid identifies a row in a table. The zone ID identifies the set of contiguous disk blocks, called the zone, that contains the row. The function returns a `NUMBER` value.

The `SYS_OP_ZONE_ID` function is used when creating a zone map with the `CREATE MATERIALIZED ZONEMAP` statement. You must specify `SYS_OP_ZONE_ID` in the `SELECT` and `GROUP BY` clauses of the defining subquery of the zone map.

For *`rowid`*, specify the `ROWID` pseudocolumn of the fact table of the zone map.

Use *`schema`* and *`table`* to specify the schema and name of the fact table, or *`t_alias`* to specify the table alias for the fact table. The specification of these parameters depends on the `FROM` clause in the defining subquery of the zone map:

Copyright © 1996, 2026, Oracle and/or its affiliates.

- If the FROM clause specifies a table alias for the fact table, then you must also specify the table alias (*t_alias*) in SYS_OP_ZONE_ID.
- If the FROM clause does not specify a table alias for the fact table, then use *table* to specify the name of the fact table. You can use the *schema* qualifier if the fact table is in a schema other than your own. If you omit *schema*, then the database assumes the fact table is in your own schema. If the FROM clause specifies only one table (the fact table) then you need not specify *schema* or *table*.

The optional *scale* parameter represents the scale of the zone map. It is not necessary to specify this parameter because, by default, SYS_OP_ZONE_ID uses the scale of the zone map being created. If you do specify *scale*, then it must match the scale of the zone map being created. Refer to the SCALE clause of CREATE MATERIALIZED ZONEMAP for information on specifying the scale of a zone map.

> **See Also**
>
> CREATE MATERIALIZED ZONEMAP for more information on creating zone maps

Examples

The following example uses the SYS_OP_ZONE_ID function when creating a basic zone map that tracks the column time_id of the fact table sales. The scale of the zone map is the default value of 10. Therefore, the SYS_OP_ZONE_ID function will default to a scale value of 10.

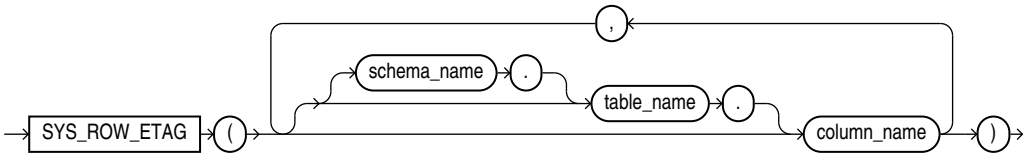
```
CREATE MATERIALIZED ZONEMAP sales_zmap
AS
  SELECT SYS_OP_ZONE_ID(rowid), MIN(time_id), MAX(time_id)
  FROM sales
  GROUP BY SYS_OP_ZONE_ID(rowid);
```

The following example is similar to the previous example, except that the scale of the zone map being created is specified as 8. Therefore, the SYS_OP_ZONE_ID function will default to a scale value of 8.

```
CREATE MATERIALIZED ZONEMAP sales_zmap
SCALE 8
AS
  SELECT SYS_OP_ZONE_ID(rowid), MIN(time_id), MAX(time_id)
  FROM sales
  GROUP BY SYS_OP_ZONE_ID(rowid);
```

The following example returns an error because the scale of the zone map being created is specified as 8, which does not match the *scale* argument of 12 specified in the SYS_OP_ZONE_ID function.

```
CREATE MATERIALIZED ZONEMAP sales_zmap
SCALE 8
AS
  SELECT SYS_OP_ZONE_ID(rowid,12), MIN(time_id), MAX(time_id)
  FROM sales
  GROUP BY SYS_OP_ZONE_ID(rowid,12);
```



The following example creates a join zone map. The fact table is sales and the dimension tables are products and customers. Because the table alias s is specified for the fact table in the FROM clause, the table alias *s* is also specified in the SYS_OP_ZONE_ID function.

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
CREATE MATERIALIZED ZONEMAP sales_zmap
AS
  SELECT SYS_OP_ZONE_ID(s.rowid),
         MIN(prod_category), MAX(prod_category),
         MIN(country_id), MAX(country_id)
  FROM sales s, products p, customers c
  WHERE s.prod_id = p.prod_id(+) AND
        s.cust_id = c.cust_id(+)
  GROUP BY SYS_OP_ZONE_ID(s.rowid);
```

SYS_ROW_ETAG

Syntax

Purpose

You can use ETAGs with table data, for lock-free row updates using SQL. To do that, use function SYS_ROW_ETAG, to obtain the current state of a given set of columns in a table row as an ETAG hash value. Function SYS_ROW_ETAG calculates an etag (128 bits hash value) for a row using the values of a set of columns in the row that you want the etag to be computed on. You can pass the function the names of the columns in any order.

Function SYS_ROW_ETAG calculates the ETAG value for a row using only the values of those columns in the row: you pass it the names of all columns that you want to be sure no other session tries to update concurrently. This includes the columns that the current session intends to update, but also any other columns on whose value that updating operation logically depends for your application. (The order in which you pass the columns to SYS_ROW_ETAG as arguments is irrelevant.)

Example

The example below creates table foo with columns c1, c2, and c3 of type NUMBER, and inserts values into the table. It then passes columns c2 and c1 to SYS_ROW_ETAG to get the etag for c2 and c1:

```
CREATE TABLE foo (c1 NUMBER, c2 NUMBER, c3 NUMBER);

Table created.

INSERT INTO foo VALUES (1, 2, 3);

1 row created.

SELECT SYS_ROW_ETAG(c2, c1) FROM foo;

SYS_ROW_ETAG(C2,C1)
--------------------------------
3B978191AD0C828DA0E6A53EDF0B278A

---------------
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> Example 4.18 in the JSON-Relational Duality Developer's Guide *Using Function SYS_ROW_ETAG To Optimistically Control Concurrent Table Updates*

SYS_TYPEID

Syntax

Purpose

`SYS_TYPEID` returns the typeid of the most specific type of the operand. This value is used primarily to identify the type-discriminant column underlying a substitutable column. For example, you can use the value returned by `SYS_TYPEID` to build an index on the type-discriminant column.

You can use this function only on object type operands. All final root object types—final types not belonging to a type hierarchy—have a null typeid. Oracle Database assigns to all types belonging to a type hierarchy a unique non-null typeid.

> **See Also**
>
> *Oracle Database Object-Relational Developer's Guide* for more information on typeids

Examples

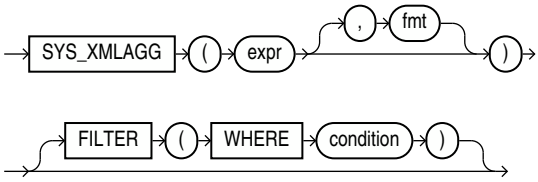
The following examples use the tables `persons` and `books`, which are created in "Substitutable Table and Column Examples". The first query returns the most specific types of the object instances stored in the `persons` table.

```
SELECT name, SYS_TYPEID(VALUE(p)) "Type_id" FROM persons p;

NAME                     Type_id
------------------------ --------------------------------
Bob                      01
Joe                      02
Tim                      03
```

The next query returns the most specific types of authors stored in the table `books`:

```
SELECT b.title, b.author.name, SYS_TYPEID(author)
   "Type_ID" FROM books b;



TITLE                    AUTHOR.NAME          Type_ID
------------------------ -------------------- ------------------
An Autobiography         Bob                  01
Business Rules           Joe                  02
Mixing School and Work   Tim                  03
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

You can use the SYS_TYPEID function to create an index on the type-discriminant column of a table. For an example, see "Indexing on Substitutable Columns: Examples".

SYS_XMLAGG

Syntax

Purpose

SYS_XMLAgg aggregates all of the XML documents or fragments represented by *expr* and produces a single XML document. It adds a new enclosing element with a default name ROWSET. If you want to format the XML document differently, then specify *fmt*, which is an instance of the XMLFormat object.

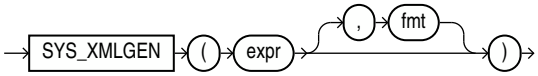
> **See Also**
>
> SYS_XMLGEN and "XML Format Model " for using the attributes of the XMLFormat type to format SYS_XMLAgg results

For the semantics of the FILTER clause, see FILTER Clause Semantics.

Examples

The following example uses the SYS_XMLGen function to generate an XML document for each row of the sample table employees where the employee's last name begins with the letter R, and then aggregates all of the rows into a single XML document in the default enclosing element ROWSET:

```
SELECT SYS_XMLAGG(SYS_XMLGEN(last_name)) XMLAGG
   FROM employees
   WHERE last_name LIKE 'R%'
   ORDER BY xmlagg;



XMLAGG
--------------------------------------------------------------------------------
<?xml version="1.0"?>
<ROWSET>
<LAST_NAME>Rajs</LAST_NAME>
<LAST_NAME>Raphaely</LAST_NAME>
<LAST_NAME>Rogers</LAST_NAME>
<LAST_NAME>Russell</LAST_NAME>
</ROWSET>
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

SYS_XMLGEN

> **Note**
>
> The `SYS_XMLGen` function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use the SQL/XML generation functions instead. See *Oracle XML DB Developer's Guide* for more information.

Syntax

Purpose

`SYS_XMLGen` takes an expression that evaluates to a particular row and column of the database, and returns an instance of type `XMLType` containing an XML document. The *expr* can be a scalar value, a user-defined type, or an `XMLType` instance.

- If *expr* is a scalar value, then the function returns an XML element containing the scalar value.
- If *expr* is a type, then the function maps the user-defined type attributes to XML elements.
- If *expr* is an `XMLType` instance, then the function encloses the document in an XML element whose default tag name is `ROW`.

By default the elements of the XML document match the elements of *expr*. For example, if *expr* resolves to a column name, then the enclosing XML element will be the same column name. If you want to format the XML document differently, then specify *fmt*, which is an instance of the `XMLFormat` object.

> **See Also**
>
> "XML Format Model " for a description of the `XMLFormat` type and how to use its attributes to format `SYS_XMLGen` results

Examples

The following example retrieves the employee email ID from the sample table `oe.employees` where the `employee_id` value is 205, and generates an instance of an `XMLType` containing an XML document with an `EMAIL` element.

```
SELECT SYS_XMLGEN(email)
   FROM employees
   WHERE employee_id = 205;

SYS_XMLGEN(EMAIL)
--------------------------------------------------------------------
<?xml version="1.0"?>
<EMAIL>SHIGGINS</EMAIL>
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

SYSDATE

Syntax

Purpose

`SYSDATE` returns the current date and time set for the operating system on which the database server resides. The data type of the returned value is `DATE`, and the format returned depends on the value of the `NLS_DATE_FORMAT` initialization parameter. The function requires no arguments. In distributed SQL statements, this function returns the date and time set for the operating system of your local database. You cannot use this function in the condition of a `CHECK` constraint.

In a multitenant setup existing PDBs and PDBs created later inherit the timezone of the system.

If you want `SYSDATE` to return the timezone of the PDB, then you must set the initialization parameter `TIME_AT_DBTIMEZONE` to `TRUE` before starting the PDB.

You can change the timezone using `ALTER SYSTEM SET TIME_ZONE` or `ALTER DATABASE db_name SET TIME_ZONE`.

You can set `SYSTIMESTAMP` to return system time by setting the initialization parameter `TIME_AT_DBTIMEZONE` to `FALSE` and restarting the database.

> **Note**
>
> - For more see TIME_AT_DBTIMEZONE of the Oracle Database Reference.
> - The `FIXED_DATE` initialization parameter enables you to set a constant date and time that `SYSDATE` will always return instead of the current date and time. This parameter is useful primarily for testing. Refer to *Oracle Database Reference* for more information on the `FIXED_DATE` initialization parameter.

Examples

The following example returns the current operating system date and time:

```
SELECT TO_CHAR
    (SYSDATE, 'MM-DD-YYYY HH24:MI:SS') "NOW"
     FROM DUAL;

NOW
-------------------
04-13-2001 09:45:51
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

SYSTIMESTAMP

Syntax

Purpose

`SYSTIMESTAMP` returns the system date, including fractional seconds and time zone, of the system on which the database resides. The return type is `TIMESTAMP WITH TIME ZONE`.

In a multitenant setup existing PDBs and PDBs created later inherit the timezone of the system.

If you want `SYSTIMESTAMP` to return the timezone of the PDB, then you must set the initialization parameter `TIME_AT_DBTIMEZONE` to `TRUE` before starting the PDB.

You can change the timezone using `ALTER SYSTEM SET TIME_ZONE` or `ALTER DATABASE db_name SET TIME_ZONE`.

You can set `SYSTIMESTAMP` to return system time by setting the initialization parameter `TIME_AT_DBTIMEZONE` to `FALSE` and restarting the database.

> **Note**
>
> For more see TIME_AT_DBTIMEZONE of the Oracle Database Reference.

Examples

The following example returns the system timestamp:

```
SELECT SYSTIMESTAMP FROM DUAL;

SYSTIMESTAMP
---------------------------------------------------------------------
28-MAR-00 12.38.55.538741 PM -08:00
```

The following example shows how to explicitly specify fractional seconds:

```
SELECT TO_CHAR(SYSTIMESTAMP, 'SSSSS.FF') FROM DUAL;

TO_CHAR(SYSTIME
--------------
55615.449255
```

The following example returns the current timestamp in a specified time zone:

```
SELECT SYSTIMESTAMP AT TIME ZONE 'UTC' FROM DUAL;

SYSTIMESTAMPATTIMEZONE'UTC'
---------------------------------------------------------------------------
08-07-21 20:39:52,743557 UTC
```

The output format in this example depends on the `NLS_TIMESTAMP_TZ_FORMAT` for the session.

Copyright © 1996, 2026, Oracle and/or its affiliates.

TAN

Syntax

Purpose

`TAN` returns the tangent of *n* (an angle expressed in radians).

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is `BINARY_FLOAT`, then the function returns `BINARY_DOUBLE`. Otherwise the function returns the same numeric data type as the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples

The following example returns the tangent of 135 degrees:

```
SELECT TAN(135 * 3.14159265359/180)
   "Tangent of 135 degrees"  FROM DUAL;

Tangent of 135 degrees
----------------------
                    - 1
```

TANH

Syntax

Purpose

`TANH` returns the hyperbolic tangent of *n*.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is `BINARY_FLOAT`, then the function returns `BINARY_DOUBLE`. Otherwise the function returns the same numeric data type as the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

The following example returns the hyperbolic tangent of .5:

```
SELECT TANH(.5) "Hyperbolic tangent of .5"
   FROM DUAL;

Hyperbolic tangent of .5
------------------------
                .462117157
```

TIMESTAMP_TO_SCN

Syntax

Purpose

`TIMESTAMP_TO_SCN` takes as an argument a timestamp value and returns the approximate system change number (SCN) associated with that timestamp. The returned value is of data type `NUMBER`. This function is useful any time you want to know the SCN associated with a particular timestamp.

> **Note**
>
> The association between an SCN and a timestamp when the SCN is generated is remembered by the database for a limited period of time. This period is the maximum of the auto-tuned undo retention period, if the database runs in the Automatic Undo Management mode, and the retention times of all flashback archives in the database, but no less than 120 hours. The time for the association to become obsolete elapses only when the database is open. An error is returned if the timestamp specified for the argument to `TIMESTAMP_TO_SCN` is too old.

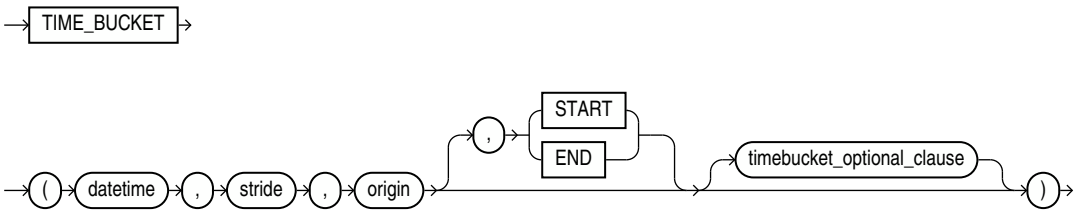
> **See Also**
>
> SCN_TO_TIMESTAMP for information on converting SCNs to timestamp

Examples

The following example inserts a row into the `oe.orders` table and then uses `TIMESTAMP_TO_SCN` to determine the system change number of the insert operation. (The actual SCN returned will differ on each system.)

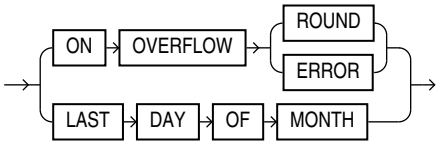
```
INSERT INTO orders (order_id, order_date, customer_id, order_total)
   VALUES (5000, SYSTIMESTAMP, 188, 2345);
1 row created.

COMMIT;
Commit complete.
```



Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT TIMESTAMP_TO_SCN(order_date) FROM orders
   WHERE order_id = 5000;



TIMESTAMP_TO_SCN(ORDER_DATE)
----------------------------
                      574100
```

TIME_BUCKET (datetime)

Syntax

***timebucket_optional_clause*::=**

Purpose

Use `TIME_BUCKET`(datetime) to obtain the datetime over an interval that you specify.

`TIME_BUCKET` has three required arguments, and two optional arguments .

- The first argument *`datetime`* is the input to the bucket.

  The third argument *`origin`* is an anchor to which all buckets are aligned.

  `datetime` and *`origin`* can be `DATE`, `TIMESTAMP`, `TIMESTAMP WITH TIMEZONE`, `TIMESTAMP WITH LOCAL TIMEZONE`, `EPOCH TIME`, `BINARY_FLOAT`, `BINARY_DOUBLE`, `CHAR`, expression, or a bind variable.

  `EPOCH TIME` is represented by Oracle type `NUMBER`, which is the number of seconds that have elapsed since 00:00:00 UTC on 1 January 1970. The supported `EPOCH TIME` range is from `SB8MINVAL(- 9223372036854775808`, inclusive) to `SB8MAXVAL(9223372036854775807`, inclusive).

  There are implicit conversions for *`datetime`* and *`origin`*:

  – If it is `BINARY_FLOAT` or `BINARY_DOUBLE`, it will be converted to `NUMBER` implicitly. Note that you must account for the loss in precision from implicit conversions.

  – If it is `CHAR`, it will be converted to `TIMESTAMP` implicitly. Note that `CHAR` should match the session `NLS_TIMESTAMP_FORMAT`. Otherwise an error is raised.

  Fractional second is supported only if *`datetime`* and *`origin`* are `EPOCH TIME`, `BINARY_FLOAT` or `BINARY_DOUBLE`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The valid range for *datetime* and *origin* is from `-4712-01-01 00:00:00` inclusive to `9999-12-31 23:59:59:00` inclusive.

- The second argument *stride* is a positive Oracle `INTERVAL`, ISO 8601 time interval string, expression or bind variable. Fractional second is supported only if *datetime* and *origin* are `EPOCH TIME`, `BINARY_FLOAT` or `BINARY_DOUBLE`.

  Oracle `INTERVAL` has two types of valid intervals: `INTERVAL YEAR TO MONTH` and `INTERVAL DAY TO SECOND`. If year or month is specified, all other units are ignored, if specified.

  For the ISO 8601 time interval string, years, months, days, hours, minutes and seconds are integers between `0` and `999999999`. `frac_secs` is the fractional part of seconds between `.0` and `.999999999`.

  The ISO 8601 time interval string that you specify should match the definition of Oracle `INTERVAL`. `P` is required, and no blanks are allowed in the value. If you specify `T`, then you must specify at least one of `hours`, `minutes`, or `seconds`. `hours` are based on 24-hour time.

  For example, `P100DT05H` indicates 100 days and 5 hours. `P1Y2M`'indicates 1 year and 2 months. `P1M1DT5H30M30S` is equivalent to `P1M` which indicates 1 month.

  The syntax of the ISO 8601 time interval string:

  Use only postive values for *stride*. (Although the Oracle `INTERVAL` and ISO 8601 time interval string can be positive or negative.)

  If *datetime* or *origin* is `EPOCH TIME`, `BINARY_FLOAT` or `BINARY_DOUBLE`, then *stride* cannot contain `YEAR` or `MONTH`. This is because month is variable and could be one of `28`, `29`, `30` or `31`.

- The fourth argument is optional and specifies whether the start or the end of the time bucket is returned. Specify `START` to return the start value of the time bucket or `END` to return the end value . The values are case-insensitive. The default value is `START`.
- The fifth argument is optional and controls how the buckets (strides) are determined.

  `ON OVERFLOW ROUND` (default): The buckets will be cut on the same day as *origin* in the corresponding month. For a month that does not have that day, the bucket is rounded to the last day of the month.

  `ON OVERFLOW ERROR`: The buckets will be cut on the same day as *origin* in the corresponding month. For a month that does not have that day will error out.

  `LAST DAY OF MONTH`: If *origin* is the last day of the month and *stride* only contains `MONTH` and/or `YEAR` , the buckets will be cut on the corresponding last day of the month.

  For example, if *origin* is `'1991-11-30'` and *stride* is `'P1M'`, then:

  – For `ON OVERFLOW ROUND`, the start of each bucket will be:

    ```
    ..., 1991-11-30, 1991-12-30, 1992-01-30, 1992-02-29, 1992-03-30,
    1992-04-30,...
    ```

Copyright © 1996, 2026, Oracle and/or its affiliates.

- For `ON OVERFLOW ERROR`, the start of each bucket will be:

  ```
  ..., 1991-11-30, 1991-12-30, 1992-01-30, error (or 1992-02-30),
  1992-03-30, 1992-04-30,...
  ```

- For `LAST DAY OF MONTH`, the start of each bucket will be:

  ```
  ..., 1991-11-30, 1991-12-31, 1992-01-31, 1992-02-29, 1992-03-31,
  1992-04-30, ...
  ```

Rules

- The end of each bucket is the same as the beginning of the following bucket. For example, if the bucket is 2 years and the start of the slice is `2000-01-01`, then the end of the bucket will be `2002-01- 01`, not `2001-12-31`. In other words, the bucket contains *`datetime`* greater than or equal to the start and less than (but not equal to) the end.
- In general, `START` of a bucket is always less than `END` of the bucket. But for the bucket on the two sides of the valid time range, `START` can be equal to `END`.
- *`origin`* and *`datetime`* can be positive or negative as long as it is in the valid range. Errors are raised if *`origin`* or *`datetime`* is outside of the valid range, or if the return value is outside of the valid range.
- If the input value is of type `TIMESTAMP WITH TIME ZONE` or `TIMESTAMP WITH LOCAL TIME ZONE`, then a time bucket might cross the daylight saving time boundaries. In this case, the duration of the time bucket is still the same as any other time bucket.
- If *`origin`* and *`datetime`* are `TIMESTAMP WITH TIME ZONE` or `TIMESTAMP WITH LOCAL TIME ZONE`, all arithmetic calculations are based in UTC time.

For details on dependencies with `NLS_LANGUAGE` and `NLS_CALENDAR` see *Database Globalization Support Guide*

Examples

The following examples use the `NLS_DATE_FORMAT YYYY-MM-DD`. Set the date format with `ALTER SESSION`:

```
ALTER SESSION SET NLS_DATE_FORMAT='YYYY-MM-DD';
```

Example 1

```
SELECT TIME_BUCKET (DATE ‘2022-06-29’, INTERVAL ‘5’ YEAR, DATE ‘2000-01-01’, START);
```

The result is:

```
2020-01-01
```

The 5-year time bucket that contains `2022-06-29` is from `2020-01-01`(start) to `2025-01-01`(end). The fourth argument `START` is used, so the start of the time bucket `2020-01-01` is returned.

Example 2

The following two queries are equivalent:

```
SELECT TIME_BUCKET ( DATE ‘-2022-06-29’, ‘P5M’, DATE ‘-2022-01-01’, END );
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Or:

```
SELECT TIME_BUCKET ( DATE ‘-2022-06-29’, INTERVAL ‘5’ MONTH, DATE ‘-2022-01-01’, END);
```

The result is:

```
-2022-11-01
```

The 5-month time bucket that contains `-2022-06-29` is from `2022-06-01`(start) to `-2022-11-01`(end). The fourth argument `END` is used, so the end of the time bucket `2022-11-01` is returned.

Example 3

```
SELECT TIME_BUCKET ( DATE ‘2005-03-10’, 'P1Y', DATE ‘2004-02-29’ ON OVERFLOW ERROR );
```

The result is:

```
 ORA-01839: date not valid for month specified
```

The one-year time bucket that contains `‘2005-03-10’` is from error (or `‘2005-02-29’`) (start) to error (or `‘2006-02-29’`) (end). Default fourth argument `START` is used, so the start of the time bucket should be returned which is an error.

Example 4

```
SELECT TIME_BUCKET ( DATE ‘2005-03-10’, 'P1Y', DATE ‘2004-02-29’ ON OVERFLOW ROUND );
```

The result is:

```
2005-02-28
```

The one-year time bucket that contains `‘2005-03-10’` is from `‘2005-02-28’`(start) to `‘2006-02-28’`(end) since February 29 is rounded to February 28. Default fourth argument `START` is used, so the start of the time bucket is returned: `‘2005-02-28’`.

Example 5

```
SELECT TIME_BUCKET ( DATE ‘2004-04-02’, ‘P1Y’, DATE ‘2003-02-28’ LAST DAY OF MONTH );
```

The result is:

```
2004-02-29
```

The one-year time bucket that contains `‘2003-02-28’` is from `‘2004-02-29’`(start) to `‘2005-02-28’`(end) since `‘2004-02-28’` is rounded to the last day of that month which is `‘2004-02-29’`. Default fourth argument `START` is used, so the start of the time bucket is returned: `‘2004-02- 29’`.

TIMESTAMPDIFF

`TIMESTAMPDIFF` is a synonym of `DATEDIFF`. See DATEDIFF.

Copyright © 1996, 2026, Oracle and/or its affiliates.

TO_APPROX_COUNT_DISTINCT

Syntax

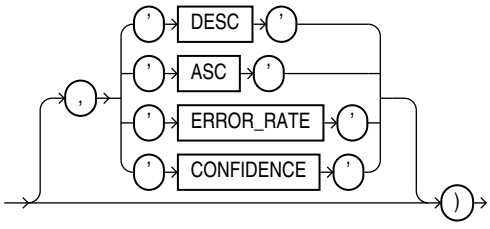
Purpose

`TO_APPROX_COUNT_DISTINCT` takes as its input a detail containing information about an approximate distinct value count, and converts it to a `NUMBER` value.

For *`detail`*, specify a detail of type `BLOB`, which was created by the `APPROX_COUNT_DISTINCT_DETAIL` function or the `APPROX_COUNT_DISTINCT_AGG` function.

See Also

- APPROX_COUNT_DISTINCT_DETAIL
- TO_APPROX_COUNT_DISTINCT



Examples

Refer to Examples for examples of using the `TO_APPROX_COUNT_DISTINCT` function in conjunction with the `APPROX_COUNT_DISTINCT_DETAIL` and `APPROX_COUNT_DISTINCT_AGG` functions.

TO_APPROX_PERCENTILE

Syntax

(*datatype*::=)

Purpose

`TO_APPROX_PERCENTILE` takes as its input a detail containing approximate percentile information, a percentile value, and a sort specification, and returns an approximate interpolated value that would fall into that percentile value with respect to the sort specification.

Copyright © 1996, 2026, Oracle and/or its affiliates.

For *detail*, specify a detail of type BLOB, which was created by the APPROX_PERCENTILE_DETAIL function or the APPROX_PERCENTLE_AGG function.

For *expr*, specify a percentile value, which must evaluate to a numeric value between 0 and 1. If you specify the ERROR_RATE or CONFIDENCE clause, then the percentile value does not apply. In this case, for *expr* you must specify null or a numeric value between 0 and 1. However, the value will be ignored.

For *datatype*, specify the data type of the approximate percentile information in the detail. This is the data type of the expression supplied to the APPROX_PERCENTILE_DETAIL function that originated the detail. Valid data types are NUMBER, BINARY_FLOAT, BINARY_DOUBLE, DATE, TIMESTAMP, INTERVAL YEAR TO MONTH, and INTERVAL DAY TO SECOND.

DESC | ASC

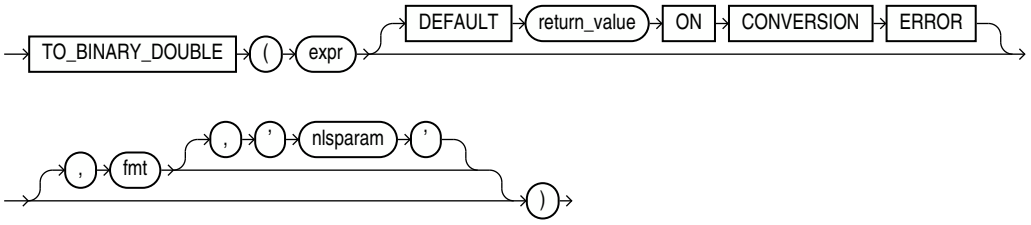
Specify the sort specification for the interpolation. Specify DESC for a descending sort order, or ASC for an ascending sort order. ASC is the default.

ERROR_RATE | CONFIDENCE

These clauses let you determine the accuracy of the percentile evaluation of the detail. If you specify one of these clauses, then instead of returning the approximate interpolated value, the function returns a decimal value from 0 to 1, inclusive, which represents one of the following values:

- If you specify ERROR_RATE, then the return value represents the error rate of the percentile evaluation for the detail.
- If you specify CONFIDENCE, then the return value represents the confidence level for the error rate returned when you specify ERROR_RATE.

If you specify ERROR_RATE or CONFIDENCE, then the percentile value *expr* is ignored.



> **See Also**
>
> - APPROX_PERCENTILE_DETAIL
> - APPROX_PERCENTILE_AGG

Examples

Refer to APPROX_PERCENTILE_AGG: Examples for examples of using the TO_APPROX_PERCENTILE function in conjunction with the APPROX_PERCENTILE_DETAIL and APPROX_PERCENTILE_AGG functions.

TO_BINARY_DOUBLE

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

`TO_BINARY_DOUBLE` converts *expr* to a double-precision floating-point number.

- *expr* can be any expression that evaluates to a character string of type `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`, a numeric value of type `NUMBER`, `BINARY_FLOAT`, or `BINARY_DOUBLE`,`BOOLEAN`, or null. If *expr* is `BINARY_DOUBLE`, then the function returns *expr*. If *expr* evaluates to null, then the function returns null. Otherwise, the function converts *expr* to a `BINARY_DOUBLE` value.
- The optional `DEFAULT` *return_value* `ON CONVERSION ERROR` clause allows you to specify the value returned by this function if an error occurs while converting *expr* to `BINARY_DOUBLE`. This clause has no effect if an error occurs while evaluating *expr*. The *return_value* can be an expression or a bind variable, and must evaluate to a character string of type `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`, a numeric value of type `NUMBER`, `BINARY_FLOAT`, or `BINARY_DOUBLE`, or null. The function converts *return_value* to `BINARY_DOUBLE` in the same way it converts *expr* to `BINARY_DOUBLE`. If *return_value* cannot be converted to `BINARY_DOUBLE`, then the function returns an error.
- The optional '*fmt*' and '*nlsparam*' arguments serve the same purpose as for the `TO_NUMBER` function. If you specify these arguments, then *expr* and *return_value*, if specified, must each be a character string or null. If either is a character string, then the function uses the *fmt* and *nlsparam* arguments to convert the character string to a `BINARY_DOUBLE` value.

If *expr* or *return_value* evaluate to the following character strings, then the function converts them as follows:

- The case-insensitive string '`INF`' is converted to positive infinity.
- The case-insensitive string '`-INF`' is converted to negative identity.
- The case-insensitive string '`NaN`' is converted to `NaN` (not a number).

You cannot use a floating-point number format element (`F`, `f`, `D`, or `d`) in a character string *expr*.

Conversions from character strings or `NUMBER` to `BINARY_DOUBLE` can be inexact, because the `NUMBER` and character types use decimal precision to represent the numeric value, and `BINARY_DOUBLE` uses binary precision.

Conversions from `BINARY_FLOAT` to `BINARY_DOUBLE` are exact.

If you specify an *expr* of type `BOOLEAN`, then `TRUE` will be converted to 1 and `FALSE` will be converted to 0.

> **See Also**
>
> TO_CHAR (number) and "Floating-Point Numbers "

Examples

The examples that follow are based on a table with three columns, each with a different numeric data type:

```
CREATE TABLE float_point_demo
  (dec_num NUMBER(10,2), bin_double BINARY_DOUBLE, bin_float BINARY_FLOAT);

INSERT INTO float_point_demo
  VALUES (1234.56,1234.56,1234.56);
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT * FROM float_point_demo;

   DEC_NUM BIN_DOUBLE  BIN_FLOAT
---------- ---------- ----------
   1234.56 1.235E+003 1.235E+003
```

The following example converts a value of data type NUMBER to a value of data type BINARY_DOUBLE:

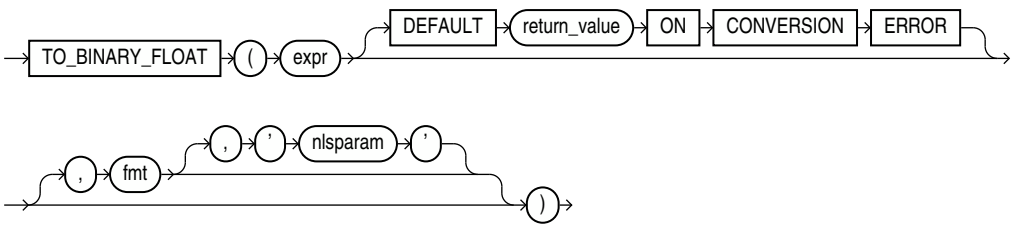
```
SELECT dec_num, TO_BINARY_DOUBLE(dec_num)
  FROM float_point_demo;

   DEC_NUM TO_BINARY_DOUBLE(DEC_NUM)
---------- ------------------------
   1234.56                1.235E+003
```

The following example compares extracted dump information from the dec_num and bin_double columns:

```
SELECT DUMP(dec_num) "Decimal",
   DUMP(bin_double) "Double"
   FROM float_point_demo;

Decimal                    Double
-------------------------- --------------------------------------------
Typ=2 Len=4: 194,13,35,57   Typ=101 Len=8: 192,147,74,61,112,163,215,10
```



The following example returns the default value of 0 because the specified expression cannot be converted to a BINARY_DOUBLE value:

```
SELECT TO_BINARY_DOUBLE('2oo' DEFAULT 0 ON CONVERSION ERROR) "Value"
  FROM DUAL;

     Value
----------
         0
```

TO_BINARY_FLOAT

Syntax

Purpose

TO_BINARY_FLOAT converts *expr* to a single-precision floating-point number.

- *expr* can be any expression that evaluates to a character string of type CHAR, VARCHAR2, NCHAR, or NVARCHAR2, a numeric value of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE,BOOLEAN, or null. If *expr* is BINARY_FLOAT, then the function returns *expr*. If

Copyright © 1996, 2026, Oracle and/or its affiliates.

expr evaluates to null, then the function returns null. Otherwise, the function converts *expr* to a BINARY_FLOAT value.

- The optional DEFAULT *return_value* ON CONVERSION ERROR clause allows you to specify the value returned by this function if an error occurs while converting *expr* to BINARY_FLOAT. This clause has no effect if an error occurs while evaluating *expr*. The *return_value* can be an expression or a bind variable, and must evaluate to a character string of type CHAR, VARCHAR2, NCHAR, or NVARCHAR2, a numeric value of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE, or null. The function converts *return_value* to BINARY_FLOAT in the same way it converts *expr* to BINARY_FLOAT. If *return_value* cannot be converted to BINARY_FLOAT, then the function returns an error.
- The optional '*fmt*' and '*nlsparam*' arguments serve the same purpose as for the TO_NUMBER function. If you specify these arguments, then *expr* and *return_value*, if specified, must each be a character string or null. If either is a character string, then the function uses the *fmt* and *nlsparam* arguments to convert the character string to a BINARY_FLOAT value.

If *expr* or *return_value* evaluate to the following character strings, then the function converts them as follows:

- The case-insensitive string 'INF' is converted to positive infinity.
- The case-insensitive string '-INF' is converted to negative identity.
- The case-insensitive string 'NaN' is converted to NaN (not a number).

You cannot use a floating-point number format element (F, f, D, or d) in a character string *expr*.

Conversions from character strings or NUMBER to BINARY_FLOAT can be inexact, because the NUMBER and character types use decimal precision to represent the numeric value and BINARY_FLOAT uses binary precision.

Conversions from BINARY_DOUBLE to BINARY_FLOAT are inexact if the BINARY_DOUBLE value uses more bits of precision than supported by the BINARY_FLOAT.

If you specify an *expr* of type BOOLEAN, then TRUE will be converted to 1 and FALSE will be converted to 0.

> **See Also**
>
> TO_CHAR (number) and "Floating-Point Numbers "

Examples

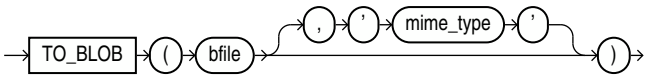
Using table float_point_demo created for TO_BINARY_DOUBLE , the following example converts a value of data type NUMBER to a value of data type BINARY_FLOAT:

```
SELECT dec_num, TO_BINARY_FLOAT(dec_num)
  FROM float_point_demo;

   DEC_NUM TO_BINARY_FLOAT(DEC_NUM)
---------- ------------------------
   1234.56               1.235E+003
```

The following example returns the default value of 0 because the specified expression cannot be converted to a BINARY_FLOAT value:

```
SELECT TO_BINARY_FLOAT('2oo' DEFAULT 0 ON CONVERSION ERROR) "Value"
  FROM DUAL;
```



Copyright © 1996, 2026, Oracle and/or its affiliates.

```
     Value
----------
         0
```

TO_BLOB (bfile)

Syntax

***to_blob_bfile*::=**

Purpose

`TO_BLOB` (bfile) converts a `BFILE` value to a `BLOB` value.

For *`mime_type`*, specify the MIME type to be set on the `BLOB` value returned by this function. If you omit *`mime_type`*, then a MIME type will not be set on the `BLOB` value.

Example

The following hypothetical example returns the `BLOB` of a `BFILE` column value `media_col` in table `media_tab`. It sets the MIME type to `JPEG` on the resulting `BLOB`.

```
SELECT TO_BLOB(media_col, 'JPEG') FROM media_tab;
```

TO_BLOB (raw)

Syntax

***to_blob*::=**

Purpose

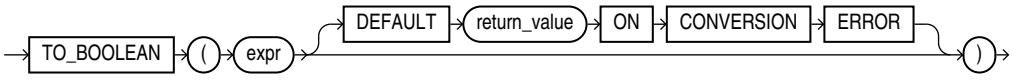
> **Note**
>
> All forms of `LONG` data types (`LONG`, `LONG RAW`, `LONG VARCHAR`, `LONG VARRAW`) were deprecated in Oracle8i Release 8.1.6. For succeeding releases, the `LONG` data type was provided for backward compatibility with existing applications. In new applications developed with later releases, Oracle strongly recommends that you use `CLOB` and `NCLOB` data types for large amounts of character data.

`TO_BLOB` (raw) converts `LONG RAW` and `RAW` values to `BLOB` values.

Copyright © 1996, 2026, Oracle and/or its affiliates.

From within a PL/SQL package, you can use TO_BLOB (raw) to convert RAW and BLOB values to BLOB.

Examples



The following hypothetical example returns the BLOB of a RAW column value:

```
SELECT TO_BLOB(raw_column) blob FROM raw_table;

BLOB
----------------------
00AADD343CDBBD
```

TO_BOOLEAN

Syntax

Purpose

Use TO_BOOLEAN to explicitly convert character value expressions or numeric value expressions to boolean values.

If *expr* is a string, it must evaluate to the allowed string inputs. See Table 2-6.

expr can take one of the following types, or null:

- A character string of type CHAR, VARCHAR2, NCHAR, NVARCHAR2
- A numeric value of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE
- A boolean value of type BOOLEAN.

Examples

```
SELECT TO_BOOLEAN(0), TO_BOOLEAN('true'), TO_BOOLEAN('no');
```

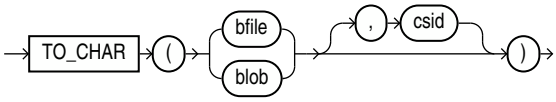
The output is:

```
TO_BOOLEAN(0)   TO_BOOLEAN('TRUE'  TO_BOOLEAN('NO'
-------------   -----------------  --------------
false           true               false
```

```
SELECT TO_BOOLEAN(1) FROM DUAL;
```

The output is:

```
TO_BOOLEAN(1)
-------------
true
```



Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> - CAST for conversion rules.
> - Boolean Data Type for more details on the built-in boolean data type.

TO_CHAR (bfile|blob)

Syntax

***to_char_bfile_blob*::=**

Purpose

`TO_CHAR` (bfile|blob) converts `BFILE` or `BLOB` data to the database character set. The value returned is always `VARCHAR2`. If the value returned is too large to fit into the `VARCHAR2` data type, then the data is truncated.

For *`csid`*, specify the character set ID of the `BFILE` or `BLOB` data. If the character set of the `BFILE` or `BLOB` data is the database character set, then you can specify a value of 0 for *`csid`*, or omit *`csid`* altogether.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of this function

Example

The following hypothetical example takes as its input a `BFILE` column `media_col` in table `media_tab`, which uses the character set with ID 873. The example returns a `VARCHAR2` value that uses the database character set.

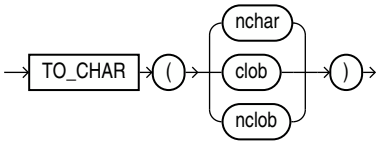
```
SELECT TO_CHAR(media_col, 873) FROM media_tab;
```

TO_CHAR (boolean)

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose



Use `TO_CHAR(boolean)` to explicitly convert a boolean value to a character value of `'TRUE'` or `'FALSE'`.

> **See Also**
>
> - CAST for conversion rules.
> - Boolean Data Type for more details on the built-in boolean data type.

TO_CHAR (character)

Syntax

***to_char_char*::=**

Purpose

`TO_CHAR` (character) converts `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB` data to the database character set. The value returned is always `VARCHAR2`.

When you use this function to convert a character LOB into the database character set, if the LOB value to be converted is larger than the target type, then the database returns an error.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following example interprets a simple string as character data:

```
SELECT TO_CHAR('01110') FROM DUAL;

TO_CH
-----
01110
```

Compare this example with the first example for TO_CHAR (number) .

The following example converts some `CLOB` data from the `pm.print_media` table to the database character set:

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT TO_CHAR(ad_sourcetext) FROM print_media
      WHERE product_id = 2268;

TO_CHAR(AD_SOURCETEXT)
--------------------------------------------------------------------
*****************************
TIGER2 2268...Standard Hayes Compatible Modem
Product ID: 2268
The #1 selling modem in the universe! Tiger2's modem includes call management
and Internet voicing. Make real-time full duplex phone calls at the same time
you're online.
*********************************
```

TO_CHAR (character) Function: Example

The following statements create a table named `empl_temp` and populate it with employee details:

```
CREATE TABLE empl_temp
  (
     employee_id NUMBER(6),
     first_name  VARCHAR2(20),
     last_name   VARCHAR2(25),
     email       VARCHAR2(25),
     hire_date   DATE DEFAULT SYSDATE,
     job_id      VARCHAR2(10),
     clob_column CLOB
  );

INSERT INTO empl_temp
VALUES(111,'John','Doe','example.com','10-JAN-2015','1001','Experienced
Employee');

INSERT INTO empl_temp
VALUES(112,'John','Smith','example.com','12-JAN-2015','1002','Junior
Employee');

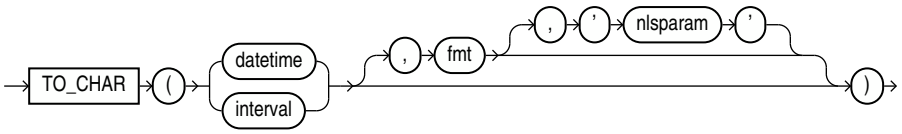
INSERT INTO empl_temp
VALUES(113,'Johnnie','Smith','example.com','12-JAN-2014','1002','Mid-Career
Employee');

INSERT INTO empl_temp
VALUES(115,'Jane','Doe','example.com','15-JAN-2015','1005','Executive
Employee');
```

The following statement converts CLOB data to the database character set:

```
SELECT To_char(clob_column) "CLOB_TO_CHAR"
FROM   empl_temp
WHERE  employee_id IN ( 111, 112, 115 );

CLOB_TO_CHAR
--------------------
Experienced Employee
Junior Employee
Executive Employee
```



Copyright © 1996, 2026, Oracle and/or its affiliates.

> **Live SQL**
>
> View and run a related example on Oracle Live SQL at *Using the TO_CHAR Function*

TO_CHAR (datetime)

Syntax

***to_char_date*::=**

Purpose

`TO_CHAR` (datetime) converts a datetime or interval value of `DATE`, `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, `TIMESTAMP WITH LOCAL TIME ZONE`, `INTERVAL DAY TO SECOND`, or `INTERVAL YEAR TO MONTH` data type to a value of `VARCHAR2` data type in the format specified by the date format *`fmt`*. If you omit *`fmt`*, then *`date`* is converted to a `VARCHAR2` value as follows:

- `DATE` values are converted to values in the default date format.
- `TIMESTAMP` and `TIMESTAMP WITH LOCAL TIME ZONE` values are converted to values in the default timestamp format.
- `TIMESTAMP WITH TIME ZONE` values are converted to values in the default timestamp with time zone format.
- Interval values are converted to the numeric representation of the interval literal.

Refer to "Format Models " for information on datetime formats.

The *`'nlsparam'`* argument specifies the language in which month and day names and abbreviations are returned. This argument can have this form:

```
'NLS_DATE_LANGUAGE = language'
```

If you omit *`'nlsparam'`*, then this function uses the default date language for your session.

> **See Also**
>
> "Security Considerations for Data Conversion"

You can use this function in conjunction with any of the XML functions to generate a date in the database format rather than the XML Schema standard format.

Copyright © 1996, 2026, Oracle and/or its affiliates.

See Also

- *Oracle XML DB Developer's Guide* for information about formatting of XML dates and timestamps, including examples
- "XML Functions " for a listing of the XML functions
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following example uses this table:

```
CREATE TABLE date_tab (
   ts_col      TIMESTAMP,
   tsltz_col   TIMESTAMP WITH LOCAL TIME ZONE,
   tstz_col    TIMESTAMP WITH TIME ZONE);
```

The example shows the results of applying `TO_CHAR` to different `TIMESTAMP` data types. The result for a `TIMESTAMP WITH LOCAL TIME ZONE` column is sensitive to session time zone, whereas the results for the `TIMESTAMP` and `TIMESTAMP WITH TIME ZONE` columns are not sensitive to session time zone:

```
ALTER SESSION SET TIME_ZONE = '-8:00';
INSERT INTO date_tab VALUES (
   TIMESTAMP'1999-12-01 10:00:00',
   TIMESTAMP'1999-12-01 10:00:00',
   TIMESTAMP'1999-12-01 10:00:00');
INSERT INTO date_tab VALUES (
   TIMESTAMP'1999-12-02 10:00:00 -8:00',
   TIMESTAMP'1999-12-02 10:00:00 -8:00',
   TIMESTAMP'1999-12-02 10:00:00 -8:00');

SELECT TO_CHAR(ts_col, 'DD-MON-YYYY HH24:MI:SSxFF') AS ts_date,
   TO_CHAR(tstz_col, 'DD-MON-YYYY HH24:MI:SSxFF TZH:TZM') AS tstz_date
   FROM date_tab
   ORDER BY ts_date, tstz_date;

02-DEC-1999 10:00:00.000000    02-DEC-1999 10:00:00.000000 -08:00
```

The following example converts an interval literal into a text literal:

```
SELECT TO_CHAR(INTERVAL '123-2' YEAR(3) TO MONTH) FROM DUAL;

TO_CHAR
-------
+123-02
```

Using TO_CHAR to Format Dates and Numbers: Example

The following statement converts date values to the format specified in the `TO_CHAR` function:

```
WITH dates AS (
  SELECT date'2015-01-01' d FROM dual union
  SELECT date'2015-01-10' d FROM dual union
  SELECT date'2015-02-01' d FROM dual
)
SELECT d "Original Date",
       to_char(d, 'dd-mm-yyyy') "Day-Month-Year",
       to_char(d, 'hh24:mi') "Time in 24-hr format",
       to_char(d, 'iw-iyyy') "ISO Year and Week of Year"
FROM dates;
```

The following statement converts date and timestamp values to the format specified in the `TO_CHAR` function:

```
WITH dates AS (
  SELECT date'2015-01-01' d FROM dual union
  SELECT date'2015-01-10' d FROM dual union
  SELECT date'2015-02-01' d FROM dual union
  SELECT timestamp'2015-03-03 23:44:32' d FROM dual union
  SELECT timestamp'2015-04-11 12:34:56' d FROM dual
)
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT d "Original Date",
       to_char(d, 'dd-mm-yyyy') "Day-Month-Year",
       to_char(d, 'hh24:mi') "Time in 24-hr format",
       to_char(d, 'iw-iyyy') "ISO Year and Week of Year",
       to_char(d, 'Month') "Month Name",
       to_char(d, 'Year') "Year"
FROM dates;
```

The following statement extracts the datetime fields specified in the `EXTRACT` function from the input datetime expressions:

```
WITH dates AS (
  SELECT date'2015-01-01' d FROM dual union
  SELECT date'2015-01-10' d FROM dual union
  SELECT date'2015-02-01' d FROM dual union
  SELECT timestamp'2015-03-03 23:44:32' d FROM dual union
  SELECT timestamp'2015-04-11 12:34:56' d FROM dual
)
SELECT extract(minute from d) minutes,
       extract(hour from d) hours,
       extract(day from d) days,
       extract(month from d) months,
       extract(year from d) years
FROM dates;
```

The following statement displays the input numbers as per the format specified in the `TO_CHAR` function:

```
WITH nums AS (
  SELECT 10 n FROM dual union
  SELECT 9.99 n FROM dual union
  SELECT 1000000 n FROM dual  --one million
)
SELECT n "Input Number N",
       to_char(n),
       to_char(n, '9,999,999.99') "Number with Commas",
       to_char(n, '0,000,000.000') "Zero-padded Number",
       to_char(n, '9.9EEEE') "Scientific Notation"
FROM nums;
```

The following statement converts the input numbers as per the format specified in the `TO_CHAR` function:

```
WITH nums AS (
  SELECT 10 n FROM dual union
  SELECT 9.99 n FROM dual union
  SELECT .99 n FROM dual union
  SELECT 1000000 n FROM dual  --one million
)
SELECT n "Input Number N",
       to_char(n),
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
       to_char(n, '9,999,999.99') "Number with Commas",
       to_char(n, '0,000,000.000') "Zero_padded Number",
       to_char(n, '9.9EEEE') "Scientific Notation",
       to_char(n, '$9,999,990.00') Monetary,
       to_char(n, 'X') "Hexadecimal Value"
FROM nums;
```

The following statement converts the input numbers as per the format specified in the `TO_CHAR` function:

```
WITH nums AS (
  SELECT 10 n FROM dual union
  SELECT 9.99 n FROM dual union
  SELECT .99 n FROM dual union
  SELECT 1000000 n FROM dual  --one million
)
SELECT n "Input Number N",
       to_char(n),
       to_char(n, '9,999,999.99') "Number with Commas",
       to_char(n, '0,000,000.000') "Zero_padded Number",
       to_char(n, '9.9EEEE') "Scientific Notation",
       to_char(n, '$9,999,990.00') Monetary,
       to_char(n, 'XXXXXX') "Hexadecimal Value"
FROM nums;
```

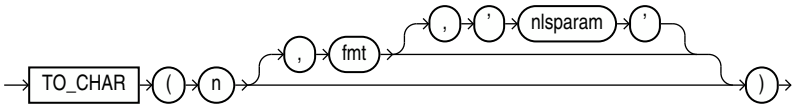
TO_CHAR (datetime) Function: Example

The following statements create a table named `empl_temp` and populate it with employee details:

```
CREATE TABLE empl_temp
  (
     employee_id NUMBER(6),
     first_name  VARCHAR2(20),
     last_name   VARCHAR2(25),
     email       VARCHAR2(25),
     hire_date   DATE DEFAULT SYSDATE,
     job_id      VARCHAR2(10),
     clob_column CLOB
  );
INSERT INTO empl_temp
VALUES(111,'John','Doe','example.com','10-JAN-2015','1001','Experienced
Employee');
INSERT INTO empl_temp
VALUES(112,'John','Smith','example.com','12-JAN-2015','1002','Junior
Employee');
INSERT INTO empl_temp
VALUES(113,'Johnnie','Smith','example.com','12-JAN-2014','1002','Mid-Career
Employee');
INSERT INTO empl_temp
VALUES(115,'Jane','Doe','example.com','15-JAN-2015','1005','Executive
Employee');
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following statement displays dates by using the short and long formats:



```
SELECT hire_date "Default",
       TO_CHAR(hire_date,'DS') "Short",
       TO_CHAR(hire_date,'DL') "Long"FROM empl_temp
WHERE employee_id IN (111, 112, 115);

Default    Short      Long
---------- ---------- -------------------------
10-JAN-15  1/10/2015  Saturday, January 10, 2015
12-JAN-15  1/12/2015  Monday, January 12, 2015
15-JAN-15  1/15/2015  Thursday, January 15, 2015
```

TO_CHAR (number)

Syntax

***to_char_number*::=**

Purpose

`TO_CHAR` (number) converts *n* to a value of `VARCHAR2` data type, using the optional number format *`fmt`*. The value *n* can be of type `NUMBER`, `BINARY_FLOAT`, or `BINARY_DOUBLE`. If you omit *`fmt`*, then *n* is converted to a `VARCHAR2` value exactly long enough to hold its significant digits.

If *n* is negative, then the sign is applied after the format is applied. Thus `TO_CHAR(-1, '$9')` returns -$1, rather than $-1.

Refer to "Format Models " for information on number formats.

The *`'nlsparam'`* argument specifies these characters that are returned by number format elements:

- Decimal character
- Group separator
- Local currency symbol
- International currency symbol

This argument can have this form:

```
'NLS_NUMERIC_CHARACTERS = ''dg''
   NLS_CURRENCY = ''text''
   NLS_ISO_CURRENCY = territory '
```

The characters *d* and *g* represent the decimal character and group separator, respectively. They must be different single-byte characters. Within the quoted string, you must use two single quotation marks around the parameter values. Ten characters are available for the currency symbol.

Copyright © 1996, 2026, Oracle and/or its affiliates.

If you omit *'nlsparam'* or any one of the parameters, then this function uses the default parameter values for your session.

See Also

- "Security Considerations for Data Conversion"
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following statement uses implicit conversion to combine a string and a number into a number:

```
SELECT TO_CHAR('01110' + 1) FROM DUAL;

TO_C
----
1111
```

Compare this example with the first example for TO_CHAR (character) .

In the next example, the output is blank padded to the left of the currency symbol. In the optional number format fmt, `L` designates local currency symbol and `MI` designates a trailing minus sign. See Table 2-16 for a complete listing of number format elements. The example shows the output in a session in which the session parameter `NLS_TERRITORY` is set to `AMERICA`.

```
SELECT TO_CHAR(-10000,'L99G999D99MI') "Amount"
     FROM DUAL;

Amount
--------------
  $10,000.00-
```

In the next example, `NLS_CURRENCY` specifies the string to use as the local currency symbol for the `L` number format element. `NLS_NUMERIC_CHARACTERS` specifies comma as the character to use as the decimal separator for the `D` number format element and period as the character to use as the group separator for the `G` number format element. These characters are expected in many countries, for example in Germany.

```
SELECT TO_CHAR(-10000,'L99G999D99MI',
   'NLS_NUMERIC_CHARACTERS = '',.''
   NLS_CURRENCY = ''AusDollars'' ') "Amount"
     FROM DUAL;

Amount
-------------------
AusDollars10.000,00-
```

In the next example, `NLS_ISO_CURRENCY` instructs the database to use the international currency symbol for the territory of `POLAND` for the `C` number format element:

```
SELECT TO_CHAR(-10000,'99G999D99C',
   'NLS_NUMERIC_CHARACTERS = '',.''
   NLS_ISO_CURRENCY=POLAND') "Amount"
     FROM DUAL;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
Amount
----------------
    -10.000,00PLN
```

TO_CHAR (number) Function: Example

The following statements create a table named `empl_temp` and populate it with employee details:

```
CREATE TABLE empl_temp
  (
     employee_id NUMBER(6),
     first_name  VARCHAR2(20),
     last_name   VARCHAR2(25),
     email       VARCHAR2(25),
     hire_date   DATE DEFAULT SYSDATE,
     job_id      VARCHAR2(10),
     clob_column CLOB
  );

INSERT INTO empl_temp
VALUES(111,'John','Doe','example.com','10-JAN-2015','1001','Experienced
Employee');

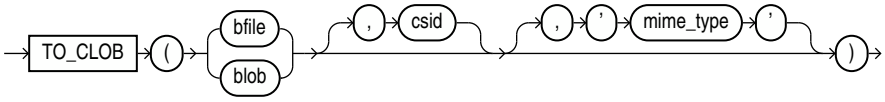
INSERT INTO empl_temp
VALUES(112,'John','Smith','example.com','12-JAN-2015','1002','Junior
Employee');

INSERT INTO empl_temp
VALUES(113,'Johnnie','Smith','example.com','12-JAN-2014','1002','Mid-Career
Employee');

INSERT INTO empl_temp
VALUES(115,'Jane','Doe','example.com','15-JAN-2015','1005','Executive
Employee');
```

The following statement converts numeric data to the database character set:

```
SELECT To_char(employee_id) "NUM_TO_CHAR"
FROM   empl_temp
WHERE  employee_id IN ( 111, 112, 113, 115 );



NUM_TO_CHAR
--------------------
111
112
113
115
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

TO_CLOB (bfile|blob)

Syntax

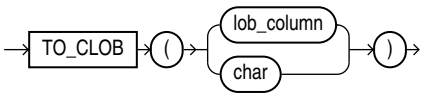
Purpose

`TO_CLOB` (bfile|blob) converts `BFILE` or `BLOB` data to the database character set and returns the data as a `CLOB` value.

For *`csid`*, specify the character set ID of the `BFILE` or `BLOB` data. If the character set of the `BFILE` or `BLOB` data is the database character set, then you can specify a value of 0 for *`csid`*, or omit *`csid`* altogether.

For *`mime_type`*, specify the MIME type to be set on the `CLOB` value returned by this function. If you omit *`mime_type`*, then a MIME type will not be set on the `CLOB` value.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of this function



Example

The following hypothetical example returns the `CLOB` of a `BFILE` column value `docu` in table `media_tab`, which uses the character set with ID 873. It sets the MIME type to `text/xml` for the resulting `CLOB`.

```
SELECT TO_CLOB(docu, 873, 'text/xml') FROM media_tab;
```

TO_CLOB (character)

Syntax

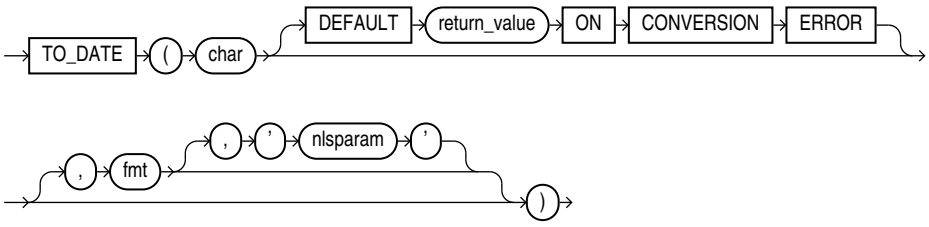
Purpose

`TO_CLOB` (character) converts `NCLOB` values in a LOB column or other character strings to `CLOB` values. *`char`* can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`. Oracle Database executes this function by converting the underlying LOB data from the national character set to the database character set.

Copyright © 1996, 2026, Oracle and/or its affiliates.

From within a PL/SQL package, you can use the `TO_CLOB` (character) function to convert `RAW`, `CHAR`, `VARCHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB` values to `CLOB` or `NCLOB` values.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of this function



Examples

The following statement converts `NCLOB` data from the sample `pm.print_media` table to `CLOB` and inserts it into a `CLOB` column, replacing existing data in that column.

```
UPDATE PRINT_MEDIA
   SET AD_FINALTEXT = TO_CLOB (AD_FLTEXTN);
```

TO_DATE

Syntax

Purpose

`TO_DATE` converts *char* to a value of `DATE` data type.

For *char*, you can specify any expression that evaluates to a character string of `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2` data type.

> **Note**
>
> This function does not convert data to any of the other datetime data types. For information on other datetime conversions, refer to TO_TIMESTAMP , TO_TIMESTAMP_TZ , TO_DSINTERVAL , and TO_YMINTERVAL .

The optional `DEFAULT` *return_value* `ON CONVERSION ERROR` clause allows you to specify the value this function returns if an error occurs while converting *char* to `DATE`. This clause has no effect if an error occurs while evaluating *char*. The *return_value* can be an expression or a bind variable, and it must evaluate to a character string of `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2` data type, or null. The function converts *return_value* to `DATE` using the same method it uses to convert *char* to `DATE`. If *return_value* cannot be converted to `DATE`, then the function returns an error.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The *fmt* is a datetime model format specifying the format of *char*. If you omit *fmt*, then *char* must be in the default date format. The default date format is determined implicitly by the NLS_TERRITORY initialization parameter or can be set explicitly by the NLS_DATE_FORMAT parameter. If *fmt* is J, for Julian, then *char* must be an integer.

> **⚠ Caution**
>
> It is good practice always to specify a format mask (*fmt*) with TO_DATE, as shown in the examples in the section that follow, if *char* is a literal or an expression that evaluates to a known, fixed format, independent of the locale (NLS) configuration of the session. When TO_DATE is used without a format mask, the function is valid only if *char* uses the same format as is determined by the NLS_TERRITORY and NLS_DATE_FORMAT parameters.
>
> However, if *char* corresponds to user input provided by an application, for example, in a bind variable, and the user input is expected to follow the locale (NLS) conventions set for the session provided in the NLS_DATE_FORMAT parameter, then the format mask should not be specified.

The *'nlsparam'* argument specifies the language of the text string that is being converted to a date. This argument can have this form:

```
'NLS_DATE_LANGUAGE = language'
```

Do not use the TO_DATE function with a DATE value for the *char* argument. The first two digits of the returned DATE value can differ from the original *char*, depending on *fmt* or the default date format.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.

> **ⓘ See Also**
>
> "Datetime Format Models " and "Data Type Comparison Rules " for more information

Examples

The following example converts a character string into a date:

```
SELECT TO_DATE(
  'January 15, 1989, 11:00 A.M.',
  'Month dd, YYYY, HH:MI A.M.',
  'NLS_DATE_LANGUAGE = American')
    FROM DUAL;

TO_DATE('JANUARY15,1989,1:
---------
1/15/1989,11:00:00 AM
```

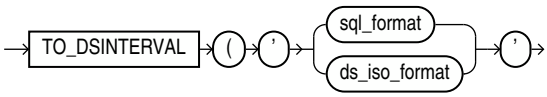
Copyright © 1996, 2026, Oracle and/or its affiliates.

The value returned reflects the default date format if the NLS_TERRITORY parameter is set to 'AMERICA'. Different NLS_TERRITORY values result in different default date formats:

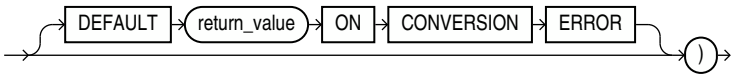
```
ALTER SESSION SET NLS_TERRITORY = 'KOREAN';

SELECT TO_DATE(
    'January 15, 1989, 11:00 A.M.',
    'Month dd, YYYY, HH:MI A.M.',
     'NLS_DATE_LANGUAGE = American')
     FROM DUAL;

TO_DATE(
--------
89/01/15
```

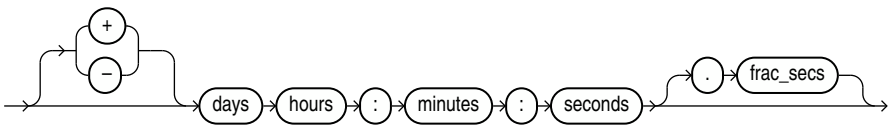


The following example returns the default value because the specified expression cannot be converted to a DATE value, due to a misspelling of the month:



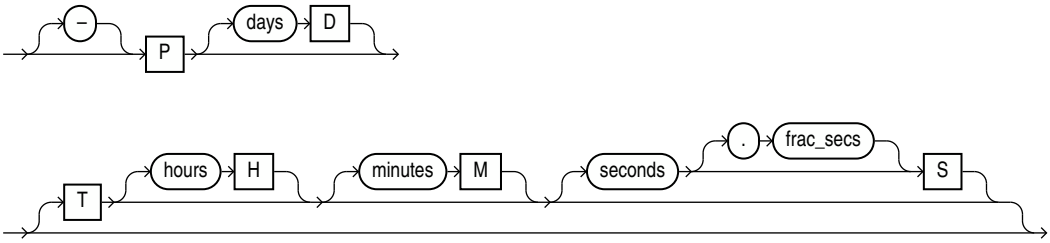
```
SELECT TO_DATE('Febuary 15, 2016, 11:00 A.M.'
       DEFAULT 'January 01, 2016 12:00 A.M.' ON CONVERSION ERROR,
       'Month dd, YYYY, HH:MI A.M.') "Value"
  FROM DUAL;

Value
---------
01-JAN-16
```



TO_DSINTERVAL

Syntax



***sql_format*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

***ds_iso_format*::=**

> **Note**
>
> In earlier releases, the `TO_DSINTERVAL` function accepted an optional *`nlsparam`* clause. This clause is still accepted for backward compatibility, but has no effect.

Purpose

`TO_DSINTERVAL` converts its argument to a value of `INTERVAL DAY TO SECOND` data type.

For the argument, you can specify any expression that evaluates to a character string of `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2` data type.

`TO_DSINTERVAL` accepts argument in one of the two formats:

- SQL interval format compatible with the SQL standard (ISO/IEC 9075)
- ISO duration format compatible with the ISO 8601:2004 standard

In the SQL format, *`days`* is an integer between 0 and 999999999, *`hours`* is an integer between 0 and 23, and *`minutes`* and *`seconds`* are integers between 0 and 59. *`frac_secs`* is the fractional part of seconds between .0 and .999999999. One or more blanks separate days from hours. Additional blanks are allowed between format elements.

In the ISO format, *`days`*, *`hours`*, *`minutes`* and *`seconds`* are integers between 0 and 999999999. *`frac_secs`* is the fractional part of seconds between .0 and .999999999. No blanks are allowed in the value. If you specify `T`, then you must specify at least one of the *`hours`*, *`minutes`*, or *`seconds`* values.

The optional `DEFAULT` *`return_value`* `ON CONVERSION ERROR` clause allows you to specify the value this function returns if an error occurs while converting the argument to an `INTERVAL DAY TO SECOND` type. This clause has no effect if an error occurs while evaluating the argument. The *`return_value`* can be an expression or a bind variable, and it must evaluate to a character string of `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2` data type. It can be in either the SQL format or ISO format, and need not be in the same format as the function argument. If *`return_value`* cannot be converted to an `INTERVAL DAY TO SECOND` type, then the function returns an error.

Examples

The following example uses the SQL format to select from the `hr.employees` table the employees who had worked for the company for at least 100 days on November 1, 2002:

```
SELECT employee_id, last_name FROM employees
   WHERE hire_date + TO_DSINTERVAL('100 00:00:00')
   <= DATE '2002-11-01'
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
   ORDER BY employee_id;

EMPLOYEE_ID LAST_NAME
----------- ---------------
        102 De Haan
        203 Mavris
        204 Baer
        205 Higgins
        206 Giet
```

The following example uses the ISO format to display the timestamp 100 days and 5 hours after the beginning of the year 2009:

```
SELECT TO_CHAR(TIMESTAMP '2009-01-01 00:00:00' + TO_DSINTERVAL('P100DT05H'),
   'YYYY-MM-DD HH24:MI:SS') "Time Stamp"
     FROM DUAL;

Time Stamp
-------------------
2009-04-11 05:00:00
```

The following example returns the default value because the specified expression cannot be converted to an `INTERVAL DAY TO SECOND` value:

```
SELECT TO_DSINTERVAL('1o 1:02:10'
       DEFAULT '10 8:00:00' ON CONVERSION ERROR) "Value"
  FROM DUAL;

Value
-----------------------------
+000000010 08:00:00.000000000
```

TO_LOB

Syntax

Purpose

> **Note**
>
> All forms of `LONG` data types (`LONG`, `LONG RAW`, `LONG VARCHAR`, `LONG VARRAW`) were deprecated in Oracle8i Release 8.1.6. For succeeding releases, the `LONG` data type was provided for backward compatibility with existing applications. In new applications developed with later releases, Oracle strongly recommends that you use `CLOB` and `NCLOB` data types for large amounts of character data.

`TO_LOB` converts `LONG` or `LONG RAW` values in the column *`long_column`* to LOB values. You can apply this function only to a `LONG` or `LONG RAW` column, and only in the select list of a subquery in an `INSERT` statement.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Before using this function, you must create a LOB column to receive the converted `LONG` values. To convert `LONG` values, create a `CLOB` column. To convert `LONG` RAW values, create a `BLOB` column.

You cannot use the `TO_LOB` function to convert a `LONG` column to a LOB column in the subquery of a `CREATE TABLE ... AS SELECT` statement if you are creating an index-organized table. Instead, create the index-organized table without the `LONG` column, and then use the `TO_LOB` function in an `INSERT ... AS SELECT` statement.

You cannot use this function within a PL/SQL package. Instead use the `TO_CLOB` (character) or `TO_BLOB` (raw) functions.

See Also

- the *`modify_col_properties`* clause of ALTER TABLE for an alternative method of converting `LONG` columns to LOB
- INSERT for information on the subquery of an `INSERT` statement
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following syntax shows how to use the `TO_LOB` function on your `LONG` data in a hypothetical table *`old_table`*:

```
CREATE TABLE new_table (col1, col2, ... lob_col CLOB);
INSERT INTO new_table (select o.col1, o.col2, ... TO_LOB(o.old_long_col)
   FROM old_table o;
```

TO_MULTI_BYTE

Syntax

Purpose

`TO_MULTI_BYTE` returns *`char`* with all of its single-byte characters converted to their corresponding multibyte characters. *`char`* can be of data type `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. The value returned is in the same data type as *`char`*.

Any single-byte characters in *`char`* that have no multibyte equivalents appear in the output string as single-byte characters. This function is useful only if your database character set contains both single-byte and multibyte characters.

This function does not support `CLOB` data directly. However, `CLOB`s can be passed in as arguments through implicit data conversion.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> - "Data Type Comparison Rules " for more information.
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `TO_MULTI_BYTE`

Examples

The following example illustrates converting from a single byte `A` to a multibyte `A` in UTF8:

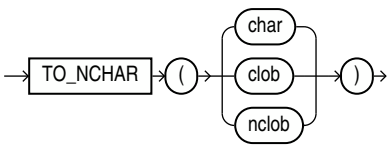
```
SELECT dump(TO_MULTI_BYTE( 'A')) FROM DUAL;

DUMP(TO_MULTI_BYTE('A'))
------------------------
Typ=1 Len=3: 239,188,161
```

TO_NCHAR (boolean)

Syntax

Purpose



Use `TO_NCHAR(boolean)` to explicitly convert a boolean value to a character value of `'TRUE'` or `'FALSE'`.

> **See Also**
>
> - CAST for conversion rules.
> - Boolean Data Type for more details on the built-in boolean data type.

TO_NCHAR (character)

Syntax

***to_nchar_char*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

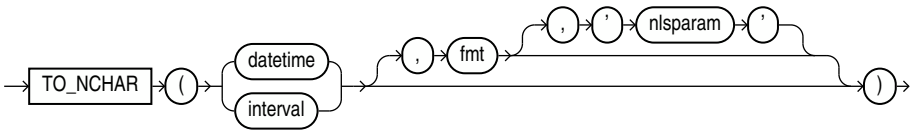
Purpose

`TO_NCHAR` (character) converts a character string, `CHAR`, `VARCHAR2`, `CLOB`, or `NCLOB` value to the national character set. The value returned is always `NVARCHAR2`. This function is equivalent to the `TRANSLATE ... USING` function with a `USING` clause in the national character set.

> **See Also**
>
> - "Data Conversion " and TRANSLATE ... USING
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following example converts `VARCHAR2` data from the `oe.customers` table to the national character set:



```
SELECT TO_NCHAR(cust_last_name) FROM customers
   WHERE customer_id=103;

TO_NCHAR(CUST_LAST_NAME)
------------------------------------------------
Taylor
```

TO_NCHAR (datetime)

Syntax

***to_nchar_date*::=**

Purpose

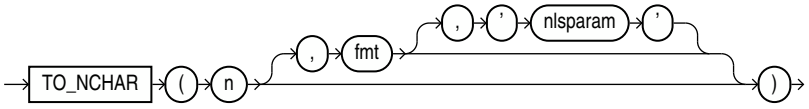
`TO_NCHAR` (datetime) converts a datetime or interval value of `DATE`, `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, `TIMESTAMP WITH LOCAL TIME ZONE`, `INTERVAL MONTH TO YEAR`, or `INTERVAL DAY TO SECOND` data type from the database character set to the national character set.

> **See Also**
>
> - "Security Considerations for Data Conversion"
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of this function

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

The following example converts the `order_date` of all orders whose status is `9` to the national character set:



```
SELECT TO_NCHAR(ORDER_DATE) AS order_date
   FROM ORDERS
   WHERE ORDER_STATUS > 9
   ORDER BY order_date;

ORDER_DATE
---------------------------------------------------------------------------
06-DEC-99 02.22.34.225609 PM
13-SEP-99 10.19.00.654279 AM
14-SEP-99 09.53.40.223345 AM
26-JUN-00 10.19.43.190089 PM
27-JUN-00 09.53.32.335522 PM
```

TO_NCHAR (number)

Syntax

***to_nchar_number*::=**

Purpose

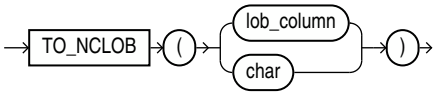
`TO_NCHAR` (number) converts *n* to a string in the national character set. The value *n* can be of type `NUMBER`, `BINARY_FLOAT`, or `BINARY_DOUBLE`. The function returns a value of the same type as the argument. The optional *`fmt`* and *`'nlsparam'`* corresponding to *n* can be of `DATE`, `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, `TIMESTAMP WITH LOCAL TIME ZONE`, `INTERVAL MONTH TO YEAR`, or `INTERVAL DAY TO SECOND` data type.

> **See Also**
>
> - "Security Considerations for Data Conversion"
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following example converts the `customer_id` values from the sample table `oe.orders` to the national character set:

```
SELECT TO_NCHAR(customer_id) "NCHAR_Customer_ID"  FROM orders
   WHERE order_status > 9
   ORDER BY "NCHAR_Customer_ID";



NCHAR_Customer_ID
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
-------------------------------------
102
103
148
148
149
```

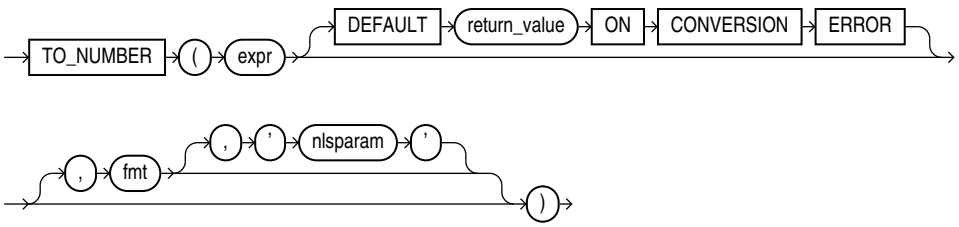
TO_NCLOB

Syntax

Purpose

`TO_NCLOB` converts `CLOB` values in a LOB column or other character strings to `NCLOB` values. *`char`* can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`. Oracle Database implements this function by converting the character set of *`char`* from the database character set to the national character set.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of this function



Examples

The following example inserts some character data into an `NCLOB` column of the `pm.print_media` table by first converting the data with the `TO_NCLOB` function:

```
INSERT INTO print_media (product_id, ad_id, ad_fltextn)
   VALUES (3502, 31001,
      TO_NCLOB('Placeholder for new product description'));
```

TO_NUMBER

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

TO_NUMBER converts *expr* to a value of NUMBER data type.

expr can be any expression that evaluates to a character string of type CHAR, VARCHAR2, NCHAR, or NVARCHAR2, a numeric value of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE, BOOLEAN, or null. If *expr* is NUMBER, then the function returns *expr*. If *expr* evaluates to null, then the function returns null. Otherwise, the function converts *expr* to a NUMBER value.

- If you specify an *expr* of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, then you can optionally specify the format model *fmt*.
- If you specify an *expr* of BINARY_FLOAT or BINARY_DOUBLE data type, then you cannot specify a format model because a float can be interpreted only by its internal representation.
- If you specify an *expr* of type BOOLEAN, then TRUE will be converted to 1 and FALSE will be converted to 0. You cannot specify a format model with inputs of type BOOLEAN.

Refer to "Format Models " for information on number formats.

The *'nlsparam'* argument in this function has the same purpose as it does in the TO_CHAR function for number conversions. Refer to TO_CHAR (number) for more information.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.

> **See Also**
>
> "Data Type Comparison Rules " for more information.

Examples

The following examples convert character string data into a number:

```
UPDATE employees SET salary = salary +
   TO_NUMBER('100.00', '9G999D99')
   WHERE last_name = 'Perkins';

SELECT TO_NUMBER('-AusDollars100','L9G999D99',
   ' NLS_NUMERIC_CHARACTERS = '',.''
     NLS_CURRENCY            = ''AusDollars''
   ') "Amount"
     FROM DUAL;

    Amount
----------
      -100
```

The following example returns the default value of 0 because the specified expression cannot be converted to a NUMBER value:

```
SELECT TO_NUMBER('2,00' DEFAULT 0 ON CONVERSION ERROR) "Value"
  FROM DUAL;

   Value
--------
       0
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

TO_SINGLE_BYTE

Syntax

Purpose

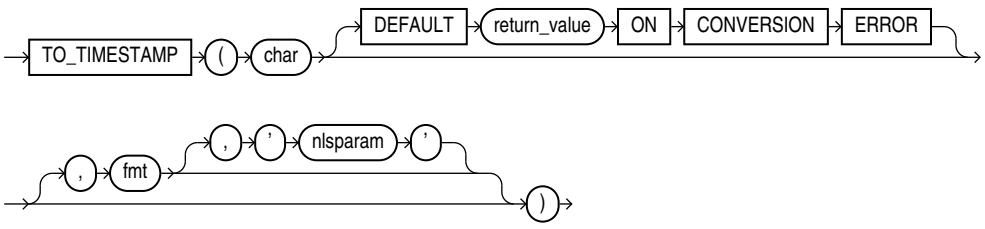
`TO_SINGLE_BYTE` returns *char* with all of its multibyte characters converted to their corresponding single-byte characters. *char* can be of data type `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. The value returned is in the same data type as *char*.

Any multibyte characters in *char* that have no single-byte equivalents appear in the output as multibyte characters. This function is useful only if your database character set contains both single-byte and multibyte characters.

This function does not support `CLOB` data directly. However, `CLOB`s can be passed in as arguments through implicit data conversion.

> **See Also**
>
> - "Data Type Comparison Rules " for more information.
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `TO_SINGLE_BYTE`

Examples



The following example illustrates going from a multibyte `A` in UTF8 to a single byte ASCII `A`:

```
SELECT TO_SINGLE_BYTE( CHR(15711393)) FROM DUAL;

T
-
A
```

TO_TIMESTAMP

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

TO_TIMESTAMP converts *char* to a value of TIMESTAMP data type.

For *char*, you can specify any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type.

The optional DEFAULT *return_value* ON CONVERSION ERROR clause allows you to specify the value this function returns if an error occurs while converting *char* to TIMESTAMP. This clause has no effect if an error occurs while evaluating *char*. The *return_value* can be an expression or a bind variable, and it must evaluate to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, or null. The function converts *return_value* to TIMESTAMP using the same method it uses to convert *char* to TIMESTAMP. If *return_value* cannot be converted to TIMESTAMP, then the function returns an error.

The optional *fmt* specifies the format of *char*. If you omit *fmt*, then *char* must be in the default format of the TIMESTAMP data type, which is determined by the NLS_TIMESTAMP_FORMAT initialization parameter. The optional *'nlsparam'* argument has the same purpose in this function as in the TO_CHAR function for date conversion.

> **⚠ Caution**
>
> It is good practice always to specify a format mask (*fmt*) with TO_TIMESTAMP, as shown in the examples in the section that follow, if *char* is a literal or an expression that evaluates to a known, fixed format, independent of the locale (NLS) configuration of the session. When TO_TIMESTAMP is used without a format mask, the function is valid only if *char* uses the same format as is determined by the NLS_TERRITORY and NLS_TIMESTAMP_FORMAT parameters.
>
> However, if *char* corresponds to user input provided by an application, for example, in a bind variable, and the user input is expected to follow the locale (NLS) conventions set for the session provided in the NLS_TIMESTAMP_FORMAT parameter, then the format mask should not be specified.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.

> **ⓘ See Also**
>
> "Data Type Comparison Rules " for more information.

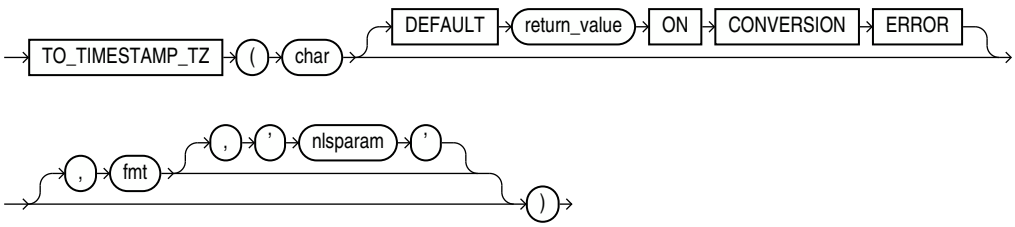
Examples

The following example converts a character string to a timestamp. The character string is not in the default TIMESTAMP format, so the format mask must be specified:

```
SELECT TO_TIMESTAMP ('10-Sep-02 14:10:10.123000', 'DD-Mon-RR HH24:MI:SS.FF')
  FROM DUAL;

TO_TIMESTAMP('10-SEP-0214:10:10.123000','DD-MON-RRHH24:MI:SS.FF')
---------------------------------------------------------------------------
10-SEP-02 02.10.10.123000000 PM
```

Copyright © 1996, 2026, Oracle and/or its affiliates.



The following example returns the default value of NULL because the specified expression cannot be converted to a TIMESTAMP value, due to an invalid month specification:

```
SELECT TO_TIMESTAMP ('10-Sept-02 14:10:10.123000'
  DEFAULT NULL ON CONVERSION ERROR,
  'DD-Mon-RR HH24:MI:SS.FF',
  'NLS_DATE_LANGUAGE = American') "Value"
  FROM DUAL;
```

> **See Also**
>
> NLS_TIMESTAMP_FORMAT initialization parameter for information on the default TIMESTAMP format and "Datetime Format Models " for information on specifying the format mask

TO_TIMESTAMP_TZ

Syntax

Purpose

TO_TIMESTAMP_TZ converts *char* to a value of TIMESTAMP WITH TIME ZONE data type.

For *char*, you can specify any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type.

> **Note**
>
> This function does not convert character strings to TIMESTAMP WITH LOCAL TIME ZONE. To do this, use a CAST function, as shown in CAST .

The optional DEFAULT *return_value* ON CONVERSION ERROR clause allows you to specify the value this function returns if an error occurs while converting *char* to TIMESTAMP WITH TIME ZONE. This clause has no effect if an error occurs while evaluating *char*. The *return_value* can be an expression or a bind variable, and it must evaluate to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, or null. The function converts *return_value* to TIMESTAMP WITH TIME ZONE using the same method it uses to convert *char* to TIMESTAMP WITH TIME ZONE. If *return_value* cannot be converted to TIMESTAMP WITH TIME ZONE, then the function returns an error.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The optional *fmt* specifies the format of *char*. If you omit *fmt*, then *char* must be in the default format of the TIMESTAMP WITH TIME ZONE data type. The optional *'nlsparam'* has the same purpose in this function as in the TO_CHAR function for date conversion.

> **Caution**
>
> It is good practice always to specify a format mask (*fmt*) with TO_TIMESTAMP_TZ, as shown in the examples in the section that follow, if *char* is a literal or an expression that evaluates to a known, fixed format, independent of the locale (NLS) configuration of the session. When TO_TIMESTAMP_TZ is used without a format mask, the function is valid only if *char* uses the same format as is determined by the NLS_TERRITORY and NLS_TIMESTAMP_TZ_FORMAT parameters.
>
> However, if *char* corresponds to user input provided by an application, for example, in a bind variable, and the user input is expected to follow the locale (NLS) conventions set for the session provided in the NLS_TIMESTAMP_TZ_FORMAT parameter, then the format mask should not be specified.

Examples

The following example converts a character string to a value of TIMESTAMP WITH TIME ZONE:

```
SELECT TO_TIMESTAMP_TZ('1999-12-01 11:00:00 -8:00',
  'YYYY-MM-DD HH:MI:SS TZH:TZM') FROM DUAL;

TO_TIMESTAMP_TZ('1999-12-0111:00:00-08:00','YYYY-MM-DDHH:MI:SSTZH:TZM')
---------------------------------------------------------------------
01-DEC-99 11.00.00.000000000 AM -08:00
```

The following example casts a null column in a UNION operation as TIMESTAMP WITH LOCAL TIME ZONE using the sample tables oe.order_items and oe.orders:

```
SELECT order_id, line_item_id,
  CAST(NULL AS TIMESTAMP WITH LOCAL TIME ZONE) order_date
  FROM order_items
UNION
SELECT order_id, to_number(null), order_date
  FROM orders;

  ORDER_ID LINE_ITEM_ID ORDER_DATE
---------- ------------ ---------------------------------
      2354            1
      2354            2
      2354            3
      2354            4
      2354            5
      2354            6
      2354            7
      2354            8
      2354            9
      2354           10
      2354           11
      2354           12
      2354           13
      2354              14-JUL-00 05.18.23.234567 PM
      2355            1
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
      2355            2
. . .
```

The following example returns the default value of NULL because the specified expression cannot be converted to a `TIMESTAMP WITH TIME ZONE` value, due to an invalid month specification:

```
SELECT TO_TIMESTAMP_TZ('1999-13-01 11:00:00 -8:00'
  DEFAULT NULL ON CONVERSION ERROR,
  'YYYY-MM-DD HH:MI:SS TZH:TZM') "Value"
  FROM DUAL;
```

TO_UTC_TIMESTAMP_TZ

Syntax

Purpose

The SQL function `TO_UTC_TIMESTAMP_TZ` takes an ISO 8601 date format string as the `varchar` input and returns an instance of SQL data type `TIMESTAMP WITH TIMEZONE`. It normalizes the input to UTC time (Coordinated Universal Time, formerly Greenwich Mean Time). Unlike SQL function `TO_TIMESTAMP_TZ` , the new function assumes that the input string uses the ISO 8601 date format, defaulting the time zone to UTC 0.

A typical use of this function would be to provide its output to SQL function `SYS_EXTRACT_UTC`, obtaining a UTC time that is then passed as a SQL bind variable to SQL/JSON condition `JSON_EXISTS`, to perform a time-stamp range comparison.

This is the allowed syntax for dates and times:

- Date (only): *YYYY*`-`*MM*`-`*DD*
- Date with time: *YYYY*`-`*MM*`-`*DD*`T`*hh*`:`*mm*`:`*ss*`[.`*s*`[`*s*`[`*s*`[`*s*`[`*s*`]]]]][`**Z**`|(+|-)`*hh*`:`*mm*`]`

where:

- ***YYYY*** specifies the *year*, as four decimal digits.
- ***MM*** specifies the *month*, as two decimal digits, `00` to `12`.
- ***DD*** specifies the *day*, as two decimal digits, `00` to `31`.
- ***hh*** specifies the *hour*, as two decimal digits, `00` to `23`.
- ***mm*** specifies the *minutes*, as two decimal digits, `00` to `59`.
- ***ss***`[.`***s***`[`***s***`[`***s***`[`***s***`]]]]` specifies the *seconds*, as two decimal digits, `00` to `59`, optionally followed by a decimal point and 1 to 6 decimal digits (representing the fractional part of a second).
- **Z** specifies *UTC* time (time zone 0). (It can also be specified by `+00:00`, but not by `-00:00`.)
- `(+|-)hh:mm` specifies the time-zone as *difference from UTC*. (One of `+` or `-` is required.)

For a time value, the time-zone part is optional. If it is absent then UTC time is assumed.

No other ISO 8601 date-time syntax is supported. In particular:

Copyright © 1996, 2026, Oracle and/or its affiliates.

- Negative dates (dates prior to year 1 BCE), which begin with a hyphen (e.g. `-2018-10-26T21:32:52`), are not supported.
- Hyphen and colon separators are required: so-called “basic” format, `YYYYMMDDThhmmss`, is not supported.
- Ordinal dates (year plus day of year, calendar week plus day number) are not supported.
- Using more than four digits for the year is not supported.

Supported dates and times include the following:

- `2018-10-26T21:32:52`
- `2018-10-26T21:32:52+02:00`
- `2018-10-26T19:32:52Z`
- `2018-10-26T19:32:52+00:00`
- `2018-10-26T21:32:52.12679`

Unsupported dates and times include the following:

- `2018-10-26T21:32` (if a time is specified then all of its parts must be present)
- `2018-10-26T`**`25`**`:32:52+02:00` (the hours part, 25, is out of range)
- `18-10-26T21:32` (the year is not specified fully)

Examples

```
SELECT TO_UTC_TIMESTAMP_TZ('1998-01-01') FROM DUAL;

TO_UTC_TIMESTAMP_TZ('1998-01-01')
---------------------------------------------------------------------------
01-JAN-98 12.00.00.000000000 AM +00:00

SELECT TO_UTC_TIMESTAMP_TZ('2000-01-02T12:34:56.789') FROM DUAL;

TO_UTC_TIMESTAMP_TZ('2000-01-02T12:34:56.789')
---------------------------------------------------------------------------
02-JAN-00 12.34.56.789000000 PM +00:00

SELECT TO_UTC_TIMESTAMP_TZ('2016-05-05T00:00:00.000Z') FROM DUAL;

TO_UTC_TIMESTAMP_TZ('2016-05-05T00:00:00.000Z')
---------------------------------------------------------------------------
05-MAY-16 12.00.00.000000000 AM +00:00

SELECT TO_UTC_TIMESTAMP_TZ('2016-05-05T02:04:35.4678Z') FROM DUAL;

TO_UTC_TIMESTAMP_TZ('2016-05-05T02:04:35.4678Z')
---------------------------------------------------------------------------
05-MAY-16 02.04.35.467800000 AM +00:00
```

TO_VECTOR

`TO_VECTOR` is a constructor that takes a string of type `VARCHAR2`, `CLOB`, `BLOB`, or `JSON` as input, converts it to a vector, and returns a vector as output. `TO_VECTOR` also takes another vector as input, adjusts its format, and returns the adjusted vector as output. `TO_VECTOR` is synonymous with `VECTOR`.

Syntax

Parameters

- *expr* must evaluate to one of:
  - A string (of character types or `CLOB`) that represents a vector.
  - A `VECTOR`.
  - A `BLOB`. The `BLOB` must represent the vector's binary bytes.
  - A JSON array. All elements in the array must be numeric.

  If *expr* is NULL, the result is NULL.

  The string representation of the vector must be in the form of an array of non-null numbers enclosed with a bracket and separated by commas, such as `[1, 3.4, -05.60, 3e+4]`. `TO_VECTOR` converts a valid string representation of a vector to a vector in the format specified. If no format is specified the default format is used.
- *number_of_dimensions* must be a numeric value that describes the number of dimensions of the vector to construct. The number of dimensions may also be specified as an asterisk (*), in which case the dimension is determined by *expr*.
- *format* must be one of the following tokens: `INT8`, `FLOAT32`, `FLOAT64`, `BINARY`, or `*`. This is the target internal storage format of the vector. If `*` is used, the format will be `FLOAT32`.

  Note that this behavior is different from declaring a vector column. When you declare a column of type `VECTOR(3, *)`, then all inserted vectors will be stored as is without a change in format.
- *storage_format* must be one of the following tokens: `DENSE`, `SPARSE`, or `*`. If no storage format is specified or if `*` is used, the following will be observed depending on the input type:
  - Textual input: the storage format will default to `DENSE`.
  - JSON input: the storage format will default to `DENSE`.
  - `VECTOR` input: there is no default and the storage format is not changed.
  - `BLOB` input: there is no default and the storage format is not changed.

Examples

```
SELECT TO_VECTOR('[34.6, 77.8]');
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
TO_VECTOR('[34.6,77.8]')
-------------------------------------------------------
[3.45999985E+001,7.78000031E+001]

SELECT TO_VECTOR('[34.6, 77.8]', 2, FLOAT32);

TO_VECTOR('[34.6,77.8]',2,FLOAT32)
-------------------------------------------------------
[3.45999985E+001,7.78000031E+001]

SELECT TO_VECTOR('[34.6, 77.8, -89.34]', 3, FLOAT32);

TO_VECTOR('[34.6,77.8,-89.34]',3,FLOAT32)
-----------------------------------------------------------
[3.45999985E+001,7.78000031E+001,-8.93399963E+001]

SELECT TO_VECTOR('[34.6, 77.8, -89.34]', 3, FLOAT32, DENSE);

TO_VECTOR('[34.6,77.8,-89.34]',3,FLOAT32,DENSE)
-----------------------------------------------------------------
[3.45999985E+001,7.78000031E+001,-8.93399963E+001]
```

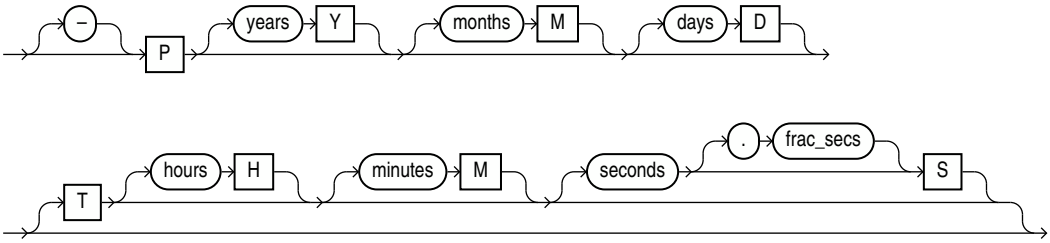
Note

- For applications using Oracle Client libraries prior to 26ai connected to Oracle Database 26ai, use the `TO_VECTOR` function to insert vector data. For example:

  ```
  INSERT INTO vecTab VALUES(TO_VECTOR('[1.1, 2.9, 3.14]'));
  ```

- Applications using Oracle Client 26ai libraries or Thin mode drivers can insert vector data directly as a string or a `CLOB`. For example:

  ```
  INSERT INTO vecTab VALUES ('[1.1, 2.9, 3.14]');
  ```



TO_YMINTERVAL

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

***ym_iso_format*::=**

Purpose

`TO_YMINTERVAL` converts its argument to a value of `INTERVAL MONTH TO YEAR` data type.

For the argument, you can specify any expression that evaluates to a character string of `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2` data type.

`TO_YMINTERVAL` accepts argument in one of the two formats:

- SQL interval format compatible with the SQL standard (ISO/IEC 9075)
- ISO duration format compatible with the ISO 8601:2004 standard

In the SQL format, *`years`* is an integer between 0 and 999999999, and *`months`* is an integer between 0 and 11. Additional blanks are allowed between format elements.

In the ISO format, years and months are integers between 0 and 999999999. Days, *`hours`*, *`minutes`*, *`seconds`*, and frac_secs are non-negative integers, and are ignored, if specified. No blanks are allowed in the value. If you specify `T`, then you must specify at least one of the *`hours`*, *`minutes`*, or *`seconds`* values.

The optional `DEFAULT` *`return_value`* `ON CONVERSION ERROR` clause allows you to specify the value this function returns if an error occurs while converting the argument to an `INTERVAL MONTH TO YEAR` type. This clause has no effect if an error occurs while evaluating the argument. The *`return_value`* can be an expression or a bind variable, and it must evaluate to a character string of `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2` data type. It can be in either the SQL format or ISO format, and need not be in the same format as the function argument. If *`return_value`* cannot be converted to an `INTERVAL MONTH TO YEAR` type, then the function returns an error.

Examples

The following example calculates for each employee in the sample `hr.employees` table a date one year two months after the hire date:

```
SELECT hire_date, hire_date + TO_YMINTERVAL('01-02') "14 months"
   FROM employees;

HIRE_DATE 14 months
--------- ---------
17-JUN-03 17-AUG-04
21-SEP-05 21-NOV-06
13-JAN-01 13-MAR-02
20-MAY-08 20-JUL-09
21-MAY-07 21-JUL-08

. . .
```

The following example makes the same calculation using the ISO format:

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
SELECT hire_date, hire_date + TO_YMINTERVAL('P1Y2M') FROM employees;
```

The following example returns the default value because the specified expression cannot be converted to an `INTERVAL MONTH TO YEAR` value:

```
SELECT TO_YMINTERVAL('1x-02'
       DEFAULT '00-00' ON CONVERSION ERROR) "Value"
  FROM DUAL;

Value
-------------
+000000000-00
```

TRANSLATE

Syntax

Purpose

`TRANSLATE` returns *`expr`* with all occurrences of each character in *`from_string`* replaced by its corresponding character in *`to_string`*. Characters in *`expr`* that are not in *`from_string`* are not replaced. The argument *`from_string`* can contain more characters than *`to_string`*. In this case, the extra characters at the end of *`from_string`* have no corresponding characters in *`to_string`*. If these extra characters appear in *`expr`*, then they are removed from the return value.

If a character appears multiple times in *`from_string`*, then the *`to_string`* mapping corresponding to the first occurrence is used.

You cannot use an empty string for *`to_string`* to remove all characters in *`from_string`* from the return value. Oracle Database interprets the empty string as null, and if this function has a null argument, then it returns null. To remove all characters in *`from_string`*, concatenate another character to the beginning of *`from_string`* and specify this character as the *`to_string`*. For example, `TRANSLATE`(*`expr`*, '`x0123456789`', '`x`') removes all digits from *`expr`*.

`TRANSLATE` provides functionality related to that provided by the `REPLACE` function. `REPLACE` lets you substitute a single string for another single string, as well as remove character strings. `TRANSLATE` lets you make several single-character, one-to-one substitutions in one operation.

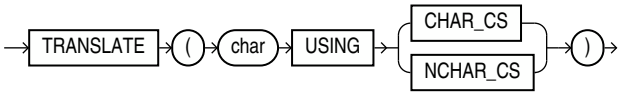
This function does not support `CLOB` data directly. However, `CLOB`s can be passed in as arguments through implicit data conversion.

See Also

- "Data Type Comparison Rules " for more information and REPLACE
- Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation `TRANSLATE` uses to compare characters from *`expr`* with characters from *`from_string`*, and for the collation derivation rules, which define the collation assigned to the character return value of `TRANSLATE`

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples



The following statement translates a book title into a string that could be used (for example) as a filename. The *from_string* contains four characters: a space, asterisk, slash, and apostrophe (with an extra apostrophe as the escape character). The *to_string* contains only three underscores. This leaves the fourth character in the *from_string* without a corresponding replacement, so apostrophes are dropped from the returned value.

```
SELECT TRANSLATE('SQL*Plus User''s Guide', ' */''', '___') FROM DUAL;

TRANSLATE('SQL*PLUSU
--------------------
SQL_Plus_Users_Guide
```

TRANSLATE ... USING

Syntax

Purpose

`TRANSLATE ... USING` converts *char* into the character set specified for conversions between the database character set and the national character set.

> **Note**
>
> The `TRANSLATE ... USING` function is supported primarily for ANSI compatibility. Oracle recommends that you use the `TO_CHAR` and `TO_NCHAR` functions, as appropriate, for converting data to the database or national character set. `TO_CHAR` and `TO_NCHAR` can take as arguments a greater variety of data types than `TRANSLATE ... USING`, which accepts only character data.

The *char* argument is the expression to be converted.

- Specifying the `USING CHAR_CS` argument converts *char* into the database character set. The output data type is `VARCHAR2`.
- Specifying the `USING NCHAR_CS` argument converts *char* into the national character set. The output data type is `NVARCHAR2`.

This function is similar to the Oracle `CONVERT` function, but must be used instead of `CONVERT` if either the input or the output data type is being used as `NCHAR` or `NVARCHAR2`. If the input contains UCS2 code points or backslash characters (\), then use the `UNISTR` function.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> - CONVERT and UNISTR
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of TRANSLATE ... USING

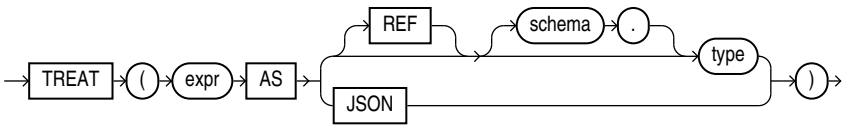
Examples

The following statements use data from the sample table oe.product_descriptions to show the use of the TRANSLATE ... USING function:

```
CREATE TABLE translate_tab (char_col  VARCHAR2(100),
                            nchar_col NVARCHAR2(50));
INSERT INTO translate_tab
   SELECT NULL, translated_name
      FROM product_descriptions
      WHERE product_id = 3501;

SELECT * FROM translate_tab;

CHAR_COL             NCHAR_COL
-------------------- --------------------------------------------------
. . .
                     C pre SPNIX4.0 - Sys
                     C pro SPNIX4.0 - Sys
                     C til SPNIX4.0 - Sys
                     C voor SPNIX4.0 - Sys
. . .



UPDATE translate_tab
   SET char_col = TRANSLATE (nchar_col USING CHAR_CS);

SELECT * FROM translate_tab;

```

TREAT

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

You can use the TREAT function to change the declared type of an expression.

Use the keywords AS JSON when you want the expression to return JSON data. This is useful when you want to force some text to be interpreted as JSON data. For example, you can use it to interpret a VARCHAR2 value of {} as an empty JSON object instead of a string.

You must have the EXECUTE object privilege on *type* to use this function.

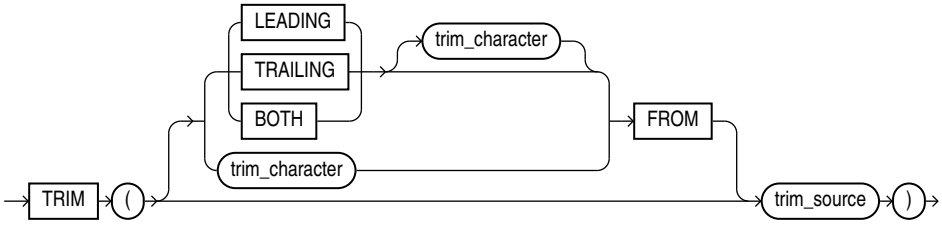
- In *expr AS JSON* , *expr* is a SQL data type containing JSON, for example CLOB.
- In *expr AS type* , *expr* and *type* must be a user-defined object types, excluding top-level collections.
- *type* must be some supertype or subtype of the declared type of *expr*. If the most specific type of *expr* is *type* (or some subtype of *type*), then TREAT returns *expr*. If the most specific type of *expr* is not *type* (or some subtype of *type*), then TREAT returns NULL.
- You can specify REF only if the declared type of *expr* is a REF type.
- If the declared type of *expr* is a REF to a source type of *expr*, then *type* must be some subtype or supertype of the source type of *expr*. If the most specific type of DEREF(*expr*) is *type* (or a subtype of *type*), then TREAT returns *expr*. If the most specific type of DEREF(*expr*) is not *type* (or a subtype of *type*), then TREAT returns NULL.

> **See Also**
>
> "Data Type Comparison Rules " for more information

Examples

The following statement uses the table oe.persons, which is created in "Substitutable Table and Column Examples". The example retrieves the salary attribute of all people in the persons table, the value being null for instances of people that are not employees.

```
SELECT name, TREAT(VALUE(p) AS employee_t).salary salary
   FROM persons p;



NAME                         SALARY
------------------------- ----------
Bob
Joe                          100000
Tim                            1000
```

You can use the TREAT function to create an index on the subtype attributes of a substitutable column. For an example, see "Indexing on Substitutable Columns: Examples".

Copyright © 1996, 2026, Oracle and/or its affiliates.

TRIM

Syntax

Purpose

`TRIM` enables you to trim leading or trailing characters (or both) from a character string. If *`trim_character`* or *`trim_source`* is a character literal, then you must enclose it in single quotation marks.

- If you specify `LEADING`, then Oracle Database removes any leading characters equal to *`trim_character`*.
- If you specify `TRAILING`, then Oracle removes any trailing characters equal to *`trim_character`*.
- If you specify `BOTH` or none of the three, then Oracle removes leading and trailing characters equal to *`trim_character`*.
- If you do not specify *`trim_character`*, then the default value is a blank space.
- If you specify only *`trim_source`*, then Oracle removes leading and trailing blank spaces.
- The function returns a value with data type `VARCHAR2`. The maximum length of the value is the length of *`trim_source`*.
- If either *`trim_source`* or *`trim_character`* is null, then the `TRIM` function returns null.

Both *`trim_character`* and *`trim_source`* can be `VARCHAR2` or any data type that can be implicitly converted to `VARCHAR2`. The string returned is a `VARCHAR2` (`NVARCHAR2`) data type if *`trim_source`* is a `CHAR` or `VARCHAR2` (`NCHAR` or `NVARCHAR2`) data type, and a `CLOB` if *`trim_source`* is a `CLOB` data type. The return string is in the same character set as *`trim_source`*.

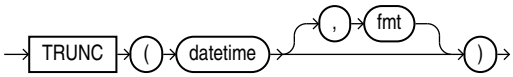
> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation `TRIM` uses to compare characters from *`trim_character`* with characters from *`trim_source`*, and for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

This example trims leading zeros from the hire date of the employees in the `hr` schema:

```
SELECT employee_id,
      TO_CHAR(TRIM(LEADING 0 FROM hire_date))
      FROM employees
```

Copyright © 1996, 2026, Oracle and/or its affiliates.



```
      WHERE department_id = 60
      ORDER BY employee_id;

EMPLOYEE_ID TO_CHAR(T
----------- ---------
        103 20-MAY-08
        104 21-MAY-07
        105 25-JUN-05
        106 5-FEB-06
        107 7-FEB-07
```

TRUNC (datetime)

Syntax

***trunc_datetime*::=**

Purpose

The `TRUNC` (datetime) function returns *`date`* with the time portion of the day truncated to the unit specified by the format model *`fmt`*.

This function is not sensitive to the `NLS_CALENDAR` session parameter. It operates according to the rules of the Gregorian calendar. The value returned is always of data type `DATE`, even if you specify a different datetime data type for date. If you do not specify the second argument *`fmt`*, then the default format model 'DD' is used and the value returned is *`date`* truncated to the day with a time of midnight.

The `TRUNC` and `FLOOR` functions are synonymous for dates and timestamps.

Refer to "CEIL, FLOOR, ROUND, and TRUNC Date Functions" for the permitted format models to use in *`fmt`*.

Examples

The following example truncates a date:

```
SELECT TRUNC(TO_DATE('27-OCT-92','DD-MON-YY'), 'YEAR')
  "New Year" FROM DUAL;

New Year
---------
01-JAN-92
```

Formatting Dates using TRUNC: Examples

In the following example, the `TRUNC` function returns the input date with the time portion of the day truncated as specified in the format model:

```
WITH dates AS (
  SELECT date'2015-01-01' d FROM dual union
  SELECT date'2015-01-10' d FROM dual union
  SELECT date'2015-02-01' d FROM dual union
  SELECT timestamp'2015-03-03 23:45:00' d FROM dual union
  SELECT timestamp'2015-04-11 12:34:56' d FROM dual
```

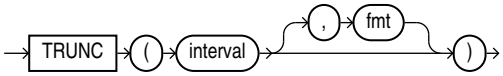
Copyright © 1996, 2026, Oracle and/or its affiliates.

```
)
SELECT d "Original Date",
       trunc(d) "Nearest Day, Time Removed",
       trunc(d, 'ww') "Nearest Week",
       trunc(d, 'iw') "Start of Week",
       trunc(d, 'mm') "Start of Month",
       trunc(d, 'year') "Start of Year"
FROM dates;
```

In the following example, the input date values are truncated and the `TO_CHAR` function is used to obtain the minute component of the truncated date values:

```
WITH dates AS (
  SELECT date'2015-01-01' d FROM dual union
  SELECT date'2015-01-10' d FROM dual union
  SELECT date'2015-02-01' d FROM dual union
  SELECT timestamp'2015-03-03 23:45:00' d FROM dual union
  SELECT timestamp'2015-04-11 12:34:56' d FROM dual
)
SELECT d "Original Date",
       trunc(d) "Date with Time Removed",
       to_char(trunc(d, 'mi'), 'dd-mon-yyyy hh24:mi') "Nearest Minute",
       trunc(d, 'iw') "Start of Week",
       trunc(d, 'mm') "Start of Month",
       trunc(d, 'year') "Start of Year"
FROM dates;
```

The following statement alters the date format for the current session:



```
ALTER SESSION SET nls_date_format = 'dd-mon-yyyy hh24:mi';
```

In the following example, the data is displayed in the new date format:

```
WITH dates AS (
  SELECT date'2015-01-01' d FROM dual union
  SELECT date'2015-01-10' d FROM dual union
  SELECT date'2015-02-01' d FROM dual union
  SELECT timestamp'2015-03-03 23:44:32' d FROM dual union
  SELECT timestamp'2015-04-11 12:34:56' d FROM dual
)
SELECT d "Original Date",
       trunc(d) "Date, time removed",
       to_char(trunc(d, 'mi'), 'dd-mon-yyyy hh24:mi') "Nearest Minute",
       trunc(d, 'iw') "Start of Week",
       trunc(d, 'mm') "Start of Month",
       trunc(d, 'year') "Start of Year"
FROM dates;
```

TRUNC (interval)

Syntax

Purpose

`TRUNC(interval)` returns the interval rounded down to the unit specified by the second argument *`fmt`*, the format model .

Copyright © 1996, 2026, Oracle and/or its affiliates.

The absolute value of `TRUNC(interval)` is never greater than the absolute value of *`interval`*. The result precision is the same as the input precision, since there is no overflow issue for `TRUNC(interval)`.

For `INTERVAL YEAR TO MONTH`, *`fmt`* can only be year. The default *`fmt`* is year.

For `INTERVAL DAY TO SECOND`, *`fmt`* can be day, hour and minute. The default *`fmt`* is day. Note that *`fmt`* does not support second.

> **See Also**
>
> Refer to CEIL, FLOOR, ROUND, and TRUNC Date Functions for the permitted format models to use in *`fmt`*.

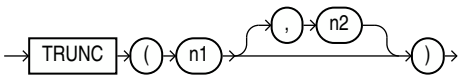
Examples

```
SELECT TRUNC(INTERVAL '+123-06' YEAR(3) TO MONTH) AS year_trunc;

YEAR_TRUNC
----------
+123-00

SELECT TRUNC(INTERVAL '+99-11' YEAR(2) TO MONTH, 'YEAR') AS year_trunc;

YEAR_TRUNC
----------
+99-00



SELECT TRUNC(INTERVAL '+4 12:42:10.222' DAY(2) TO SECOND(3), 'DD') AS day_trunc;

DAY_TRUNC
-------------------
+04 00:00:00.000000
```

TRUNC (number)

Syntax

***trunc_number*::=**

Purpose

The `TRUNC` (number) function returns *n1* truncated to *n2* decimal places. If *n2* is omitted, then *n1* is truncated to 0 places. *n2* can be negative to truncate (make zero) *n2* digits left of the decimal point.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If you omit *n2*, then the function returns the

Copyright © 1996, 2026, Oracle and/or its affiliates.

same data type as the numeric data type of the argument. If you include *n2*, then the function returns NUMBER.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

Examples

The following examples truncate numbers:

```
SELECT TRUNC(15.79,1) "Truncate" FROM DUAL;

  Truncate
----------
      15.7

SELECT TRUNC(15.79,-1) "Truncate" FROM DUAL;

  Truncate
----------
        10
```

TZ_OFFSET

Syntax

Purpose

TZ_OFFSET returns the time zone offset corresponding to the argument based on the date the statement is executed. You can enter a valid time zone region name, a time zone offset from UTC (which simply returns itself), or the keyword SESSIONTIMEZONE or DBTIMEZONE. For a listing of valid values for *time_zone_name*, query the TZNAME column of the V$TIMEZONE_NAMES dynamic performance view.

> **Note**
>
> Time zone region names are needed by the daylight saving feature. These names are stored in two types of time zone files: one large and one small. One of these files is the default file, depending on your environment and the release of Oracle Database you are using. For more information regarding time zone files and names, see *Oracle Database Globalization Support Guide*.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `TZ_OFFSET`

Examples

The following example returns the time zone offset of the US/Eastern time zone from UTC:

```
SELECT TZ_OFFSET('US/Eastern') FROM DUAL;

TZ_OFFS
-------
-04:00
```

UID

Syntax

Purpose

`UID` returns an integer that uniquely identifies the session user (the user who logged on).

> **See Also**
>
> USER to learn how Oracle Database determines the session user

Examples

The following example returns the UID of the session user:

```
SELECT UID FROM DUAL;
```

UNISTR

Syntax

Purpose

`UNISTR` takes as its argument a text literal or an expression that resolves to character data and returns it in the national character set. The national character set of the database can be either AL16UTF16 or UTF8. `UNISTR` provides support for Unicode string literals by letting you specify

Copyright © 1996, 2026, Oracle and/or its affiliates.

the Unicode encoding value of characters in the string. This is useful, for example, for inserting data into NCHAR columns.

The Unicode encoding value has the form '\xxxx' where 'xxxx' is the hexadecimal value of a character in UCS-2 encoding format. Supplementary characters are encoded as two code units, the first from the high-surrogates range (U+D800 to U+DBFF), and the second from the low-surrogates range (U+DC00 to U+DFFF). To include the backslash in the string itself, precede it with another backslash (\\).

For portability and data preservation, Oracle recommends that in the UNISTR string argument you specify only ASCII characters and the Unicode encoding values.

See Also

- *Oracle Database Globalization Support Guide* for information on Unicode and national character sets
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of UNISTR

Examples

The following example passes both ASCII characters and Unicode encoding values to the UNISTR function, which returns the string in the national character set:

```
SELECT UNISTR('abc\00e5\00f1\00f6') FROM DUAL;

UNISTR
------
abcåñö
```

UPPER

Syntax

Purpose

UPPER returns *char*, with all letters uppercase. *char* can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The return value is the same data type as *char*. The database sets the case of the characters based on the binary mapping defined for the underlying character set. For linguistic-sensitive uppercase, refer to NLS_UPPER .

See Also

Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of UPPER

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

The following example returns each employee's last name in uppercase:

```
SELECT UPPER(last_name) "Uppercase"
   FROM employees;
```

USER

Syntax

Purpose

`USER` returns the name of the session user (the user who logged on). This may change during the duration of a database session as Real Application Security sessions are attached or detached. If a Real Application Security session is currently attached to the database session, then it returns user `XS$NULL`.

This function returns a `VARCHAR2` value.

Oracle Database compares values of this function with blank-padded comparison semantics.

In a distributed SQL statement, the `UID` and `USER` functions together identify the user on your local database. You cannot use these functions in the condition of a `CHECK` constraint.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `USER`

Examples

The following example returns the session user and the user's UID:

```
SELECT USER, UID FROM DUAL;
```

USERENV

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

> **Note**
>
> USERENV is a legacy function that is retained for backward compatibility. Oracle recommends that you use the SYS_CONTEXT function with the built-in USERENV namespace for current functionality. See SYS_CONTEXT for more information.

USERENV returns information about the current session. This information can be useful for writing an application-specific audit trail table or for determining the language-specific characters currently used by your session. You cannot use USERENV in the condition of a CHECK constraint. Table 7-19 describes the values for the *parameter* argument.

All calls to USERENV return VARCHAR2 data except for calls with the SESSIONID, SID, and ENTRYID parameters, which return NUMBER.

Table 7-19 Parameters of the USERENV Function

Parameter	Return Value
CLIENT_INFO	CLIENT_INFO returns up to 64 bytes of user session information that can be stored by an application using the DBMS_APPLICATION_INFO package. **Caution:** Some commercial applications may be using this context value. Refer to the applicable documentation for those applications to determine what restrictions they may impose on use of this context area. **See Also:** *Oracle Database Security Guide* for more information on application context, CREATE CONTEXT, and SYS_CONTEXT
ENTRYID	The current audit entry number. The audit entryid sequence is shared between fine-grained audit records and regular audit records. You cannot use this attribute in distributed SQL statements.
ISDBA	ISDBA returns 'TRUE' if the user has been authenticated as having DBA privileges either through the operating system or through a password file.
LANG	LANG returns the ISO abbreviation for the language name, a shorter form than the existing 'LANGUAGE' parameter.
LANGUAGE	LANGUAGE returns the language and territory used by the current session along with the database character set in this form: `language_territory.characterset`
SESSIONID	SESSIONID returns the auditing session identifier. You cannot specify this parameter in distributed SQL statements.
SID	SID returns the session ID.
TERMINAL	TERMINAL returns the operating system identifier for the terminal of the current session. In distributed SQL statements, this parameter returns the identifier for your local session. In a distributed environment, this parameter is supported only for remote SELECT statements, not for remote INSERT, UPDATE, or DELETE operations.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `USERENV`

Examples

The following example returns the `LANGUAGE` parameter of the current session:

```
SELECT USERENV('LANGUAGE') "Language" FROM DUAL;

Language
----------------------------------
AMERICAN_AMERICA.WE8ISO8859P1
```

UUID

Syntax

`UUID` returns a version 4 variant 1 UUID as a `RAW(16)` value in the format:

`xxxxxxxx-xxxx-4xxx-Bxxx-xxxxxxxxxxxx` where `x` is a hexadecimal digit.

`UUID` can optionally take as input a *`version_specifier`* of `NUMBER` type. `UUID(0)` and `UUID(4)` are equivalent to UUID() in that in both cases a version 4 variant 1 UUID is returned.

Versions other than 4 and 0 return an error.

Example

```
SELECT UUID() from dual;
```

The output is:

```
UUID()

--------------------------------

848DC57A12AA4F81BFB42EA509879467
```

Note: RAW(16) is converted into printable form.

UUID_TO_RAW

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

`UUID_TO_RAW` converts the input argument *`uuid_string`* into internal format of `RAW(16)` if it passes the check of `IS_UUID(uuid_string)`. If the validation fails, it returns an error.

`uuid_string` must be in the ASCII character set. The string may optionally enclosed in `'{'` and `'}'`. It may also contain hyphens. If hyphens are present all four of the must be present and they must in character positions 9, 14, 19, 24 after discarding any braces.

If the input is NULL, it returns NULL.

Example 1

```
SELECT UUID_TO_RAW ('{82e19137-f810-44ad-b26e-379d828408a1}') FROM DUAL;
```

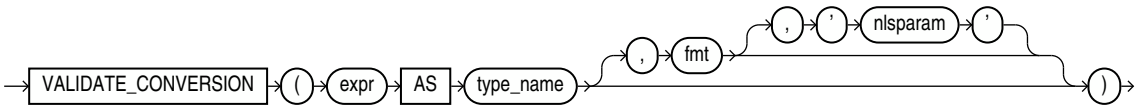
The output is:

```
UUID_TO_RAW('{82E19137-F810-44AD
--------------------------------
82E19137F81044ADB26E379D828408A1
```

Note that `RAW(16)` is converted into printable form.

Example 2

```
SELECT UUID_TO_RAW('{d20f8c3c-de13-4b95-8d25-eff3fbdb7e71}')  FROM DUAL;
```



The output is:

```
ERROR at line 1:

ORA-62432: {d20f8c3c-de13-4b95-8d25-eff3fbdb7e71} is not a valid UUID value
```

VALIDATE_CONVERSION

Syntax

Purpose

`VALIDATE_CONVERSION` determines whether *`expr`* can be converted to the specified data type. If *`expr`* can be successfully converted, then this function returns 1; otherwise, this function returns 0. If *`expr`* evaluates to null, then this function returns 1. If an error occurs while evaluating *`expr`*, then this function returns the error.

For *`expr`*, specify a SQL expression. The acceptable data types for *`expr`*, and the purpose of the optional *`fmt`* and *`nlsparam`* arguments, depend on the data type you specify for *`type_name`*.

For *`type_name`*, specify the data type to which you want to convert *`expr`*. You can specify the following data types:

- `BINARY_DOUBLE`

Copyright © 1996, 2026, Oracle and/or its affiliates.

If you specify BINARY_DOUBLE, then *expr* can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, or a numeric value of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE. The optional *fmt* and *nlsparam* arguments serve the same purpose as for the TO_BINARY_DOUBLE function. Refer to TO_BINARY_DOUBLE for more information.

- BINARY_FLOAT

  If you specify BINARY_FLOAT, then *expr* can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, or a numeric value of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE. The optional *fmt* and *nlsparam* arguments serve the same purpose as for the TO_BINARY_FLOAT function. Refer to TO_BINARY_FLOAT for more information.

- DATE

  If you specify DATE, then *expr* can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type. The optional *fmt* and *nlsparam* arguments serve the same purpose as for the TO_DATE function. Refer to TO_DATE for more information.

- INTERVAL DAY TO SECOND

  If you specify INTERVAL DAY TO SECOND, then *expr* can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, and must contain a value in either the SQL interval format or the ISO duration format. The optional *fmt* and *nlsparam* arguments do not apply for this data type. Refer to TO_DSINTERVAL for more information on the SQL interval format and the ISO duration format.

- INTERVAL YEAR TO MONTH

  If you specify INTERVAL YEAR TO MONTH, then *expr* can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, and must contain a value in either the SQL interval format or the ISO duration format. The optional *fmt* and *nlsparam* arguments do not apply for this data type. Refer to TO_YMINTERVAL for more information on the SQL interval format and the ISO duration format.

- NUMBER

  If you specify NUMBER, then *expr* can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, a numeric value of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE or value of type BOOLEAN. The optional *fmt* and *nlsparam* arguments serve the same purpose as for the TO_NUMBER function. Refer to TO_NUMBER for more information.

  If *expr* is a value of type NUMBER, then the VALIDATE_CONVERSION function verifies that *expr* is a legal numeric value. If *expr* is not a legal numeric value, then the function returns 0. This enables you to identify corrupt numeric values in your database.

- TIMESTAMP

  If you specify TIMESTAMP, then *expr* can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type. The optional *fmt* and *nlsparam* arguments serve the same purpose as for the TO_TIMESTAMP function. If you omit *fmt*, then *expr* must be in the default format of the TIMESTAMP data type, which is determined by the NLS_TIMESTAMP_FORMAT initialization parameter. Refer to TO_TIMESTAMP for more information.

- TIMESTAMP WITH TIME ZONE

  If you specify TIMESTAMP WITH TIME ZONE, then *expr* can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type. The optional *fmt*

Copyright © 1996, 2026, Oracle and/or its affiliates.

and *nlsparam* arguments serve the same purpose as for the TO_TIMESTAMP_TZ function. If you omit *fmt*, then *expr* must be in the default format of the TIMESTAMP WITH TIME ZONE data type, which is determined by the NLS_TIMESTAMP_TZ_FORMAT initialization parameter. Refer to TO_TIMESTAMP_TZ for more information.

- TIMESTAMP WITH LOCAL TIME ZONE

  If you specify TIMESTAMP, then *expr* can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type. The optional *fmt* and *nlsparam* arguments serve the same purpose as for the TO_TIMESTAMP function. If you omit *fmt*, then *expr* must be in the default format of the TIMESTAMP data type, which is determined by the NLS_TIMESTAMP_FORMAT initialization parameter. Refer to TO_TIMESTAMP for more information.

- BOOLEAN

  BOOLEAN is supported as a target type. It supports NUMBER type family, VARCHAR type family, and BOOLEAN itself as input.

Examples

In each of the following statements, the specified value can be successfully converted to the specified data type. Therefore, each of these statements returns a value of 1.

```
SELECT VALIDATE_CONVERSION(1000 AS BINARY_DOUBLE)
  FROM DUAL;

SELECT VALIDATE_CONVERSION('1234.56' AS BINARY_FLOAT)
  FROM DUAL;

SELECT VALIDATE_CONVERSION('July 20, 1969, 20:18' AS DATE,
    'Month dd, YYYY, HH24:MI', 'NLS_DATE_LANGUAGE = American')
  FROM DUAL;

SELECT VALIDATE_CONVERSION('200 00:00:00' AS INTERVAL DAY TO SECOND)
  FROM DUAL;

SELECT VALIDATE_CONVERSION('P1Y2M' AS INTERVAL YEAR TO MONTH)
  FROM DUAL;

SELECT VALIDATE_CONVERSION('$100,00' AS NUMBER,
    '$999D99', 'NLS_NUMERIC_CHARACTERS = '',.''')
  FROM DUAL;

SELECT VALIDATE_CONVERSION('29-Jan-02 17:24:00' AS TIMESTAMP,
    'DD-MON-YY HH24:MI:SS')
  FROM DUAL;

SELECT VALIDATE_CONVERSION('1999-12-01 11:00:00 -8:00'
    AS TIMESTAMP WITH TIME ZONE, 'YYYY-MM-DD HH:MI:SS TZH:TZM')
  FROM DUAL;

SELECT VALIDATE_CONVERSION('11-May-16 17:30:00'
    AS TIMESTAMP WITH LOCAL TIME ZONE, 'DD-MON-YY HH24:MI:SS')
  FROM DUAL;
```

The following statement returns 0, because the specified value cannot be converted to BINARY_FLOAT:

```
SELECT VALIDATE_CONVERSION('$29.99' AS BINARY_FLOAT)
  FROM DUAL;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following statement returns 1, because the specified number format model enables the value to be converted to `BINARY_FLOAT`:

```
SELECT VALIDATE_CONVERSION('$29.99' AS BINARY_FLOAT, '$99D99')
  FROM DUAL;
```

VALUE

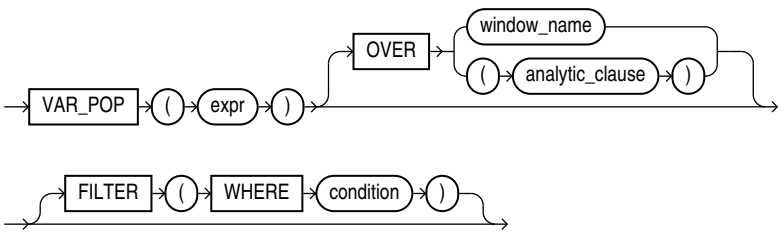
Syntax

Purpose

`VALUE` takes as its argument a correlation variable (table alias) associated with a row of an object table and returns object instances stored in the object table. The type of the object instances is the same type as the object table.

Examples

The following example uses the sample table `oe.persons`, which is created in "Substitutable Table and Column Examples":



```
SELECT VALUE(p) FROM persons p;

VALUE(P)(NAME, SSN)
-----------------------------------------------------------
PERSON_T('Bob', 1234)
EMPLOYEE_T('Joe', 32456, 12, 100000)
PART_TIME_EMP_T('Tim', 5678, 13, 1000, 20)
```

> **See Also**
>
> "IS OF *type* Condition " for information on using `IS OF` type conditions with the `VALUE` function

VAR_POP

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

`VAR_POP` returns the population variance of a set of numbers after discarding the nulls in this set. You can use it as both an aggregate and analytic function.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

If the function is applied to an empty set, then it returns null. The function makes the following calculation:

$$\texttt{SUM((expr - (SUM(expr) / COUNT(expr)))}^2\texttt{) / COUNT(expr)}$$

> **See Also**
>
> "About SQL Expressions " for information on valid forms of *expr* and "Aggregate Functions "

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Aggregate Example

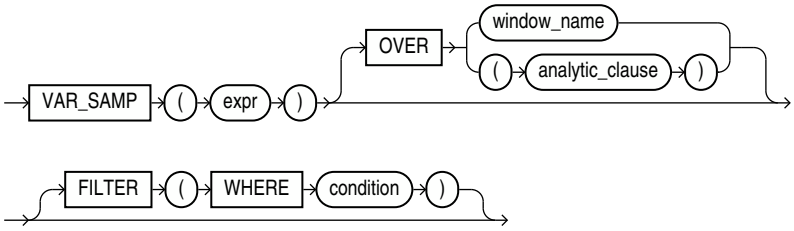
The following example returns the population variance of the salaries in the `employees` table:

```
SELECT VAR_POP(salary) FROM employees;

VAR_POP(SALARY)
---------------
     15141964.9
```

Analytic Example

The following example calculates the cumulative population and sample variances in the `sh.sales` table of the monthly sales in 1998:



```
SELECT t.calendar_month_desc,
   VAR_POP(SUM(s.amount_sold))
      OVER (ORDER BY t.calendar_month_desc) "Var_Pop",
   VAR_SAMP(SUM(s.amount_sold))
      OVER (ORDER BY t.calendar_month_desc) "Var_Samp"
  FROM sales s, times t
  WHERE s.time_id = t.time_id AND t.calendar_year = 1998
  GROUP BY t.calendar_month_desc
  ORDER BY t.calendar_month_desc, "Var_Pop", "Var_Samp";
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
CALENDAR    Var_Pop   Var_Samp
-------- ---------- ----------
1998-01            0
1998-02  2269111326 4538222653
1998-03  5.5849E+10 8.3774E+10
1998-04  4.8252E+10 6.4336E+10
1998-05  6.0020E+10 7.5025E+10

1998-08  4.1345E+10 4.7252E+10
1998-09  3.9591E+10 4.4540E+10
1998-10  3.9995E+10 4.4439E+10
1998-11  3.6870E+10 4.0558E+10
1998-12  4.0216E+10 4.3872E+10
```

VAR_SAMP

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

VAR_SAMP returns the sample variance of a set of numbers after discarding the nulls in this set. You can use it as both an aggregate and analytic function.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion

If the function is applied to an empty set, then it returns null. The function makes the following calculation:

$(SUM(expr - (SUM(expr) / COUNT(expr)))^2) / (COUNT(expr) - 1)$

This function is similar to VARIANCE, except that given an input set of one element, VARIANCE returns 0 and VAR_SAMP returns null.

Copyright © 1996, 2026, Oracle and/or its affiliates.

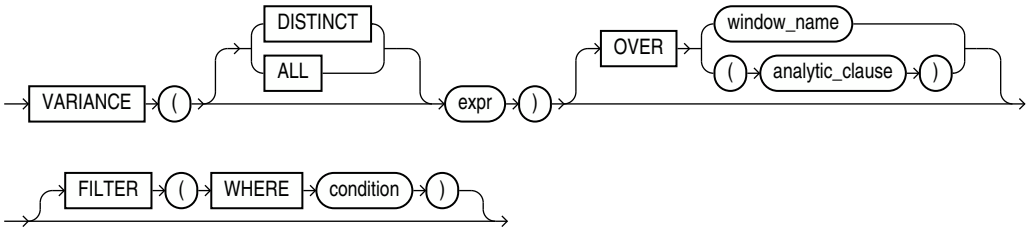
> **See Also**
>
> "About SQL Expressions " for information on valid forms of *expr* and "Aggregate Functions "

For the semantics of the FILTER clause, see FILTER Clause Semantics.

Aggregate Example

The following example returns the sample variance of the salaries in the sample employees table.

```
SELECT VAR_SAMP(salary) FROM employees;



VAR_SAMP(SALARY)
----------------
      15284813.7
```

Analytic Example

Refer to the analytic example for VAR_POP .

VARIANCE

Syntax

> **See Also**
>
> "Analytic Functions " for information on syntax, semantics, and restrictions

Purpose

VARIANCE returns the variance of *expr*. You can use it as an aggregate or analytic function.

Oracle Database calculates the variance of *expr* as follows:

- 0 if the number of rows in *expr* = 1
- VAR_SAMP if the number of rows in *expr* > 1

If you specify DISTINCT, then you can specify only the *query_partition_clause* of the *analytic_clause*. The *order_by_clause* and *windowing_clause* are not allowed.

Copyright © 1996, 2026, Oracle and/or its affiliates.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

> **See Also**
>
> Table 2-9 for more information on implicit conversion, "About SQL Expressions " for information on valid forms of *expr* and "Aggregate Functions "

For the semantics of the `FILTER` clause, see FILTER Clause Semantics.

Aggregate Example

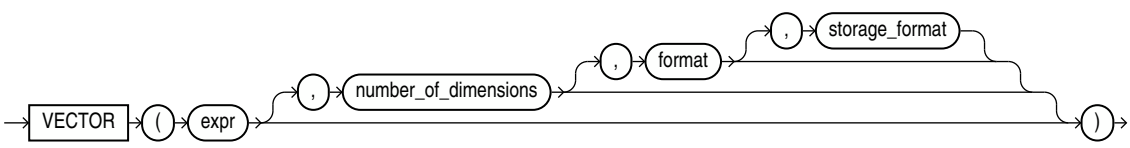
The following example calculates the variance of all salaries in the sample `employees` table:

```
SELECT VARIANCE(salary) "Variance"
   FROM employees;

  Variance
----------
15283140.5
```

Analytic Example

The following example returns the cumulative variance of salary values in Department 30 ordered by hire date.



```
SELECT last_name, salary, VARIANCE(salary)
      OVER (ORDER BY hire_date) "Variance"
   FROM employees
   WHERE department_id = 30
   ORDER BY last_name, salary, "Variance";

LAST_NAME                     SALARY   Variance
------------------------- ---------- ----------
Baida                           2900 16283333.3
Colmenares                      2500   11307000
Himuro                          2600   13317000
Khoo                            3100   31205000
Raphaely                       11000          0
Tobias                          2800 21623333.3
```

VECTOR

`VECTOR` is synonymous with `TO_VECTOR`.

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

See TO_VECTOR for semantics and examples.

> **Note**
>
> Applications using Oracle Client 26ai libraries or Thin mode drivers can insert vector data directly as a string or a CLOB. For example:
>
> ```
> INSERT INTO vecTab VALUES ('[1.1, 2.9, 3.14]');
> ```

Examples

```
SELECT VECTOR('[34.6, 77.8]');

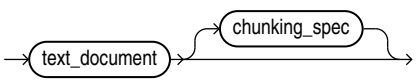
VECTOR('[34.6,77.8]')
-----------------------------------------------------
[3.45999985E+001,7.78000031E+001]

SELECT VECTOR('[34.6, 77.8]', 2, FLOAT32);

VECTOR('[34.6,77.8]',2,FLOAT32)
-------------------------------------------------------
[3.45999985E+001,7.78000031E+001]

SELECT VECTOR('[34.6, 77.8, -89.34]', 3, FLOAT32);

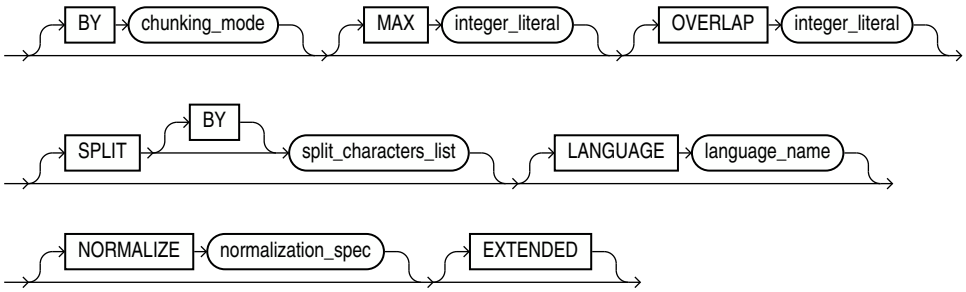
VECTOR('[34.6,77.8,-89.34]',3,FLOAT32)
---------------------------------------------------------
[3.45999985E+001,7.78000031E+001,-8.93399963E+001]
```



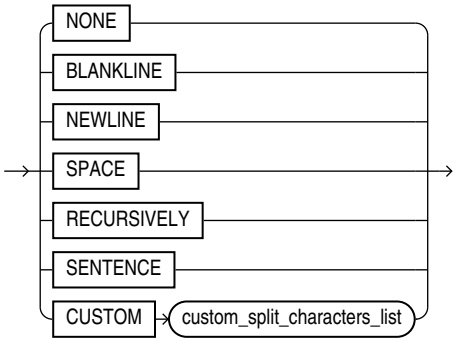
VECTOR_CHUNKS

Use VECTOR_CHUNKS to split plain text into smaller chunks to generate vector embeddings that can be used with vector indexes or hybrid vector indexes.

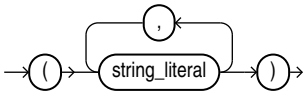
Syntax



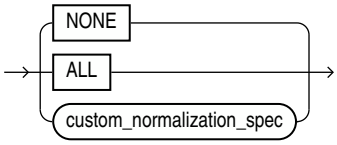
***chunks_table_arguments*::=**



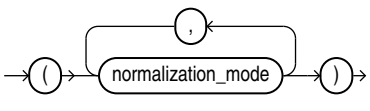
Copyright © 1996, 2026, Oracle and/or its affiliates.



***chunking_spec*::=**

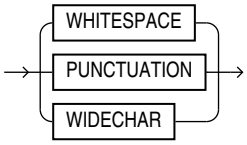


***split_characters_list*::=**

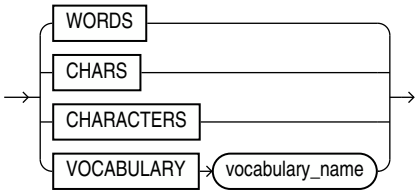


custom_split_characters_list

normalization_spec



custom_normalization_spec



Copyright © 1996, 2026, Oracle and/or its affiliates.

normalization_mode

***chunking_mode*::=**

Purpose

`VECTOR_CHUNKS` takes a character value as the *`text_document`* argument and splits it into chunks using a process controlled by the chunking parameters given in the optional *`chunking_spec`*. The chunks are returned as rows of a virtual relational table. Therefore, `VECTOR_CHUNKS` can only appear in the `FROM` clause of a subquery.

The returned virtual table has the following columns:

- `CHUNK_OFFSET` of data type `NUMBER` is the position of each chunk in the source document, relative to the start of the document, which has a position of 1.
- `CHUNK_LENGTH` of data type `NUMBER` is the length of each chunk.
- `CHUNK_TEXT` is a segment of text that has been split off from *`text_document`*.

The data type of the `CHUNK_TEXT` column and the length unit used by the values of `CHUNK_OFFSET` and `CHUNK_LENGTH` depend on the data type of *`text_document`* as listed in the following table:

Table 7-20 Input and Output Data Type Details

Input Data Type	Output Data Type	Offset and Length Unit
VARCHAR2	VARCHAR2	byte
CHAR	VARCHAR2	byte
CLOB	VARCHAR2	character
NVARCHAR2	NVARCHAR2	byte
NCHAR	NVARCHAR2	byte
NCLOB	NVARCHAR2	character

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **Note**
>
> - For more information about data types, see *Data Types* in the SQL Reference Manual.
> - The `VARCHAR2` input data type is limited to `4000` bytes unless the `MAX_STRING_SIZE` parameter is set to `EXTENDED`, which increases the limit to `32767`.

Parameters

All chunking parameters are optional, and the default chunking specifications are automatically applied to your chunk data.

When specifying chunking parameters for this API, ensure that you provide these parameters only in the listed order.

Table 7-21 Chunking Parameters Table

Parameter	Description and Acceptable Values
`BY`	Specifies the mode for splitting your data, that is, to split by counting the number of characters, words, or vocabulary tokens. **Valid values**: • `CHARACTERS` (or `CHARS`): Splits by counting the number of characters. • `WORDS`: Splits by counting the number of words. Words are defined as sequences of alphabetic characters, sequences of digits, individual punctuation marks, or symbols. For segmented languages without whitespace word boundaries (such as Chinese, Japanese, or Thai), each native character is considered a word (that is, unigram). • `VOCABULARY`: Splits by counting the number of vocabulary tokens. Vocabulary tokens are words or word pieces, recognized by the vocabulary of the tokenizer that your embedding model uses. You can load your vocabulary file using the `VECTOR_CHUNKS` helper API `DBMS_VECTOR_CHAIN.CREATE_VOCABULARY`. **Note**: For accurate results, ensure that the chosen model matches the vocabulary file used for chunking. If you are not using a vocabulary file, then ensure that the input length is defined within the token limits of your model. **Default value**: `WORDS`
`MAX`	Specifies a limit on the maximum size of each chunk. This setting splits the input text at a fixed point where the maximum limit occurs in the larger text. The units of `MAX` correspond to the `BY` mode, that is, to split data when it reaches the maximum size limit of a certain number of characters, words, numbers, punctuation marks, or vocabulary tokens. **Valid values**: • `BY CHARACTERS`: `50` to `4000` characters • `BY WORDS`: `10` to `1000` words • `BY VOCABULARY`: `10` to `1000` tokens **Default value**: `100`

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-21 (Cont.) Chunking Parameters Table

Parameter	Description and Acceptable Values
SPLIT [BY]	Specifies where to split the input text when it reaches the maximum size limit. This helps to keep related data together by defining appropriate boundaries for chunks. **Valid values**: • NONE: Splits at the MAX limit of characters, words, or vocabulary tokens. • NEWLINE, BLANKLINE, and SPACE: These are single-split character conditions that split at the last split character before the MAX value. Use NEWLINE to split at the end of a line of text. Use BLANKLINE to split at the end of a blank line (sequence of characters, such as two newlines). Use SPACE to split at the end of a blank space. • RECURSIVELY: This is a multiple-split character condition that breaks the input text using an ordered list of characters (or sequences). RECURSIVELY is predefined as BLANKLINE, NEWLINE, SPACE, NONE in this order: 1. If the input text is more than the MAX value, then split by the first split character. 2. If that fails, then split by the second split character. 3. And so on. 4. If no split characters exist, then split by MAX wherever it appears in the text. • SENTENCE: This is an end-of-sentence split condition that breaks the input text at a sentence boundary. This condition automatically determines sentence boundaries by using knowledge of the input language's sentence punctuation and contextual rules. This language-specific condition relies mostly on end-of-sentence (EOS) punctuations and common abbreviations. Contextual rules are based on word information, so this condition is only valid when splitting the text by words or vocabulary (not by characters). **Note**: This condition obeys the BY WORD and MAX settings, and thus may not determine accurate sentence boundaries in some cases. For example, when a sentence is larger than the MAX value, it splits the sentence at MAX. Similarly, it includes multiple sentences in the text only when they fit within the MAX limit. • CUSTOM: Splits based on a custom list of characters strings, for example, markup tags. You can provide custom sequences up to a limit of 16 split character strings, with a maximum length of 10 bytes each. Provide valid text literals as follows: `VECTOR_CHUNKS(c. doc, BY character SPLIT CUSTOM ('<html>' , '</html>')) vc` **Default value**: RECURSIVELY
OVERLAP	Specifies the amount (as a positive integer literal or zero) of the preceding text that the chunk should contain, if any. This helps in logically splitting up related text (such as a sentence) by including some amount of the preceding chunk text. The amount of overlap depends on how the maximum size of the chunk is measured (in characters, words, or vocabulary tokens). The overlap begins at the specified SPLIT condition (for example, at NEWLINE). **Valid value**: 5% to 20% of MAX **Default value**: 0

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-21 (Cont.) Chunking Parameters Table

Parameter	Description and Acceptable Values

LANGUAGE	Specifies the language of your input data.
	This clause is important, especially when your text contains certain characters (for example, punctuations or abbreviations) that may be interpreted differently in another language.
	Valid values:
	• NLS-supported language name or its abbreviation, as listed in *Oracle AI Database Globalization Support Guide*.
	• Custom language name or its abbreviation, as listed in Supported Languages and Data File Locations. You use the DBMS_VECTOR_CHAIN.CREATE_LANG_DATA chunker helper API to load language-specific data (abbreviation tokens) into the database, for your specified language.
	You must use double quotation marks (") for any language name with spaces. For example:
	`LANGUAGE "simplified chinese"`
	For one-word language names, quotation marks are not needed. For example:
	`LANGUAGE american`
	Default value: NLS_LANGUAGE from session

NORMALIZE	Automatically pre-processes or post-processes issues (such as multiple consecutive spaces and smart quotes) that may arise when documents are converted into text. Oracle recommends you to use a normalization mode to extract high-quality chunks. **Valid values**: • NONE: Applies no normalization. • ALL: Normalizes multi-byte (Unicode) punctuation to standard single-byte. • Applies all supported normalization modes: PUNCTUATION, WHITESPACE, and WIDECHAR. – PUNCTUATION: Converts quotes, dashes, and other punctuation characters supported in the character set of the text to their common ASCII form. For example: * U+2013 (En Dash) maps to U+002D (Hyphen-Minus) * U+2018 (Left Single Quotation Mark) maps to U+0027 (Apostrophe) * U+2019 (Right Single Quotation Mark) maps to U+0027 (Apostrophe) * U+201B (Single High-Reversed-9 Quotation Mark) maps to U+0027 (Apostrophe) – WHITESPACE: Minimizes whitespace by eliminating unnecessary characters. For example, retain blanklines, but remove any extra newlines and interspersed spaces or tabs: `" \n \n " => "\n\n"` – WIDECHAR: Normalizes wide, multi-byte digits and (a-z) letters to single-byte. These are multi-byte equivalents for 0-9 and a-z A-Z, which can show up in Chinese, Japanese, or Korean text. **Default value**: NONE
EXTENDED	Increases the output limit of a VARCHAR2 string to 32767 bytes, without requiring you to set the MAX_STRING_SIZE parameter to EXTENDED. If EXTENDED is present in *chunking_spec*, the maximum length of a CHUNK_TEXT column value is 32767 bytes. If it is absent, the maximum length is 4000 bytes if MAX_STRING_SIZE is set to STANDARD and 32767 bytes if MAX_STRING_SIZE is set to EXTENDED.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

VECTOR_CHUNKS can be called for a single character value provided in a character literal or a bind variable as shown in the following example:

```
COLUMN chunk_offset HEADING Offset FORMAT 999
COLUMN chunk_length HEADING Len    FORMAT 999
COLUMN chunk_text   HEADING Text   FORMAT a60

VARIABLE txt VARCHAR2(4000)
EXECUTE :txt := 'An example text value to split with VECTOR_CHUNKS, having over 10 words
because the minimum MAX value is 10';

SELECT * FROM VECTOR_CHUNKS(:txt BY WORDS MAX 10);

SELECT * FROM VECTOR_CHUNKS('Another example text value to split with VECTOR_CHUNKS,
having over 10 words because the minimum MAX value is 10' BY WORDS MAX 10);
```

To chunk values of a table column, the table needs to be joined with the VECTOR_CHUNKS call using left correlation as shown in the following example:

```
CREATE TABLE documentation_tab (
  id   NUMBER,
  text VARCHAR2(2000));

INSERT INTO documentation_tab
   VALUES(1, 'sample');

COMMIT;

SET LINESIZE 100;
SET PAGESIZE 20;
COLUMN pos FORMAT 999;
COLUMN siz FORMAT 999;
COLUMN txt FORMAT a60;

PROMPT SQL VECTOR_CHUNKS
SELECT D.id id, C.chunk_offset pos, C.chunk_length siz, C.chunk_text txt
FROM documentation_tab D, VECTOR_CHUNKS(D.text
                                  BY words
                                  MAX 200
                                  OVERLAP 10
                                  SPLIT BY recursively
                                  LANGUAGE american
                                  NORMALIZE all) C;
```

VECTOR_DISTANCE

VECTOR_DISTANCE is the main function that you can use to calculate the distance between two vectors.

Syntax

Purpose

VECTOR_DISTANCE takes two vectors as parameters. You can optionally specify a distance metric to calculate the distance. If you do not specify a distance metric, then the default distance metric is cosine. If the input vectors are BINARY vectors, the default metric is hamming.

You can optionally use the following shorthand vector distance functions:

- L1_DISTANCE
- L2_DISTANCE
- COSINE_DISTANCE
- INNER_PRODUCT
- HAMMING_DISTANCE
- JACCARD_DISTANCE

All the vector distance functions take two vectors as input and return the distance between them as a BINARY_DOUBLE.

Note the following caveats:

- If you specify a metric as the third argument, then that metric is used.
- If you do not specify a metric, then the following rules apply:
  - If there is a single column referenced in *expr1* and *expr2* as in: VECTOR_DISTANCE(vec1, :bind), and if there is a vector index defined on *vec1*, then the metric used when defining the vector index is used.

    If no vector index is defined on *vec1*, then the COSINE metric is used.
  - If there are multiple columns referenced in *expr1* and *expr2* as in: VECTOR_DISTANCE(vec1, vec2), or VECTOR_DISTANCE(vec1+vec2, :bind), then for all indexed columns, if their metrics used in the definitions of the indexes are the same, then that metric is used.

    On the other hand, if the indexed columns do not have a common metric, or none of the columns have an index defined, then the COSINE metric is used.
- In a similarity search query, if *expr1* or *expr2* reference an indexed column and you specify a distance metric that conflicts with the metric specified in the vector index, then the vector index is not used and the metric you specified is used to perform an exact search.
- Approximate (index-based) searches can be done if only one column is referenced by either *expr1* or *expr2*, and this column has a vector index defined, and the metric that is

Copyright © 1996, 2026, Oracle and/or its affiliates.

specified in the vector_distance matches the metric used in the definition of the vector index.

Parameters

- *expr1* and *expr2* must evaluate to vectors and have the same format and number of dimensions.

  If you use JACCARD_DISTANCE or the JACCARD metric, then *expr1* and *expr2* must evaluate to BINARY vectors.
- This function returns NULL if either *expr1* or *expr2* is NULL.
- *metric* must be one of the following tokens :
  - COSINE metric is the default metric. It calculates the cosine distance between two vectors.
  - DOT metric calculates the negated dot product of two vectors. The INNER_PRODUCT function calculates the dot product, as in the negation of this metric.
  - EUCLIDEAN metric, also known as L2 distance, calculates the Euclidean distance between two vectors.
  - EUCLIDEAN_SQUARED metric, also called L2_SQUARED, is the Euclidean distance without taking the square root.
  - HAMMING metric calculates the hamming distance between two vectors by counting the number dimensions that differ between the two vectors.
  - MANHATTAN metric, also known as L1 distance or taxicab distance, calculates the Manhattan distance between two vectors.
  - JACCARD metric calculates the Jaccard distance. The two vectors used in the query must be BINARY vectors.

Shorthand Operators for Distances

Syntax

- `expr1 <-> expr2`

  <-> is the **Euclidean distance operator**: `expr1 <-> expr2` is equivalent to `L2_DISTANCE(expr1, expr2)` or `VECTOR_DISTANCE(expr1, expr2, EUCLIDEAN)`
- `expr1 <=> expr2`

  <=> is the **cosine distance operator**: `expr1 <=> expr2` is equivalent to `COSINE_DISTANCE(expr1, expr2)` or `VECTOR_DISTANCE(expr1, expr2, COSINE)`
- `expr1 <#> expr2`

  <#> is the **negative dot product operator**: `expr1 <#> expr2` is equivalent to `-1*INNER_PRODUCT(expr1, expr2)` or `VECTOR_DISTANCE(expr1, expr2, DOT)`

Examples Using Shorthand Operators for Distances

```
 '[1, 2]' <-> '[0,1]'

v1 <-> '[' || '1,2,3' || ']' is equivalent to v1 <-> '[1, 2, 3]'

v1 <-> '[1,2]' is equivalent to L2_DISTANCE(v1, '[1,2]')

v1 <=> v2 is equivalent to COSINE_DISTANCE(v1, v2)

 v1 <#> v2 is equivalent to -1*INNER_PRODUCT(v1, v2)
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

VECTOR_DISTANCE with metric EUCLIDEAN is equivalent to L2_DISTANCE:

```
VECTOR_DISTANCE(expr1, expr2, EUCLIDEAN);

L2_DISTANCE(expr1, expr2);
```

VECTOR_DISTANCE with metric COSINE is equivalent to COSINE_DISTANCE:

```
VECTOR_DISTANCE(expr1, expr2, COSINE);

COSINE_DISTANCE(expr1, expr2);
```

VECTOR_DISTANCE with metric DOT is equivalent to -1 * INNER_PRODUCT:

```
VECTOR_DISTANCE(expr1, expr2, DOT);

-1*INNER_PRODUCT(expr1, expr2);
```

VECTOR_DISTANCE with metric MANHATTAN is equivalent to L1_DISTANCE:

```
VECTOR_DISTANCE(expr1, expr2, MANHATTAN);

L1_DISTANCE(expr1, expr2);
```

VECTOR_DISTANCE with metric HAMMING is equivalent to HAMMING_DISTANCE:

```
VECTOR_DISTANCE(expr1, expr2, HAMMING);

HAMMING_DISTANCE(expr1, expr2);
```

VECTOR_DISTANCE with metric JACCARD is equivalent to JACCARD_DISTANCE:

```
VECTOR_DISTANCE(expr1, expr2, JACCARD);

JACCARD_DISTANCE(expr1, expr2);
```

L1_DISTANCE

L1_DISTANCE is a shorthand version of the VECTOR_DISTANCE function that calculates the distance between two vectors. It takes two vectors as input and returns the distance between them as a BINARY_DOUBLE.

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Parameters

- *expr1* and *expr2* must evaluate to vectors and have the same format and number of dimensions.
- `L1_DISTANCE` returns NULL, if either *expr1* or *expr2* is NULL.

L2_DISTANCE

`L2_DISTANCE` is a shorthand version of the `VECTOR_DISTANCE` function that calculates the distance between two vectors. It takes two vectors as input and returns the distance between them as a `BINARY_DOUBLE`.

Syntax

Parameters

- *expr1* and *expr2* must evaluate to vectors that have the same format and number of dimensions.
- `L2_DISTANCE` returns NULL, if either *expr1* or *expr2* is NULL.

COSINE_DISTANCE

`COSINE_DISTANCE` is a shorthand version of the `VECTOR_DISTANCE` function that calculates the distance between two vectors. It takes two vectors as input and returns the distance between them as a `BINARY_DOUBLE`.

Syntax

Parameters

- *expr1* and *expr2* must evaluate to vectors that have the same format and number of dimensions.
- `COSINE_DISTANCE` returns NULL, if either *expr1* or *expr2* is NULL.

INNER_PRODUCT

`INNER_PRODUCT` calculates the inner product of two vectors. It takes two vectors as input and returns the inner product as a `BINARY_DOUBLE`. `INNER_PRODUCT(<expr1>, <expr2>)` is equivalent to `-1 * VECTOR_DISTANCE(<expr1>, <expr2>, DOT)`.

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Parameters

- *expr1* and *expr2* must evaluate to vectors that have the same format and number of dimensions.
- INNER_PRODUCT returns NULL, if either *expr1* or *expr2* is NULL.

VECTOR_DIMS

VECTOR_DIMS returns the number of dimensions of a vector as a NUMBER. VECTOR_DIMS is synonymous with VECTOR_DIMENSION_COUNT.

Syntax

Purpose

Refer to VECTOR_DIMENSION_COUNT for full semantics.

VECTOR_DIMENSION_COUNT

VECTOR_DIMENSION_COUNT returns the number of dimensions of a vector as a NUMBER.

Syntax

Purpose

VECTOR_DIMENSION_COUNT is synonymous with VECTOR_DIMS.

Parameters

expr must evaluate to a vector.

If *expr* is NULL, NULL is returned.

Example

```
SELECT VECTOR_DIMENSION_COUNT( TO_VECTOR('[34.6, 77.8]', 2, FLOAT64) );

VECTOR_DIMENSION_COUNT(TO_VECTOR('[34.6,77.8]',2,FLOAT64))
----------------------------------------------------------
2
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

VECTOR_DIMENSION_FORMAT

`VECTOR_DIMENSION_FORMAT` returns the storage format of the vector. It returns a `VARCHAR2`, which can be one of the following values: `INT8`, `FLOAT32`, `FLOAT64`, or `BINARY`.

Syntax

Parameters

expr must evaluate to a vector.

If *expr* is NULL, NULL is returned.

Examples

```
SELECT VECTOR_DIMENSION_FORMAT(TO_VECTOR('[34.6, 77.8]', 2, FLOAT64));

VECTOR_DIMENSION_FORMAT(TO_VECTOR('[34.6,77.8]',2,
------------------------------------------------
FLOAT64

VECTOR_EMBEDDING

Use `VECTOR_EMBEDDING` to generate a single vector embedding for different data types using embedding or feature extraction machine learning models.

Syntax

***mining_attribute_clause*::=**

Purpose

The function accepts the following types as input:

`VARCHAR2` for text embedding models. Oracle automatically converts any other type to `VARCHAR2` except for `NCLOB`, which is automatically converted to `NVARCHAR2`. Oracle does not expect values whose textual representation exceeds the maximum size of a `VARCHAR2`, since embedding models support only text that translates to a couple of thousand tokens. An attribute with a type that has no conversion to `VARCHAR2` results in a SQL compilation error.

For feature extraction models Oracle Machine Learning for SQL supports standard Oracle data types except `DATE`, `TIMESTAMP`, `RAW`, and `LONG`. Oracle Machine Learning supports date type (datetime, date, timestamp) for case_id, `CLOB/BLOB/FILE` that are interpreted as text columns, and the following collection types as well:

- `DM_NESTED_CATEGORICALS`
- `DM_NESTED_NUMERICALS`
- `DM_NESTED_BINARY_DOUBLES`
- `DM_NESTED_BINARY_FLOATS`

The function always returns a `VECTOR` type, whose dimension is dictated by the model itself. The model stores the dimension information in metadata within the data dictionary.

You can use `VECTOR_EMBEDDING` in `SELECT` clauses, in predicates, and as an operand for SQL operations accepting a `VECTOR` type.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Parameters

model_name refers to the name of the imported embedding model that implements the embedding machine learning function.

mining_attribute_clause

- The *mining_attribute_clause* argument identifies the column attributes to use as predictors for scoring. This is used as a convenience, as the embedding operator only accepts single input value.
- `USING *` : all the relevant attributes present in the input (supplied in JSON metadata) are used. This is used as a convenience. For an embedding model, the operator only takes one input value as embedding models have only one column.
- `USING` *expr* [`AS` *alias*] [, *expr* [`AS` *alias*]] : all the relevant attributes present in the comma-separated list of column expressions are used. This syntax is consistent with the syntax of other machine learning operators. You may specify more than one attribute, however, the embedding model only takes one relevant input. Therefore, you must specify a single mining attribute.

Example

The following example generates vector embeddings with "hello" as the input, utilizing the pretrained ONNX format model `my_embedding_model.onnx` imported into the Database. For complete example, see Import ONNX Models and Generate Embeddings

```
SELECT TO_VECTOR(VECTOR_EMBEDDING(model USING 'hello' as data)) AS embedding;
--------------------------------------------------------------------------------
[-9.76553112E-002,-9.89954844E-002,7.69771636E-003,-4.16760892E-003,-9.69305634E-002,

> - *Data Requirements for Machine Learning*
> - *Vector Distance Metrics*

VECTOR_NORM

`VECTOR_NORM` returns the Euclidean norm of a vector `(SQRT(SUM((xi-yi)2)))` as a `BINARY_DOUBLE`. This value is also called magnitude or size and represents the Euclidean distance between the vector and the origin.

Syntax

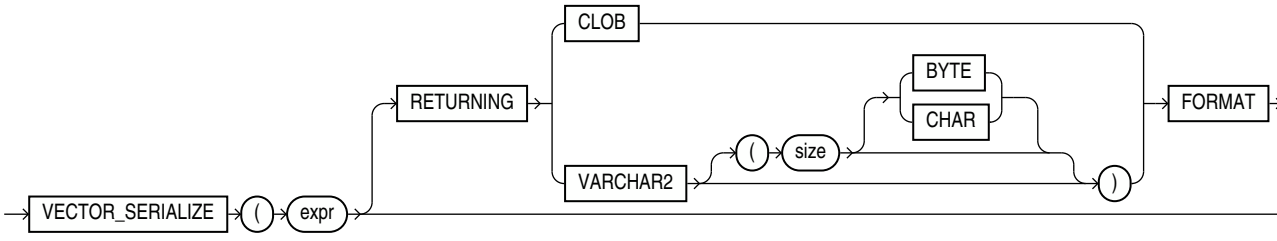
Copyright © 1996, 2026, Oracle and/or its affiliates.

Parameters

expr must evaluate to a vector.

If *expr* is NULL, NULL is returned.

Example



```
SELECT VECTOR_NORM( TO_VECTOR('[4, 3]', 2, FLOAT32) );

VECTOR_NORM(TO_VECTOR('[4,3]',2,FLOAT32))
----------------------------------------
5.0E+000
```

VECTOR_SERIALIZE

VECTOR_SERIALIZE is synonymous with FROM_VECTOR.

Syntax

Purpose

See FROM_VECTOR for semantics and examples.

Examples

```
SELECT VECTOR_SERIALIZE(VECTOR('[1.1,2.2,3.3]',3,FLOAT32));

VECTOR_SERIALIZE(VECTOR('[1.1,2.2,3.3]',3,FLOAT32))
------------------------------------------------------------
[1.10000002E+000,2.20000005E+000,3.29999995E+000]

1 row selected.

SELECT VECTOR_SERIALIZE(VECTOR('[1.1, 2.2, 3.3]',3,FLOAT32) RETURNING VARCHAR2(1000));

VECTOR_SERIALIZE(VECTOR('[...]',3,FLOAT32)RETURNINGVARCHAR2(1000))
------------------------------------------------------------
[1.10000002E+000,2.20000005E+000,3.29999995E+000]

1 row selected.

SELECT VECTOR_SERIALIZE(VECTOR('[1.1, 2.2, 3.3]',3,FLOAT32) RETURNING CLOB);
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
VECTOR_SERIALIZE(VECTOR('[1.1, 2.2, 3.3]',3,FLOAT32)RETURNINGCLOB)
------------------------------------------------------
[1.10000002E+000,2.20000005E+000,3.29999995E+000]

1 row selected.

SELECT VECTOR_SERIALIZE(TO_VECTOR('[5,[2,4],[1.0,2.0]]', 5, FLOAT64, SPARSE) RETURNING
CLOB FORMAT SPARSE);

VECTOR_SERIALIZE(TO_VECTOR('[5,[2,4],[1.0,2.0]]',5,FLOAT64,SPARSE)RETURNINGCLOBF
--------------------------------------------------------------------------------
[5,[2,4],[1.0E+000,2.0E+000]]

1 row selected.

SELECT VECTOR_SERIALIZE(TO_VECTOR('[5,[2,4],[1.0,2.0]]', 5, FLOAT64, SPARSE) RETURNING
CLOB FORMAT DENSE);

VECTOR_SERIALIZE(TO_VECTOR('[5,[2,4],[1.0,2.0]]',5,FLOAT64,SPARSE)RETURNINGCLOBF
--------------------------------------------------------------------------------
[0,1.0E+000,0,2.0E+000,0]

1 row selected.
```

VSIZE

Syntax

Purpose

`VSIZE` returns the number of bytes in the internal representation of *expr*. If *expr* is null, then this function returns null.

This function does not support `CLOB` data directly. However, `CLOB`s can be passed in as arguments through implicit data conversion.

> **See Also**
>
> "Data Type Comparison Rules " for more information

Examples

The following example returns the number of bytes in the `last_name` column of the employees in department 10:

```
SELECT last_name, VSIZE (last_name) "BYTES"
  FROM employees
  WHERE department_id = 10
  ORDER BY employee_id;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
LAST_NAME            BYTES
-------------- ----------
Whalen                6
```

WIDTH_BUCKET

Syntax

Purpose

`WIDTH_BUCKET` lets you construct equiwidth histograms, in which the histogram range is divided into intervals that have identical size. (Compare this function with `NTILE`, which creates equiheight histograms.) Ideally each bucket is a closed-open interval of the real number line. For example, a bucket can be assigned to scores between 10.00 and 19.999 ... to indicate that 10 is included in the interval and 20 is excluded. This is sometimes denoted [10, 20).

For a given expression, `WIDTH_BUCKET` returns the bucket number into which the value of this expression would fall after being evaluated.

- *`expr`* is the expression for which the histogram is being created. This expression must evaluate to a numeric or datetime value or to a value that can be implicitly converted to a numeric or datetime value. If *`expr`* evaluates to null, then the expression returns null.
- *`min_value`* and *`max_value`* are expressions that resolve to the end points of the acceptable range for *`expr`*. Both of these expressions must also evaluate to numeric or datetime values, and neither can evaluate to null.
- *`num_buckets`* is an expression that resolves to a constant indicating the number of buckets. This expression must evaluate to a positive integer.

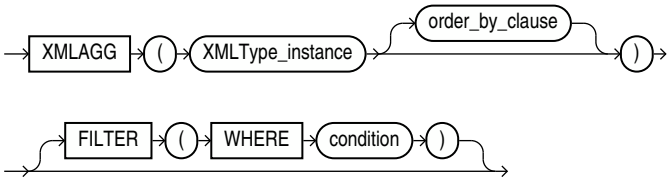
> **See Also**
>
> Table 2-9 for more information on implicit conversion

When needed, Oracle Database creates an underflow bucket numbered 0 and an overflow bucket numbered *`num_buckets`*+1. These buckets handle values less than *`min_value`* and more than *`max_value`* and are helpful in checking the reasonableness of endpoints.

Examples

The following example creates a ten-bucket histogram on the `credit_limit` column for customers in Switzerland in the sample table `oe.customers` and returns the bucket number ("Credit Group") for each customer. Customers with credit limits greater than or equal to the maximum value are assigned to the overflow bucket, 11:

```
SELECT customer_id, cust_last_name, credit_limit,
   WIDTH_BUCKET(credit_limit, 100, 5000, 10) "Credit Group"
   FROM customers WHERE nls_territory = 'SWITZERLAND'
   ORDER BY "Credit Group", customer_id, cust_last_name, credit_limit;



CUSTOMER_ID CUST_LAST_NAME       CREDIT_LIMIT Credit Group
----------- -------------------- ------------ ------------
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

847 Streep                  5000         11
```

XMLAGG

Syntax

Purpose

`XMLAgg` is an aggregate function. It takes a collection of XML fragments and returns an aggregated XML document. Any arguments that return null are dropped from the result.

`XMLAgg` is similar to `SYS_XMLAgg` except that `XMLAgg` returns a collection of nodes but it does not accept formatting using the `XMLFormat` object. Also, `XMLAgg` does not enclose the output in an element tag as does `SYS_XMLAgg`.

Within the *`order_by_clause`*, Oracle Database does not interpret number literals as column positions, as it does in other uses of this clause, but simply as number literals.

> **See Also**
>
> XMLELEMENT and SYS_XMLAGG

Copyright © 1996, 2026, Oracle and/or its affiliates.

For the semantics of the FILTER clause, see FILTER Clause Semantics.

Examples

The following example produces a Department element containing Employee elements with employee job ID and last name as the contents of the elements:

```
SELECT XMLELEMENT("Department",
   XMLAGG(XMLELEMENT("Employee",
   e.job_id||' '||e.last_name)
   ORDER BY last_name))
   as "Dept_list"
   FROM employees e
   WHERE e.department_id = 30;

Dept_list
------------------------------------------------------------
<Department>
  <Employee>PU_CLERK Baida</Employee>
  <Employee>PU_CLERK Colmenares</Employee>
  <Employee>PU_CLERK Himuro</Employee>
  <Employee>PU_CLERK Khoo</Employee>
  <Employee>PU_MAN Raphaely</Employee>
  <Employee>PU_CLERK Tobias</Employee>
</Department>
```

The result is a single row, because XMLAgg aggregates the rows. You can use the GROUP BY clause to group the returned set of rows into multiple groups:

```
SELECT XMLELEMENT("Department",
      XMLAGG(XMLELEMENT("Employee", e.job_id||' '||e.last_name)))
   AS "Dept_list"
   FROM employees e
   GROUP BY e.department_id;

Dept_list
-----------------------------------------------------------
<Department>
  <Employee>AD_ASST Whalen</Employee>
</Department>

<Department>
  <Employee>MK_MAN Hartstein</Employee>
  <Employee>MK_REP Fay</Employee>
</Department>

<Department>
  <Employee>PU_MAN Raphaely</Employee>
  <Employee>PU_CLERK Khoo</Employee>
  <Employee>PU_CLERK Tobias</Employee>
  <Employee>PU_CLERK Baida</Employee>
  <Employee>PU_CLERK Colmenares</Employee>
  <Employee>PU_CLERK Himuro</Employee>
</Department>
. . .
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

XMLCAST

Syntax

(*datatype*::=)

Purpose

`XMLCast` casts *`value_expression`* to the scalar SQL data type specified by *`datatype`*. The *`value_expression`* argument is a SQL expression that is evaluated.

datatype

The *`datatype`* argument can be of data type `NUMBER`, `VARCHAR2`, `VARCHAR`, `CHAR`, `CLOB`, `BLOB`, `REF XMLTYPE`, and any of the datetime data types.

`BLOB`, or `CLOB` with options *`reference`* or *`value`*. The default is *`reference`*.

> **See Also**
>
> - *Oracle XML DB Developer's Guide* for more information on uses for this function and examples
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of `XMLCAST` when it is a character value

XMLCDATA

Syntax

Purpose

`XMLCData` generates a CDATA section by evaluating *`value_expr`*. The *`value_expr`* must resolve to a string. The value returned by the function takes the following form:

```
<![CDATA[string]]>
```

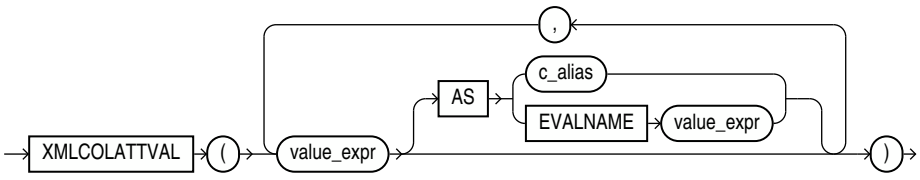
If the resulting value is not a valid XML CDATA section, then the function returns an error.The following conditions apply to `XMLCData`:

- The *`value_expr`* cannot contain the substring `]]>`.
- If *`value_expr`* evaluates to null, then the function returns null.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> *Oracle XML DB Developer's Guide* for more information on this function

Examples



The following statement uses the `DUAL` table to illustrate the syntax of `XMLCData`:

```
SELECT XMLELEMENT("PurchaseOrder",
   XMLAttributes(dummy as "pono"),
   XMLCdata('<!DOCTYPE po_dom_group [
   <!ELEMENT po_dom_group(student_name)*>
   <!ELEMENT po_purch_name (#PCDATA)>
   <!ATTLIST po_name po_no ID #REQUIRED>
   <!ATTLIST po_name trust_1 IDREF #IMPLIED>
   <!ATTLIST po_name trust_2 IDREF #IMPLIED>
   ]>')) "XMLCData" FROM DUAL;

XMLCData
------------------------------------------------------------
<PurchaseOrder pono="X"><![CDATA[
<!DOCTYPE po_dom_group [
   <!ELEMENT po_dom_group(student_name)*>
   <!ELEMENT po_purch_name (#PCDATA)>
   <!ATTLIST po_name po_no ID #REQUIRED>
   <!ATTLIST po_name trust_1 IDREF #IMPLIED>
   <!ATTLIST po_name trust_2 IDREF #IMPLIED>
   ]>
  ]]>
</PurchaseOrder>
```

XMLCOLATTVAL

Syntax

Purpose

`XMLColAttVal` creates an XML fragment and then expands the resulting XML so that each XML fragment has the name `column` with the attribute `name`.

You can use the `AS` clause to change the value of the `name` attribute to something other than the column name. You can do this by specifying *`c_alias`*, which is a string literal, or by specifying `EVALNAME` *`value_expr`*. In the latter case, the value expression is evaluated and the result, which must be a string literal, is used as the alias. The alias can be up to 4000 characters if the initialization parameter `MAX_STRING_SIZE = STANDARD`, and 32767 characters if `MAX_STRING_SIZE = EXTENDED`. See "Extended Data Types" for more information.

You must specify a value for *`value_expr`*. If *`value_expr`* is null, then no element is returned.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Restriction on XMLColAttVal

You cannot specify an object type column for *value_expr*.

Examples

The following example creates an `Emp` element for a subset of employees, with nested `employee_id`, `last_name`, and `salary` elements as the contents of `Emp`. Each nested element is named `column` and has a `name` attribute with the column name as the attribute value:

```
SELECT XMLELEMENT("Emp",
   XMLCOLATTVAL(e.employee_id, e.last_name, e.salary)) "Emp Element"
   FROM employees e
   WHERE employee_id = 204;

Emp Element
--------------------------------------------------------------------
<Emp>
  <column name="EMPLOYEE_ID">204</column>
  <column name="LAST_NAME">Baer</column>
  <column name="SALARY">10000</column>
</Emp>
```

Refer to the example for XMLFOREST to compare the output of these two functions.

XMLCOMMENT

Syntax

Purpose

`XMLComment` generates an XML comment using an evaluated result of *value_expr*. The *value_expr* must resolve to a string. It cannot contain two consecutive dashes (hyphens). The value returned by the function takes the following form:

```
<!--string-->
```

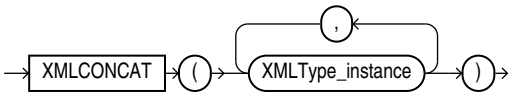
If *value_expr* resolves to null, then the function returns null.

> **See Also**
>
> *Oracle XML DB Developer's Guide* for more information on this function

Examples

The following example uses the `DUAL` table to illustrate the `XMLComment` syntax:

```
SELECT XMLCOMMENT('OrderAnalysisComp imported, reconfigured, disassembled')
   AS "XMLCOMMENT" FROM DUAL;



XMLCOMMENT
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
--------------------------------------------------------------------------------
<!--OrderAnalysisComp imported, reconfigured, disassembled-->
```

XMLCONCAT

Syntax

Purpose

`XMLConcat` takes as input a series of `XMLType` instances, concatenates the series of elements for each row, and returns the concatenated series. `XMLConcat` is the inverse of `XMLSequence`.

Null expressions are dropped from the result. If all the value expressions are null, then the function returns null.

> **See Also**
>
> XMLSEQUENCE

Examples

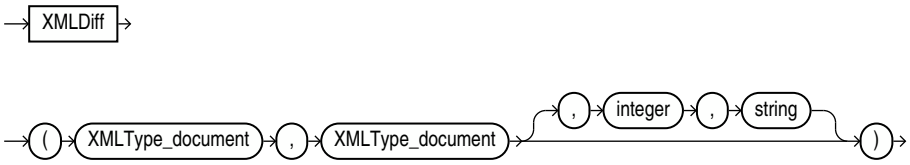
The following example creates XML elements for the first and last names of a subset of employees, and then concatenates and returns those elements:

```
SELECT XMLCONCAT(XMLELEMENT("First", e.first_name),
   XMLELEMENT("Last", e.last_name)) AS "Result"
   FROM employees e
   WHERE e.employee_id > 202;

Result
--------------------------------------------------------------
<First>Susan</First>
<Last>Mavris</Last>

<First>Hermann</First>
<Last>Baer</Last>

<First>Shelley</First>
<Last>Higgins</Last>



<First>William</First>
<Last>Gietz</Last>

4 rows selected.
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

XMLDIFF

Syntax

Purpose

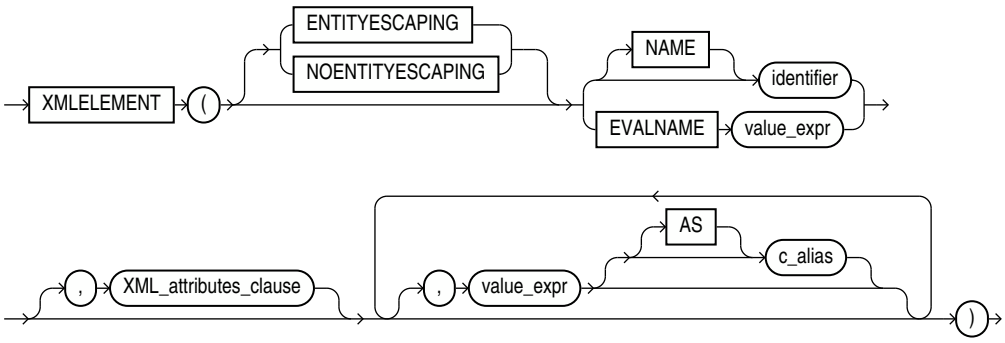
The `XMLDiff` function is the SQL interface for the XmlDiff C API. This function compares two XML documents and captures the differences in XML conforming to an Xdiff schema. The diff document is returned as an XMLType document.

- For the first two arguments, specify the names of two XMLType documents.
- For the *`integer`*, specify a number representing the hashLevel for a C function XmlDiff. If you do not want hashing, set this argument to 0 or omit it entirely. If you do not want hashing, but you want to specify flags, then you must set this argument to 0.
- For *`string`*, specify the flags that control the behavior of the function. These flags are specified by one or more names separated by semicolon. The names are the same as the names of constants for XmlDiff function.

> **See Also**
>
> *Oracle XML Developer's Kit Programmer's Guide* for more information on using this function, including examples, and *Oracle Database XML C API Reference* for information on the XML APIs for C

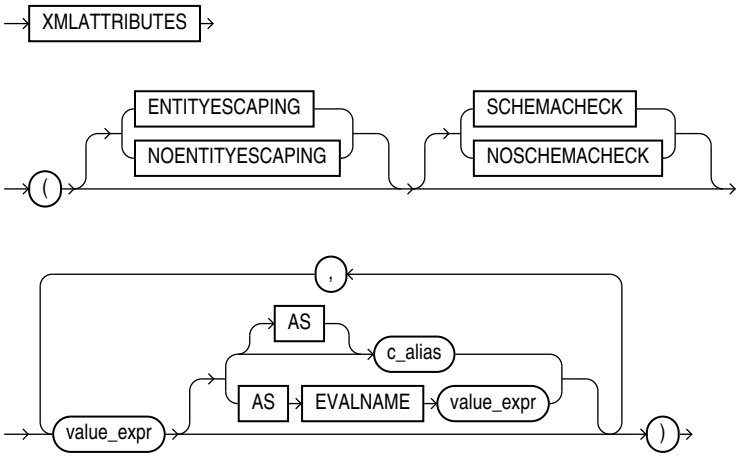
Examples

The following example compares two XML documents and returns the difference as an XMLType document:



```
SELECT XMLDIFF(
XMLTYPE('<?xml version="1.0"?>
<bk:book xmlns:bk="http://example.com">
   <bk:tr>
        <bk:td>
                <bk:chapter>
                        Chapter 1.
                </bk:chapter>
        </bk:td>
        <bk:td>
                 <bk:chapter>
                        Chapter 2.
                </bk:chapter>
        </bk:td>
   </bk:tr>
</bk:book>'),
XMLTYPE('<?xml version="1.0"?>
```

Copyright © 1996, 2026, Oracle and/or its affiliates.



```
<bk:book xmlns:bk="http://example.com">
   <bk:tr>
        <bk:td>
                <bk:chapter>
                        Chapter 1.
                </bk:chapter>
        </bk:td>
        <bk:td/>
   </bk:tr>
</bk:book>')
)
FROM DUAL;
```

XMLELEMENT

Syntax

***XML_attributes_clause*::=**

Purpose

`XMLElement` takes an element name for *`identifier`* or evaluates an element name for `EVALNAME` *`value_expr`*, an optional collection of attributes for the element, and arguments that make up the content of the element. It returns an instance of type `XMLType`. `XMLElement` is similar to `SYS_XMLGen` except that `XMLElement` can include attributes in the XML returned, but it does not accept formatting using the `XMLFormat` object.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The `XMLElement` function is typically nested to produce an XML document with a nested structure, as in the example in the following section.

For an explanation of the `ENTITYESCAPING` and `NONENTITYESCAPING` keywords, refer to *Oracle XML DB Developer's Guide*.

You must specify a value for Oracle Database to use an the enclosing tag. You can do this by specifying *`identifier`*, which is a string literal, or by specifying `EVALNAME` *`value_expr`*. In the latter case, the value expression is evaluated and the result, which must be a string literal, is used as the identifier. The identifier does not have to be a column name or column reference. It cannot be an expression or null. It can be up to 4000 characters if the initialization parameter `MAX_STRING_SIZE = STANDARD`, and 32767 characters if `MAX_STRING_SIZE = EXTENDED`.

The objects that make up the element content follow the `XMLATTRIBUTES` keyword. In the *`XML_attributes_clause`*, if the *`value_expr`* is null, then no attribute is created for that value expression. The type of *`value_expr`* cannot be an object type or collection. If you specify an alias for *`value_expr`* using the `AS` clause, then the *`c_alias`* or the evaluated value expression (`EVALNAME` *`value_expr`*) can be up to 4000 characters if the initialization parameter `MAX_STRING_SIZE = STANDARD`, and 32767 characters if `MAX_STRING_SIZE = EXTENDED`.

> **See Also**
>
> "Extended Data Types" for more information on `MAX_STRING_SIZE`

For the optional *`value_expr`* that follows the *`XML_attributes_clause`* in the diagram:

- If *`value_expr`* is a scalar expression, then you can omit the `AS` clause, and Oracle uses the column name as the element name.
- If *`value_expr`* is an object type or collection, then the `AS` clause is mandatory, and Oracle uses the specified *`c_alias`* as the enclosing tag.
- If *`value_expr`* is null, then no element is created for that value expression.

>
> SYS_XMLGEN

Examples

The following example produces an `Emp` element for a series of employees, with nested elements that provide the employee's name and hire date:

```
SELECT XMLELEMENT("Emp", XMLELEMENT("Name",
   e.job_id||' '||e.last_name),
   XMLELEMENT("Hiredate", e.hire_date)) as "Result"
   FROM employees e WHERE employee_id > 200;

Result
--------------------------------------------------------------------
<Emp>
  <Name>MK_MAN Hartstein</Name>
  <Hiredate>2004-02-17</Hiredate>
</Emp>

<Emp>
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
  <Name>MK_REP Fay</Name>
  <Hiredate>2005-08-17</Hiredate>
</Emp>

<Emp>
  <Name>HR_REP Mavris</Name>
  <Hiredate>2002-06-07</Hiredate>
</Emp>

<Emp>
  <Name>PR_REP Baer</Name>
  <Hiredate>2002-06-07</Hiredate>
</Emp>

<Emp>
  <Name>AC_MGR Higgins</Name>
  <Hiredate>2002-06-07</Hiredate>
</Emp>

<Emp>
  <Name>AC_ACCOUNT Gietz</Name>
  <Hiredate>2002-06-07</Hiredate>
</Emp>

6 rows selected.
```

The following similar example uses the `XMLElement` function with the *`XML_attributes_clause`* to create nested XML elements with attribute values for the top-level element:

```
SELECT XMLELEMENT("Emp",
      XMLATTRIBUTES(e.employee_id AS "ID", e.last_name),
      XMLELEMENT("Dept", e.department_id),
      XMLELEMENT("Salary", e.salary)) AS "Emp Element"
   FROM employees e
   WHERE e.employee_id = 206;

Emp Element
--------------------------------------------------------------
<Emp ID="206" LAST_NAME="Gietz">
  <Dept>110</Dept>
  <Salary>8300</Salary>
</Emp>
```

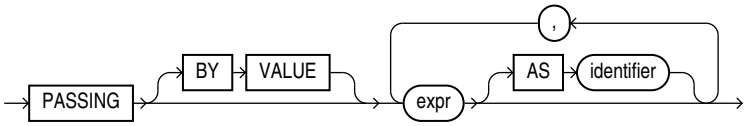
Notice that the `AS` *`identifier`* clause was not specified for the `last_name` column. As a result, the XML returned uses the column name `last_name` as the default.

Finally, the next example uses a subquery within the *`XML_attributes_clause`* to retrieve information from another table into the attributes of an element:

```
SELECT XMLELEMENT("Emp", XMLATTRIBUTES(e.employee_id, e.last_name),
   XMLELEMENT("Dept", XMLATTRIBUTES(e.department_id,
   (SELECT d.department_name FROM departments d
   WHERE d.department_id = e.department_id) as "Dept_name")),
   XMLELEMENT("salary", e.salary),
   XMLELEMENT("Hiredate", e.hire_date)) AS "Emp Element"
   FROM employees e
   WHERE employee_id = 205;

Emp Element
-----------------------------------------------------------------
<Emp EMPLOYEE_ID="205" LAST_NAME="Higgins">
  <Dept DEPARTMENT_ID="110" Dept_name="Accounting"/>
```

Copyright © 1996, 2026, Oracle and/or its affiliates.



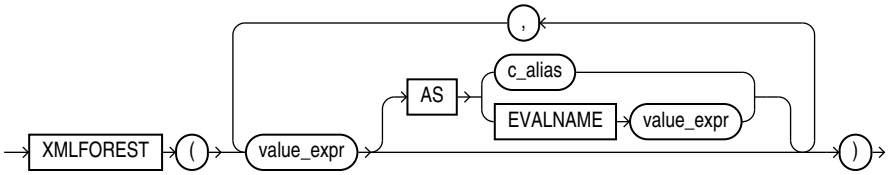
```
  <salary>12008</salary>
  <Hiredate>2002-06-07</Hiredate>
</Emp>
```

XMLEXISTS

Syntax

***XML_passing_clause*::=**

Purpose



`XMLExists` checks whether a given XQuery expression returns a nonempty XQuery sequence. If so, the function returns `TRUE`; otherwise, it returns `FALSE`. The argument *`XQuery_string`* is a literal string, but it can contain XQuery variables that you bind using the *`XML_passing_clause`*.

The *`expr`* in the *`XML_passing_clause`* is an expression returning an `XMLType` or an instance of a SQL scalar data type that is used as the context for evaluating the XQuery expression. You can specify only one *`expr`* in the `PASSING` clause without an identifier. The result of evaluating each *`expr`* is bound to the corresponding identifier in the *`XQuery_string`*. If any *`expr`* that is not followed by an `AS` clause, then the result of evaluating that expression is used as the context item for evaluating the *`XQuery_string`*. If *`expr`* is a relational column, then its declared collation is ignored by Oracle XML DB.

> **See Also**
>
> *Oracle XML DB Developer's Guide* for more information on uses for this function and examples

XMLFOREST

Syntax

Copyright © 1996, 2026, Oracle and/or its affiliates.

Purpose

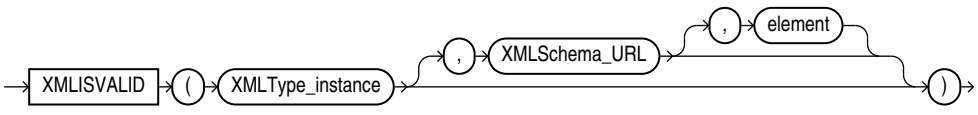
`XMLForest` converts each of its argument parameters to XML, and then returns an XML fragment that is the concatenation of these converted arguments.

- If *value_expr* is a scalar expression, then you can omit the `AS` clause, and Oracle Database uses the column name as the element name.
- If *value_expr* is an object type or collection, then the `AS` clause is mandatory, and Oracle uses the specified expression as the enclosing tag.

  You can do this by specifying *c_alias*, which is a string literal, or by specifying `EVALNAME` *value_expr*. In the latter case, the value expression is evaluated and the result, which must be a string literal, is used as the identifier. The identifier does not have to be a column name or column reference. It cannot be an expression or null. It can be up to 4000 characters if the initialization parameter `MAX_STRING_SIZE = STANDARD`, and 32767 characters if `MAX_STRING_SIZE = EXTENDED`. See "Extended Data Types" for more information.
- If *value_expr* is null, then no element is created for that *value_expr*.

Examples

The following example creates an `Emp` element for a subset of employees, with nested `employee_id`, `last_name`, and `salary` elements as the contents of `Emp`:



```
SELECT XMLELEMENT("Emp",
   XMLFOREST(e.employee_id, e.last_name, e.salary))
   "Emp Element"
   FROM employees e WHERE employee_id = 204;

Emp Element
--------------------------------------------------------------------
<Emp>
  <EMPLOYEE_ID>204</EMPLOYEE_ID>
  <LAST_NAME>Baer</LAST_NAME>
  <SALARY>10000</SALARY>
</Emp>
```

Refer to the example for XMLCOLATTVAL to compare the output of these two functions.

XMLISVALID

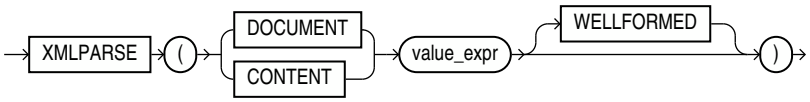
Syntax

Purpose

`XMLISVALID` checks whether the input *XMLType_instance* conforms to the relevant XML schema. It does not change the validation status recorded for *XMLType_instance*.

If the input XML document is determined to be valid, then `XMLISVALID` returns 1; otherwise, it returns 0. If you provide *XMLSchema_URL* as an argument, then that is used to check

Copyright © 1996, 2026, Oracle and/or its affiliates.



conformance. Otherwise, the XML schema specified by the XML document is used to check conformance.

- *XMLType_instance* is the XMLType instance to be validated.
- *XMLSchema_URL* is the URL of the XML schema against which to check conformance.
- *element* is the element of the specified schema against which to check conformance. Use this if you have an XML schema that defines more than one top level element, and you want to check conformance against a specific one of those elements.

> **See Also**
>
> *Oracle XML DB Developer's Guide* for information on the use of this function, including examples

XMLPARSE

Syntax

Purpose

XMLParse parses and generates an XML instance from the evaluated result of *value_expr*. The *value_expr* must resolve to a string. If *value_expr* resolves to null, then the function returns null.

- If you specify DOCUMENT, then *value_expr* must resolve to a singly rooted XML document.
- If you specify CONTENT, then *value_expr* must resolve to a valid XML value.
- When you specify WELLFORMED, you are guaranteeing that *value_expr* resolves to a well-formed XML document, so the database does not perform validity checks to ensure that the input is well formed.

> **See Also**
>
> *Oracle XML DB Developer's Guide* for more information on this function

Examples

The following example uses the DUAL table to illustrate the syntax of XMLParse:

```
SELECT XMLPARSE(CONTENT '124 <purchaseOrder poNo="12435">
   <customerName> Acme Enterprises</customerName>
   <itemNo>32987457</itemNo>
   </purchaseOrder>'
WELLFORMED) AS PO FROM DUAL;

PO
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
-----------------------------------------------------------------
124 <purchaseOrder poNo="12435">
   <customerName> Acme Enterprises</customerName>
   <itemNo>32987457</itemNo>
   </purchaseOrder>
```

XMLPATCH

Syntax

Purpose

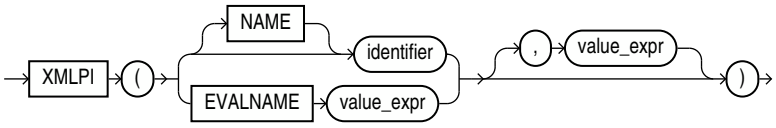
The `XMLPatch` function is the SQL interface for the XmlPatch C API. This function patches an XML document with the changes specified. A patched `XMLType` document is returned.

- For the first argument, specify the name of the input `XMLType` document.
- For the second argument, specify the XMLType document containing the changes to be applied to the first document. The changes should conform to the Xdiff XML schema. You can supply the XML output from the Oracle XML Developer's Kit Java method `diff()`.

> **See Also**
>
> *Oracle XML Developer's Kit Programmer's Guide* for more information on using this function, including examples, and *Oracle Database XML C API Reference* for information on the XML APIs for C

Examples

The following example patches an `XMLType` document with the changes specified in another `XMLType` and returns a patched `XMLType` document:



```
SELECT XMLPATCH(
XMLTYPE('<?xml version="1.0"?>
<bk:book xmlns:bk="http://example.com">
   <bk:tr>
        <bk:td>
                <bk:chapter>
                        Chapter 1.
                </bk:chapter>
        </bk:td>
        <bk:td>
                 <bk:chapter>
                        Chapter 2.
                </bk:chapter>
        </bk:td>
   </bk:tr>
</bk:book>'),
XMLTYPE('<?xml version="1.0"?>
<xd:xdiff xsi:schemaLocation="http://xmlns.oracle.com/xdb/xdiff.xsd
  http://xmlns.oracle.com/xdb/xdiff.xsd"
  xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
  xmlns:bk="http://example.com">
  <?oracle-xmldiff operations-in-docorder="true" output-model="snapshot"
    diff-algorithm="global"?>
  <xd:delete-node xd:node-type="element"
   xd:xpath="/bk:book[1]/bk:tr[1]/bk:td[2]/bk:chapter[1]"/>
</xd:xdiff>')
)
FROM DUAL;
```

XMLPI

Syntax

Purpose

`XMLPI` generates an XML processing instruction using *`identifier`* and optionally the evaluated result of *`value_expr`*. A processing instruction is commonly used to provide to an application information that is associated with all or part of an XML document. The application uses the processing instruction to determine how best to process the XML document.

You must specify a value for Oracle Database to use an the enclosing tag. You can do this by specifying *`identifier`*, which is a string literal, or by specifying `EVALNAME` *`value_expr`*. In the latter case, the value expression is evaluated and the result, which must be a string literal, is used as the identifier. The identifier does not have to be a column name or column reference. It cannot be an expression or null. It can be up to 4000 characters if the initialization parameter `MAX_STRING_SIZE` = `STANDARD`, and 32767 characters if `MAX_STRING_SIZE` = `EXTENDED`. See "Extended Data Types" for more information.

The optional *`value_expr`* must resolve to a string. If you omit the optional *`value_expr`*, then a zero-length string is the default. The value returned by the function takes this form:

```
<?identifier string?>
```

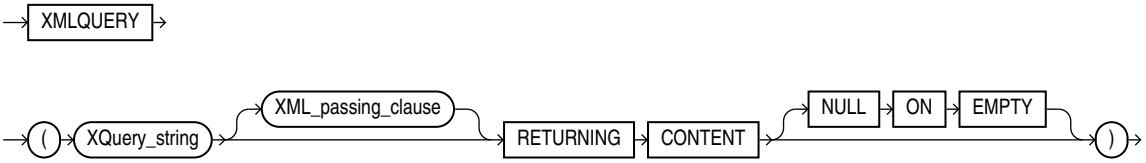
`XMLPI` is subject to the following restrictions:

- The *`identifier`* must be a valid target for a processing instruction.
- You cannot specify `xml` in any case combination for *`identifier`*.
- The *`identifier`* cannot contain the consecutive characters ?>.

> **See Also**
>
> *Oracle XML DB Developer's Guide* for more information on this function

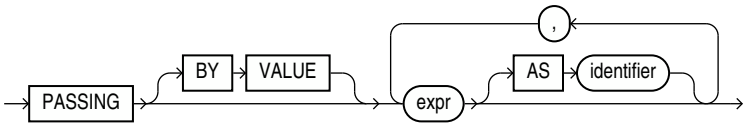
Examples

The following statement uses the `DUAL` table to illustrate the use of the `XMLPI` syntax:



```
SELECT XMLPI(NAME "Order analysisComp", 'imported, reconfigured, disassembled')
   AS "XMLPI" FROM DUAL;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.



```
XMLPI
--------------------------------------------------------------------------------
<?Order analysisComp imported, reconfigured, disassembled?>
```

XMLQUERY

Syntax

***XML_passing_clause*::=**

Purpose

`XMLQUERY` lets you query XML data in SQL statements. It takes an XQuery expression as a string literal, an optional context item, and other bind variables and returns the result of evaluating the XQuery expression using these input values.

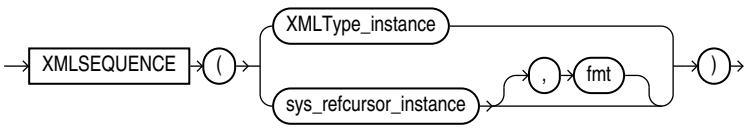
- *`XQuery_string`* is a complete XQuery expression, including prolog.
- The *`expr`* in the *`XML_passing_clause`* is an expression returning an `XMLType` or an instance of a SQL scalar data type that is used as the context for evaluating the XQuery expression. You can specify only one *`expr`* in the `PASSING` clause without an identifier. The result of evaluating each *`expr`* is bound to the corresponding identifier in the *`XQuery_string`*. If any *`expr`* that is not followed by an `AS` clause, then the result of evaluating that expression is used as the context item for evaluating the *`XQuery_string`*. If *`expr`* is a relational column, then its declared collation is ignored by Oracle XML DB.
- `RETURNING CONTENT` indicates that the result from the XQuery evaluation is either an XML 1.0 document or a document fragment conforming to the XML 1.0 semantics.
- If the result set is empty, then the function returns the SQL `NULL` value. The `NULL ON EMPTY` keywords are implemented by default and are shown for semantic clarity.

> **See Also**
>
> *Oracle XML DB Developer's Guide* for more information on this function

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

The following statement specifies the *warehouse_spec* column of the oe.warehouses table in the *XML_passing_clause* as a context item. The statement returns specific information about the warehouses with area greater than 50K.



```
SELECT warehouse_name,
EXTRACTVALUE(warehouse_spec, '/Warehouse/Area'),
XMLQuery(
   'for $i in /Warehouse
   where $i/Area > 50000
   return <Details>
             <Docks num="{$i/Docks}"/>
             <Rail>
               {
               if ($i/RailAccess = "Y") then "true" else "false"
               }
             </Rail>
          </Details>' PASSING warehouse_spec RETURNING CONTENT) "Big_warehouses"
   FROM warehouses;

WAREHOUSE_ID Area      Big_warehouses
------------ --------- ------------------------------------------------------
           1     25000
           2     50000
           3     85700 <Details><Docks></Docks><Rail>false</Rail></Details>
           4    103000 <Details><Docks num="3"></Docks><Rail>true</Rail></Details>
 . . .
```

XMLSEQUENCE

> **Note**
>
> The XMLSEQUENCE function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use the XMLTABLE function instead. See XMLTABLE for more information.

Syntax

Purpose

XMLSequence has two forms:

- The first form takes as input an XMLType instance and returns a varray of the top-level nodes in the XMLType. This form is effectively superseded by the SQL/XML standard function XMLTable, which provides for more readable SQL code. Prior to Oracle Database 10g Release 2, XMLSequence was used with SQL function TABLE to do some of what can now be done better with the XMLTable function.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- The second form takes as input a `REFCURSOR` instance, with an optional instance of the `XMLFormat` object, and returns as an `XMLSequence` type an XML document for each row of the cursor.

Because `XMLSequence` returns a collection of `XMLType`, you can use this function in a `TABLE` clause to unnest the collection values into multiple rows, which can in turn be further processed in the SQL query.

> **See Also**
>
> *Oracle XML DB Developer's Guide* for more information on this function, and XMLTABLE

Examples

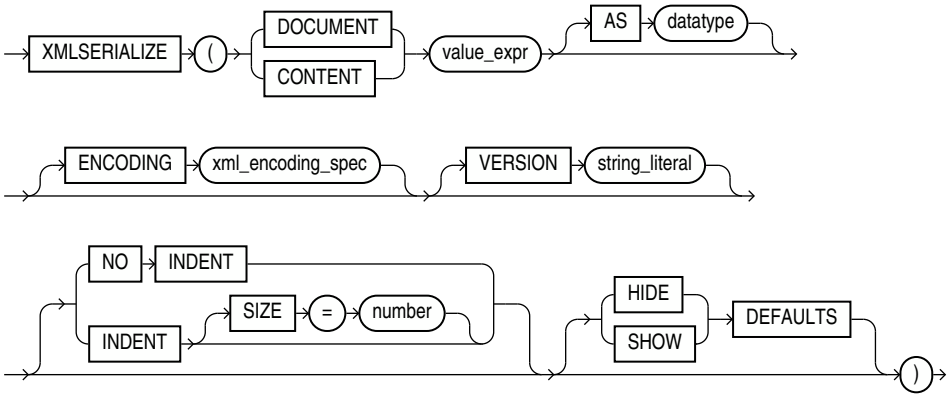
The following example shows how `XMLSequence` divides up an XML document with multiple elements into `VARRAY` single-element documents. In this example, the `TABLE` keyword instructs Oracle Database to consider the collection a table value that can be used in the `FROM` clause of the subquery:

```
SELECT EXTRACT(warehouse_spec, '/Warehouse') as "Warehouse"
   FROM warehouses WHERE warehouse_name = 'San Francisco';

Warehouse
------------------------------------------------------------
<Warehouse>
  <Building>Rented</Building>
  <Area>50000</Area>
  <Docks>1</Docks>
  <DockType>Side load</DockType>
  <WaterAccess>Y</WaterAccess>
  <RailAccess>N</RailAccess>
  <Parking>Lot</Parking>
  <VClearance>12 ft</VClearance>
</Warehouse>

1 row selected.

SELECT VALUE(p)
   FROM warehouses w,
   TABLE(XMLSEQUENCE(EXTRACT(warehouse_spec, '/Warehouse/*'))) p
   WHERE w.warehouse_name = 'San Francisco';



VALUE(P)
--------------------------------------------------------------------
<Building>Rented</Building>
<Area>50000</Area>
<Docks>1</Docks>
<DockType>Side load</DockType>
<WaterAccess>Y</WaterAccess>
<RailAccess>N</RailAccess>
<Parking>Lot</Parking>
<VClearance>12 ft</VClearance>

8 rows selected.
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

XMLSERIALIZE

Syntax

(*datatype*::=)

Purpose

`XMLSerialize` creates a string or LOB containing the contents of *`value_expr`*.

Any lob returned by `XMLSERIALIZE` will be read-only.

If you specify `DOCUMENT`, then the *`value_expr`* must be a valid XML document.

If you specify `CONTENT`, then the *`value_expr`* need not be a singly rooted XML document. However it must be valid XML content.

datatype

The *`datatype`* specified can be:

- `VARCHAR2` or `VARCHAR`, but not `NVARCHAR2`
- `BLOB`, or `CLOB` with options *`reference`* or *`value`*. The default is *`reference`*.
- With `BLOB`, you can specify the `ENCODING` clause to use the specified encoding in the prolog. The *`xml_encoding_spec`* is an XML encoding declaration (`encoding="..."`).

The default type is `CLOB`.

Specify the `VERSION` clause to use the version you provide as *`string_literal`* in the XML declaration (`<?xml version="..." ...?>`).

Specify `NO INDENT` to strip all insignificant whitespace from the output. Specify `INDENT SIZE = N`, where *`N`* is a whole number, for output that is pretty-printed using a relative indentation of *`N`* spaces. If *`N`* is `0`, then pretty-printing inserts a newline character after each element, placing each element on a line by itself, but omitting all other insignificant whitespace in the output. If `INDENT` is present without a `SIZE` specification, then 2-space indenting is used. If you omit this clause, then the behavior (pretty-printing or not) is indeterminate.

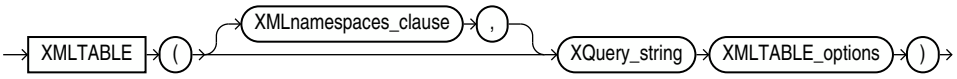
`HIDE DEFAULTS` and `SHOW DEFAULTS` apply only to XML schema-based data. If you specify `SHOW DEFAULTS` and the input data is missing any optional elements or attributes for which the XML schema defines default values, then those elements or attributes are included in the output

Copyright © 1996, 2026, Oracle and/or its affiliates.

with their default values. If you specify `HIDE DEFAULTS`, then no such elements or attributes are included in the output. `HIDE DEFAULTS` is the default behavior.

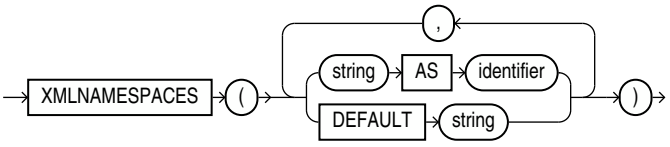
> **See Also**
>
> - *Oracle XML DB Developer's Guide* for more information on this function
> - Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `XMLSERIALIZE`

Examples



The following statement uses the `DUAL` table to illustrate the syntax of `XMLSerialize`:

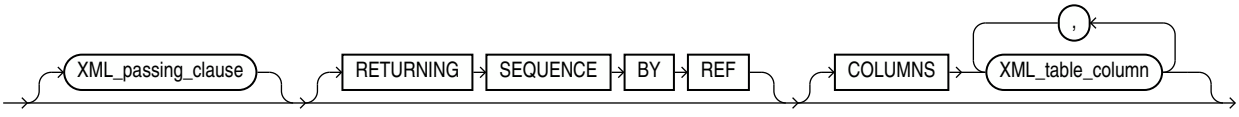
```
SELECT XMLSERIALIZE(CONTENT XMLTYPE('<Owner>Grandco</Owner>')) AS xmlserialize_doc
   FROM DUAL;



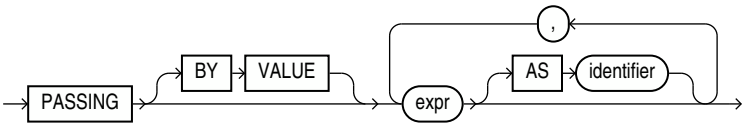
XMLSERIALIZE_DOC
----------------
<Owner>Grandco</Owner>
```

XMLTABLE

Syntax

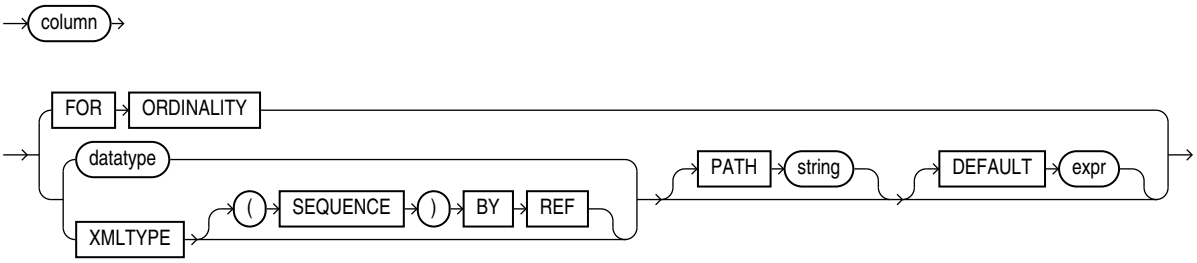


***XMLnamespaces_clause*::=**



> **Note**
>
> You can specify at most one `DEFAULT` *`string`* clause.

***XMLTABLE_options*::=**



Copyright © 1996, 2026, Oracle and/or its affiliates.

***XML_passing_clause*::=**

***XML_table_column*::=**

(*datatype*::=)

Purpose

`XMLTable` maps the result of an XQuery evaluation into relational rows and columns. You can query the result returned by the function as a virtual relational table using SQL.

- The `XMLNAMESPACES` clause contains a set of XML namespace declarations. These declarations are referenced by the XQuery expression (the evaluated *`XQuery_string`*), which computes the row, and by the XPath expression in the `PATH` clause of *`XML_table_column`*, which computes the columns for the entire `XMLTable` function. If you want to use qualified names in the `PATH` expressions of the `COLUMNS` clause, then you need to specify the `XMLNAMESPACES` clause.
- *`XQuery_string`* is a literal string. It is a complete XQuery expression and can include prolog declarations. The value of XQuery_string serves as input to the XMLTable function; it is this XQuery result that is decomposed and stored as relational data.
- The *`expr`* in the *`XML_passing_clause`* is an expression returning an `XMLType` or an instance of a SQL scalar data type that is used as the context for evaluating the XQuery expression. You can specify only one *`expr`* in the `PASSING` clause without an identifier. The result of evaluating each *`expr`* is bound to the corresponding identifier in the *`XQuery_string`*. If any *`expr`* that is not followed by an `AS` clause, then the result of evaluating that expression is used as the context item for evaluating the *`XQuery_string`*. This clause supports only passing by value, not passing by reference. Therefore, the `BY VALUE` keywords are optional and are provided for semantic clarity.
- The optional `RETURNING SEQUENCE BY REF` clause causes the result of the XQuery evaluation to be returned by reference. This allows you to refer to any part of the source data in the *`XML_table_column`* clause.

  If you omit this clause, then the result of the XQuery evaluation is returned by value. That is, a copy of the targeted nodes is returned instead of a reference to the actual nodes. In this case, you cannot refer to any data that is not in the returned copy in the *`XML_table_column`* clause. In particular, you cannot refer to data that precedes the targeted nodes in the source data.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- The optional COLUMNS clause defines the columns of the virtual table to be created by XMLTable.
  - If you omit the COLUMNS clause, then XMLTable returns a row with a single XMLType pseudocolumn named COLUMN_VALUE.
  - FOR ORDINALITY specifies that *column* is to be a column of generated row numbers. There must be at most one FOR ORDINALITY clause. It is created as a NUMBER column.
  - For each resulting column except the FOR ORDINALITY column, you must specify the column data type, which can be XMLType or any other data type.

    If the column data type is XMLType, then specify the XMLTYPE clause. If you specify the optional (SEQUENCE) BY REF clause, then a reference to the source data targeted by the PATH expression is returned as the column content. Otherwise, *column* contains a copy of that targeted data.

    Returning the XMLType data by reference lets you specify other columns whose paths target nodes in the source data that are outside those targeted by the PATH expression for column.

    If the column data type is any other data type, then specify *datatype_clause*.

    datatype

    The *datatype* specified can be:

    * BLOB, or CLOB with options *reference* or *value*. The default is *reference*.
    * Any other data type.
  - The optional PATH clause specifies that the portion of the XQuery result that is addressed by XQuery expression string is to be used as the column content.

    If you omit PATH, then the XQuery expression *column* is assumed. For example:

    ```
    XMLTable(... COLUMNS xyz)
    ```

    is equivalent to

    ```
    XMLTable(... COLUMNS xyz PATH 'XYZ')
    ```

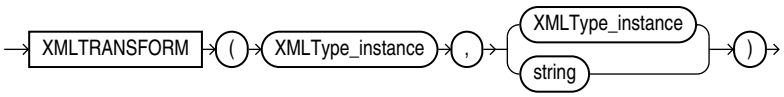
    You can use different PATH clauses to split the XQuery result into different virtual-table columns.
  - The optional DEFAULT clause specifies the value to use when the PATH expression results in an empty sequence. Its *expr* is an XQuery expression that is evaluated to produce the default value.

See Also

- *Oracle XML DB Developer's Guide* for more information on the XMLTable function, including additional examples, and on XQuery in general
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to each character data type column in the table generated by XMLTABLE

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples



The following example converts the result of applying the XQuery `'/Warehouse'` to each value in the `warehouse_spec` column of the `warehouses` table into a virtual relational table with columns `Water` and `Rail`:

```
SELECT warehouse_name warehouse,
   warehouse2."Water", warehouse2."Rail"
   FROM warehouses,
   XMLTABLE('/Warehouse'
      PASSING warehouses.warehouse_spec
      COLUMNS
         "Water" varchar2(6) PATH 'WaterAccess',
         "Rail" varchar2(6) PATH 'RailAccess')
      warehouse2;

WAREHOUSE                          Water  Rail
---------------------------------- ------ ------
Southlake, Texas                   Y      N
San Francisco                      Y      N
New Jersey                         N      N
Seattle, Washington                N      Y
```

XMLTRANSFORM

Syntax

Purpose

`XMLTransform` takes as arguments an `XMLType` instance and an XSL style sheet, which is itself a form of `XMLType` instance. It applies the style sheet to the instance and returns an `XMLType`.

This function is useful for organizing data according to a style sheet as you are retrieving it from the database.

> **See Also**
>
> *Oracle XML DB Developer's Guide* for more information on this function

Examples

The `XMLTransform` function requires the existence of an XSL style sheet. Here is an example of a very simple style sheet that alphabetizes elements within a node:

```
CREATE TABLE xsl_tab (col1 XMLTYPE);

INSERT INTO xsl_tab VALUES (
   XMLTYPE.createxml(
   '<?xml version="1.0"?>
    <xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/Transform" >
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
      <xsl:output encoding="utf-8"/>
      <!-- alphabetizes an xml tree -->
      <xsl:template match="*">
        <xsl:copy>
          <xsl:apply-templates select="*|text()">
            <xsl:sort select="name(.)" data-type="text" order="ascending"/>
          </xsl:apply-templates>
        </xsl:copy>
      </xsl:template>
      <xsl:template match="text()">
        <xsl:value-of select="normalize-space(.)"/>
      </xsl:template>
    </xsl:stylesheet>  '));

1 row created.
```

The next example uses the `xsl_tab` XSL style sheet to alphabetize the elements in one `warehouse_spec` of the sample table `oe.warehouses`:

```
SELECT XMLTRANSFORM(w.warehouse_spec, x.col1).GetClobVal()
   FROM warehouses w, xsl_tab x
   WHERE w.warehouse_name = 'San Francisco';

XMLTRANSFORM(W.WAREHOUSE_SPEC,X.COL1).GETCLOBVAL()
--------------------------------------------------------------------------------
<Warehouse>
  <Area>50000</Area>
  <Building>Rented</Building>
  <DockType>Side load</DockType>
  <Docks>1</Docks>
  <Parking>Lot</Parking>
  <RailAccess>N</RailAccess>
  <VClearance>12 ft</VClearance>
  <WaterAccess>Y</WaterAccess>
</Warehouse>
```

CEIL, FLOOR, ROUND, and TRUNC Date Functions

Table 7-22 lists the format models you can use with the `CEIL`, `FLOOR`, `ROUND`, and `TRUNC` date functions and the units to which they round and truncate dates. The default model, 'DD', returns the date rounded or truncated to the day with a time of midnight.

Table 7-22 Date Format Models for the CEIL, FLOOR, ROUND, and TRUNC Date Functions

Format Model	Rounding or Truncating Unit
CC SCC	One greater than the first two digits of a four-digit year
SYYYY YYYY YEAR SYEAR YYY YY Y	Year (rounds up on July 1)

Copyright © 1996, 2026, Oracle and/or its affiliates.

Table 7-22 (Cont.) Date Format Models for the CEIL, FLOOR, ROUND, and TRUNC Date Functions

Format Model	Rounding or Truncating Unit

`IYYY`
`IY`
`IY`
`I`
	Year containing the calendar week, as defined by the ISO 8601 standard

`Q`	Quarter (rounds up on the sixteenth day of the second month of the quarter)

`MONTH`
`MON`
`MM`
`RM`
	Month (rounds up on the sixteenth day)

`WW`	Same day of the week as the first day of the year
`IW`	Same day of the week as the first day of the calendar week as defined by the ISO 8601 standard, which is Monday
`W`	Same day of the week as the first day of the month

`DDD`
`DD`
`J`
	Day

`DAY`
`DY`
`D`
	Starting day of the week

`HH`
`HH12`
`HH24`
	Hour

`MI`	Minute

The starting day of the week used by the format models DAY, DY, and D is specified implicitly by the initialization parameter `NLS_TERRITORY`.

About User-Defined Functions

You can write user-defined functions in PL/SQL, Java, or C to provide functionality that is not available in SQL or SQL built-in functions. User-defined functions can appear in a SQL statement wherever an expression can occur.

For example, user-defined functions can be used in the following:

- The select list of a `SELECT` statement
- The condition of a `WHERE` clause
- `CONNECT BY`, `START WITH`, `ORDER BY`, and `GROUP BY` clauses
- The `VALUES` clause of an `INSERT` statement
- The `SET` clause of an `UPDATE` statement

***user_defined_function*::=**

The optional expression list must match attributes of the function, package, or operator.

Restriction on User-defined Functions

The `DISTINCT` and `ALL` keywords are valid only with a user-defined aggregate function.

> **See Also**
>
> - CREATE FUNCTION for information on creating functions, including restrictions on user-defined functions
> - *Oracle Database Development Guide* for a complete discussion of the creation and use of user functions

Prerequisites

User-defined functions must be created as top-level functions or declared with a package specification before they can be named within a SQL statement.

To use a user function in a SQL expression, you must own or have `EXECUTE` privilege on the user function. To query a view defined with a user function, you must have the `READ` or `SELECT` privilege on the view. No separate `EXECUTE` privileges are needed to select from the view.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> CREATE FUNCTION for information on creating top-level functions and CREATE PACKAGE for information on specifying packaged functions

Name Precedence

Within a SQL statement, the names of database columns take precedence over the names of functions with no parameters. For example, if the Human Resources manager creates the following two objects in the `hr` schema:

```
CREATE TABLE new_emps (new_sal NUMBER, ...);
CREATE FUNCTION new_sal RETURN NUMBER IS BEGIN ... END;
```

then in the following two statements, the reference to `new_sal` refers to the column `new_emps.new_sal`:

```
SELECT new_sal FROM new_emps;
SELECT new_emps.new_sal FROM new_emps;
```

To access the function `new_sal`, you would enter:

```
SELECT hr.new_sal FROM new_emps;
```

Here are some sample calls to user functions that are allowed in SQL expressions:

```
circle_area (radius)
payroll.tax_rate (empno)
hr.employees.tax_rate (dependent, empno)@remote
```

Example

To call the `tax_rate` user function from schema `hr`, execute it against the `ss_no` and `sal` columns in `tax_table`, specify the following:

```
SELECT hr.tax_rate (ss_no, sal)
    INTO income_tax
    FROM tax_table WHERE ss_no = tax_id;
```

The `INTO` clause is PL/SQL that lets you place the results into the variable `income_tax`.

Naming Conventions

If only one of the optional schema or package names is given, then the first identifier can be either a schema name or a package name. For example, to determine whether `PAYROLL` in the reference `PAYROLL.TAX_RATE` is a schema or package name, Oracle Database proceeds as follows:

1. Check for the `PAYROLL` package in the current schema.
2. If a `PAYROLL` package is not found, then look for a schema name `PAYROLL` that contains a top-level `TAX_RATE` function. If no such function is found, then return an error.
3. If the `PAYROLL` package is found in the current schema, then look for a `TAX_RATE` function in the `PAYROLL` package. If no such function is found, then return an error.

You can also refer to a stored top-level function using any synonym that you have defined for it.

Copyright © 1996, 2026, Oracle and/or its affiliates.

8

Common SQL DDL Clauses

This chapter describes some SQL data definition clauses that appear in multiple SQL statements.

This chapter contains these sections:

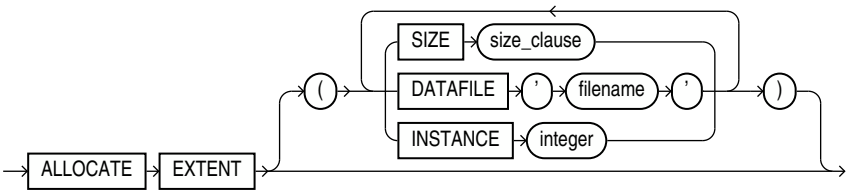
- *allocate_extent_clause*
- *constraint*
- *deallocate_unused_clause*
- *file_specification*
- *logging_clause*
- *parallel_clause*
- *physical_attributes_clause*
- *size_clause*
- *storage_clause*
- *annotations_clause*

allocate_extent_clause

Purpose

Use the *allocate_extent_clause* clause to explicitly allocate a new extent for a database object.

Explicitly allocating an extent with this clause does not change the values of the NEXT and PCTINCREASE storage parameters, so does not affect the size of the next extent to be allocated implicitly by Oracle Database. Refer to *storage_clause* for information about the NEXT and PCTINCREASE storage parameters.



You can allocate an extent in the following SQL statements:

- ALTER CLUSTER (see ALTER CLUSTER)
- ALTER INDEX: to allocate an extent to the index, an index partition, or an index subpartition (see ALTER INDEX)
- ALTER MATERIALIZED VIEW: to allocate an extent to the materialized view, one of its partitions or subpartitions, or the overflow segment of an index-organized materialized view (see ALTER MATERIALIZED VIEW)
- ALTER MATERIALIZED VIEW LOG (see ALTER MATERIALIZED VIEW LOG)
- ALTER TABLE: to allocate an extent to the table, a table partition, a table subpartition, the mapping table of an index-organized table, the overflow segment of an index-organized table, or a LOB storage segment (see ALTER TABLE)

Copyright © 1996, 2026, Oracle and/or its affiliates.

Syntax

***allocate_extent_clause*::=**

(*size_clause*::=)

Semantics

This section describes the parameters of the *allocate_extent_clause*. For additional information, refer to the SQL statement in which you set or reset these parameters for a particular database object.

You cannot specify the *allocate_extent_clause* and the *deallocate_unused_clause* in the same statement.

SIZE

Specify the size of the extent in bytes. The value of *integer* can be 0 through 2147483647. To specify a larger extent size, use an integer within this range with `K`, `M`, `G`, or `T` to specify the extent size in kilobytes, megabytes, gigabytes, or terabytes.

For a table, index, materialized view, or materialized view log, if you omit `SIZE`, then Oracle Database determines the size based on the values of the storage parameters of the object. However, for a cluster, Oracle does not evaluate the cluster's storage parameters, so you must specify `SIZE` if you do not want Oracle to use a default value.

DATAFILE '*filename*'

Specify one of the data files in the tablespace of the table, cluster, index, materialized view, or materialized view log to contain the new extent. If you omit `DATAFILE`, then Oracle chooses the data file.

INSTANCE *integer*

Use this parameter only if you are using Oracle Real Application Clusters.

Specifying `INSTANCE` *integer* makes the new extent available to the freelist group associated with the specified instance. If the instance number exceeds the maximum number of freelist groups, then Oracle divides the specified number by the maximum number and uses the remainder to identify the freelist group to be used. An instance is identified by the value of its initialization parameter `INSTANCE_NUMBER`.

If you omit this parameter, then the space is allocated to the table, cluster, index, materialized view, or materialized view log but is not drawn from any particular freelist group. Instead, Oracle uses the master freelist and allocates space as needed.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **Note**
>
> If you are using automatic segment-space management, then the `INSTANCE` parameter of the *`allocate_extent_clause`* may not reserve the newly allocated space for the specified instance, because automatic segment-space management does not maintain rigid affinity between extents and instances.

constraint

Purpose

Use a *`constraint`* to define an **integrity constraint**, a rule that restricts the values in a database. The database lets you create six types of constraints and lets you declare them in two ways.

The six types of integrity constraint are described briefly here and more fully in "Semantics":

- A **`NOT NULL` constraint** prohibits a database value from being null.
- A **unique constraint** prohibits multiple rows from having the same value in the same column or combination of columns but allows some values to be null.
- A **primary key constraint** combines a `NOT NULL` constraint and a unique constraint in a single declaration. It prohibits multiple rows from having the same value in the same column or combination of columns and prohibits values from being null.
- A **foreign key constraint** requires values in one table to match values in another table.
- A **check constraint** requires a value in the database to comply with a specified condition.
- A `REF` column by definition references an object in another object type or in a relational table. A **REF constraint** lets you further describe the relationship between the `REF` column and the object it references.

> **Note**
>
> You can declare cross row, cross table constraints with assertions. See CREATE ASSERTION for details.

You can define constraints syntactically in two ways:

- As part of the definition of an individual column or attribute. This is called **inline** specification.
- As part of the table definition. This is called **out-of-line** specification.

`NOT NULL` constraints must be declared inline. All other constraints can be declared either inline or out of line.

Constraint clauses can appear in the following statements:

- `CREATE TABLE` (see CREATE TABLE)
- `ALTER TABLE` (see ALTER TABLE)
- `CREATE VIEW` (see CREATE VIEW)

Copyright © 1996, 2026, Oracle and/or its affiliates.

- `ALTER VIEW` (see ALTER VIEW)

View Constraints

The database does not enforce view constraints. However, you can enforce constraints on views through constraints on base tables.

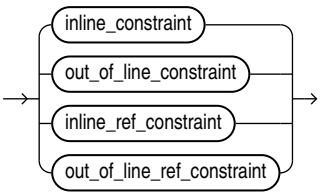
You can specify only unique, primary key, and foreign key constraints on views, and they are supported only in `DISABLE NOVALIDATE` mode. You cannot define view constraints on attributes of an object column.

> **See Also**
>
> View Constraints for additional information on view constraints and "DISABLE Clause" for information on `DISABLE NOVALIDATE` mode

External Table Constraints

You can specify only `NOT NULL`, unique, primary key, and foreign key constraints on external tables. Unique, primary key, and foreign key constraints are supported only in `RELY DISABLE` mode.

> **See Also**
>
> DISABLE Clause for information on `RELY` and `DISABLE`.



Prerequisites

You must have the privileges necessary to issue the statement in which you are defining the constraint.

To create a foreign key constraint, in addition, the parent table or view must be in your own schema or you must have the `REFERENCES` privilege on the columns of the referenced key in the parent table or view.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Semantics

This section describes the semantics of *constraint*. For additional information, refer to the SQL statement in which you define or redefine a constraint for a table or view.

The database does not support constraints on columns or attributes whose type is a user-defined object, nested table, VARRAY, REF, or LOB, with two exceptions:

- NOT NULL constraints are supported for a column or attribute whose type is user-defined object, VARRAY, REF, or LOB.
- NOT NULL, foreign key, and REF constraints are supported on a column of type REF.

CONSTRAINT *constraint_name*

Specify a name for the constraint. The name must satisfy the requirements listed in "Database Object Naming Rules ". If you omit this identifier, then the database generates a name with the form SYS_C*n*. The database stores the name and the definition of the integrity constraint in the USER_, ALL_, and DBA_CONSTRAINTS data dictionary views (in the CONSTRAINT_NAME and SEARCH_CONDITION columns, respectively).

> **See Also**
>
> *Oracle Database Reference* for information on the data dictionary views

NOT NULL Constraints

A NOT NULL constraint prohibits a column from containing nulls. The NULL keyword by itself does not actually define an integrity constraint, but you can specify it to explicitly permit a column to contain nulls. You must define NOT NULL and NULL using inline specification. If you specify neither NOT NULL nor NULL, then the default is NULL.

NOT NULL constraints are the only constraints you can specify inline on XMLType and VARRAY columns.

To satisfy a NOT NULL constraint, every row in the table must contain a value for the column.

> **Note**
>
> The database does not index table rows in which all key columns are null except in the case of bitmap indexes. Therefore, if you want an index on all rows of a table, then you must either specify NOT NULL constraints for at least one of the index key columns or create a bitmap index.

Restrictions on NOT NULL Constraints

NOT NULL constraints are subject to the following restrictions:

- You cannot specify NULL or NOT NULL in a view constraint.
- You cannot specify NULL or NOT NULL for an attribute of an object. Instead, use a CHECK constraint with the IS [NOT] NULL condition.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> "Attribute-Level Constraints Example" and "NOT NULL Example"

Unique Constraints

A **unique** constraint designates a column as a unique key. A **composite unique key** designates a combination of columns as the unique key. When you define a unique constraint inline, you need only the `UNIQUE` keyword. When you define a unique constraint out of line, you must also specify one or more columns. You must define a composite unique key out of line.

To satisfy a unique constraint, no two rows in the table can have the same value for the unique key. However, the unique key made up of a single column can contain nulls. To satisfy a composite unique key, no two rows in the table or view can have the same combination of values in the key columns. Any row that contains nulls in all key columns automatically satisfies the constraint. However, two rows that contain nulls for one or more key columns and the same combination of values for the other key columns violate the constraint.

Unique constraints are sensitive to declared collations of their key columns. See Collation Sensitivity of Constraints for more details.

When you specify a unique constraint on one or more columns, the database implicitly creates an index on the unique key. If you are defining uniqueness for purposes of query performance, then the database recommends that you instead create the unique index explicitly using a `CREATE UNIQUE INDEX` statement. You can also use the `CREATE UNIQUE INDEX` statement to create a unique function-based index that defines a conditional unique constraint. See "Using a Function-based Index to Define Conditional Uniqueness: Example" for more information.

When you specify an enabled unique constraint on an extended data type column, you may receive a "maximum key length exceeded" error when the database tries to create the index to enforce uniqueness for the enabled constraint. See "Creating an Index on an Extended Data Type Column" for information on how to work around this issue.

Restrictions on Unique Constraints

Unique constraints are subject to the following restrictions:

- None of the columns in the unique key can be of LOB, `LONG`, `LONG RAW`, `VARRAY`, `NESTED TABLE`, `OBJECT`, `REF`, `TIMESTAMP WITH TIME ZONE`, or user-defined type. However, the unique key can contain a column of `TIMESTAMP WITH LOCAL TIME ZONE`.
- A composite unique key cannot have more than 32 columns.
- You cannot designate the same column or combination of columns as both a primary key and a unique key.
- You cannot specify a unique key when creating a subview in an inheritance hierarchy. The unique key can be specified only for the top-level (root) view.
- When you specify a unique constraint for an external table, you must specify the `RELY` and `DISABLE` constraint states. See External Table Constraints for more information.

> **See Also**
>
> "Unique Key Example" and Composite Unique Key Example

Copyright © 1996, 2026, Oracle and/or its affiliates.

Primary Key Constraints

A **primary key** constraint designates a column as the primary key of a table or view. A **composite primary key** designates a combination of columns as the primary key. When you define a primary key constraint inline, you need only the `PRIMARY KEY` keywords. When you define a primary key constraint out of line, you must also specify one or more columns. You must define a composite primary key out of line.

To satisfy a primary key constraint:

- No primary key value can appear in more than one row in the table.
- No column that is part of the primary key can contain a null.

When you create a primary key constraint:

- The database uses an existing index if it contains a unique set of values before enforcing the primary key constraint. The existing index can be defined as unique or nonunique. When a DML operation is performed, the primary key constraint is enforced using this existing index.
- If no existing index can be used, then the database generates a unique index.

When you drop a primary key constraint:

- If the primary key was created using an existing index, then the index is not dropped.
- If the primary key was created using a system-generated index, then the index is dropped.

When you designate an extended data type column as an enabled primary key, you may receive a "maximum key length exceeded" error when the database tries to create the index to enforce uniqueness for the enabled constraint. See "Creating an Index on an Extended Data Type Column" for information on how to work around this issue.

Primary key constraints are sensitive to declared collations of their key columns. See Collation Sensitivity of Constraints for more details.

Restrictions on Primary Key Constraints

Primary constraints are subject to the following restrictions:

- A table or view can have only one primary key.
- None of the columns in the primary key can be LOB, `LONG`, `LONG RAW`, `VARRAY`, `NESTED TABLE`, `BFILE`, `REF`, `TIMESTAMP WITH TIME ZONE`, or user-defined type. However, the primary key can contain a column of `TIMESTAMP WITH LOCAL TIME ZONE`.
- The size of the primary key cannot exceed approximately one database block.
- A composite primary key cannot have more than 32 columns.
- You cannot designate the same column or combination of columns as both a primary key and a unique key.
- You cannot specify a primary key when creating a subview in an inheritance hierarchy. The primary key can be specified only for the top-level (root) view.
- When you specify a primary key constraint for an external table, you must specify the `RELY` and `DISABLE` constraint states. See External Table Constraints for more information.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> "Primary Key Example" and "Composite Primary Key Example"

Foreign Key Constraints

A **foreign key constraint** (also called a **referential integrity constraint**) designates a column as the foreign key and establishes a relationship between that foreign key and a specified primary or unique key, called the **referenced key**. A **composite foreign key** designates a combination of columns as the foreign key.

The table or view containing the foreign key is called the **child** object, and the table or view containing the referenced key is called the **parent** object. The foreign key and the referenced key can be in the same table or view. In this case, the parent and child tables are the same. If you identify only the parent table or view and omit the column name, then the foreign key automatically references the primary key of the parent table or view. The corresponding column or columns of the foreign key and the referenced key must match in order, data types, and declared collations.

Foreign key constraints are sensitive to declared collations of the referenced primary or unique key columns. See Collation Sensitivity of Constraints for more details.

You can define a foreign key constraint on a single key column either inline or out of line. You must specify a composite foreign key and a foreign key on an attribute out of line.

To satisfy a composite foreign key constraint, the composite foreign key must refer to a composite unique key or a composite primary key in the parent table or view, or the value of at least one of the columns of the foreign key must be null.

You can designate the same column or combination of columns as both a foreign key and a primary or unique key. You can also designate the same column or combination of columns as both a foreign key and a cluster key.

You can define multiple foreign keys in a table or view. Also, a single column can be part of more than one foreign key.

Restrictions on Foreign Key Constraints

Foreign key constraints are subject to the following restrictions:

- None of the columns in the foreign key can be of LOB, `LONG`, `LONG RAW`, `VARRAY`, `NESTED TABLE`, `BFILE`, `REF`, `TIMESTAMP WITH TIME ZONE`, or user-defined type. However, the primary key can contain a column of `TIMESTAMP WITH LOCAL TIME ZONE`.
- The referenced unique or primary key constraint on the parent table or view must already be defined.
- A composite foreign key cannot have more than 32 columns.
- The child and parent tables must be on the same database. To enable referential integrity constraints across nodes of a distributed database, you must use database triggers. See CREATE TRIGGER .
- If either the child or parent object is a view, then the constraint is subject to all restrictions on view constraints. See "View Constraints ".
- You cannot define a foreign key constraint in a `CREATE TABLE` statement that contains an `AS` *`subquery`* clause. Instead, you must create the table without the constraint and then add it later with an `ALTER TABLE` statement.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- When a table has a foreign key, and the parent of the foreign key is an index-organized table, a session that updates a row that contains the foreign key can hang when another session is updating a non-key column in the parent table.
- When you specify a foreign key constraint for an external table, you must specify the `RELY` and `DISABLE` constraint states. See External Table Constraints for more information.

> **See Also**
>
> - *Oracle Database Development Guide* for more information on using constraints
> - "Foreign Key Constraint Example" and "Composite Foreign Key Constraint Example"

references_clause

Foreign key constraints use the *`references_clause`* syntax. When you specify a foreign key constraint inline, you need only the *`references_clause`*. When you specify a foreign key constraint out of line, you must also specify the `FOREIGN KEY` keywords and one or more columns.

ON DELETE Clause

The `ON DELETE` clause lets you determine how the database automatically maintains referential integrity if you remove a referenced primary or unique key value. If you omit this clause, then the database does not allow you to delete referenced key values in the parent table that have dependent rows in the child table.

- Specify `CASCADE` if you want the database to remove dependent foreign key values.
- Specify `SET NULL` if you want the database to convert dependent foreign key values to `NULL`. You cannot specify this clause for a virtual column, because the values in a virtual column cannot be updated directly. Rather, the values from which the virtual column are derived must be updated.

Restriction on ON DELETE

You cannot specify this clause for a view constraint.

> **See Also**
>
> "ON DELETE Example"

Check Constraints

A check constraint lets you specify a condition that each row in the table must satisfy. To satisfy the constraint, each row in the table must make the condition either `TRUE` or unknown (due to a null). When the database evaluates a check constraint condition for a particular row, any column names in the condition refer to the column values in that row.

The syntax for inline and out-of-line specification of check constraints is the same. However, inline specification can refer only to the column (or the attributes of the column if it is an object column) currently being defined, whereas out-of-line specification can refer to multiple columns or attributes.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The database does not verify that conditions of check constraints are not mutually exclusive. Therefore, if you create multiple check constraints for a column, design them carefully so their purposes do not conflict. Do not assume any particular order of evaluation of the conditions.

You can specify a check constraint with a precheck state of PRECHECK, if you want to be able to validate the constraint outside of the database using an external JSON schema validator.

The SQL conditions used in CHECK constraints that have an equivalent condition in the JSON schema vocabulary are supported.

You can specify PRECHECK with existing constraint states ENABLE and VALIDATE at the same time.

If you do not specify PRECHECK or NOPRECHECK explicitly, the database sets the value of PRECHECK or NOPRECHECK automatically, based on whether a check constraint can be expressed as JSON schema.

The precheck state is independent from existing constraint states. You can use it with an exisiting constraint to indicate that the constraint can be prevalidated outside the database using the JSON schema.

You can remove the PRECHECK constraint state by setting it to NOPRECHECK using ALTER TABLE MODIFY CONSTRAINT.

If the condition of a check constraint depends on NLS parameters, such as NLS_DATE_FORMAT, the database evaluates the condition using the database values of the parameters, not the session values. You can find the database values of the NLS parameters in the data dictionary view NLS_DATABASE_PARAMETERS. These values are associated with a database by the DDL statement CREATE DATABASE and never change afterwards.

Restrictions on Check Constraints

Check constraints are subject to the following restrictions:

- You cannot specify a check constraint for a view. However, you can define the view using the WITH CHECK OPTION clause, which is equivalent to specifying a check constraint for the view.
- The condition of a check constraint can refer to any column in the table, but it cannot refer to columns of other tables.
- Conditions of check constraints cannot contain the following constructs:
  - Subqueries and scalar subquery expressions
  - Calls to the functions that are not deterministic (CURRENT_DATE, CURRENT_TIMESTAMP, DBTIMEZONE, LOCALTIMESTAMP, SESSIONTIMEZONE, SYSDATE, SYSTIMESTAMP, UID, USER, and USERENV)
  - Calls to user-defined functions
  - Dereferencing of REF columns (for example, using the DEREF function)
  - Nested table columns or attributes
  - The pseudocolumns CURRVAL, NEXTVAL, LEVEL, or ROWNUM
  - Date constants that are not fully specified
  - You cannot specify a check constraint for an external table.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> - Conditions for additional information and syntax
> - "Check Constraint Examples" and "Attribute-Level Constraints Example"
> - PRECHECK Using JSON Schema
> - CHECK Constraint Examples

REF Constraints

`REF` constraints let you describe the relationship between a column of type `REF` and the object it references.

ref_constraint

`REF` constraints use the *`ref_constraint`* syntax. You define a `REF` constraint either inline or out of line. Out-of-line specification requires you to specify the `REF` column or attribute you are further describing.

- For *`ref_column`*, specify the name of a `REF` column of an object or relational table.
- For *`ref_attribute`*, specify an embedded `REF` attribute within an object column of a relational table.

Both inline and out-of-line specification let you define a scope constraint, a rowid constraint, or a referential integrity constraint on a `REF` column.

If the scope table or referenced table of the `REF` column has a primary-key-based object identifier, then the `REF` column is a **user-defined `REF` column**.

> - "Foreign Key Constraints", and "REF Constraint Examples"

SCOPE REF Constraints

In a table with a `REF` column, each `REF` value in the column can conceivably reference a row in a different object table. The `SCOPE` clause restricts the scope of references to a single table, *`scope_table`*. The values in the `REF` column or attribute point to objects in *`scope_table`*, in which object instances of the same type as the `REF` column are stored.

Specify the `SCOPE` clause to restrict the scope of references in the `REF` column to a single table. For you to specify this clause, *`scope_table`* must be in your own schema, or you must have the `READ` or `SELECT` privilege on *`scope_table`*, or you must have the `READ ANY TABLE` or `SELECT ANY TABLE` system privilege. You can specify only one scope table for each `REF` column.

Restrictions on Scope Constraints

Scope constraints are subject to the following restrictions:

- You cannot add a scope constraint to an existing column unless the table is empty.
- You cannot specify a scope constraint for the `REF` elements of a `VARRAY` column.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- You must specify this clause if you specify AS *subquery* and the subquery returns user-defined REF data types.
- You cannot subsequently drop a scope constraint from a REF column.
- You cannot specify a scope constraint for an external table.

Rowid REF Constraints

Specify WITH ROWID to store the rowid along with the REF value in *ref_column* or *ref_attribute*. Storing the rowid with the REF value can improve the performance of dereferencing operations, but will also use more space. Default storage of REF values is without rowids.

> **See Also**
>
> The function DEREF for an example of dereferencing

Restrictions on Rowid Constraints

Rowid constraints are subject to the following restrictions:

- You cannot define a rowid constraint for the REF elements of a VARRAY column.
- You cannot subsequently drop a rowid constraint from a REF column.
- If the REF column or attribute is scoped, then this clause is ignored and the rowid is not stored with the REF value.
- You cannot specify a rowid constraint for an external table.

Referential Integrity Constraints on REF Columns

The *references_clause* of the *ref_constraint* syntax lets you define a foreign key constraint on the REF column. This clause also implicitly restricts the scope of the REF column or attribute to the referenced table. However, whereas a foreign key constraint on a non-REF column references an actual column in the parent table, a foreign key constraint on a REF column references the implicit object identifier column of the parent table.

If you do not specify a constraint name, then the database generates a system name for the constraint of the form SYS_C*n*.

If you add a referential integrity constraint to an existing REF column that is already scoped, then the referenced table must be the same as the scope table of the REF column. If you later drop the referential integrity constraint, then the REF column will remain scoped to the referenced table.

As is the case for foreign key constraints on other types of columns, you can use the *references_clause* alone for inline declaration. For out-of-line declaration you must also specify the FOREIGN KEY keywords plus one or more REF columns or attributes.

> **See Also**
>
> *Oracle AI Database Object-Relational Developer's Guide* for more information on object identifiers

Copyright © 1996, 2026, Oracle and/or its affiliates.

Restrictions on Foreign Key Constraints on REF Columns

Foreign key constraints on `REF` columns have the following additional restrictions:

- The database implicitly adds a scope constraint when you add a referential integrity constraint to an existing unscoped `REF` column. Therefore, all the restrictions that apply for scope constraints also apply in this case.
- You cannot specify a column after the object name in the *`references_clause`*.

Collation Sensitivity of Constraints

Starting with Release 12*c* Release 2 (12.2), primary key, unique, and foreign key constraints are sensitive to declared collations of their key columns. A primary or unique key character column value from a new or updated row is compared with values in existing rows using the declared collation of the key column. For example, if the declared collation of the key column is the case-insensitive collation `BINARY_CI`, a new or updated row may be rejected if the new key column value differs from some existing key value only by case. The collation `BINARY_CI` treats character values differing only by case as equal.

A foreign key character column value is compared to parent primary or unique key column values using the declared collation of the parent key column. For example, if the declared collation of the key column is the case-insensitive collation `BINARY_CI`, a new or updated child row may be accepted even if there is no identical parent key value for the corresponding foreign key value, provided there exists a value differing only by case.

The declared collation of a foreign key column must be the same as the collation of the corresponding parent key column.

Columns in a composite key of a constraint may have different declared collations.

When the declared collation of a key column of a constraint is a pseudo-collation, the constraint uses a corresponding variant of the collation `BINARY`. Pseudo-collations cannot be used directly to compare values for a constraint, because constraints are static and cannot depend on session NLS parameters on which the pseudo-collations depend. Therefore:

- The pseudo-collations `USING_NLS_COMP`, `USING_NLS_SORT`, and `USING_NLS_SORT_CS` use the collation `BINARY`.
- The pseudo-collation `USING_NLS_COMP_CI` uses the collation `BINARY_CI`.
- The pseudo-collation `USING_NLS_COMP_AI` uses the collation `BINARY_AI`.

When the effective collation used by a primary or unique key column is not `BINARY`, the database creates a hidden virtual column for this column. The expression of the virtual column calculates collation keys for character values of the original key column. The primary key or unique constraint is internally created on the virtual column instead of the original column. The virtual column is visible in the data dictionary views of the `*_TAB_COLS` family. For each of these hidden virtual columns, the `COLLATED_COLUMN_ID` of the `*_TAB_COLS` views contains the internal sequence number pointing to the corresponding original key column. The hidden virtual columns count to the 1000-column limit of a table, i.e. 1000 if the `MAX_COLUMNS` initialization parameter is set to `STANDARD`, or 4096 columns if `MAX_COLUMNS` is set to `EXTENDED`.

Specifying Constraint State

You can specify how and when the database should enforce the constraint when you define the constraint.

constraint_state

You can use *`constraint_state`* with both inline and out-of-line specification. Except for the clauses `DEFERRABLE` and `INITIALLY`, that may be specified in any order, you must specify the rest of the component clauses in the order shown, and each clause only once.

DEFERRABLE Clause

The `DEFERRABLE` and `NOT DEFERRABLE` parameters indicate whether or not, in subsequent transactions, constraint checking can be deferred until the end of the transaction using the `SET CONSTRAINT(S)` statement. If you omit this clause, then the default is `NOT DEFERRABLE`.

- Specify `NOT DEFERRABLE` to indicate that in subsequent transactions you cannot use the `SET CONSTRAINT[S]` clause to defer checking of this constraint until the transaction is committed. The checking of a `NOT DEFERRABLE` constraint can never be deferred to the end of the transaction.

  If you declare a new constraint `NOT DEFERRABLE`, then it must be valid at the time the `CREATE TABLE` or `ALTER TABLE` statement is committed or the statement will fail.
- Specify `DEFERRABLE` to indicate that in subsequent transactions you can use the `SET CONSTRAINT[S]` clause to defer checking of this constraint until a `COMMIT` statement is submitted. If the constraint check fails, then the database returns an error and the transaction is not committed. This setting in effect lets you disable the constraint temporarily while making changes to the database that might violate the constraint until all the changes are complete.

> **Note**
>
> The optimizer does not consider indexes on deferrable constraints as usable.

You cannot alter the deferrability of a constraint. Whether you specify either of these parameters, or make the constraint `NOT DEFERRABLE` implicitly by specifying neither of them, you cannot specify this clause in an `ALTER TABLE` statement. You must drop the constraint and re-create it.

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> - SET CONSTRAINT[S] for information on setting constraint checking for a transaction
> - *Oracle Database Administrator's Guide* and *Oracle Database Concepts* for more information about deferred constraints
> - "DEFERRABLE Constraint Examples"

Restriction on [NOT] DEFERRABLE

You cannot specify either of these parameters for a view constraint.

INITIALLY Clause

The `INITIALLY` clause establishes the default checking behavior for constraints that are `DEFERRABLE`. The `INITIALLY` setting can be overridden by a `SET CONSTRAINT(S)` statement in a subsequent transaction.

- Specify `INITIALLY IMMEDIATE` to indicate that the database should check this constraint at the end of each subsequent SQL statement. If you do not specify `INITIALLY` at all, then the default is `INITIALLY IMMEDIATE`.

  If you declare a new constraint `INITIALLY IMMEDIATE`, then it must be valid at the time the `CREATE TABLE` or `ALTER TABLE` statement is committed or the statement will fail.
- Specify `INITIALLY DEFERRED` to indicate that the database should check this constraint at the end of subsequent transactions.

This clause is not valid if you have declared the constraint to be `NOT DEFERRABLE`, because a `NOT DEFERRABLE` constraint is automatically `INITIALLY IMMEDIATE` and cannot ever be `INITIALLY DEFERRED`.

RELY Clause

The `RELY` and `NORELY` parameters specify whether a constraint in `NOVALIDATE` mode is to be taken into account for query rewrite. Specify `RELY` to activate a constraint in `NOVALIDATE` mode for query rewrite in an unenforced query rewrite integrity mode. The constraint is in `NOVALIDATE` mode, so the database does not enforce it. The default is `NORELY`.

Unenforced constraints are generally useful only with materialized views and query rewrite. Depending on the `QUERY_REWRITE_INTEGRITY` mode, query rewrite can use only constraints that are in `VALIDATE` mode, or that are in `NOVALIDATE` mode with the `RELY` parameter set, to determine join information.

Restriction on the RELY Clause

You cannot set a nondeferrable `NOT NULL` constraint to `RELY`.

> **See Also**
>
> *Oracle Database Data Warehousing Guide* for more information on materialized views and query rewrite

Using Indexes to Enforce Constraints

When defining the state of a unique or primary key constraint, you can specify an index for the database to use to enforce the constraint, or you can instruct the database to create the index used to enforce the constraint.

using_index_clause

You can specify the *using_index_clause* only when enabling unique or primary key constraints. You can specify the clauses of the *using_index_clause* in any order, but you can specify each clause only once.

- If you specify *schema.index*, then the database attempts to enforce the constraint using the specified index. If the database cannot find the index or cannot use the index to enforce the constraint, then the database returns an error.
- If you specify the *create_index_statement*, then the database attempts to create the index and use it to enforce the constraint. If the database cannot create the index or cannot use the index to enforce the constraint, then the database returns an error.
- If you neither specify an existing index nor create a new index, then the database creates the index. In this case:
  - The index receives the same name as the constraint.
  - If *table* is partitioned, then you can specify a locally or globally partitioned index for the unique or primary key constraint.

Restrictions on the *using_index_clause*

The following restrictions apply to the *using_index_clause*:

- You cannot specify this clause for a view constraint.
- You cannot specify this clause for a `NOT NULL`, foreign key, or check constraint.
- You cannot specify an index (*schema.index*) or create an index (*create_index_statement*) when enabling the primary key of an index-organized table.
- You cannot specify the *parallel_clause* of *index_attributes*.
- The `INDEXTYPE IS` ... clause of *index_properties* is not valid in the definition of a constraint.

> **See Also**
>
> - CREATE INDEX for a description of *index_attributes*, the *global_partitioned_index* and *local_partitioned_index* clauses, and for a description of `NOSORT` and the *logging_clause* in relation to indexes

> - "Explicit Index Control Example"

ENABLE Clause

Specify `ENABLE` if you want the constraint to be applied to the data in the table.

If you enable a unique or primary key constraint, and if no index exists on the key, then the database creates a unique index. Unless you specify `KEEP INDEX` when subsequently disabling

Copyright © 1996, 2026, Oracle and/or its affiliates.

the constraint, this index is dropped and the database rebuilds the index every time the constraint is reenabled.

You can also avoid rebuilding the index and eliminate redundant indexes by creating new primary key and unique constraints initially disabled. Then create (or use existing) nonunique indexes to enforce the constraint. The database does not drop a nonunique index when the constraint is disabled, so subsequent `ENABLE` operations are facilitated.

- `ENABLE VALIDATE` specifies that all old and new data also complies with the constraint. An enabled validated constraint guarantees that all data is and will continue to be valid.

  If any row in the table violates the integrity constraint, then the constraint remains disabled and the database returns an error. If all rows comply with the constraint, then the database enables the constraint. Subsequently, if new data violates the constraint, then the database does not execute the statement and returns an error indicating the integrity constraint violation.

  If you place a primary key constraint in `ENABLE VALIDATE` mode, then the validation process will verify that the primary key columns contain no nulls. To avoid this overhead, mark each column in the primary key `NOT NULL` before entering data into the column and before enabling the primary key constraint of the table.

- `ENABLE NOVALIDATE` ensures that all new DML operations on the constrained data comply with the constraint. This clause does not ensure that existing data in the table complies with the constraint.

If you specify neither `VALIDATE` nor `NOVALIDATE`, then the default is `VALIDATE`.

If you change the state of any single constraint from `ENABLE NOVALIDATE` to `ENABLE VALIDATE`, then the operation can be performed in parallel, and does not block reads, writes, or other DDL operations.

Restriction on the ENABLE Clause

You cannot enable a foreign key that references a disabled unique or primary key.

DISABLE Clause

Specify `DISABLE` to disable the integrity constraint. Disabled integrity constraints appear in the data dictionary along with enabled constraints. If you do not specify this clause when creating a constraint, then the database automatically enables the constraint.

- `DISABLE VALIDATE` disables the constraint and drops the index on the constraint, but keeps the constraint valid. This feature is most useful in data warehousing situations, because it lets you load large amounts of data while also saving space by not having an index. This setting lets you load data from a nonpartitioned table into a partitioned table using the *`exchange_partition_subpart`* clause of the `ALTER TABLE` statement or using SQL*Loader. All other modifications to the table (inserts, updates, and deletes) by other SQL statements are disallowed.

  > **See Also**
  >
  > *Oracle Database Data Warehousing Guide* for more information on using this setting

- `DISABLE NOVALIDATE` signifies that the database makes no effort to maintain the constraint (because it is disabled) and cannot guarantee that the constraint is true (because it is not being validated).

Copyright © 1996, 2026, Oracle and/or its affiliates.

You cannot drop a table whose primary key is being referenced by a foreign key even if the foreign key constraint is in `DISABLE NOVALIDATE` state. Further, the optimizer can use constraints in `DISABLE NOVALIDATE` state.

> **See Also**
>
> *Oracle Database SQL Tuning Guide* for information on when to use this setting

If you specify neither `VALIDATE` nor `NOVALIDATE`, then the default is `NOVALIDATE`.

If you disable a unique or primary key constraint that is using a unique index, then the database drops the unique index. Refer to the `CREATE TABLE` *enable_disable_clause* for additional notes and restrictions.

VALIDATE | NOVALIDATE

The behavior of `VALIDATE` and `NOVALIDATE` depends on whether the constraint is enabled or disabled, either explicitly or by default. Therefore, the `VALIDATE` and `NOVALIDATE` keywords are described in the context of "ENABLE Clause" and "DISABLE Clause".

Note on Foreign Key Constraints in NOVALIDATE Mode

When a foreign key constraint is in `NOVALIDATE` mode, if existing data in the table does not comply with the constraint and the `QUERY_REWRITE_INTEGRITY` parameter is not set to `ENFORCED`, then the optimizer may use join elimination during queries on the table. In this case, a query may return table rows with noncompliant foreign key values even if the query contains a join condition that should filter out those rows.

Handling Constraint Exceptions

When defining the state of a constraint, you can specify a table into which the database places the rowids of all rows violating the constraint.

exceptions_clause

Use the *exceptions_clause* syntax to define exception handling. If you omit *schema*, then the database assumes the exceptions table is in your own schema. If you omit this clause altogether, then the database assumes that the table is named `EXCEPTIONS`. The `EXCEPTIONS` table or the table you specify must exist on your local database.

You can create the `EXCEPTIONS` table using one of these scripts:

- `UTLEXCPT.SQL` uses physical rowids. Therefore it can accommodate rows from conventional tables but not from index-organized tables. (See the Note that follows.)
- `UTLEXPT1.SQL` uses universal rowids, so it can accommodate rows from both conventional and index-organized tables.

If you create your own exceptions table, then it must follow the format prescribed by one of these two scripts.

If you are collecting exceptions from index-organized tables based on primary keys (rather than universal rowids), then you must create a separate exceptions table for each index-organized table to accommodate its primary-key storage. You create multiple exceptions tables with different names by modifying and resubmitting the script.

Restrictions on the *exceptions_clause*

The following restrictions apply to the *exceptions_clause*:

Copyright © 1996, 2026, Oracle and/or its affiliates.

- You cannot specify this clause for a view constraint.
- You cannot specify this clause in a `CREATE TABLE` statement, because no rowids exist until *after* the successful completion of the statement.

> **See Also**
>
> – The `DBMS_IOT` package in *Oracle Database PL/SQL Packages and Types Reference* for information on the SQL scripts
>
> – *Oracle Database Performance Tuning Guide* for information on eliminating migrated and chained rows

View Constraints

The database does not enforce view constraints. However, operations on views are subject to the integrity constraints defined on the underlying base tables. This means that you can enforce constraints on views through constraints on base tables.

Notes on View Constraints

View constraints are a subset of table constraints and are subject to the following restrictions:

- You can specify only unique, primary key, and foreign key constraints on views. However, you can define the view using the `WITH CHECK OPTION` clause, which is equivalent to specifying a check constraint for the view.
- View constraints are supported only in `DISABLE NOVALIDATE` mode. You cannot specify any other mode. You must specify the keyword `DISABLE` when you declare the view constraint. You need not specify `NOVALIDATE` explicitly, as it is the default.
- The `RELY` and `NORELY` parameters are optional. View constraints, because they are unenforced, are usually specified with the `RELY` parameter to make them more useful. The `RELY` or `NORELY` keyword must precede the `DISABLE` keyword.
- Because view constraints are not enforced directly, you cannot specify `INITIALLY DEFERRED` or `DEFERRABLE`.
- You cannot specify the *`using_index_clause`*, the *`exceptions_clause`* clause, or the `ON DELETE` clause of the *`references_clause`*.
- You cannot define view constraints on attributes of an object column.

External Table Constraints

Starting with Release12*c* Release 2 (12.2), you can specify `NOT NULL`, unique, primary key, and foreign key constraints on external tables.

`NOT NULL` constraints on external tables are enforced and prohibit columns from containing nulls.

Unique, primary key, and foreign key constraints are supported on external tables only in `RELY DISABLE` mode. You must specify the keywords `RELY` and `DISABLE` when you create these constraints. These constraints are declarative and are not enforced. They can increase query performance and reduce resource consumption because more optimizer transformations can be taken into account. In order for the optimizer to utilize these `RELY DISABLE` constraints, the `QUERY_REWRITE_INTEGRITY` initialization parameter must be set to either `trusted` or `stale_tolerated`.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Examples

Unique Key Example

The following statement is a variation of the statement that created the sample table `sh.promotions`. It defines inline and implicitly enables a unique key on the `promo_id` column (other constraints are not shown):

```
CREATE TABLE promotions_var1
    ( promo_id          NUMBER(6)
                        CONSTRAINT promo_id_u  UNIQUE
    , promo_name        VARCHAR2(20)
    , promo_category    VARCHAR2(15)
    , promo_cost        NUMBER(10,2)
    , promo_begin_date DATE
    , promo_end_date    DATE
    ) ;
```

The constraint `promo_id_u` identifies the `promo_id` column as a unique key. This constraint ensures that no two promotions in the table have the same ID. However, the constraint does allow promotions without identifiers.

Alternatively, you can define and enable this constraint out of line:

```
CREATE TABLE promotions_var2
    ( promo_id          NUMBER(6)
    , promo_name        VARCHAR2(20)
    , promo_category    VARCHAR2(15)
    , promo_cost        NUMBER(10,2)
    , promo_begin_date DATE
    , promo_end_date    DATE
    , CONSTRAINT promo_id_u UNIQUE (promo_id)
   USING INDEX PCTFREE 20
      TABLESPACE stocks
      STORAGE (INITIAL 8M) );
```

The preceding statement also contains the *`using_index_clause`*, which specifies storage characteristics for the index that the database creates to enable the constraint.

Composite Unique Key Example

The following statement defines and enables a composite unique key on the combination of the `warehouse_id` and `warehouse_name` columns of the `oe.warehouses` table:

```
ALTER TABLE warehouses
   ADD CONSTRAINT wh_unq UNIQUE (warehouse_id, warehouse_name)
   USING INDEX PCTFREE 5
   EXCEPTIONS INTO wrong_id;
```

The `wh_unq` constraint ensures that the same combination of `warehouse_id` and `warehouse_name` values does not appear in the table more than once.

The `ADD CONSTRAINT` clause also specifies other properties of the constraint:

- The `USING INDEX` clause specifies storage characteristics for the index that the database creates to enable the constraint.
- The `EXCEPTIONS INTO` clause causes the database to write to the `wrong_id` table information about any rows currently in the `warehouses` table that violate the constraint. If the `wrong_id` exceptions table does not already exist, then this statement will fail.

Primary Key Example

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following statement is a variation of the statement that created the sample table `hr.locations`. It creates the `locations_demo` table and defines and enables a primary key on the `location_id` column (other constraints from the `hr.locations` table are omitted):

```
CREATE TABLE locations_demo
    ( location_id    NUMBER(4) CONSTRAINT loc_id_pk PRIMARY KEY
    , street_address VARCHAR2(40)
    , postal_code    VARCHAR2(12)
    , city           VARCHAR2(30)
    , state_province VARCHAR2(25)
    , country_id     CHAR(2)
    ) ;
```

The `loc_id_pk` constraint, specified inline, identifies the `location_id` column as the primary key of the `locations_demo` table. This constraint ensures that no two locations in the table have the same location number and that no location identifier is `NULL`.

Alternatively, you can define and enable this constraint out of line:

```
CREATE TABLE locations_demo
    ( location_id    NUMBER(4)
    , street_address VARCHAR2(40)
    , postal_code    VARCHAR2(12)
    , city           VARCHAR2(30)
    , state_province VARCHAR2(25)
    , country_id     CHAR(2)
    , CONSTRAINT loc_id_pk PRIMARY KEY (location_id));
```

NOT NULL Example

The following statement alters the `locations_demo` table (created in "Primary Key Example") to define and enable a `NOT NULL` constraint on the `country_id` column:

```
ALTER TABLE locations_demo
   MODIFY (country_id CONSTRAINT country_nn NOT NULL);
```

The constraint `country_nn` ensures that no location in the table has a null `country_id`.

Composite Primary Key Example

The following statement defines a composite primary key on the combination of the `prod_id` and `cust_id` columns of the sample table `sh.sales`:

```
ALTER TABLE sales
    ADD CONSTRAINT sales_pk PRIMARY KEY (prod_id, cust_id) DISABLE;
```

This constraint identifies the combination of the `prod_id` and `cust_id` columns as the primary key of the `sales` table. The constraint ensures that no two rows in the table have the same combination of values for the `prod_id` column and `cust_id` columns.

The constraint clause (`PRIMARY KEY`) also specifies the following properties of the constraint:

- The constraint definition does not include a constraint name, so the database generates a name for the constraint.
- The `DISABLE` clause causes the database to define the constraint but not enable it.

Foreign Key Constraint Example

The following statement creates the `dept_20` table and defines and enables a foreign key on the `department_id` column that references the primary key on the `department_id` column of the `departments` table:

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
CREATE TABLE dept_20
   (employee_id     NUMBER(4),
    last_name       VARCHAR2(10),
    job_id          VARCHAR2(9),
    manager_id      NUMBER(4),
    hire_date       DATE,
    salary          NUMBER(7,2),
    commission_pct  NUMBER(7,2),
    department_id   CONSTRAINT fk_deptno
                    REFERENCES departments(department_id) );
```

The constraint `fk_deptno` ensures that all departments given for employees in the `dept_20` table are present in the `departments` table. However, employees can have null department numbers, meaning they are not assigned to any department. To ensure that all employees are assigned to a department, you could create a `NOT NULL` constraint on the `department_id` column in the `dept_20` table in addition to the `REFERENCES` constraint.

Before you define and enable this constraint, you must define and enable a constraint that designates the `department_id` column of the `departments` table as a primary or unique key.

The foreign key constraint definition does not use the `FOREIGN KEY` clause, because the constraint is defined inline. The data type of the *`department_id`* column is not needed, because the database automatically assigns to this column the data type of the referenced key.

The constraint definition identifies both the parent table and the columns of the referenced key. Because the referenced key is the primary key of the parent table, the referenced key column names are optional.

Alternatively, you can define this foreign key constraint out of line:

```
CREATE TABLE dept_20
   (employee_id     NUMBER(4),
    last_name       VARCHAR2(10),
    job_id          VARCHAR2(9),
    manager_id      NUMBER(4),
    hire_date       DATE,
    salary          NUMBER(7,2),
    commission_pct  NUMBER(7,2),
    department_id,
   CONSTRAINT fk_deptno
      FOREIGN  KEY (department_id)
      REFERENCES  departments(department_id) );
```

The foreign key definitions in both variations of this statement omit the `ON DELETE` clause, causing the database to prevent the deletion of a department if any employee works in that department.

ON DELETE Example

This statement creates the `dept_20` table, defines and enables two referential integrity constraints, and uses the `ON DELETE` clause:

```
CREATE TABLE dept_20
   (employee_id     NUMBER(4) PRIMARY KEY,
    last_name       VARCHAR2(10),
    job_id          VARCHAR2(9),
    manager_id      NUMBER(4) CONSTRAINT fk_mgr
                    REFERENCES employees ON DELETE SET NULL,
    hire_date       DATE,
    salary          NUMBER(7,2),
    commission_pct  NUMBER(7,2),
    department_id   NUMBER(2)   CONSTRAINT fk_deptno
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
                    REFERENCES departments(department_id)
                    ON DELETE CASCADE );
```

Because of the first `ON DELETE` clause, if manager number 2332 is deleted from the `employees` table, then the database sets to null the value of `manager_id` for all employees in the `dept_20` table who previously had manager 2332.

Because of the second `ON DELETE` clause, the database cascades any deletion of a `department_id` value in the `departments` table to the `department_id` values of its dependent rows of the `dept_20` table. For example, if Department 20 is deleted from the `departments` table, then the database deletes all of the employees in Department 20 from the `dept_20` table.

Composite Foreign Key Constraint Example

The following statement defines and enables a foreign key on the combination of the `employee_id` and `hire_date` columns of the `dept_20` table:

```
ALTER TABLE dept_20
   ADD CONSTRAINT fk_empid_hiredate
   FOREIGN KEY (employee_id, hire_date)
   REFERENCES hr.job_history(employee_id, start_date)
   EXCEPTIONS INTO wrong_emp;
```

The constraint `fk_empid_hiredate` ensures that all the employees in the `dept_20` table have `employee_id` and `hire_date` combinations that exist in the `employees` table. Before you define and enable this constraint, you must define and enable a constraint that designates the combination of the `employee_id` and `hire_date` columns of the `employees` table as a primary or unique key.

The `EXCEPTIONS INTO` clause causes the database to write information to the `wrong_emp` table about any rows in the `dept_20` table that violate the constraint. If the `wrong_emp` exceptions table does not already exist, then this statement will fail.

Check Constraint Examples

The following statement creates a `divisions` table and defines a `check` constraint in each column of the table:

```
CREATE TABLE divisions
   (div_no    NUMBER  CONSTRAINT check_divno
              CHECK (div_no BETWEEN 10 AND 99)
              DISABLE,
    div_name  VARCHAR2(9)  CONSTRAINT check_divname
              CHECK (div_name = UPPER(div_name))
              DISABLE,
    office    VARCHAR2(10)  CONSTRAINT check_office
              CHECK (office IN ('DALLAS','BOSTON',
              'PARIS','TOKYO'))
              DISABLE);
```

Each constraint restricts the values of the column in which it is defined:

- `check_divno` ensures that no division numbers are less than 10 or greater than 99.
- `check_divname` ensures that all division names are in uppercase.
- `check_office` restricts office locations to Dallas, Boston, Paris, or Tokyo.

Because each `CONSTRAINT` clause contains the `DISABLE` clause, the database only defines the constraints and does not enable them.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The following statement creates the dept_20 table, defining out of line and implicitly enabling a check constraint:

```
CREATE TABLE dept_20
   (employee_id     NUMBER(4) PRIMARY KEY,
    last_name       VARCHAR2(10),
    job_id          VARCHAR2(9),
    manager_id      NUMBER(4),
    salary          NUMBER(7,2),
    commission_pct  NUMBER(7,2),
    department_id   NUMBER(2),
    CONSTRAINT check_sal CHECK (salary * commission_pct <= 5000));
```

This constraint uses an inequality condition to limit an employee's total commission, the product of salary and commission_pct, to $5000:

- If an employee has non-null values for both salary and commission, then the product of these values must not exceed $5000 to satisfy the constraint.
- If an employee has a null salary or commission, then the result of the condition is unknown and the employee automatically satisfies the constraint.

Because the constraint clause in this example does not supply a constraint name, the database generates a name for the constraint.

The following statement defines and enables a primary key constraint, two foreign key constraints, a NOT NULL constraint, and two check constraints:

```
CREATE TABLE order_detail
  (CONSTRAINT pk_od PRIMARY KEY (order_id, part_no),
   order_id    NUMBER
      CONSTRAINT fk_oid
         REFERENCES oe.orders(order_id),
   part_no     NUMBER
      CONSTRAINT fk_pno
         REFERENCES oe.product_information(product_id),
   quantity    NUMBER
      CONSTRAINT nn_qty NOT NULL
      CONSTRAINT check_qty CHECK (quantity > 0),
   cost        NUMBER
      CONSTRAINT check_cost CHECK (cost > 0) );
```

The constraints enable the following rules on table data:

- pk_od identifies the combination of the order_id and part_no columns as the primary key of the table. To satisfy this constraint, no two rows in the table can contain the same combination of values in the order_id and the part_no columns, and no row in the table can have a null in either the order_id or the part_no column.
- fk_oid identifies the order_id column as a foreign key that references the order_id column in the orders table in the sample schema oe. All new values added to the column order_detail.order_id must already appear in the column oe.orders.order_id.
- fk_pno identifies the product_id column as a foreign key that references the product_id column in the product_information table owned by oe. All new values added to the column order_detail.product_id must already appear in the column oe.product_information.product_id.
- nn_qty forbids nulls in the quantity column.
- check_qty ensures that values in the quantity column are always greater than zero.
- check_cost ensures the values in the cost column are always greater than zero.

Copyright © 1996, 2026, Oracle and/or its affiliates.

This example also illustrates the following points about constraint clauses and column definitions:

- Out-of-line constraint definition can appear before or after the column definitions. In this example, the out-of-line definition of the `pk_od` constraint precedes the column definitions.
- A column definition can contain multiple inline constraint definitions. In this example, the definition of the `quantity` column contains the definitions of both the `nn_qty` and `check_qty` constraints.
- A table can have multiple `CHECK` constraints. Multiple `CHECK` constraints, each with a simple condition enforcing a single business rule, are preferable to a single `CHECK` constraint with a complicated condition enforcing multiple business rules. When a constraint is violated, the database returns an error identifying the constraint. Such an error more precisely identifies the violated business rule if the identified constraint enables a single business rule.

Create a Table with PRECHECK: Example

The following example creates a table `Product` with `PRECHECK` constraints on columns `Price`, `Color`, `Description`, constant `NUMBER`, and constraint `TC1` :

```
CREATE TABLE Product(
  Id NUMBER NOT NULL PRIMARY KEY,
  Name VARCHAR2(50),
  Price NUMBER CHECK (mod(price,4) = 0 and 10 <> price) PRECHECK,
  Color NUMBER CHECK (Color >= 10 and Color <=50 and mod(color,2) = 0)
    PRECHECK,
  Description VARCHAR2(50) CHECK (Length(Description) <= 40) PRECHECK,
  Constant NUMBER CHECK (Constant=10) PRECHECK,
  CONSTRAINT TC1 CHECK (Color > 0 AND Price > 10) PRECHECK,
  CONSTRAINT TC2 CHECK (CATEGORY IN ('Home', 'Apparel') AND Price > 10)
);
Table PRODUCT created.
```

Add Precheck State to a New Constraint using ALTER TABLE:

```
ALTER TABLE Product MODIFY (Name VARCHAR2(50) CHECK
  (regexp_like(Name, '^Product')) PRECHECK);
```

Add Precheck to an Existing Costraint State :

```
ALTER TABLE Product MODIFY CONSTRAINT TC2 PRECHECK;
```

Remove an Existing Precheck State:

```
ALTER TABLE Product MODIFY CONSTRAINT TC1 NOPRECHECK;
```

Check PRECHECK State in USER_CONSTRAINTS: Example

Given the following table `Product`:

```
SQL> CREATE TABLE Product(
       Id NUMBER NOT NULL PRIMARY KEY,
       Name VARCHAR2(50),
       Category VARCHAR2(10) NOT NULL,
       Price NUMBER CHECK (mod(price,4) = 0 and 10 <> price),
       Color NUMBER CHECK (Color >= 10 and Color <=50) PRECHECK,
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
      Description VARCHAR2(50) CHECK (Length(Description) <= 40),
      Created_At DATE,
      Updated_At DATE,
      CONSTRAINT TC1 CHECK (Color > 0 AND Price > 10),
      CONSTRAINT TC2 CHECK (CATEGORY IN ('Home', 'Apparel')) NOPRECHECK,
      CONSTRAINT TC3 CHECK (Created_At > Updated_At)
    );

Table PRODUCT created.
```

You can check the PRECHECK state in USER_CONSTRAINTS as follows:

```
SELECT CONSTRAINT_NAME, SEARCH_CONDITION, PRECHECK
  FROM USER_CONSTRAINTS
  WHERE table_name='PRODUCT' and constraint_type='C';
```

The result is:

```
CONSTRAINT_NAME                 SEARCH_CONDITION                    PRECHECK
_______________                 ____________________________________
_____________
SYS_C008676 "ID"                IS NOT NULL
SYS_C008677 "CATEGORY"          IS NOT NULL
SYS_C008678  mod(price,4)       = 0 and 10 <> price                  PRECHECK
SYS_C008679 Color               >= 10 and Color <=50                 PRECHECK
SYS_C008680 Length(Description) <= 40                                PRECHECK
TC1                             Color > 0 AND Price > 10             PRECHECK
TC2                             CATEGORY IN ('Home', 'Apparel')      NOPRECHECK
TC3                             Created_At > Updated_At              NOPRECHECK

8 rows selected.
```

Several constraints are automatically set to a value in both inline and out-of-line constraints.

Case-Insensitive Constraints Example

The following statements create two tables in a parent-child relationship. The parent table is a product description table and the child table is a product component description table. Unique constraints are defined to assure that product and description values are unambiguous. For illustrative purposes, the product and component ID are case-insensitive character values. (In real-world applications, primary key IDs are usually numeric or case-normalized.)

```
CREATE TABLE products
    ( product_id VARCHAR2(20) COLLATE BINARY_CI
          CONSTRAINT product_pk PRIMARY KEY
    , description VARCHAR2(1000) COLLATE BINARY_CI
          CONSTRAINT product_description_unq UNIQUE
    );

CREATE TABLE product_components
    ( component_id VARCHAR2(40) COLLATE BINARY_CI
          CONSTRAINT product_component_pk PRIMARY KEY
    , product_id CONSTRAINT product_component_fk REFERENCES products(product_id)
    , description VARCHAR2(1000) COLLATE BINARY_CI
          CONSTRAINT product_component_descr_unq UNIQUE
    );
```

Note that if you do not specify the data type or the collation for a foreign key column, then they are inherited from the parent key column.

The following statements add a product and its components into the tables:

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
INSERT INTO products(product_id, description)
            VALUES('BICY0001', 'Men''s bicycle, fr 21", wh 24", gear 3x7');
INSERT INTO product_components(component_id, product_id, description)
            VALUES('BICY0001_FRAME01', 'BICY0001', 'Aluminium frame 21"');
INSERT INTO product_components(component_id, product_id, description)
            VALUES('BICY0001_WHEEL01', 'bicy0001', 'Wheels 24"');
INSERT INTO product_components(component_id, product_id, description)
            VALUES('BICY0001_GEAR01', 'Bicy0001', 'Front derailleur 3 chainrings');
INSERT INTO product_components(component_id, product_id, description)
            VALUES('BICY0001_gear02', 'BiCy0001', 'Rear derailleur 7 chainrings');
```

Note the different case of the product ID in different component rows. Because the primary key on the product ID is declared as case-insensitive, all possible letter case combinations of the same ID are considered equal.

The following statement demonstrates that it is not possible to enter another product with the same description differing only by case. It fails with the error `ORA-00001: unique constraint (`*`schema`*`.PRODUCT_DESCRIPTION_UNQ) violated`.

```
INSERT INTO products(product_id, description)
            VALUES('BICY0002', 'MEN''S BICYCLE, fr 21", wh 24", gear 3x7');
```

Similarly, the following statement demonstrates that the primary key contraint of the product table is case-insensitive and does not allow values differing only by case. It fails with the error `ORA-00001: unique constraint (`*`schema`*`.PRODUCT_PK) violated`.

```
INSERT INTO products(component_id, product_id, description)
            VALUES('bicy0001', 'Women''s bicycle, fr 21", wh 24", gear 2x6');
```

The following statement demonstrates that it is not possible to enter another component with the same description differing only by case. It fails with the error `ORA-00001: unique constraint (`*`schema`*`.PRODUCT_COMPONENT_DESCR_UNQ) violated`.

```
INSERT INTO product_components(component_id, product_id, description)
            VALUES('BICY0001_gear03', 'BiCy0001', 'REAR DERAILLEUR 7 CHAINRINGS');
```

Attribute-Level Constraints Example

The following example guarantees that a value exists for both the `first_name` and `last_name` attributes of the `name` column in the `students` table:

```
CREATE TYPE person_name AS OBJECT
   (first_name VARCHAR2(30), last_name VARCHAR2(30));
/

CREATE TABLE students (name person_name, age INTEGER,
   CHECK (name.first_name IS NOT NULL AND
          name.last_name IS NOT NULL));
```

REF Constraint Examples

The following example creates a duplicate of the sample schema object type `cust_address_typ`, and then creates a table containing a `REF` column with a `SCOPE` constraint:

```
CREATE TYPE cust_address_typ_new AS OBJECT
    ( street_address     VARCHAR2(40)
    , postal_code        VARCHAR2(10)
    , city               VARCHAR2(30)
    , state_province     VARCHAR2(10)
    , country_id         CHAR(2)
    );
/
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
CREATE TABLE address_table OF cust_address_typ_new;

CREATE TABLE customer_addresses (
   add_id NUMBER,
   address REF cust_address_typ_new
   SCOPE IS address_table);
```

The following example creates the same table but with a referential integrity constraint on the `REF` column that references the object identifier column of the parent table:

```
CREATE TABLE customer_addresses (
   add_id NUMBER,
   address REF cust_address_typ REFERENCES address_table);
```

The following example uses the type `department_typ` and the table `departments_obj_t`, created in "Creating Object Tables: Examples". A table with a scoped `REF` is then created.

```
CREATE TABLE employees_obj
   ( e_name   VARCHAR2(100),
     e_number NUMBER,
     e_dept   REF department_typ SCOPE IS departments_obj_t );
```

The following statement creates a table with a `REF` column which has a referential integrity constraint defined on it:

```
CREATE TABLE employees_obj
   ( e_name   VARCHAR2(100),
     e_number NUMBER,
     e_dept   REF department_typ REFERENCES departments_obj_t);
```

Explicit Index Control Example

The following statement shows another way to create a unique (or primary key) constraint that gives you explicit control over the index (or indexes) the database uses to enforce the constraint:

```
CREATE TABLE promotions_var3
    ( promo_id         NUMBER(6)
    , promo_name       VARCHAR2(20)
    , promo_category   VARCHAR2(15)
    , promo_cost       NUMBER(10,2)
    , promo_begin_date DATE
    , promo_end_date   DATE
    , CONSTRAINT promo_id_u UNIQUE (promo_id, promo_cost)
        USING INDEX (CREATE UNIQUE INDEX promo_ix1
           ON promotions_var3 (promo_id, promo_cost))
    , CONSTRAINT promo_id_u2 UNIQUE (promo_cost, promo_id)
        USING INDEX promo_ix1);
```

This example also shows that you can create an index for one constraint and use that index to create and enable another constraint in the same statement.

DEFERRABLE Constraint Examples

The following statement creates table `games` with a `NOT DEFERRABLE INITIALLY IMMEDIATE` constraint check (by default) on the `scores` column:

```
CREATE TABLE games (scores NUMBER CHECK (scores >= 0));
```

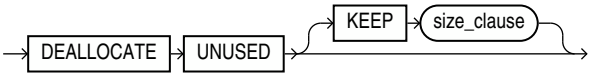
To define a unique constraint on a column as `INITIALLY DEFERRED DEFERRABLE`, issue the following statement:

Copyright © 1996, 2026, Oracle and/or its affiliates.

```
CREATE TABLE games
  (scores NUMBER, CONSTRAINT unq_num UNIQUE (scores)
   INITIALLY DEFERRED DEFERRABLE);
```

deallocate_unused_clause

Purpose



Use the *deallocate_unused_clause* to explicitly deallocate unused space at the end of a database object segment and make the space available for other segments in the tablespace.

You can deallocate unused space using the following statements:

- `ALTER CLUSTER` (see ALTER CLUSTER)
- `ALTER INDEX`: to deallocate unused space from the index, an index partition, or an index subpartition (see ALTER INDEX)
- `ALTER MATERIALIZED VIEW`: to deallocate unused space from the overflow segment of an index-organized materialized view (see ALTER MATERIALIZED VIEW)
- `ALTER TABLE`: to deallocate unused space from the table, a table partition, a table subpartition, the mapping table of an index-organized table, the overflow segment of an index-organized table, or a LOB storage segment (see ALTER TABLE)

Syntax

***deallocate_unused_clause*::=**

(*size_clause*::=)

Semantics

This section describes the semantics of the *deallocate_unused_clause*. For additional information, refer to the SQL statement in which you set or reset this clause for a particular database object.

You cannot specify both the *deallocate_unused_clause* and the *allocate_extent_clause* in the same statement.

Oracle Database frees only unused space above the high water mark (the point beyond which database blocks have not yet been formatted to receive data). Oracle deallocates unused space beginning from the end of the object and moving toward the beginning of the object to the high water mark.

If an extent is completely contained in the deallocation, then the whole extent is freed for reuse. If an extent is partially contained in the deallocation, then the used part up to the high water mark becomes the extent, and the remaining unused space is freed for reuse.

Oracle credits the amount of the released space to the user quota for the tablespace in which the deallocation occurs.

The exact amount of space freed depends on the values of the `INITIAL`, `MINEXTENTS`, and `NEXT` storage parameters. Refer to the *storage_clause* for a description of these parameters.

Copyright © 1996, 2026, Oracle and/or its affiliates.

KEEP *integer*

Specify the number of bytes above the high water mark that the segment of the database object is to have after deallocation.

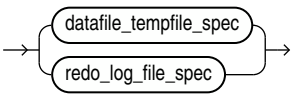
- If you omit `KEEP` and the high water mark is above the size of `INITIAL` and `MINEXTENTS`, then all unused space above the high water mark is freed. When the high water mark is less than the size of `INITIAL` or `MINEXTENTS`, then all unused space above `MINEXTENTS` is freed.
- If you specify `KEEP`, then the specified amount of space is kept and the remaining space is freed. When the remaining number of extents is less than `MINEXTENTS`, then Oracle adjusts `MINEXTENTS` to the new number of extents. If the initial extent becomes smaller than `INITIAL`, then Oracle adjusts `INITIAL` to the new size.
- In either case, Oracle sets the value of the `NEXT` storage parameter to the size of the last extent that was deallocated.

file_specification

Purpose

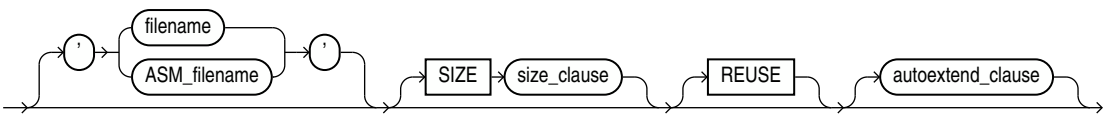
Use one of the *`file_specification`* forms to specify a file as a data file or temp file, or to specify a group of one or more files as a redo log file group. If you are storing your files in Oracle Automatic Storage Management (Oracle ASM) disk groups, then you can further specify the file as a disk group file.

A *`file_specification`* can appear in the following statements:



- `CREATE CONTROLFILE` (see CREATE CONTROLFILE)
- `CREATE DATABASE` (see CREATE DATABASE)
- `ALTER DATABASE` (see ALTER DATABASE)
- `CREATE TABLESPACE` (see CREATE TABLESPACE)
- `ALTER TABLESPACE` (see ALTER TABLESPACE)
- `ALTER DISKGROUP` (see ALTER DISKGROUP)

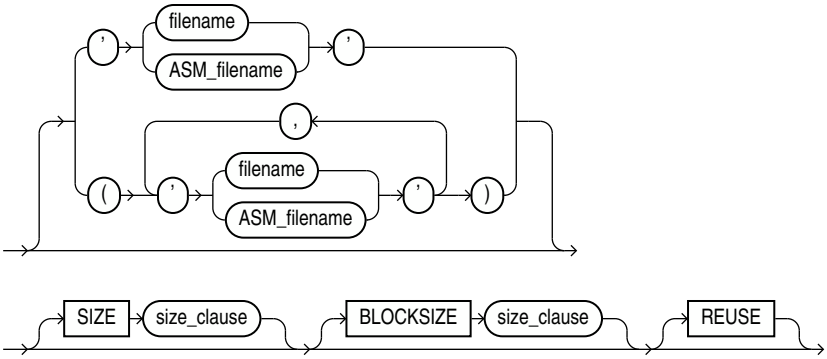
Prerequisites



You must have the privileges necessary to issue the statement in which the file specification appears.

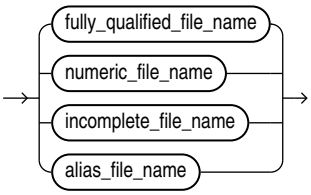
Syntax

***file_specification*::=**



***datafile_tempfile_spec*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

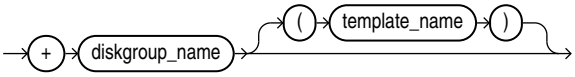


(*size_clause*::=)

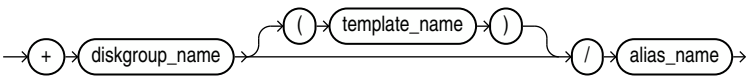
***redo_log_file_spec*::=**

(*size_clause*::=)

***ASM_filename*::=**

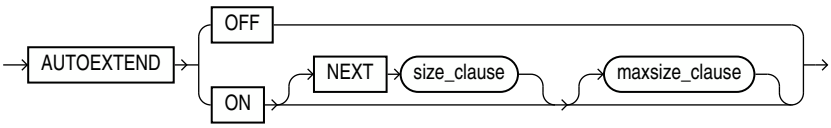


***fully_qualified_file_name*::=**

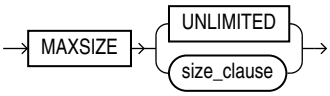


***numeric_file_name*::=**

***incomplete_file_name*::=**



***alias_file_name*::=**



Copyright © 1996, 2026, Oracle and/or its affiliates.

***autoextend_clause*::=**

(*size_clause*::=)

***maxsize_clause*::=**

(*size_clause*::=)

Semantics

This section describes the semantics of *file_specification*. For additional information, refer to the SQL statement in which you specify a data file, temp file, redo log file, or Oracle ASM disk group or disk group file.

datafile_tempfile_spec

Use this clause to specify the attributes of data files and temp files if your database storage is in a file system or in Oracle ASM disk groups.

redo_log_file_spec

Use this clause to specify the attributes of redo log files if your database storage is in a file system or in Oracle ASM disk groups.

filename

Use *filename* for files stored in a file system. The *filename* can specify either a new file or an existing file. For a *new* file:

- If you are *not* using Oracle Managed Files, then you must specify both *filename* and the SIZE clause or the statement fails. When you specify a filename without a size, Oracle attempts to reuse an existing file and returns an error if the file does not exist.
- If you *are* using Oracle Managed Files, then *filename* is optional, as are the remaining clauses of the specification. In this case, Oracle Database creates a unique name for the file and saves it in the directory specified by one of the following initialization parameters:
  - The DB_RECOVERY_FILE_DEST (for logfiles and control files)
  - The DB_CREATE_FILE_DEST initialization parameter (for any type of file)
  - The DB_CREATE_ONLINE_LOG_DEST_*n* initialization parameter, which takes precedence over DB_CREATE_FILE_DEST and DB_RECOVERY_FILE_DEST for log files.

For an *existing* file, specify the name of either a data file, temp file, or a redo log file member. The *filename* can contain only single-byte characters from 7-bit ASCII or EBCDIC character sets. Multibyte characters are not valid.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The filename can include a path prefix. If you do not specify such a path prefix, then the database adds the path prefix for the default storage location, which is platform dependent.

A redo log file group can have one or more members (copies). Each *filename* must be fully specified according to the conventions for your operating system.

The way the database interprets *filename* also depends on whether you specify it with the SIZE and REUSE clauses.

- If you specify *filename* only, or with the REUSE clause but without the SIZE clause, then the file must already exist.
- If you specify *filename* with SIZE but without REUSE, then the file must be a new file.
- If you specify *filename* with both SIZE and REUSE, then the file can be either new or existing. If the file exists, then it is reused with the new size. If it does not exist, then the database ignores the REUSE keyword and creates a new file of the specified size.

> **See Also**
>
> *Oracle Automatic Storage Management Administrator's Guide* for more information on Oracle Managed Files, "Specifying a Data File: Example", and "Specifying a Log File: Example"

ASM_filename

Use a form of ASM_filename for files stored in Oracle ASM disk groups. You can create or refer to data files, temp files, and redo log files with this syntax.

All forms of ASM_filename begin with the plus sign (+) followed by the name of the disk group. You can determine the names of all Oracle ASM disk groups by querying the V$ASM_DISKGROUP view.

> **See Also**
>
> *Oracle Automatic Storage Management Administrator's Guide* for information on using Oracle ASM

fully_qualified_file_name

When you create a file in an Oracle ASM disk group, the file receives a system-generated fully qualified Oracle ASM filename. You can use this form only when referring to an existing Oracle ASM file. Therefore, if you are using this form during file creation, you must also specify REUSE.

- *db_name* is the value of the DB_UNIQUE_NAME initialization parameter. This name is equivalent to the name of the database on which the file resides, but the parameter distinguishes between primary and standby databases, if both exist.
- *file_type* and *file_type_tag* indicate the type of database file. Table 8-1 lists all of the file types and their corresponding Oracle ASM tags.
- *filenumber* and *incarnation_number* are system-generated identifiers to guarantee uniqueness.

You can determine the fully qualified names of Oracle ASM files by querying the dynamic performance view appropriate for the file type (for example V$DATAFILE for data files,

Copyright © 1996, 2026, Oracle and/or its affiliates.

V$CONTROLFILE for control files, and so on). You can also obtain the *filenumber* and *incarnation_number* portions of the fully qualified names by querying the V$ASM_FILE view.

Table 8-1 Oracle File Types and Oracle ASM File Type Tags

Oracle ASM *file_type*	Description	Oracle ASM *file_type_tag*	Comments
CONTROLFILE	Control files and backup control files	Current Backup	—
DATAFILE	Data files and data file copies	*tsname*	Tablespace into which the file is added
ONLINELOG	Online logs	group_*group#*	—
ARCHIVELOG	Archive logs	thread_*thread#*_seq_*sequence#*	—
TEMPFILE	Temp files	*tsname*	Tablespace into which the file is added
BACKUPSET	Data file and archive log backup pieces; data file incremental backup pieces	*hasspfile_timestamp*	*hasspfile* can take one of two values: *s* indicates that the backup set includes the spfile; *n* indicates that the backup set does not include the spfile.
PARAMETERFILE	Persistent parameter files	spfile	—
DATAGUARDCONFIG	Data Guard configuration file	*db_unique_name*	Data Guard uses the value of the DB_UNIQUE_NAME initialization parameter.
FLASHBACK	Flashback logs	log_*log#*	—
CHANGETRACKING	Block change tracking data	ctf	Used during incremental backups
DUMPSET	Data Pump dumpset	user_*obj#*_*file#*	Dump set files encode the user name, the job number that created the dump set, and the file number as part of the tag.
XTRANSPORT	Data file convert	*tsname*	—
AUTOBACKUP	Automatic backup files	*hasspfile_timestamp*	*hasspfile* can take one of two values: *s* indicates that the backup set includes the spfile; *n* indicates that the backup set does not include the spfile.

numeric_file_name

A numeric Oracle ASM filename is similar to a fully qualified filename except that it uses only the unique *filenumber.incarnation_number* string. You can use this form only to refer to an existing file. Therefore, if you are using this form during file creation, you must also specify REUSE.

incomplete_file_name

Incomplete Oracle ASM filenames are used during file creation only. If you specify the disk group name alone, then Oracle ASM uses the appropriate default template for the file type. For

Copyright © 1996, 2026, Oracle and/or its affiliates.

example, if you are creating a data file in a `CREATE TABLESPACE` statement, Oracle ASM uses the default `DATAFILE` template to create an Oracle ASM data file. If you specify the disk group name with a template, then Oracle ASM uses the specified template to create the file. In both cases, Oracle ASM also creates a fully qualified filename.

template_name

A template is a named collection of attributes. You can create templates and apply them to files in a disk group. You can determine the names of all Oracle ASM template names by querying the `V$ASM_TEMPLATE` data dictionary view. Refer to *diskgroup_template_clauses* for instructions on creating Oracle ASM templates.

You can specify *template* only during file creation. It appears in the incomplete and alias name forms of the *ASM_filename* diagram:

- If you specify *template* immediately after the disk group name, then Oracle ASM uses the specified template to create the file, and gives the file a fully qualified filename.
- If you specify template after specifying an alias, then Oracle ASM uses the specified template to create the file, gives the file a fully qualified filename, and also creates the alias so that you can subsequently use it to refer to the file. If the alias you specify refers to an existing file, then Oracle ASM ignores the template specification unless you also specify `REUSE`.

> **See Also**
>
> *diskgroup_template_clauses* for information about the default templates

alias_file_name

An alias is a user-friendly name for an Oracle ASM file. You can use alias filenames during file creation or reference. You can specify a template with an alias, but only during file creation. To determine the alias names for Oracle ASM files, query the `V$ASM_ALIAS` data dictionary view.

If you are specifying an alias during file creation, then refer to *diskgroup_directory_clauses* and *diskgroup_alias_clauses* for instructions on specifying the full alias name.

SIZE Clause

Specify the size of the file in bytes. Use `K`, `M`, `G`, or `T` to specify the size in kilobytes, megabytes, gigabytes, or terabytes.

- For undo tablespaces, you must specify the `SIZE` clause for each data file. For other tablespaces, you can omit this parameter if the file already exists, or if you are creating an Oracle Managed File.
- If you omit this clause when creating an Oracle Managed File, then Oracle creates a 100M file.
- The size of a tablespace must be one block greater than the sum of the sizes of the objects contained in it.

> **See Also**
>
> *Oracle Database Administrator's Guide* for information on automatic undo management and undo tablespaces and "Adding a Log File: Example"

Copyright © 1996, 2026, Oracle and/or its affiliates.

BLOCKSIZE Clause

Specify `BLOCKSIZE` to override the operating system-dependent sector size. If you omit this clause, then the database uses the operating system-dependent sector size as the block size.

When you add a redo log file to a 512-byte sector disk or to a 4KB sector disk with 512-byte emulation, the blocksize of the new file must be the original platform base block size or 4KB.

- If the redo log file is being added to a 512-byte sector disk, then you must specify 512 or 1024 (or 1K) as the block size, depending on your platform.
- If the redo log file is being added to a 4KB sector disk (native), then you must specify either 4096 or 4K as the block size.
- If the redo log file is being added to a 4KB sector disk with 512-byte emulation, then you can specify either 512, 1024 (or 1K), or 4096 (or 4K) as the block size, depending on your platform.

All logs within a log group must have the same block size. Two log groups created on separate disks can have different block sizes. However, the mixed configuration introduces overhead at every log switch. Oracle recommends that you create all log files with the same block size.

This clause is useful when the 4K sector size is in use, but you want to optimize disk space use rather than performance. In such a case you can override the operating system sector size by specifying `BLOCKSIZE` 512 or, for HP-UX, `BLOCKSIZE` 1024.

> **See Also**
>
> "Adding a Log File: Example"

REUSE

Specify `REUSE` to allow Oracle to reuse an existing file.

- If the file already exists, then Oracle reuses the filename and applies the new size (if you specify `SIZE`) or retains the original size.
- If the file does not exist, then Oracle ignores this clause and creates the file.

Restriction on the REUSE Clause

You cannot specify `REUSE` unless you have specified *`filename`*.

Whenever Oracle uses an existing file, the previous contents of the file are lost.

> **See Also**
>
> "Adding a Data File: Example" and "Adding a Log File: Example"

autoextend_clause

The *`autoextend_clause`* is valid for data files and temp files but not for redo log files. Use this clause to enable or disable the automatic extension of a new or existing data file or temp file. If you omit this clause, then:

- For Oracle Managed Files:

Copyright © 1996, 2026, Oracle and/or its affiliates.

  - If you specify SIZE, then Oracle Database creates a file of the specified size with AUTOEXTEND disabled.
  - If you do not specify SIZE, then the database creates a 100M file with AUTOEXTEND enabled. When autoextension is required, the database extends the file by its original size or 100MB, whichever is smaller. You can override this default behavior by specifying the NEXT clause.
- For user-managed files, with or without SIZE specified, Oracle creates a file with AUTOEXTEND disabled.

ON

Specify ON to enable autoextend.

OFF

Specify OFF to turn off autoextend if is turned on. When you turn off autoextend, the values of NEXT and MAXSIZE are set to zero. If you turn autoextend back on in a subsequent statement, then you must reset these values.

NEXT

Use the NEXT clause to specify the size in bytes of the next increment of disk space to be allocated automatically when more extents are required. The default is the size of one data block.

MAXSIZE

Use the MAXSIZE clause to specify the maximum disk space allowed for automatic extension of the data file.

UNLIMITED

Use the UNLIMITED clause if you do not want to limit the disk space that Oracle can allocate to the data file or temp file.

Restriction on the *autoextend_clause*

You cannot specify this clause as part of the *datafile_tempfile_spec* in a CREATE CONTROLFILE statement or in an ALTER DATABASE CREATE DATAFILE clause.

Examples

Specifying a Log File: Example

The following statement creates a database named payable that has two redo log file groups, each with two members, and one data file:

```
CREATE DATABASE payable
   LOGFILE GROUP 1 ('diska:log1.log', 'diskb:log1.log') SIZE 50K,
           GROUP 2 ('diska:log2.log', 'diskb:log2.log') SIZE 50K
   DATAFILE 'diskc:dbone.dbf' SIZE 30M;
```

The first file specification in the LOGFILE clause specifies a redo log file group with the GROUP value 1. This group has members named 'diska:log1.log' and 'diskb:log1.log', each 50 kilobytes in size.

The second file specification in the LOGFILE clause specifies a redo log file group with the GROUP value 2. This group has members named 'diska:log2.log' and 'diskb:log2.log', also 50 kilobytes in size.

Copyright © 1996, 2026, Oracle and/or its affiliates.

The file specification in the DATAFILE clause specifies a data file named 'diskc:dbone.dbf', 30 megabytes in size.

Each file specification specifies a value for the SIZE parameter and omits the REUSE clause, so none of these files can already exist. Oracle must create them.

Adding a Log File: Example

The following statement adds another redo log file group with two members to the payable database:

```
ALTER DATABASE payable
   ADD LOGFILE GROUP 3 ('diska:log3.log', 'diskb:log3.log')
   SIZE 50K REUSE;
```

The file specification in the ADD LOGFILE clause specifies a new redo log file group with the GROUP value 3. This new group has members named 'diska:log3.log' and 'diskb:log3.log', each 50 kilobytes in size. Because the file specification specifies the REUSE clause, each member can (but need not) already exist.

The following statement adds a logfile group 5 with member log files on migration target disks 4k_disk_a and 4k_disk_b. After executing this statement, you can switch existing log files on disks with 512-byte block size to logs with 4K block size using the *switch_logfile_clause*.

```
ALTER DATABASE ADD LOGFILE GROUP 5
     ('4k_disk_a:log5.log', '4k_disk_b:log5.log')
     SIZE 100M BLOCKSIZE 4096 REUSE;
```

Specifying a Data File: Example

The following statement creates a tablespace named stocks that has three data files:

```
CREATE TABLESPACE stocks
   DATAFILE 'stock1.dbf' SIZE 10M,
            'stock2.dbf' SIZE 10M,
            'stock3.dbf' SIZE 10M;
```

The file specifications for the data files specify files named 'diskc:stock1.dbf', 'diskc:stock2.dbf', and 'diskc:stock3.dbf'.

Adding a Data File: Example

The following statement alters the stocks tablespace and adds a new data file:

```
ALTER TABLESPACE stocks
   ADD DATAFILE 'stock4.dbf' SIZE 10M REUSE;
```

The file specification specifies a data file named 'stock4.dbf'. If the filename does not exist, then Oracle simply ignores the REUSE keyword.

Using a Fully Qualified Oracle ASM Data File Name: Example

When using Oracle ASM, the following syntax shows how to use the *fully_qualified_file_name* clause to bring online a data file in a hypothetical database, testdb:

```
ALTER DATABASE testdb
   DATAFILE '+dgroup_01/testdb/datafile/system.261.1' ONLINE;
```

Copyright © 1996, 2026, Oracle and/or its affiliates.

logging_clause

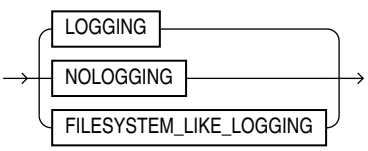
Purpose

The *logging_clause* lets you specify whether certain DML operations will be logged in the redo log file (LOGGING) or not (NOLOGGING).

You can specify the *logging_clause* in the following statements:

- CREATE TABLE and ALTER TABLE: for logging of the table, a table partition, a LOB segment, or the overflow segment of an index-organized table (see CREATE TABLE and ALTER TABLE).

  > **Note**
  >
  > Logging specified for a LOB column can differ from logging set at the table level. If you specify LOGGING at the table level and NOLOGGING for a LOB column, then DML changes to the base table row are logged, but DML changes to the LOB data are not logged.



- CREATE INDEX and ALTER INDEX: for logging of the index or an index partition (see CREATE INDEX and ALTER INDEX).
- CREATE MATERIALIZED VIEW and ALTER MATERIALIZED VIEW: for logging of the materialized view, one of its partitions, or a LOB segment (see CREATE MATERIALIZED VIEW and ALTER MATERIALIZED VIEW).
- CREATE MATERIALIZED VIEW LOG and ALTER MATERIALIZED VIEW LOG: for logging of the materialized view log or one of its partitions (see CREATE MATERIALIZED VIEW LOG and ALTER MATERIALIZED VIEW LOG).
- CREATE TABLESPACE and ALTER TABLESPACE: to set or modify the default logging characteristics for all objects created in the tablespace (see CREATE TABLESPACE and ALTER TABLESPACE).
- CREATE PLUGGABLE DATABASE and ALTER PLUGGABLE DATABASE: to set or modify the default logging characteristics for all tablespaces created in the pluggable database (PDB) (see CREATE PLUGGABLE DATABASE and ALTER PLUGGABLE DATABASE).

You can also specify LOGGING or NOLOGGING for the following operations:

- Rebuilding an index (using CREATE INDEX ... REBUILD)
- Moving a table (using ALTER TABLE ... MOVE)

Syntax

***logging_clause*::=**

Copyright © 1996, 2026, Oracle and/or its affiliates.

Semantics

This section describes the semantics of the *logging_clause*. For additional information, refer to the SQL statement in which you set or reset logging characteristics for a particular database object.

- If you specify LOGGING, then the creation of a database object, as well as subsequent inserts into the object, will be logged in the redo log file.
- If you specify NOLOGGING, then the creation of a database object, as well as subsequent conventional inserts, will be logged in the redo log file. Direct-path inserts will not be logged.
  - For a **nonpartitioned object**, the value specified for this clause is the actual physical attribute of the segment associated with the object.
  - For **partitioned objects**, the value specified for this clause is the default physical attribute of the segments associated with all partitions specified in the CREATE statement (and in subsequent ALTER ... ADD PARTITION statements), unless you specify the logging attribute in the PARTITION description.
  - For SecureFiles LOBs, the NOLOGGING setting is converted internally to FILESYSTEM_LIKE_LOGGING.
  - CACHE NOLOGGING is not allowed for BasicFiles LOBs.
- The FILESYSTEM_LIKE_LOGGING clause is valid only for logging of SecureFiles LOB segments. You cannot specify this setting for BasicFiles LOBs. Specify this setting if you want to log only metadata changes. This setting is similar to the metadata journaling of file systems, which reduces mean time to recovery from failures. The LOGGING setting, for SecureFiles LOBs, is similar to the data journaling of file systems. Both the LOGGING and FILESYSTEM_LIKE_LOGGING settings provide a complete transactional file system by way of SecureFiles.

> **Note**
>
> For LOB segments, with the NOLOGGING and FILESYSTEM_LIKE_LOGGING settings it is possible for data to be changed on disk during a backup operation, resulting in an inconsistent backup. To avoid this situation, ensure that changes to LOB segments are saved in the redo log file by setting LOGGING for LOB storage. Alternatively, change the database to FORCE LOGGING mode so that changes to *all* LOB segments are saved in the redo.

If the object for which you are specifying the logging attributes resides in a database or tablespace in force logging mode, then Oracle Database ignores any NOLOGGING setting until the database or tablespace is taken out of force logging mode.

If the database is running in ARCHIVELOG mode, then media recovery from a backup made before the LOGGING operation re-creates the object. However, media recovery from a backup made before the NOLOGGING operation does not re-create the object.

The size of a redo log generated for an operation in NOLOGGING mode is significantly smaller than the log generated in LOGGING mode.

In NOLOGGING mode, data is modified with minimal logging (to mark new extents INVALID and to record dictionary changes). When applied during media recovery, the extent invalidation records mark a range of blocks as logically corrupt, because the redo data is not fully logged.

Copyright © 1996, 2026, Oracle and/or its affiliates.

Therefore, if you cannot afford to lose the database object, then you should take a backup after the NOLOGGING operation.

NOLOGGING is supported in only a subset of the locations that support LOGGING. Only the following operations support the NOLOGGING mode:

DML:

- Direct-path INSERT (serial or parallel) resulting either from an INSERT or a MERGE statement. NOLOGGING is not applicable to any UPDATE operations resulting from the MERGE statement.
- Direct Loader (SQL*Loader)

DDL:

- CREATE TABLE ... AS SELECT (In NOLOGGING mode, the creation of the table will be logged, but direct-path inserts will not be logged.)
- CREATE TABLE ... *LOB_storage_clause* ... *LOB_parameters* ... CACHE | NOCACHE | CACHE READS
- ALTER TABLE ... *LOB_storage_clause* ... *LOB_parameters* ... CACHE | NOCACHE | CACHE READS (to specify logging of newly created LOB columns)
- ALTER TABLE ... *modify_LOB_storage_clause* ... *modify_LOB_parameters* ... CACHE | NOCACHE | CACHE READS (to change logging of existing LOB columns)
- ALTER TABLE ... MOVE
- ALTER TABLE ... (all partition operations that involve data movement)
  - ALTER TABLE ... ADD PARTITION (hash partition only)
  - ALTER TABLE ... MERGE PARTITIONS
  - ALTER TABLE ... SPLIT PARTITION
  - ALTER TABLE ... MOVE PARTITION
  - ALTER TABLE ... MODIFY PARTITION ... ADD SUBPARTITION
  - ALTER TABLE ... MODIFY PARTITION ... COALESCE SUBPARTITION
- CREATE INDEX
- ALTER INDEX ... REBUILD
- ALTER INDEX ... REBUILD [SUB]PARTITION
- ALTER INDEX ... SPLIT PARTITION

For **objects other than LOBs**, if you omit this clause, then the logging attribute of the object defaults to the logging attribute of the tablespace in which it resides.

For **LOBs**, if you omit this clause, then:

- If you specify CACHE, then LOGGING is used (because you cannot have CACHE NOLOGGING).
- If you specify NOCACHE or CACHE READS, then the logging attribute defaults to the logging attribute of the tablespace in which it resides.

NOLOGGING does not apply to LOBs that are stored internally (in the table with row data). If you specify NOLOGGING for LOBs with values less than 4000 bytes and you have not disabled STORAGE IN ROW, then Oracle ignores the NOLOGGING specification and treats the LOB data the same as other table data.

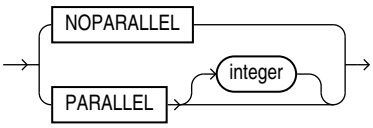
parallel_clause

Purpose

The *parallel_clause* lets you parallelize the creation of a database object and set the default degree of parallelism for subsequent queries of and DML operations on the object.

You can specify the *parallel_clause* in the following statements:



- `CREATE TABLE`: to set parallelism for the table (see CREATE TABLE).
- `ALTER TABLE` (see ALTER TABLE):
  - To change parallelism for the table
  - To parallelize the operations of adding, coalescing, exchanging, merging, splitting, truncating, dropping, or moving a table partition
- `CREATE CLUSTER` and `ALTER CLUSTER`: to set or alter parallelism for a cluster (see CREATE CLUSTER and ALTER CLUSTER).
- `CREATE INDEX`: to set parallelism for the index (see CREATE INDEX).
- `ALTER INDEX` (see ALTER INDEX):
  - To change parallelism for the index
  - To parallelize the rebuilding of the index or the splitting of an index partition
- `CREATE MATERIALIZED VIEW`: to set parallelism for the materialized view (see CREATE MATERIALIZED VIEW).
- `ALTER MATERIALIZED VIEW` (see ALTER MATERIALIZED VIEW):
  - To change parallelism for the materialized view
  - To parallelize the operations of adding, coalescing, exchanging, merging, splitting, truncating, dropping, or moving a materialized view partition
  - To parallelize the operations of adding or moving materialized view subpartitions
- `CREATE MATERIALIZED VIEW LOG`: to set parallelism for the materialized view log (see CREATE MATERIALIZED VIEW LOG).
- `ALTER MATERIALIZED VIEW LOG` (see ALTER MATERIALIZED VIEW LOG):
  - To change parallelism for the materialized view log
  - To parallelize the operations of adding, coalescing, exchanging, merging, splitting, truncating, dropping, or moving a materialized view log partition
- `ALTER DATABASE ... RECOVER`: to recover the database (see ALTER DATABASE).
- `ALTER DATABASE ... standby_database_clauses`: to parallelize operations on the standby database (see ALTER DATABASE).
- `CREATE VECTOR INDEX`: (see CREATE VECTOR INDEX).

Copyright © 1996, 2026, Oracle and/or its affiliates.

> **See Also**
>
> *Oracle Database PL/SQL Packages and Types Reference* for information on the `DBMS_PARALLEL_EXECUTE` package, which provides methods to apply table changes in chunks of rows. Changes to each chunk are independently committed when there are no errors.

Syntax

***parallel_clause*::=**

Semantics

This section describes the semantics of the *parallel_clause*. For additional information, refer to the SQL statement in which you set or reset parallelism for a particular database object or operation.

> **Note**
>
> The syntax of the *parallel_clause* supersedes syntax appearing in earlier releases. The superseded syntax is still supported for backward compatibility, but may result in slightly different behavior from that documented.

The database interprets the *parallel_clause* based on the setting of the `PARALLEL_DEGREE_POLICY` initialization parameter. When that parameter is set to `AUTO`, the *parallel_clause* is ignored entirely, and the optimizer determines the best degree of parallelism for all statements. When `PARALLEL_DEGREE_POLICY` is set to either `MANUAL` or `LIMITED`, the *parallel_clause* is interpreted as follows:

NOPARALLEL

Specify `NOPARALLEL` for serial execution. This is the default.

PARALLEL

Specify `PARALLEL` for parallel execution.

- If `PARALLEL_DEGREE_POLICY` is set to `MANUAL`, then the optimizer calculates a degree of parallelism equal to the number of CPUs available on all participating instances times the value of the `PARALLEL_THREADS_PER_CPU` initialization parameter.
- If `PARALLEL_DEGREE_POLICY` is set to `LIMITED`, then the optimizer determines the best degree of parallelism.

PARALLEL *integer*

integer is optional and specifies the degree of parallelism you require (number of parallel threads) in the parallel operation. Each parallel thread may use one or two parallel execution

Copyright © 1996, 2026, Oracle and/or its affiliates.

servers. If you do not specify *integer*, the database calculates the optimum degree of parallelism.

Notes on the *parallel_clause*

The following notes apply to the *parallel_clause*:

- Parallelism is disabled for DML operations on tables on which you have defined a trigger or referential integrity constraint.
- Parallelism is not supported for UPDATE or DELETE operations on index-organized tables.
- When you specify the *parallel_clause* during creation of a table, if the table contains any columns of LOB or user-defined object type, then subsequent INSERT, UPDATE, DELETE or MERGE operations that modify the LOB or object type column are executed serially without notification. Subsequent queries, however, will be executed in parallel.
- A parallel hint overrides the effect of the *parallel_clause*.
- DML statements and CREATE TABLE ... AS SELECT statements that reference remote objects can run in parallel. However, the remote object must really be on a remote database. The reference cannot loop back to an object on the local database, for example, by way of a synonym on the remote database pointing back to an object on the local database.
- DML operations on tables with LOB columns can be parallelized. However, intrapartition parallelism is not supported.

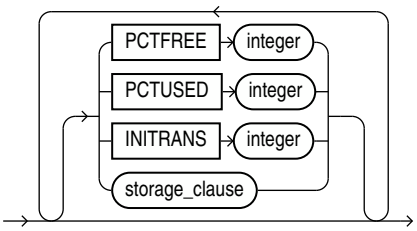
> **See Also**
>
> *Oracle Database VLDB and Partitioning Guide* for more information on parallelized operations, and "Creating a Table: Parallelism Examples"

physical_attributes_clause

Purpose

The *physical_attributes_clause* lets you specify the value of the PCTFREE, PCTUSED, and INITRANS parameters and the storage characteristics of a table, cluster, index, or materialized view.

You can specify the *physical_attributes_clause* in the following statements:



- CREATE CLUSTER and ALTER CLUSTER: to set or change the physical attributes of the cluster and all tables in the cluster (see CREATE CLUSTER and ALTER CLUSTER).
- CREATE TABLE: to set the physical attributes of the table, a table partition, the OIDINDEX of an object table, or the overflow segment of an index-organized table (see CREATE TABLE).
- ALTER TABLE: to change the physical attributes of the table, the default physical attributes of future table partitions, or the physical attributes of existing table partitions (see ALTER TABLE). The following restrictions apply:
  - You cannot specify physical attributes for a temporary table.
  - You cannot specify physical attributes for a clustered table. Tables in a cluster inherit the physical attributes of the cluster.

Copyright © 1996, 2026, Oracle and/or its affiliates.

- `CREATE INDEX`: to set the physical attributes of an index or index partition (see CREATE INDEX).
- `ALTER INDEX`: to change the physical attributes of the index, the default physical attributes of future index partitions, or the physical attributes of existing index partitions (see ALTER INDEX).
- `CREATE MATERIALIZED VIEW`: to set the physical attributes of the materialized view, one of its partitions, or the index Oracle Database generates to maintain the materialized view (see CREATE MATERIALIZED VIEW).
- `ALTER MATERIALIZED VIEW`: to change the physical attributes of the materialized view, the default physical attributes of future partitions, the physical attributes of an existing partition, or the index Oracle creates to maintain the materialized view (see ALTER MATERIALIZED VIEW).
